At a meeting of pilots, presided over by Arrumiat, the captain fixed the lines of their compass cards. On the table in the cabin a figure was laid out with the aid of beans and the captain copied it on paper as well as possible. "When I thought that I had set up the wrong figure by the choice of my points and wanted to improve it and to make it into a more perfect quadrant I was not allowed to do so. When I repeatedly rounded the corners of the square figure I was requested to leave it as it was and for that reason it must be accepted in the condition it is."

They divide the horizon up into four quarters or perhaps better into two semi-circles: the [129] eastern and the western, Uebuel* is the name of the Polar Star and Mailab* * is Orion's Belt. The three points which are meant to represent east and west are all called Mailab and Tubule mailap. None of the three has a special name, but only the general term for all of them is known. It is noteworthy that there is no term available for East to North or West to North. On their compass card the corresponding points are North to East, Northeast to North and Northeast to East, but East to North is not included; the place for it remains empty. The same thing happens in the four quadrant, although the points of these angles seem to equal ours. Their third quadrant resembles the fourth, but the second does not bear similarity either to the first or one of the

*Hambruch on Elato: uĭluĭl
** Hambruch: ŭliŭl; Altair, mai i lŏp.

others. Their first quadrant is divided into 8 parts, for Tagale mol corresponds to NE; of the eight only seven are marked and have names. The others are not divided up evenly but are arranged in the manner shown in the figure. I was unable to find an explanation for this peculiarity.

The months, gédj, are named after the stars that rise around midnight and stand at zenith early in the morning.

Thus the monthly periods have derived their name from the time when the stars are found at zenith.

A. Kramer		Hambruch	Month
ul	Aldebaran	ūl, ül (round)	September
ʃliol	Orion's Belt	ūliül	October
māl	Sirius	mall, māl (animal)	November
idj	"Fog" west of Regulus in the lion	its, itj	December
sárepol	Corvus	zāre üol	January
aremaus (...moi)	Arcturus	aremaus	February
tumur	Antares	tumul	March
mairig	Star west of Atair	mai rik	April
mailap	Atair	mai i lap	May

Lamotrek

Pleiades	magárigar (Truk: moériger)	April	tafalimagárigar, evening wind when the Pleiades stand at 30°; when they set at night there follow calms, mopele magárigar [136](mop, to drown; see Onoun); this is the best time for angle fishing, when the water is calm, without strong currents.
	when mag rises in the East	in May	the wind is known as kobuádj; the word is derived from uádj "to cook," because for 6-12 hours violent easterly winds prevail, which make the ocean appear as if it is followed by djigerali mag.

			which lasts until the ul sets in.
Aldebaran	ul	middle to end of May	djelul, renders the water ripply, because often short squalls blow from the East and Northeast.
Orion	irir ali ol (eliol, Orion's Belt)	July	westerly winds for 2-3 days when aliol rises in the morning, light rángaliol blow from the east for 2-3 days
Sirius	mal, gongalemál or golongalemal	early in June	westerly winds for 1-2 days, but uncertain
		sets about the middle of June	liurap (from rap "to cover, lay down close together) alemál, calms.
Mist in the Lion	idj	setting between July 1-15	westerly winds kalangalidj for about 14 days, followed by easterly winds djangaliól, (from djang

		"to hang up" when aliol stands at a certain height)
Regulus ililigëk	July-August	eangalililigek blow SW, W NW for about 6 weeks without intermission when the tail of Canus major (sirius) rises; eangali faliuk alimal is the last of the period and is easterly (faliuk from iuk, tail and mal, see above).
Southern Cross bup	end of August to the beginning of September	djep alup strong southwesterly winds, with generally clear weather
gap	setting in the evening at 35°	for 12-24 hours the easterly ëtang prevails (sitang, ëtang "the pressing down"

			-- of the bupi djep)
Canopus	gap i eaur	equinox	the winds may be changing and may come sooner or later
		upon setting	atangaligap, easterly winds for 1-3 days
Arcturus	áremoi (see above)	upon setting	eang ali aremói mopolog ali aremoi (mop "to drown"). [137]
	efang alúl	rise at the time of the breadfruit harvest, 15 days after ul (Aldebaran)	strong easterly winds prevail for half a day and blow down the ripe breadfruit
	póulimal, the lowest star of the tail of Canus major "shakes the animal (mal)"		easterly winds preceding eangalifaliuk (see Regulus)
			in the same manner the

on the fishing line | | wind shakes the bread-fruit trees.

[ER: An additional list of stars and constellations is given in the source, but omitted here]

4: Krämer--137 (1909) 1937 Woleaians
116, 751 Lamotrek

In case of epidemics and contagious diseases, the sick are isolated in the canoe-houses.

The following types of illnesses, mes, were mentioned:

cold, ngutali bodj
cough, fágafag [138]
illness resembling influenza, masélepik (Yap word) with the symptoms of colds, cough, hard sputum, pains in the chest, back, shoulders and eyes; laryngitis, yellow tongue, fever.
tuberculosis, mësebot
lupus, lugeileng (cf. the gods, page 147, who took the illness upon himself and thus gave the name to it. Syphillis was not known).
leprosy, batur
abcess, framboesia, rup
swelling of testicles, morulap
ringworm, kelísebou; this disease is rare and can be cured by the Oleai islanders.
vitiligo, boëdj ("white") with nervous disturbances
blindness, matabās
swollen thigh, abcess, lōs
elephantiasis of the leg, bedjëdjop (berërop); when it is still at the beginning stage and not quite certain it is called bōbō; the cause is said to be the breaking of taboos.

tumors (lipom), pir
swellings, berëlal
"demon madness," katok alus, in the case of fear of illness; but it also affects the body and is accompanied by hunger.

4: Krämer--138-139 (1909) 1937 Woleaians
116, 751 Lamotrek

In order to keep away the evil spirits of illness fans are used (gálibă ali kuei) and they are also expected to keep disease at some distance from the island. At intervals of about 100 yards all around the island gilli tilimes "mats of defense" are hung up in order that the demons will be unable to enter within the circuit; the mats used in this instance are the tapokóu of coconut pinnae which are made of two parts. In order to keep away death, mas, a medicine by the name of tafei limes is used; the bark of the roots of young kelau, djel, ut, ear, ngo are taken; they are scraped and added to a grass root, bugor; everything is washed and put into a pouch, tūkemôil* or tukemöi. . . . This is put into a wooden bowl with clean water; it is covered up with a mat and left standing. After some time one tries with tagag whether the medicine is good. If the person who has prepared the medicine is satisfied with the way it has turned out, then all the inhabitants of the house drink of it and he speaks a little verse. [ER: The verse is omitted here.] [139] The pouch remains in the tabbi, the wooden bowl, and every day at midnight water is added and drunk.

Outsiders may not drink any of the liquid, but it is a privilege of the inhabitants of the house.

---

* On Lamotrek these pouches are hung up in the houses after use. Urupo (house) upon the return from a voyage placed one underneath a mog tree.

4: Krämer--139 (1909) 1937 Woleaians
116, 755 Lamotrek

A special medicine is prepared against influenza, masélepik. It is called afeilialis and was reported by Ikelúr. The juice of two coconuts is put into a wooden bowl; a pouch, tukemõil, with herbs and a small pouch with burnt coconut (Palau: ulogóug) and a third bag with djig, giliau, and uórong are soaked in it and then wrung out; the pouches remain in the bowl.

Hot stones are thrown into the liquid. The sick person is covered up with a mat and the bowl is placed next to him underneath the cover. The medicineman moves two lagat bunches of ferns (Figure 63 [VMM: see source]) and two branches of giliau over the sick under the mat and finally picks up a net (djróu) in order to catch the evil spirits that escape. At last he swings two branches of ear; he puts their ends into his mouth while he tries to charm them and appeals for help. After all these steps have been taken, the sick person is helped to sit up and drinks the medicine in the bowl. The same thing is repeated three times within two days. After use, the pouches with the medicines are hung up in the house.

4: Krämer--140 (1909) 1937 Woleaians/4
116, 752 Elato

Sores and abcesses, las, are opened with the fidjefidj instrument (Fig. 69) [VMM: see source]. Itilimara (house 5), the father of Lolit, died of this treatment. In his case an abcess of the arm-pit was punctured and it is likely that the artery was cut. Kelur, Auólimar, and Boéso still performed punctures in 1910.

Bleeding is also done with the fidjefidj. Hysterotomies are not performed. Lutke previously has mentioned acupunctures done with fish teeth (tail of the apisurus) by insertion of a rake. For ulcers the leaves of djaival, a small creeper, are used.

4: Kramer--140* (1909) 1937 Woleaians
116, 753 Elato

Hambruch learned on Elato that in case of illness, for different types of medicines, bángebang, are tried; if none of them is successful, the sick person will have to die. It is Eluelap's will and for that reason he is invoked...

4: Krämer--140 (1909) 1937 Woleaians
116, 753 Lamotrek

Hellwig calls the coughing illness, mass, which means death and probably refers to influenza.

4: Krämer--140 (1909) 1937 Woleaians
116, 843 Lamotrek

Women who are pregnant for the first time, are given a medicine, tafei i lolomai* once a month....

*At that time the medicineman carries the poúl i lolomai, the angle, and the devil's eyes.

4: Krämer--140-142 (1909) 1937 Woleaians
116, 755 Elato

Against a stomach ache a pouch, tukemöilü táfei, is made up.... While magic words are spoken, the figure of a cross is described with this pouch, i.e., the movement is horizontal and vertical. The medicineman also has a red cross painted on his forehead and both shoulders. [ER: The words spoken on this occasion are omitted here and the same is true of other songs that accompany various steps of medical treatment.] [142]

Elisabeth Krämer observed the following case: a woman had swollen glands. Her husband gathered leaves and bark of the tree galau (giliau?) and crushed both on a wooden board; then he filled the crushed mass into coconut leaves, tied them together like a pacifier and fastened young coconut pinnae with magic knots to it. Then a young nut was opened, the pacifier was dipped into the milk of the nut and then taken out and pressed out over the water so that the color changed to brownish-green. The woman drank this water as a medicine.

4: Krämer--142 (1909) 1937 Woleaians 1-2
116, 833, 201 Lamotrek

It is usual for the man to ask the woman whether she is willing to have sexual intercourse, ramoidjau. The woman expresses her consent by moving her hand over her face from the forehead down; this gesture is known as tŏfi (mat).

4: Krämer--142 (1909) 1937 Woleaians
116, 839 Lamotrek

The following perversities are known:

onanism	sir
irrumatio	faigabóng
cunnilinotus	móngo
sadism	li

4: Krämer--142-143 (1909) 1937 Woleaians
116, 833 Elato

The word for coitus is tengi.

It is usually preceded by lengthening of the labia minora and defloration of a virgin, ulut* which takes place as soon as the breasts of the girl begin to develop. The former is best known from Oleai. The mother calls in a man, the válevei. She sits on a porch, metalim, and the man and young girl stay in the gapel in the rear. For four days the man tries to stretch the labia minora, fir, which is considered absolutely necessary. The women laugh at a dẫrefir (not lengthened).

After four days follows the rupture of the hymen, ŋgatangat; the vagina is gradually widened, first with the fifth, and then with the fourth, third, second and first finger and finally with two fingers simultaneously. [143] The mother pays the man for his work, but probably not always. It is not certain whether he is the first to have intercourse with the girl. In any case, the valevei is taboo for the girl. **

*All women without children are also called ulut; a widow is known as lipidj.

**ua, boat; level, voyage... Thus the literal meaning of the word valevei is "boat of voyage," which is a beautiful name for this man; see Krämer Die Samoainseln, I, page 81 where the word used for the priests means "warship."

4: Kramer--143 (1909) 1937 Woleaians
116, 173, 833 Elato

On Elato, Hambruch learned the following about the origin of coitus:

In olden times the people did not know anything about coitus. Then Lugeilēn came and saw a man and a woman, the man Temŏnémŏn and the woman Liparáre. She was very beautiful. "Well, what are you doing? Where is your husband?" "He is out fishing." "All right, go and bathe and afterwards I shall show you something pleasant." "But first I have a question to ask you. Do you like to have intercourse?" "I don't know." "Then go into the house. I shall show you something." And then he instructed the woman in sexual intercourse. The woman was very pleased about it. Lugeilĕn said good-bye to her. Being most interested in what she had just learned the woman completely forgot about her cooking. She ran down to the beach and called loudly for her husband: "Come, come, quickly! Leave the canoe and the fish. I'll show you something new!" "Whatever is the matter?" "Come, come quickly," and the man had to go into the house. The woman showed him how he was to lie down, because he did not know anything at all. When he did not have an erection, the woman took his penis in her hand and rubbed it thoroughly and then he could sleep with her. This they practiced for days and weeks until finally they had lost all their flesh. Then Lugeilĕn returned and asked the two: "What are you doing?" And they told him. "Oh, stop! You should do it only once a week, otherwise you will die." And they followed his suggestion.

4: Krämer--143-145 (1909) 1937 Woleaians-1-5
116, 173 Lamotrek

In Kotzebue, III, it is said that east of Mokemok no temples and sacrifices existed. But the Faletaipu allows the conclusion that a house for the worship of god was available.

In the beginning everything was dark and the sky lay over the water. In the water there was a large reef, Oledjapdjap* which became the mother of three gods, alus: [144]

Salual lived in Ilal, the lower world. (Polynesian; i lalo, below and from it also "ruler below"; cf. Muller, Yap, page 308.)

Sauaur (Hambruch Zauuor) or Souiaur**

Aluelap*** (Hambruch: Eluelap) "Great Spirit" (on Yap: Yalulop).

---

*Hambruch: from ole "very old" and zapzap "earlier, begin"; Hambruch learned of this thought of the reef as the ancestral mother on Elato; cf. Ifaluk where Hambruch was working, On Faraulip one talks of the growth of a rod which the woman planted on the reef and from which Eluelap rose.

**Aur, the master of the South Sea island... See also Fus, story 2.

***Kotzebue says that the god (tautup) of Elath and Lamurrec is called Fuss. As for details on this spirit, Cantova says on page 304 that his parents were Sabucour and Halmelul (Hammelu Elalamor?...) and that his daughter Ligobund, the creatoress, had three children.

3. Zemalgoror (Truk: Semengŏror)
4. Legeileng
5. Ururulang, the pusher of the clouds and the messenger of Aluelap*

Hambruch names another daughter in addition to three forElato, she is Nimegei and Müller lists her in Yap...as Nimegai, which in translation means "I alone remain"; she married Lugëléng (see Lugeileng above under no. 4); but on Feis she is given as his daughter.

In addition to the above-mentioned three--Legoupap, Legaburalialial and Lidjarere--six more female spirits were mentioned to me on Lamotrek by another informant, but their origin as daughters of Aluelap is not sure. [145]

Their names are:

5. Litáfeo, who was given the threads of life.
6. Ilĕgúio who supervises 5, and sees to it that the threads do not become confused. If she has to cut one, the owner will die.
7. Ilatiu who comes down from heaven in order to find out what is going on

*Hambruch mentions the same three for Elato but by him Eluelap, the well-known Anulap is listed in second place while on Lamotrek he was named as the third. For Truk, 5 brothers and 5 sisters are named, and the above mentioned two brothers are lacking.

4: Krämer--143-145 (1909) 1937 Woleaians-2
116, 173 Lamotrek

Saulal was the master of the ocean who provided the fish, Sauaur was the ruler of Aur and provided the breadfruit, and Aluelap was the master of the universe, the oldest and the highest, comparable to Yongelap on Yap. . . Eluelap's wife was Limarauarau* whose name was the same as that of the great celestial vault, Eluelap lived with his wife in the great house Fadjamal.

He had three daughters (for the fourth see Hambruch, see below)**;

1. Ligóboub
2. Lisarërë, her sister came to Makuei (not in the Carolines)
3. Ligabú (r) ale aliali who was not supposed to do anything; for that reason she was tied into a bundle and hung from the roof-tree of Fadjamal.

They also had five sons (Hambruch):

1. Zemeruch, who helps the workman with the construction of houses and canoes (Truk: sou im is the word for carpenter).
2. Zelang (Truk: Silelap is the builder of a canoe)

---

*According to Cantova the woman was called Leteugieul and came from Oleai; since she only had one son, Lugeileng, he adopted the Reschahuileng of Lamotrek whose mother lived here.

**The descent from the couple is contested.

below; she takes good news up to heaven since Aluelap does not want to hear anything unpleasant.

8. Ledjoumes supports no. 7 in the good things, because nothing bad is to be reported in the house Fadjamal.
9. Legédjigedj took down the coconut....
10. Aliulang, is the name for the month of gedj...for this reason the gedj fish (gudj?) was taboo and could not be caught and not even its name was to be pronounced for the sake of Legédjĕgedj (9). Aluelang suggested that men should die and be resurrected like the gods, but Ligedjegedj thought it would be better if they died once and for all, Aluelap was in agreement with the latter idea, because them men would not be able to spy in heaven and later imitate the gods in everything...

This story is given in Cantova, page 305, but here Erigiregers, the evil spirit, brings death to the people who previously had not died, but merely slept from the last moon to the first new crescent. There the evil spirits are called Elus Melabut and the good ones are called Elus Melafirs. The spirit Morogrog is considered the carrier of fire.

Eluelap in the house Fadjamal always sleeps on the floor (Hambruch: nifang) and when

they want to wake him they pull up his eyelids.... The sky, aidjal* is the medium for his speech; the earth is called sãlop.

*Audjal is the messenger of the gods. On Elato: the bird, baz, tells him about all the happenings on earth, whether the people are good or bad.... He lets the evil die and they go to the jaf (fire?) and stay there; but the good are admitted into the house of Fatsumãn and they live in splendor with the gods.

4: Krämer--145 (1909) 1937 Woleaians
116, 173 Lamotrek

On Lámotrek I heard another myth.... When the sky was above... a man by the name of Pelialu sat on a tree in Sätoal aitū (Sätoaleirek, called after the sea, veirek; Sätoal aitū named after the island of Tā on Saloan (Volume 6, I, page 22); cf, also Dō the southern island of Pollap, etc. The word Sätoval is said to be derived from sät, ocean and oál, bush; one said for instance in the bush: leval, there , nival, here and began to catch gurugak=sea swallows. When he had caught one, it suddenly revealed itself as a spirit (alu) and pulled the man up to heaven with its net. Thus he came to Fadjumal and there noticed all the spirits of illnesses coming towards him with the intention of destroying him. For the guards of the path, Ileitiu and Lidjómas, had already announced his coming. In the house there was a bag hanging down from the roof tree. Ligabur ale aliali, who had power over all on earth, was in the house. And when the illnesses were about to fall over the man, she ordered the bird to seize him by his hair and to take him back down to earth. In this manner they learned in heaven of the presence of man on earth through Pelialu. For that reason, Pelialu is looked upon as a helpful alu. The word olsóbōl, "to protect, aid," with the final syllable bōl apparently has the same stem as Peli.)

4: Krämer--145-148 (1909) 1937 Woleaians-1-9
116, 173 Elato

On Elato the creation is represented in this manner: Olezapzap, the ancestral mother of the gods... planted a stick in the middle of the universe and it grew into a tree* and reached heaven itself, [146] which at that time was still located fairly close above the

* Probably a coconut palm, but one without fruit.... This is the creation of Elato (Hambruch): In olden times there was a stone from which grew a tree, ülelü, a fern with big leaves. That was the very beginning of the world. A bird, garĕgar, came and let its excrement fall on the stone; and in it was a drop of blood and from it originated the woman Legobu (see above... Ligoboub); she soon gave birth to two children, a girl Loi i falu and a boy Loi u pi; their names in translation mean "great place" and great sand." Loi i falu gathered the material from which the islands are made and Loi u pi helped his sister. Both of them were spirits, but their children were human beings. One daughter was Ligabu e aliali and it may be written in another manner: li= woman, malabus, dumb, and ali ali to fly (=the dumb fly to and fro); she completed the island which the others had begun. She did not want to do anything but sleep, drink, dream, and wish; thus she wished that the places she had made would be inhabited by human beings. She cut her hand until blood flowed forth and formed people, men and women. These people were distributed over the island....

earth. And she told her son Eluelap and his daughter Ligoboub to take some sand and to form the earth. They picked up coconut shells, filled them with sand, climbed up the tree, and formed the earth. Eluelap climbed even higher than to the top of the tree and lifted the heaven, lang, and spread it out over the tree and above it he formed the vault of the great blue firmament, limarauarau. He brought the sky to its present place, ueneng. (God Fus "Star"...)

On Iamotrek the story of the creation continues:

Thus Eluelap is the creator and has a daughter Leboupboup (Liboubup) or Legoupup who gave birth to Legaburs al le alual*)the flyer, see above sister no. 3. When she came

*Previously she was mentioned as the sister of Legoupup; upon order of Aluelap she made the earth and later on sent his messenger Eidjal (see above, aidjal, the celestial vault as the means of his speech) as a wind in order that he might enter into the nose of Ligoubub. Eidjal did as he was told and penetrated as far as her stomach where he established himself as breath and the being of Aluelap; and Ligoubub became pregnant and gave birth to two children, a boy and a girl. Eidjal then returned to heaven to bring the news to Aluelap. And Aluelap sent him back down to name the children, the boy Tipalalailog or Tip for short (from tipei, "my will, thought") and the girl Ilalaailog or Il for short (=deliberate, not unjust), and the two children became the cause of good thoughts everywhere...

down from heaven she could not find land anywhere. Therefore she had to fly around for some time and to gather sand and stones and she made the first firm ground. And with one hand full of sand she created all the other islands. Thereafter she made the plants and animals and the birds in the air and everything else. But there was no one around to admire her work. And she cut the tip of the finger of her right hand* and she let the blood drip down on the ground. And soon a woman was formed and a man and they were names Yat and Yol; and they lived together and had many children.

Yat and Yol...among others had the following children; three girls:

1. Lataaisean
2. Lemaugarertra
3. Elamalor, a name which sometimes sounded like Elamalaur (Hambruch for Elato mentions Ilamelul, Ilamulul story 1).

And they had a son, Oralvers. [147]

All of them lived carefree lives and did not know death. Legaburs al le alual even took them out to the ocean over which they could run. But the other spirits became jealous and angry and Ligoubub returned to heaven and left the people to take care of themselves. And they became subject to hunger, illness and death.

Aluelap had another reason for separating heaven and earth; he did not want the people to learn too much. For Lisarërë had taught the women to work and especially had

*On Truk...this was the method Aluelap used to create Ligoubub.

familiarized them with the art of weaving through her daughter, the spider Likesoburára whose web served as an example. In addition plaiting, and the manufacture of textiles, was shown to the women on earth.

The third sister Ligabut ale aliali did not do anything, but she sent the spirit of jealousy to dwell among the people. She flew about without purpose and was lazy.

One day Lugeileng* the son of Elaulap (above no. 4) came down to earth from heaven and he saw a leper. He felt such pity with the man and his deformation that he exchanged his skin for that of the sick man and he gave him everything except his gums. Lugeileng

*On Truk he is the son of Anulap (no. 4 above) who adopted him according to story 1, and the same is told for the island of Ku. Hambruch, in another place wrote that his father was Mezelang e gotu... and that Eluelap had adopted him and had come to love him dearly; see story 1. --According to Cantova, page 306, Lugeileng had a celestial wife, who gave birth to two sons, Carrer and Meliliau; the other was a mortal woman from Falalu, and she gave birth to Olefat.

came to Yol with his diseased skin but the women in this house did not want to give any food to the sick man until the daughter Elamalor took pity and handed him food and water. This pleased Lugeileng. He came to like her so much that he took her along with him after he had changed into a handsome young man.

It was Elamalor who bore him a son, the well-known Olifat.*

The native Urupo said in this connection that Elamalaur had been sent by Lugeileng to fetch a shell; when she brought it back he took it and with it cut her skull and Olifat jumped out (the same happening is related in story 1). Olifat was able to run about immediately after his birth and he himself removed all signs of his recent birth from his body. He looked up and when he saw his father Lugeileng in heaven he ascended on him. One day Olifat observed some children in heaven playing with a shark, and they had tied the shark to a line and let him swim about. Olifat said to the children: "Give me the line and let me play for a little while." But they all refused him, with the exception of one of the children, who indeed was the one to be spared the bites of the shark.

Other children played with the marafas fish, which they also had tied to a line. Once

*On Fanany it was a native woman, Tarisso, who was named as the mother. Much has been written about Olifat including the early reports of Freycinet. . . . According to the Nautical Magazine of 1866 there were three sons in the family: Alutap, Lungalen, and the giver of food. . . Olofat.

more Olifat wanted to join in their play, but all except one refused to let him, and the child was the only one whose arm was not cut by the fish. [148]

Another group of children was playing with toy canoes and when Olifat wanted to join them he experienced the same attitude as in the preceding cases; the one child that was in favor of letting Olifat join in the fun was the one to keep his canoe, while all the others drifted away. Finally Olifat observed some men cutting coconut fronds to cover some huts. He felt the desire to do his share in the work, but none of the men would give him a knife; finally one agreed to let him take his. Olefat returned it to him after use, whereas all the other men lost their knives. In addition the man who had shown interest in Olifat was the only one able to climb down from the top of the tree, for all the others were struck up high and could not return to the ground. When the unhappy men lamented their fate Olifat took pity on them and he ordered Kalung (?Kulung...) to free them. But their unfriendliness did not remain without consequences. When the inhabitants of heaven distributed large quantities of coconuts as reward for the cutting of fronds, Olifat was not given anything because they did not know him; no one knew him except his father Lugeileng. And because they did not know him they made fun of him and laughed at him and when they were building a house and were digging holes for the supports they pushed him into one of these holes and drove a post in after him, because they wanted to kill him. But Olifat quickly changed into an ant and climbed up; he changed back to his

human figure and he sat down on one of the beams of the framework of the house. And the men recognized him. When Aluelap called him he went up to him and complained about the behavior of the men. And Olifat changed once more and he became air. The sister of Lugeileng (Lisarere) became pregnant and she bore a coconut, which was placed in front of the house Fadjamal. During a single night a palm tree grew from this nut and it began to show fruit which increased in number at an amazing rate. But Aluelap made the fruit taboo because they had descended from the sister of Lugeileng. When one of his brothers stole a nut, Lugeileng became angry and chased him out of heaven because he wanted to eat the eye of the gods* He came to Gadjau and went mad and tried to kill all the people whom Ligoubub had created by order of Aluelap. . . . He felled four palm trees and cut them up to make spears from their wood. But the chief observed everything from the great house and recognized his tricks. He put all his people on gabeibei, driftwood, and let it drift out to the open sea; and thus they reached Truk and later Poloat, etc.

It was this discord among the brothers that brought war into the world and especially

*See the story of the coconut eye. Taro, too, came to earth by theft; a spirit stole a tuber in heaven and ran away with it, but he fell and broke through the floor of heaven and dropped down to earth. He died from this serious fall but the taro fell into the swamp and grew.

4: Krämer--145-148 (1909) 1937 Woleaians-8
116, 173 Elato

to the volcanic islands where there is so much hostility. Lamotrek believes that he is descended from Gadjau.

4: Krämer--148-149 (1909) 1937 Woleaians
116, 173 Elato

On Elato one tells that Olifat introduced the fire, iáf, to the people and taught them how to cook. [149]

Concerning Lugeileng (cf. Ugélianged, the same word on Palau) it is to be reported from Elato that he is looked upon as the bringer of the canoe. His workmaster is Zelang ... who is thought of as the patron of the carpenters but who is not given recognition in heaven. Alúelap himself instructed him in all the details of canoe construction. The boat ends, the forked tail figurehead for that reason, are also called mónu (Hambruch) ... In connection with the construction of canoes the boat builder was mentioned.

4: Krämer--149 (1909) 1937 Woleaians-1-2
116, 502, 776 Lamotrek

On Lamotrek Zelang is called Sëlang and is considered the inventor of the figurehead, its shapes and is one of the five assistants of Lugeileng and the carpenters; the other four are:

2. Semälegóror, the guardian of the form, of the outrigger, the planks; he draws and marks the lines, speeds up the work. Perhaps he is identical with Semágor the brother of Morva Feis in story 2...
2a. Semadjek looks after the thwarts, the ebëp and fáraf and he helps with them.
3. Ligadjälap or Ligëdjilab, the painter, takes care of the paint (lap), the line and the cement.
4. Simalégodjuát the "turner," from godjúat "to turn over" does the first rough work on the tree trunk in the bush and he checks on how the wood can best be used.
5. Meseíseit improves the work of Sëlang with his fine eye (mes).

In addition, Hambruch mentions Alülemez who helps the men with the caulking so that the boat will prove water-tight. In general he is responsible for the safety of the canoe, protects it from breaking and helps with repairs.

Above all these ranks Lugeileng. He hovers over the place of construction and his people execute the work. His dwelling is Falesidj* in heaven.

*sidj is supposed to be the word for bamboo on Yap, but is not found in Müller's book on Yap.

4: Krämer--149 (1909) 1937 Woleaians-2
116, 502, 776 Lamotrek

For the voyage itself Paluelap is important because he is the "great pallu"; he is mentioned principally in connection with Pollat. According to Hambruch he married the woman Ilagaiidjor on that island and from her learned all about navigation and for that reason Pollap leads all other islands in that art.

4: Krämer--149-150 (1909) 1937 Woleaians-1-2
116, 776, 173 Elato

Hambruch was told on Elato that the following are children of Paliulăp and Ilisagŏrŭ:

Farouai (a boy)	he controls the weather and gives out warnings in case of bad weather
Alului (a boy)	see below
Rongerik (a boy)	he guides the canoes back home; see Pollap
Xaligi (a boy)	he takes care of the canoes and their construction on land
Rongelap (a boy)	he takes the canoes out to the open seas; [150]
Zemal (a girl)	
Mangear (a girl)	she is in charge of the food and sees to it that the dishes prepared for the drew of a canoe turn out well
Ilegafaz (a girl)	she takes care of the fire on board

It is said of Alulei* that under the name of Aluelap he is the navigator; on Pollap too he is the expert on canoes. In Muller 313 he is called Paloolop, or his father is known by that name. It is really of no importance whether Alului is the son of Paluelap or is Paluelap himself, because in navigation they are identical. He is best known as the god of the oracles.** Thus he is thought of as the god of navigation and has four eyes, two in

* On Oleai the word equals alu levei the spirit of the voyage...
**inopui or boe

front and two in back. . . Hambruch learned on Elato that Alului went out with the canoes on its voyages and safely guided it. His place, parang, is on the outrigger of every boat on which coconuts, begi, aromatic plants, etc. are placed before the start of any voyage. If the sea carries away the sacrificial offering, Alului is said to have called for them. He has a wife. His son is called Falus and he helps his father.

Lugeileng is also looked upon as the messenger of Aluelap. Hambruch learned on Elato that Lugeleng visited all islands and reported to Eluelap about their condition, about the inhabitants and their character, their behavior and their work; if they are industrious he helps them, but if they are lazy he sends them a typhoon. Zaulalu assists him in this work. Every day a report is made. Lugeleng gave the islanders the dance, and song, and medicine.

4: Kramer--150 (1909) 1937 Woleaians
116, 776 Lamotrek

On Lamotrek Audjal is considered the real ressenger of the gods, whereas on Elato the concept includes Ururulang.... One day Audjal was very angry at the human beings because they were not good. For that reason and as a punishment he changed the figures; in the past one had counted: 10 seg, 9 tiv, 8 val, 7 fis, 6 uōl, 5 lim, 4 fāng, 3 ēēl, 2 rū, 1 ëót so that one began with 10, which was the immediate return of work, now the counting begins with 1.

Urupo comments: originally their knowledge extended to the elbow but now it is limited to the tip of the fifth finger; but with every generation of white people it grows into infinity. God has given them four fingers, but to the Kanakas he has only given the fifth.

4: Krämer--150-151 (1909) 1937 Woleaians
116, 776 Lamotrek

Ururulang, the messenger...is the guard who walks up and down in front of the heavenly house of Fadjamal (Hambruch: Fatsumel). He hears and sees everything and reports all to Eluelap. No soul is admitted to heaven unless he has been judged by him. The good may settle in the house of Fadjamal but the evil are thrown into the waterhold bŏl ipĕs where they have to stay for ever. Every mortal has a thread of life, the idjor e melâu.* When a soul enters the heavens, Ururulang tells his people, Kula, that they should look at the [151] thread of life and see whether it is in order. If his men are able to disentangle it quickly the person is good but if it is a hard task and the thread remains entwined the person is bad. Oleiguso is the woman who cuts the thread, and Litafidjor (=woman hold straight the thread) the woman who turns it and keeps it in place and gives it to Eluelap. When a human being is born his "flesh" is on earth, but the thread of his life, his idjor e mĕlau is in heaven.

Hambruch also heard the name Yongelaf mentioned and his story was the same as on Faraulip; above he has been mentioned in connection with Yap. He was also told about Nigereger, the dweller on earth, who one day quarreled with the moon; the latter finally said: "Nigĕregĕr you shall die; if I myself die I shall be alive tomorrow, but you die once and for all."

*mellau, life.

4: Krämer--151 (1909) 1937 Woleaians 1-3
116, 775 Elato

Hambruch learned on Elato that the souls ascend to heaven by a ladder which stands in the west where heaven and earth touch.

Punishment of humans is controlled by the three brothers Elúelap, Zaulal, and Zauaur ...and depends on the degree of evil.

In Bolipes, the place of the damned, no one needs to guard the souls. Ururulang and his assistants take them there. Underneath the sleeping mat of Elúelap there is a hole in the celestial building of Fádjamal and through it they slide down into the realm of Zaulal.

4: Krämer--151 (1909) 1937 Woleaians
116, 789 Elato

On Elato I noticed a fan, gáliba, in the yard of a building complex which was there for the sake of magic, kuet....

Magic, bolebol, and the Oracle

(cf. photos 2, 4, 10, 12 and color plate 3) [VMM: see source].

In the main there is no difference in this field as compared with the other islands. In the houses (e.g., Sopo's house) hanging altars are found; the beautiful altar from Udot on Truk is said to have come from Lamotrek.

A novel feature is the gobai rod with eyes. The sorcerer, vãk, (Fig. 70 and 71) usually has a house (im bólebol), in which he prepares his medicines and which generally is located near the hut of the sick. Some of the magic songs have been rendered in the section on medicine and canoe construction and in other places numerous references have been made to magic activities, because they play an important part all through life."

4: Krämer--151-152 (1909) 1937 Woleaians
116, 789, 821 Lamotrek

Some songs have been given...magic songs of rain: If there is too much rain and it is to be ended, conjuration is done by an address, by the Triton's horn, taui, and [152] by means of a rain switch made of the coral plant kaini lidal; it is handled by a professional conjuror. As the magic song is chanted, the switch with the horn is swung in the direction of the clouds, after the horn has first been sounded with all possible strength. alis ali touber is the magic song for the purification of the house of Ikelur (house 3); no one must be present while this magic is made with the exception of Faragau (house 1), because Ikelur is afraid that he will have to die otherwise.

4: Krämer--152-153 (1909) 1937 Woleaians
116, 783 Lamotrek

The alus Roiang... was sent out by Aluelap to request that the houses were to be cleaned and all signs of blood and birth stains were to be removed. [153] [ER: The words of a magic song are given in the original text, but are omitted here.]

4: Krämer--154 (1909) 1937 Woleaians
116, 754 Lamotrek

Dress: The sorcerer has a red cross* painted on his forehead and its vertical line reaches down to the root of his nose; in addition he appears with one red line each from the tip of the shoulder to the arm-pit** and a vertical line from the lower end of the breast-bone approximately to the navel. On his head he wears a wreath of coconut pinnae (see lower left, metalöris) with two rings in front, the metal alus, the "eyes of the spirit"*** (Figure 73 [VMM: see source]) or gobai 1 touber. On Figure 70 [VMM: see source] Ikelur holds it in both hands; many young coconut pinnae hang down from the wand. When a sick person is treated with the gobai, the sorcerer first takes the stick and describes a circle around the face, and then two circles around the tip of the nose, the left shoulder, the right shoulder, the right shoulder, the left shoulder, the navel and the hair and finally the wand is driven into the ground in back of the sick person.

*The cross that plays a part in the song of the stomach ache...see Figure 78 [VMM: of source].
**The forol-lines
***Actually four eyes are supposed to constitute a whorl.

4: Krämer--154-155 (1909) 1937 Woleaians-1-1
116, 789 Lamotrek

Here we can give a summary description of the setup for the practice of magic. For garangap fishing, canoe construction, house purification, storm magic and medical treatment young coconut pinnae, uvudj or ubudj are used. Hellwig has some specimens.

a. Double knots (knots, djedjabedda), held with both hands horizontally by both knots; when the two hands approach one another the double leaf splits; a quick return movement of the hands makes the leaves beat against each other and produces a clapping sound. By this sound the magic formula is accentuated in some places and the song is given rhythm which is of some importance, for instance, when a group of people led by the sorcerer, vak, move along the beach. Thus the double (see Figure 74) [VMM: see source] is used like a sled whip; it is called ubudj vai vei or vei vei l'ubudj and was shown to me mainly in connection with the canoe construction song. In contrast to the mentioned metál* alus it does not have to be put on.
b. Four switches with coconut pinnae, owúte asse (ubudj) are used by the conjuror to drive illness from the island. [155]
c. Two headbands or armbands , ōwute matalál, with one bow metaloris (see metál alus).

* "His eye," alus, demon.

d. Headdress of split coconut pinnae.

e. Two headbands, marre marre ōwúte metalóris. Two bows are on the forehead, and the ends are either tied together at the back of the head or are fastened with a comb (see above metálálus Figure 73)[VMM: see source].

Needles used to fasten the decorative pinnae are made of the ribs of pinnae and are known as loy, sivel. Hellwig discovered a complete outfit of a conjuror hanging from a tree on the beach in the northwest of the island, near a hut in an otherwise lonely region; the inhabitants of the little hut did not object to the removal of the set-up. The magic was directed against Truk from where the illness, mass, was said to come.

4: Krämer--155-157 (1909) 1937 Woleaians-1-2
116, 789, 821 Lamotrek

The Wands of Storm Magic, gosilifei

The spirit Roiang...learned about storm magic from the spirit Tipoeo, who in turn had been told about it by Aluelap. Storm magic was vigorously practiced at the time of the visit of the expedition. We could see that from the objects publicly displayed on the beach of Lamotrek which are shown on photo 4d [VMM: see source]. The drawing of Figure 76 [VMM: see source] even more distinctly shows this arrangement on the beach. One observes that a Triton's horn is hung up with it and that a sacrificial offering is attached to the top. Another specimen, given to me by Ikelur, is in the Linden Museum in Stuttgart no. 77830 (see photo 7) [VMM: see source] and many coconut pinnae are tied to it. [156]

...the Central Carolinian sorcerers, the vak, fight the storm with ray spines on their wands which are greatly feared in combat and are considered one with the god Saulal....

The wood represents the god Aluelap and the cement unites the two. The stings, sometimes, are turned against the conjuror himself when he tries to force the realization of the wish. The janus head represents Paluelap and Aluluei...who are supposed to look out to all sides. Accordingly at the very beginning of a voyage when the mast is planted, one makes the fore alus for Aluluei....it has been said that he appears to be one with Aluelap or Paluelap. Therefore the janus head is supposed to represent Aluluei and has two eyes in front and two in back....Such magic figures are attached to canoes or set up on land (see idols on Figure 77, 78). [VMM: see source] [157]

4: Krämer--155-157 (1909) 1937 Woleaians -2
116, 789, 821 Lamotrek

The latter are dedicated to Ligóubub. . . and are called ëpil alu; ëpil has the meaning of lower, e.g., the root of a tree or the bottom of a bowl. The root of the plant ëlau is scraped; the scrapings are put into coconut juice and the liquid is drunk against illness or wind. They are kept inside of houses, but otherwise are identical with the others mentioned. The kuling. . . is said to have given directions for the magic figures. The meaning of the ray spines, ohét, remains unknown.

4: Krämer--159 (1909) 1937 Woleaians
116, 345 Lamotrek

No details could be learned about oracles by lot, nor was anything known about the 16 demons; nevertheless the setting of part of story 75 in Müller, Yap, II, page 616 is on Lamotrek. The entire mythology is discussed in connection with Feis and seems to be peculiar to the Western Carolines, since no mention of it is made east of Feis.

In Cantova, page 311, reference is made to the prophetic knots used on the Western Carolines.

4: Krämer--175 (1909) 1937 Woleaians 1-3
116, 531 Lamotrek

No special attention is given to art. But the canoe-house, dwellings, mats and looms of Lamotrek are the most beautifully ornamented of all. Also tattoo patterns and bamboo boxes show a variety of designs; the most important are represented below.

The chart of the following designs is taken mainly from tattooing, but some of them are patterns of chip carving....[VMM: For designs see source.]

4: Krämer--175 (1909) 1937 Woleaians
116, 533 Lamotrek

Music

No details are known about it.
Hellwig collected a flute, a tigetig, made of Yap bamboo, sit.

4: Krämer--175 (1909) 1937 Wolesians
116, 532 Lamotrek

Of the sculptured woodwork only the birds shall be mentioned here; one of them hangs from the eaves of the canoe-house (color photograph 2). [VMM: see source]. The chest with its figures (Figure 31) [VMM: see source] is foreign work, as has been indicated above.

4: Krämer--183

Woleai

OLEAÍ

(Map 4) [VMM: See 4: Krämer 184]

Position: halfway between Lat. 7° 21' N. and Long. 143° 55' E.

Exact position: northern tip of Raur, Lat. 7° 21' 39" N. and Long. 143° 57' 30" E.

Südsee-Handbuch, page 36: The Oleaí Islands (Oleai, Uleai, Wolea, Ulie, Anangai) are located approximately 130 nautical miles west of the Elato Islands. The group comprises two atolls which surround a western and an eastern lagoon. The former is larger, but the bigger islands are grouped around the eastern lagoon. The main island of Flalap, located on the northern side of the eastern lagoon, gradually is connected with the island of Marijong (Mariom) by means of a sand dune which follows in the west; this same sort of bridge exists also with Paliau located to the southeast, which in turn is linked to Raur in the south. The group is formed of 19 islands--some of them large and some of them small--only the eight largest are inhabited, whereas the others exhibit a luxuriant growth of coconut palms and tall breadfruit trees. The names of the inhabited islands are Raur, Flalap (Oleái), Marijong, Tagaulap, Saliap, Utagal and Falalis.

These Woleai islands are arranged in the form of two semi-circles, which intersect at the island of Tagaulap; they are grouped in such a manner than an Arabic "3" is formed by them. The opening of this 3 is to the south. This large entrance in the reef exposes the lagoon freely to the southwestern monsoon and when it blows, the waves run high into the port. The latter, in addition, has many reef banks. One of the most dangerous shoals is found northeast of the island of Motegosu (Motagu) and .7 nautical miles west of Paliau. In case of violent winds of the type that often prevails at the time of the northeastern monsoon, the sea is very rough, and has breakers coming from all sides and meeting in a roaring confusion.

116, 361 Woleai

The dwellings of the natives are located on the sides of the islands facing the interior lagoon. They extend along the entire strip of sandy beach and there are no obvious boundaries between the various villages.

Entrances to the Oleai group are the North Channel between Jalangifereil and Fareiles, the West Channel, and the Raur Channel east of Motegosu; the latter has an approximate width of 1/2 nautical miles and in the middle has a depth of 16 to 46 meters. An entrance that is practicable for canoes and boats is found between Tagaulap and Marijong. Next to it, in the direction of Tagaulap high breakers are found even when the breeze is slight. The surf is strongest almost exactly at the vertex of the semi-circles and at the time of the northeastern monsoon.

In 1904 the population of the Woleai group numbered 661. The main reason given for a lowering of the population figure is dysentery, due to the consumption of sour toddy, and elephantiasis and paralysis. The serious typhoon of March 28, 1907 devastated the eastern islands of the group and took the lives of 200 people. It is probable that the population has decreased and now is little more than 450.

4: Krämer--185 (1909) 1937 Woleaians

Tagaulap. About fifteen to twenty years ago at the time of the southwestern monsoon a tidal wave tore away the entire southern end of the island of Tagaulap with all its houses, coconut palms and breadfruit trees but without the loss of human life. Today the tip of the island is completely covered by sand and only the bare skeletons of dead trees rise above the dry sand. [186]

During the typhoon at the end of March 1907 Raur was destroyed by a tidal wave. No more than two people escaped this catastrophe. The former island at the present time is a reef covered with a sandbank. During the typhoon, the government schooner "Ponape" happened to lie at anchor south of Flalap. When the winds were northeasterly to westnortheasterly she lost both her anchors and with the tidal wave that had destroyed Raur, she was carried southwest across the reefs and out to sea.

Pacific Islands Pilot, page 501: The Woleai or Anangai Islands are located approximately 60 miles northeast of the Eauripik Islands. The southern side of the atoll is largely submerged and is divided into two lagoons by means of a series of reefs extending southeastward from the island of Tagaulap (Lat. 7° 22' N. and Long. [ER: original text reads Lat.] 143° 53' E). The western lagoon of the Woleai Islands is wide and in general deep although it has scattered shoals. The entrance to it is shallow and large ships cannot pass through it. Both lagoons are open to the south and fully exposed to the heavy seas caused by the southwest monsoon. A sandy cay [sic] is located on the reef on the southern side of the atoll approximately 1 1/2 miles from Tagaulap.

Two white houses are visible on the southwestern beach of Woleai, the northernmost of the islands of the group, but they cannot be seen distinctly. Two wooden landing bridges are found in the center of the southern side of the island of Marion approximately 4 cable lengths west of Woleai; the northern pier is weak. There is another pier at the southernmost tip of the island. In 1930 the population of the group numbered 539 persons.

4: Krämer--186 (1909) 1937 Woleaians
116, 262 Woleai

A few chickens are available [VMM: on the Woleai Islands]; fish is abundant. Breadfruit, taro, bananas, etc., grow on the islands.

Entrances. The Raur Channel leads into the southern part of the eastern lagoon. It is approximately 2 1/4 cable lengths in width, as it runs between reefs extending southwest of the southern end of Raur and surrounding the island of Motogozu. It has depths from 10-25 fathoms (18.3-45.7 meters) in the fairway, but there might be less water in the approach. The western channel at the southwestern side of the west lagoon just southeast of the island of Falulap and in the center has a rock with a depth of 3 1/2 fathoms (6.4 meters) of water. The North Channel at the northeastern side of the west lagoon between the islands of Farailes and Jalangigereil, --southeast of the latter--is approximately one cable length wide between the reefs that extend on both sides and has depths of from three to seven fathoms (5.5-12.8 meters).

There is one additional entrance between the reefs extending from the eastern end of Tagaulap and the southern end of Mariaon, but it is narrow and the tidal currents in it are strong so that it [187] is practicable only for small boats (Marion Entrance).

Shoals: there are many in the western lagoon and they have been chartered. In the east lagoon there is a series of shoals with depths from 1-6 fathoms (1.8-11 meters) located about 8 cable lengths southeast of Mariaon Island. A rock with a depth of 2 fathoms (3.7 meters) is located approximately 2 3/4 cable lengths southwest of the southwesternmost end of the banks and another one, with a depth of two fathoms, is found 3 1/4 cable lengths north of the southern end of Raur.

Anchorages. Large ships may drop anchor in the eastern lagoon in depths of from

fifteen to twenty fathoms (27.4-36.6 meters); here fine sand and good protection are found approximately 4 1/2 cable lengths west of the northern part of Raur.

Small boats can drop anchor at the time of the southwest monsoon opposite to the southeastern side of Mariaon and also opposite to the northern side of the island of Tagaulap (Lat. 7° 22' N. and Long. 143° 53' E.).

In this connection compare map 772 [VMM: see 4: Krämer 184]

This map, as compared with the earlier ones... the Russian and the German ones which, in general, are in agreement gives the results of better soundings, especially of the western lagoon and its northern part. It also shows the extent of the southern barrier of the reef which hitherto had not been determined. The Russian line of soundings from Tagaulap south-south-westward, east-northeast of Falalis, the southernmost of the islands, had indicated the barrier, because here the depth of the lagoon had decreased to about 10 meters from an approximate depth of 40 meters. The new English map no. 772 shows a formation about 2 kilometers in length trending ENE from Falalis; between its eastern submarine end and the isolated sandy cay [sic] reef, there is a depression which I call Falalis Channel; the depth of this channel is 5.3-16 fathoms (9.5-31 meters).

Another new feature of the map is the sandy cay [sic] reef mentioned (on the German map it is indicated only superficially) on which a sandy islet is found straight south of

the western tip of Tagaulap and at a distance of 2 1/2 kilometers from it; the same is true of the isolated reef that follows in an easterly direction and on which the island of Motogosu is located. Between the two there is an entrance with a depth of approximately 7 fathoms(13 meters) which I call the Middle Channel; through it large ships can sail into the west and east lagoon, or better said, they could if the margins of the various reefs were marked by beacons. Hitherto the above-mentioned Raur Channel has been used for entrance into the east lagoon; our expedition ship went through it, since it and the east lagoon have been sounded with all necessary accuracy. [188] This is the location of the largest and most important island of the Oleai group which has given the name to it. The west lagoon is two or three times the size of the east lagoon and is less narrowed by shoals. The middle basin has a depth of 20-27 fathoms (36.5-49.5 meters); sandbanks are confined to the margins: there are two in the southeast (near the sand cay [sic] reef) which have a depth of 4.1 fathoms (7.5 meters), one in the northeast with a depth of 5.3 fathoms (9.5 meters) and a few smaller ones also in the northeast and southeast. It is noteworthy that no mention is made of the destruction of Raur... and the map has Raur and Paliau charted according to their appearance before 1907.

Bearings: in the south of Raur and about one nautical mile off the island, 216 fathoms (389 meters); at the same distance from Motogosu approximately 2 kilometers to the south 347 fathoms (625 meters): about 400 meters in front of the exit from the West Channel 168 fathoms (300 meters), whereas 500 meters to the south of that location the depth is no more than 20 fathoms. (36 meters).

4: Krämer--188-189 (1909) 1937 Woleaians

James Wilson: [VMM: who discovered Oleai in 1797 said]

"At a distance of one mile we sounded the two ends in NW 1/2 W to W to N 1/2 E from which we were able to arrive at an estimate of their extent. The latitude of their southern part is 7° 16' and 144° 30' E..."

4: Krämer--189-193 (1909) 1937 Woleaians -1-7
116, 175 Woleai

The Spanish apparently had not sighted the atolls of Lamotrek and Oleai before 1700; the first was James Wilson who sailed in these waters in 1797 on the "Duff"... Even though Oleai was sighted at this late date, the white people on Guam had learned earlier of the existence of various groups of atolls in the Central Carolines. In 1722 Cantova collected information about Ulea and Lamotrek on Guam, and it is published in his letters (see Kozebue Entdeckungsreise... page 85)

Here we give the continuation of the story of the island of Lamotrek which, like Oleai, was truly discovered by James Wilson:

"At a distance of one mile we sounded the two ends in NW 1/2 W to W to N 1/2 E from which we were able to arrive at an estimate of their extent. The latitude of their southern part is 7° 16' and 144° 30' E. At first about 60 canoes came towards us, and later our crew counted 150 sighted. Since each one of them was manned by seven persons on the average, that would give us a total of 1050. If we add to that figure one half that number who were left behind ashore and twice that number to account for the women and children then the population of this group alone amounts to 3150 heads. To judge from the appearance of the islands, so large a group must often be subject to severe famine. For the first time we saw native women of this island region, and about one dozen of them sailed towards us in three canoes; two of these canoes were accompanied by men but the third was filled with women exclusively. They remained on the weatherside for a considerable length of time while the men seemed to watch them zealously. When they

noticed that we did not seem to pay them a great deal of attention, they were allowed to approach within a few yards of our ship. They looked us and the ship over with apparent pleasure. Some of them had pretty faces and had neither thick lips nor broad faces although they were inclined towards both. Their hair is black and long. The color of their skin is somewhat different from that of the men in that a sickish looking whiteness[190] is mixed with a natural olive color. Since we saw them almost nude their greatest credit and most important impression was the modesty of their behaviour. Most of the men were nude as were the women, whereas some wore a decorative belt around their bodies, near the navel; these belts are about one inch in width and composed of pieces of black and white shells which are perforated and strung in the manner of beads. Some of the natives wore a wide, brimmed, conical hat, somewhat reminiscent of the hats of the Chinese. The islands seemed alike in every respect not allowing one any advantage except perhaps the possibility of greater luxuries afforded through their neighbors; and perhaps more extensive shoals and calm waters offer a protection and a shelter for fish before the storm. It is possible that here they find more natural aid than on the deserted islands. But to judge from their trade goods they had the same possessions. Their goods included coconut fiber rope, of which we were able to buy thirty fathoms for a six-inch long piece of an old iron wheel. This rope of the islanders is generally one inch thick and in quality equals our hempen rope or is superior to it. At no time did the

natives make any secret out of their great desire for iron and we might have filled our ship with ropes for almost the price mentioned if we had spent a few hours near the island. We would indeed have taken the time for it if we had known--as we discovered later on--that they often bring a good price in China. The fishing utensils of the islanders are little different from those we had seen on the eastern islands. But their mats were striking with their fine weave and were made in the form of Spanish sashes with a fantastic border at both ends and with black threads worked into the material. The natural color of these sashes is white but many of them are dyed a beautiful yellow with the color substance of the curcuma. It is impossible to see these exquisitely made sashes and the primitive people who made them without wondering how they have arrived at the practice of this art. It is not impossible that they have been instructed by Jesuit missionaries, for two of them were sent out to the island group in 1710 by the Spanish government in Manila; but the ship that was to take them to their destination was cast adrift by the currents, and the Jesuits were shipwrecked. Later another group was sent which continued its efforts for some years until its members had become convinced of the general poverty prevailing on the islands and had come to the conclusion that they could not be of any use to the Spanish Kingdom. Thus they left the islands, and since that time (around 1720) they have been completely neglected. These happenings make it so much more remarkable that this useful art has been maintained for this length of time. Since it reflects the merit of the original teachers and wins them praise, it has been an

inspiration to our missionaries who [191] try everything in their power to introduce the mechanical arts and who have not failed completely in their efforts,*

Turtles are included amont the things of their subsistence, since we were able to buy one--weighing about 20 pounds--for a piece of iron about 2 meters long.

They handle their boats with great skill and sail without fear from island to island. From this fact we concluded that hostilities and wars are rare and that free movement would thus be possible; this idea is substantiated by the lack of weapons of the islanders, who have none, with the exception of a sling. Their language is different from all we had heard hitherto; with the exception of a few words such as lulu (iron), capitaine, etc. we could understand little of what they were saying....

After having passed these thirteen islands, which undoubtedly comprise the group of Oleai, Wilson did not sight any other small islands, and continued in a straight course towards Palau...

After the discovery of the island group by Wilson, it was Don Luis de Torres--as far as we know.... who was the first to visit Oleai and to give us more detailed information about it. Kotzebue, III, page 93, reports that in 1804 the ship "Maria" of Boston--Captain of the ship Samuel W. Bell, Supercargo Thomas Bormann--sailed from Guajan on a

*This latter assumption is, of course, erroneous.

voyage of discovery and to look for trepang on the Caroline Islands. Don Luis de Torres was on board because he wanted to see the islanders who had drifted to Guam (S. Luito) and to whom he had taken a liking. He wanted to do them some favors, and was eager to know why they had not come to Guajan for a visit, and wanted to induce them to return to that island. According to the diary of Don Luis, the following were determined on the voyage: a shoal of 24 fathoms at Lat. 8° 20' N and Long.* 149° E, the wild island of Piguelao, according to Kadu, [192]called Bigelle at 8° 6' and 147° 17'** and the sandbank of Oraitilipu with a depth of 12 fathoms at the same latitude***; besides there was the uninhabited island of Fallao which according to Torres is called Fahueu, (Cahtova: Fayo) and which is located at 8° 5' and 146° 45'****; Farruelap*****(Torres: Fatoilep)

*According to map 97, the Gray Feather Bank with a depth of 9 meters is located at 8° 10' and 148° 43' and the Hitchfield Bank with 20 meters of water at 7° 50' and 149° 40', and there are no other sandbanks in the region.

**Map 97 has Pidelot at 8° 9' and 147° 42'.

***On map 97 a bank by this name is charted at 8° 6' and 147° 15' with a question mark and a depth of 22 meters.

****The so-called West Faiĕu; East Faiĕu. . . and in Namoin. The meaning of the name is "Stone one", stone, fau and on Lamotrek: fai and from that Fais has derived its name with the meaning of "rocky." Map 97, 8° 5' and 146° 52'.

*****Map 97: Faraulip

is at 8° 3' and 144° 30' and Guliai (Torres: Ulee; Cantova: Ulea, Kadu: Olx) is at 7° and 144°.

For his map, see Kotzebue Entdeckungsreise... Vol. III, page 85.

One English passenger of the Maris, De Luis Juan, remained on Oleai. Kadu said that he knew him by the name of Lisol and that he had a wife and child. He is said to have died on the island. Don Luis left cattle and pigs, but since his time they have become extinct again.

Torres has become very well known through A, V. Chamisso, who reports so much on Ulea, although his ship, the "Ruruik" under captain v. Kotzebue, did not visit the atoll. He received a great deal of information from Don Luis de Torres and especially from Kadu, about whom he writes as follows....:

"At the beginning of 1817, we had come to know and made friends with the islanders of the group of Otidia and Kaben of the island chain of Radack in the extreme east of this province and we had come to recognize the natives as very likeable people. When we sailed to Aur later, islands of the same group, the natives came towards us in their canoes and climbed aboard as soon as we had dropped anchor; among them was a man who in many ways was distinguished from the rest of the islanders. His tattooing was not of the regular patterns of the Radack natives, but indistinct figures of fishes and birds could be seen singly and in rows around his knees and on his arms and shoulders.

He was of a stouter build and lighter color then the others and his hair was more curly. He addressed us in a language which sounded different to us from that of Radack, and completely unfamiliar, and we immediately tried in vain to talk to him of the Sandwich Islands. He made it understood that he was inclined to stay on our ship and to accompany us on our future voyages. His request was willingly accepted... Kadu is a native of the island group of Ulea south of Guajan; although he was not of noble birth he was a confident of his king Toua, who had him execute his wishes and orders on other islands; accordingly on former voyages he had come to know the chain of islands which had contact with Ulea and westward knew the region as far as Pelew and eastward as far as Setoan."....

The next and most important visitor of Oleai was Lütke, who came to the island in 1828.....He arrived at Namourrek on March 25 and made [193] a rapid survey which later formed the basis for the map of the Reichsmarineamt, tells that early in the morning of the 26th, several canoes sailed towards the ship and that the crews of the boats were distinguished by an outstandingly elegant system of tattooing which covered their entire body with the exception of the head. They did not bring us any fish, but instead asked us for food. Whatever we gave them they devoured greedily so that we came to the conclusion that there was a famine on land; according to Floyd [AN: an Englishman who had stayed on Murilo for 18 months] there is indeed a severe shortage of food on the coral islands almost every year in the fall, and it lasts for a month or two. During that

time, the natives live almost exclusively on breadfruit dough (Krämer: mar). Some of the natives of the island sailed with us to Elato where they went ashore by canoe. Lively traffic is maintained with Guaham (Guam) and it is said that Spanich ships often call at the island in their search for trepang. In Guam Lütke met chief Orolitau of Elato whom the governor had put in control of trade in the Marianas. I learned a great deal from him about the Caroline Islands. He is said to have had three wives: Letaururu, Laguol, and Lamoarup; his assistants Sepa named Mairuk and Mesauro, and another assistant, Orotak, one wife: Namoarimet, Lütke did not find an entrance on the west side of the island group. Kittlitz observed shrubs of scaevola on land.

By March 28, Lütke had reached a position off Faroilap where he met a tamol who spoke Spanish fluently and who called himself Alberto, probably due to a former stay in the Marianas. On this island, too, a shortage of food was obvious. During the following days, April 1, Olimarao was sighted after some search and was charted. A canoe with three men approached the ship and one of the crew was very hungry. On April 3, Lütke reached Ifaluk and that same evening he sighted Uleai, with whith the crew of the Rurik had become familiar through the talk of Kadu. But in spite of repeated questions none knew the name of Kadu, which Chamisso spelled without the accent. Thus it was a name which was either assumed later on or was mispronounced. On April 4 it was possible to drop anchor in the east lagoon. Here fish in large quantities were offered for sale. The

islands in the east were called Ra-ur and Palliau and the northernmost Ulea or Uleai, and they were grouped in the form of a triangle with bent sides. The island of Marion was located on the north side of the bank and between it and Ulea a reef was half hidden in the water. It resembled the reef between Eunoar* and Lukunor, which is longer, however. The channels in the east, e.g., between Raur and Palaiu are shallow enough to allow wading across.

*It must be Piafa, although the latter, according to the German map, is at a distance of 1570 meters from Lukunor, whereas Mariong is no more than 470 meters from Oleai.

116, 136 Woleai

...[VMM: there were] large numbers of white sea swallows, Gygis candida, flying around the trees; their squalling, alluring calls could always be heard in their flight. Strepsilas collaris is among the common beach-birds and the curlew, Numenius tenuirostris, is seen one at a time occasionally. In the bush, Sylvia syrinx and the Lamprothornis of Lukunor are found which are distinguished from a similar species of Kusae by a sulphur yellowish white [194] body with black longitudinal lines. There are no chickens and no pigeons and no pteropidae. Once a cuckoo was heard.

4: Krämer--194 (1909) 1937 Woleaians
116, 136 Woleai 1-5

Kittlitz received the following species of fish: the striking red serranus species (Serranus punctulatus and urodelus) and a new myripristic species with white marginal lines on the front and rear fin, and a new Genus Odax (Axodon Cuvier) with big shovel-like incisors which protruded strongly.

The purplish Julis Gaymardi occurred in single specimens; the golden yellow Julis with light green abdomen and a half-crescent-shaped tail fin, Helichoeres, Labrus, Sparus insidiator and zonephorus, Labrus fasciatus, Scarus ocillatus, Grammistes puntatus, the dark-brown Acanthuru pyroferus (armed) etc., rounded out the colorful picture.

116 Woleai

[VMM: When Lütke was in the Woleai Islands] the situation in respect to supplies was better on Lukunor where the population on the whole was more friendly, a fact which is probably to be explained by their greater seclusion. The houses, in their construction and interior arrangement, are the same as on the other island, but those on Oleai are more solid and cleaner. The planks and boards used often were of amazingly large size and the latter are made from skillfully exploited tree stumps of breadfruit trees.

The call of farak* requested the women to disappear and indeed they were not visible to the strangers. They stayed in their small houses which are usually tightly closed. It was not until the fourth day that the men called them out in order that they might receive their gifts of jewelry; when this solemn moment was over, the call of farak was heard again. On April 8, a canoe filled with women approached the ship but they only cruised around and did not try to come on board. The women wore a woven garment (mats) and the girls wore a narrow belt of fresh foliage.

In the western part of the atoll Ulemarai and Seliap and other small islands are located. Ulemarai was the home island of Kadu; he himself... was not known there, but his king Toúa** was still alive and came on board the ship in spite of his age.

*Fritz: fáreg, march; and thus the meaning is "go away!"
**Torres said Roua and also Ruch instead of Tuch (Truk)

4: Krämer--194 (1909) 1937 Woleaians

The natives are very skillful divers. A 15 year old boy was able to catch anything that was thrown into the water by diving. As long as he was shown the object before it was thrown, he managed to catch it.

4: Krämer--194 (1909) 1937 Woleaians

116, 502 Woleai

L. H. Gulik in the Nautical Magazine of 1862 speaks of Wolea--Ulie: he says that in 1788 a native had sailed to Guam, a distance of 600 nautical miles, and that the canoe had arrived safely.

L. H. Gulik mentions a population of 600.

4: Krämer--194-196 (1909) 1937 Woleaians-1-4
116, 175 Woleai

Captain Lütke bought a complete sailing vessel from Tapeligar, the head chief of the island of Ulea and paid no more than three axes for it.

On April 9 Lütke's ship set sail again and moved westward along the southern side of the reef barrier in order to survey the area. The limited land area on the leeside was striking. The reef itself was submerged and its location could only be recognized by the greenish color of the water. [195]

The voyage was contined to Eurupyk.

Andrew Cheyne visited the group of Ullieye in September 1844. He speaks of 13 islands nine of them inhabited by a total of 1500 natives. He reports that trade is carried on with the surrounding islands and Guam. The islanders are clever and treacherous and have weapons such as clubs, slings, and stones.

The schooner "Rupak" under the command of Captain Gall...according to Robertson, visited Ulleai on March 25, 1875. Gall met a trader by the name of Williams who reported that a short time ago a Spanish vessel had called at the island, and that the crew had felled almost all the breadfruit trees and that famine had been the consequence; 5-6 people died of starvation every single day. He said the English flag had been torn down and the Spanish hoisted in its stead, but that the Englishmen had exchanged them once more, immediately after the Spanish had continued on their voyage.

L. H. Gulik in the Nautical Magazine of 1862 speaks of Wolea--Ulie: he says that in 1788 a native had sailed to Guam, a distance of 600 nautical miles, and that the canoe

had arrived safely.

L. H. Gulik mentions a population of 600. In 1807 the head chief had visited Saipan (Seypan) and had been received so hospitably that consequently an entire colony of islanders had settled on Saipan; once a year they sailed back to their native land. They take care of the trade with the Spanish in a region which included Truk. Their language is different from that spoken on Eap and Truk.

Alfred Tetens. . . must have visited Oleai several times on his ship Vesta between 1865-68, as most of the commercial schooners did. He mentions a few interesting factors in his little booklet:

The inhabitants of the Uliei Islands are more peaceful than the natives of other groups; the men are handsome and of muscular physique and their entire body is tattooed in a very tasteful fashion. Their ears and necks exhibit all kinds of ornaments and their "woolly" hair is decorated by a bunch of tall feathers. Many of the young women and girls are very beautiful, but their appearance is impaired by ugly tattooing on the chest, mostly fish and bird heads.

On the occasion of the visit of King Jogelock, the latter showed very good manners, but the curiosity of the women around him proved bothersome. The Uliei natives have a reputation of being the experts of navigation in the Carolines; they visit, for instance, the Marianas.

The fresh water available on the island is bad and cannot be drunk; the juice of coconuts and palm-wine must serve as substitutes.

The dress of the natives resembles that of the islanders on Mokemok; their houses are built with some imagination and are clean. The natives seem well suited to become influenced by European culture. [196]

Nothing is known of the visit of Spanish ships.

S. M. S. "Albatross" called at Uleai (Kubary's designation) on September 30, 1885, anchor was dropped off Raur, where money was asked for every sip of brackish water.

During the German Colonial period ships called fairly frequently at Oleai and the "Germania" cruised through the island region once every four months.

Government ships and copra schooners also entered the lagoon. The district official on Yap. . . visited Oleai in November, 1905. He said that at that time the palms were growing normally and that the rat plague was moderate; the same was true of the consumption of toddy. But the death of a trader has aroused suspicion, and the testimony of witnesses finally revealed that he had been strangled and killed by blows of a hammer; the murderer was a Sonserol native who in the meantime had gone west. For that reason, a policeman was left behind on Oleai. It is said that all traders were killed in 1902.

Of importance for the island group were two visits of the government physician Dr. Born, who went there in 1903 and 1907. He reports on the first trip in the Mitteilungen aus den deutschen Schutzgebieten 1904 (page 175-191) in which he gives special attention

to ethnography. The second visit was of special significance because Born was on the island at the time of the Good Friday typhoon of 1907 and we thus have an accurate account of such a violent storm on one of the coral islands; he reports on it in the Kolonialblatt of 1907 and we reprint excerpts [VMM: see 4: Krämer 196 ff.]

Typhoon 1907 in the Western Carolines
The devastation of the Oleai island group (with map)*

On March 27 the government schooner "Ponape" returned to Oleai from a voyage to Ifaluk... The weather had been fine for weeks; but now winds with thunder squalls arose so that the distance of 35 nautical miles took 42 hours. The difficult entrance to Ifaluk was successful; previously the ships dropped anchor outside the lagoon in 9-16 fathoms of water. The return voyage took 5 1/2 hours. (On March 27). The voyage to Yap was to be continued on the following day. In order to give medical attention to the islanders, some passengers of the ship went ashore in the afternoon. The evening was calm and the moon shone brightly and splendidly (one day before the full moon). Early on the 28th of March several strong thunderstorms came from the east and north and strong rain squalls were interrupted by calms. Striking was the current from east and south which became steadily stronger. Early in the morning many frigate birds could be observed above the atoll flying about aimlessly although normally they are seldom seen around the land. At noon, in the lagoon, high breakers hit the sandy beach. The barometer took a dive and the "Ponape" remained in port, because the captain thought it would be better if the ship were to await the threatening typhoon in the inland water. Born was

*The illustrations that go with it are found in Krämer 1927: Die Entstehung und Besiedlung der Koralleninseln, photograph IV.

asked to stay on board but he could no longer manage to take his luggage through [197] the strong surf. At 2:30 in the afternoon the waves around the outer reef and the lagoon were extraordinarily high; the "Ponape" chose another anchorage. As Born was trying to go ashore there arose a sudden squall from NNE so that the canoe was flooded. Born had great trouble trying to reach the beach; his house on the island had been abandoned by that time, because high waves had passed over the sand dunes 80-1000 meters long and had advanced to the house. Within the next two hours and a half this dune on the eastern tip (SE) was washed away completely so that a wide passage (previously narrow) resulted between the main island of Flalap and Paliau; through it high waters poured into the lagoon where they met with the breakers from the SW, so that water surged up to amazing heights.

At five o'clock the waves became high again, after the wind had calmed for some time, and Born had been able to reach the house; he was sitting on the porch when the water reached him there and carried him several paces away...

At 5:15 Born sent a note to the captain of the "Ponape" with the advice,... of changing the anchorage of the ship once more and moving it to a more protected position at the NW tip of the island near the island of Ifang. The answer he received was that the barometer was steady and that the wind was expected to die down but that the waves would run even higher than before.

Shortly before 6 o'clock Born was forced to leave the station; the buildings had already collapsed. He retired to the neighboring village of Leuleperik where he took up quarters in a new native house approximately 800-1000 meters from the northeast shore.

Late in the evening the NE wind gathered momentum and branches broke off trees. From one o'clock in the morning on, it was so violent that the noise sounded like the fire of small guns and was only interrupted by the somewhat different sound of cracking tree trunks. But both were hardly audible through the roaring of the wind and the breakers. But the houses were yet able to withstand the storm of the night.

At 5 o'clock in the morning the news came that the water had reached the nearby village and that the house in which Born and Villacon were staying was surrounded by water. The water rose so rapidly that it was hardly possible to gather the most important things and to take them to the Japanese station in the village of Jaur, located at the widest part of the island. The path was passable only with difficulty; but finally it could be managed without accident. From Jaur one can overlook the lagoon, where the "Ponape" was no longer visible. On the horizon in the west strong sheet lightning could be observed. The surf in the lagoon reached the very houses of the village. A stay in the station seemed dangerous, and everyone retired to the western canoe-house where all the natives of the island had assembled. They were completely confused and overwhelmed by the happenings and recalled an old oracle that at some time in the future their island would be washed away. They thought that the time had come. Soon

this group was joined by the Japanese who had to flee when their station was washed away by the high waves. But by now even the present shelter was no longer safe, and everybody moved on to the northwestern tip of the island near Ifang. This was the last escape...In a house on a low hill [198] large numbers of screaming and weeping natives had sought shelter. The lamentations increased when a man announced that presently the water was also coming from NNE. Born climbed a palm tree and from this position was able to observe the seas moving through the woods like white cats. When he came down from his lookout, the water stood up to his hips. Everyone tried to pick up planks and ropes and went down to the shore of the lagoon. Fortunately the water rose slowly and the wind became weaker. Born noticed a gigantic breadfruit tree which had been uprooted; its roots rose several meters into the air, and Born and several others climbed on it. They had barely reached their new position when the typhoon started to rage from ESE with an indescribable velocity. It seemed as if a thousand trains were rushing by. It was 9 o'clock in the morning and the wind continued in this manner until three in the afternoon. The air was so full of water and sand that one could only see a few steps ahead. Then the wind calmed down somewhat; for some moments the sun actually broke through and it became possible to recognize one's surroundings: fairly close to the shore of the lagoon at the NW corner of the island.

The water had fallen somewhat and the destruction could be viewed; the trees were

piled to a height of several meters. There was no sign of houses and human beings other than the remnants of the large canoe-houses visible on the beach. Moving through water that reached his hips, Born approached the village of Jaur and on his way he observed two youths, painted red, who were carrying a pig inland. Following them, he arrived at the center of the island where a large number of natives had come together and where all spent the first night. Apparently no one had come over from Oleai, but soon bad news came from the SE.

On Saturday, March 30, early in the morning, the wind had calmed down considerably but in the lagoon the waters continued to surge and boil high; there was no trace of the "Ponape". Some natives said that they had last seen her lights on the morning of the 29th, but by now she was considered lost. A walk along the beach proved the terrible havoc wrought by the typhoon; there was nothing left of the island of Raur except a sandbank with a few solitary palm trees. On the beach of Leuleperik, the body of a 5-year old boy was washed ashore. It soon became known that there were no more than two survivors from Raur, a man and a woman; that meant that 130 had lost their lives. Only 9 had been on other islands when the typhoon hit. On Paliau about 50 of the 90 natives had been victims of the storm. On Tagaulap a woman had been killed when a house collapsed. Four women of Saliap had been on Raur and 10 people from Utagal and 5 from Falalis so that the total loss of lives must have been about 200. The doctor was unable to give much aid to the numerous injured because all medicines and instruments had been

washed away by the waves. In the course of Saturday and Sunday, many bodies were washed ashore, most of them mutilated in a cruel fashion. Miraculous escapes were also recorded; several natives of Paliau drifted to Saliap, and four from Raur to Utagal; two children--a boy [199] of 5 and a girl of 8--landed safely on Marijong.

The survivors of Paliau and Raur reported the following: on the evening of March 28, some of the experienced men judged from the roar of the breakers that a tidal wave was moving in the direction of their island. Some preparations were made, e.g., many women and children were taken up high on breadfruit trees and were tied on. During the following night, the water on the island reached a height of 1 1/2 meters. But it was not until the following morning, the morning of March 29th at 8 o'clock, that the tidal wave really came. One could see it approach from the tops of the highest breadfruit trees; it appeared to be about 40 meters high and like a dark cloud with deafening noise it broke over the island like a gigantic stream of water. Everything withstood this onrush, but soon a second, even higher tidal wave swept over the island and carried along everything, trees, houses, and human beings. The lagoon was turned into a boiling kettle in which drifting tree trunks and boards ground up everything.

The entire island of Raur, with its total length of 1700 meters was washed away while a new island appeared between Falális and Motogosóu in the south; this island seems to have existed once in the past and was called Met (see map 4) [VMM: see 4: Krämer 184].

The narrow shallow entrance between Paliau and the main island (Figure 80) [VMM: see source] was greatly widened and deepened. The reef between the two islands had cracked like a marble block. And the ground of Paliau and Raur looked as if it had burst. On the outer reef of Raur through which the tidal wave had broken, three longish coral debris aggradations stood out like islets. The entire fundamental formation was as smooth as the top of a table and only some coral pebbles were scattered over it. The tidal wave must have come from ENE.

The mail streamer was not due until about May 25 and threatening starvation was a big problem.* The coconuts were picked and divers tried to salvage the taro of the fields which stood under 2-3 meters of water. The chiefs were in charge of the distribution of foodstuffs and did an excellent job of it.

The trading station O'Keefe-Yap was used to store the extra food. The water tank, with a capacity of 3 1/2 cubic meters had been carried off 100 meters in spite of the fact that it had been [200] cemented in. The scattered goods and food supplies could be saved in part. Most of them were distributed among the natives by the government physician and at government cost.

A great drought followed so that when the "Germania" arrived on April 11, she came as a saviour. The steamer also brought the news that the "Ponape" had arrived safely

*I learned that for that reason typhoons are also known as Lángeta "no food."

on Saipan on April 4.

Captain Martens reports that on Friday, March 29, from 7:30 P.M. the typhoon was raging. One squall followed upon another. No land was visible in spite of the full moon. [ER: The experiences of the ship during these days are described in the text, but are omitted here.] Since the current was definitely and violently NW it was impossible to take a course towards Yap and for that reason the ships sailed in the direction of Guam or Saipan; the latter was reached on April 4.

The destruction wrought by the typhoon was so considerable that at the instigation of the German government a large number of coconut palms were planted: 1000 on Volea, 500 on Máriong, 500 on Tagaulap, 500 on Vótagai, and 1500 on Falális; on Raur which now belongs to Daruélimog as many as 4000 trees were planted and on Paliau 2000. SS Natuna picked up many people after the typhoon, 100 on Volea, 7 on Mariong, 8 on Tagulap, 1 on Soluap, and 110 on Falális. About 200 were taken to Saipan.

The soldier and supervisor Goru. . . .--he could only write his name--asked me to give a message to the government on Yap and to inform it that he wanted to stay on Volea. Agupelior sent 20 woven mats as a gift with the information that now there was plenty of food on Oleai, and that the natives of that island who had been transplanted could well return. Goru saw to it that 20,000 new coconut palms were planted after the typhoon. The breadfruit trees did not bear fruit for a long time, and the taro swamps were covered by a salt crust.

4: Krämer--201 (1909) 1937 Woleaians
116, 142 Woleai

In Lütke, Volume III, page 144 (Observations) the following is said: the inhabitants of the low islands are thin rather than fat and tall rather than short. Their hair is thick, brownish black and knotty. The nose protrudes and is wide and large, the lips thick, etc. These standards are applicable as a rule.

4: Krämer--201 (1909) 1937 Woleaians
116, 144 Woleai

In a treatment of the population of Oleai we must bear in mind that it is greatly mixed due to the migrations of the natives of the surrounding islands. The settlement charts show that we may hardly talk of a true local type.

4: Krämer--201 (1909) 1937 Woleaians
116, 141 Woleai

Hambruch measured 12 natives, 4 women and 8 men; the former had a height of about 150 centimeters (3), but one of them was 162.8 centimeters tall. The men varied between 158-167, with an average height of 163 centimeters.

Dolichocephaly is no longer observed, since there is no cephalic index under 170; two of the people were brachycephalic (81.1 and 85.5), 7 were mesocephalic (73.6-77.7) and three had a cephalic index of 70-71.5.

4: Krämer--201 (1909) 1937 Woleaians
116, 157, 144 Woleai

In general it must be stressed that the natives of Uleai are charming, a fact which has been observed by previous visitors and which is most true of the women. The photographs are well able to prove this point. An English half-breed (photograph 18c) [VMM: see source], as on Lamotrek, proves British dominance.

4: Krämer--201 (1909) 1937 Woleaians
116, 142 Woleai

The Caroline hand was found on three men. The hair of the women is straight, has wide waves, and that of almost all the men is quite frizzly and in one instance extremely curly. Cantova describes the islanders of Faroilap, who wanted to sail to Oleai and drifted to Guam; they had frizzly hair. The color of their bodies is the brown of the Central Carolinians.

4: Krämer--201-202 (1909) 1937 Woleaians
116, 161, 175 Woleai

As on Lamotrek, a strong decrease of the population took place in the Oleai group. Freycinet (page 101) says that around 1800 the population figure for Guliay was 3,000. In addition, the following islands must be mentioned to give a true picture of the group: Raor (Raur) with a population of 110, Paliao (Paliau) 125, Mariog (Mariong) 90, Fagoun-lap (Tagaulap) 86, Soliap (Soluap) 70, Fallougla (Votagai?) 50, Harradies (Falalis) 50, Falouelap (Falulap) 36, Hanarisaray (Eangaligarail) 32. It is news that the latter was inhabited at all. On the other hand, the old main island of Votagai is missing. It is not clear whether these figures are included among the population of 3,000 given for Guliay, or whether they are to be added. In any case 3,000 would be much too high a figure for one coral island, since Volea or Falalap, the main island of Oleai, barely has an area of one square kilometer. Under very favorable conditions, 1000 people can subsist on the products of one square kilometer of tropical land, but 3000 is an utter impossibility. Thus the figure is either wrong or it applies to the entire atoll with all its islands. [202]

I learned on the spot that Falalis, like Volea, in the past had a population of 300(cf. 3000 given above), but that in 1909 only 30 persons inhabited Falalis, 60 Tagaulap, 50 Mariong, 200 Raur before the typhoon, and 60 Paliau. Probably we might assume 300 each for Volea and Votagai in the past. Gulick, in the Nautical Magazine of 1862, page 174, states that the population numbers about 600. As mentioned above, the figure for 1904 was 661 and for 1930, 539.

4: Krämer--202 (1909) 1937 Woleaians
116, 152, 609 Woleai

The Uleai islanders in the past seem to have been rather rough: I learned on Lamotrek that around 1894 an Irishman, Harry Grishom, had been murdered by 4 natives. They shot him in the back and then threw him into the channel of Paliau. Probably in this instance, as in the case of the murder on Oleai, the guilty parties are strangers. For in general, the natives of Oleai have always had a reputation of friendliness and companionship; we ourselves had proof of this characteristic and Tetens also describes it.

4: Krämer--202 (1909) 1937 Woleaians
116, 103 Woleai

The Südsee-handbuch gives the names of Oleai, Uleai, Wolea, Ulie, and Anangai.* Meinicke names Ulie, Ulea, Uleai, and according to Gulick it should really be Wolea. In the new Spanish Encyclopedea universal illustrada of 1929 we find Uli, Ulea, Uleay, Ulie, Woleai, and Oleai. These different names are naturally taken from the reports of the visitors. The following are listed: Clain, 1697, Valayay, 1706, Ulier, 1710 Olie, Cantova: Ulee,** Torres: Guliai, Chamisso: Ulea, Lütke: Ouleyai, Kolonialatlas 1908: Oleai, Hamburg Südsee Expedition: Volea, Japanese map: Woleai. Oleai as a German language transcription comes closest to the true name as exact recordings have shown. Various place names are given with and without "w" e.g., Onoun which is also pronounced Voloul with the meaning of "round." Olimarau is frequently pronounced Volimarau and on Pollap there are several examples, e.g., Vorieng ghost and inland water, and Volebuku are given in story 5, etc. Völepeg (peg sounding like pik) is a common name for the "small places" of the surrounding region such as Aurepik, Sorol etc. Especially the main island of Falalap, "the great land," the largest of them all is usually known as Volea, which is a fairly good distinction from the Oleai of the entire group. In the song of storm magic Valeoai has the meaning of "on my boat" (wa, oá, boat).

*This is the word the Yap islanders use for Oleai; I heard it myself and W. Müller substantiates it in his work on Yap.

**I myself distinctly heard Oleai pronounced Oleē on Mokemok where Cantova was.

4: Krämer--202-203 (1909) 1937 Woleaians
116, 194 Woleai

The first publication on the language of Oleai was the glossary given in Kotzebue Entdeckungsreise. . . page 55-67 which on the whole is in agreement with later treatises; [203] this is quite natural if we assume good ears and transcribers. Some of the words are included in the list for the sake of comparison; we see that most of them are more in line with the vocabulary of Feis and it seems that the informant must have been a Feis native living on Oleai. With reference to the dj sound we should add that there exists also a very soft j and that sometimes the dj is hardened into a ts sound, as in the case, for instance in Fatsumal.

l and n may again be interchanged as on Lamotrek, although in the latter place the l is often more important.

For rainbow, loiliar, Agupelior distinctly said noiniar.

We also find the parallels of Nei and Lei

Lag and Nag

and before names Ne instead of Le

The possessive suffixes are occasionally replaced by preceding possessive pronouns.

Woleaians
Woleai

There is no white missionary on the island of Woleai.

On Oleai I learned more about the missionary Snelling, after he had been ordered to leave the island. He sailed to Onoun and Póloat but missed both and on his return voyage arrived on Aurepik after drifting on the high seas for three months in a native canoe; the crew of a boat from Oleai saw him on Aurepik. He had become so thin that he looked almost like a skeleton. The crew of the Oleai canoe reported the news at home, and the head chief Agupelior set out to get Snelling. He actually brought him to Oleai and transported him to Vósavo to his house on a stretcher--he was too weak to walk--where he died after a short time. Agupelior had promised him to take him to Truk as soon as his wife had given birth. It seemed as if the Japanese had interfered in a disagreeable fashion.

4: Krämer-- 204-205 (1909) 1937 Woleaians -1-2
116, 131 Woleai

The Oleai atoll is distinguished from the other groups by its hourglass shape. Oriented eastwest, the island has a length of 5.6 nautical miles and, in the west (Falalis-Votagái), it has a width of 3 nautical miles, whereas in the east (Raur at the southern tip, Voléa at the northern cape) it has a width of 2.1 nautical miles. The narrowest part of that hour-glass shape is about 1 nautical mile wide; from the new Sand-Cay to Tagaulap it would be a distance of 1 1/2 nautical miles.

This neck divides the inland water into two lagoons which are separated from one another in the northern part of the narrow section by single reefs. It is only southward, that a connecting channel, 2 1/2 cable lengths in width, runs from east to west and within the barrier reef has sufficient depth for some larger ships (at least 15 meters). The depth of the water in the east is mostly 7-9 fathoms, and in the south it is approximately twice that. Here we also find the most commonly used entrance, the Raur Channel. The large western lagoon in most places had a depth exceeding 20 fathoms and, in the middle, 27 fathoms; in the south it has another large entrance with a shoal with a depth of 5.3 fathoms, the Falális entrance. Between these two entrances, the Raur and Falális Channel, there is a third smaller one with a depth of 7 fathoms which is located between Sandy Cay and the small island of Motogosóu; it leads into the connecting channel through which one can get directly into the lagoons either in the east or west. All three of the southern entrances thus have sufficient depth (at least 15 meters) and sufficient width (at least 300

meters) but their margins are submerged, since the reef foundation on which Raur is located projects more than 700 meters to the west (up to the Raur Channel) and the reef of Falalis projects about 1500 meters towards the east. That leaves as boundaries in the south two submarine isolated reefs on which the small island of Motogosou is located in the east and the Sandy Cay mentioned in the west, which was newly created in the typhoon of 1907. According to the natives, there exists an old story which claims that there was an island in the same spot in the past and that it was destroyed by a typhoon in a similar manner to that in which Raur was washed away in 1907. The same typhoon deposited the sand formation which is known as the Sandy Cay in the old place. The special plan of map 93 of the Reichsmarineamt of 1903 has the nucleus of the Sandy Cay reef very lightly marked on the southern side west of the Motogosou reef; west of it we find a line of soundings running from SW-NE with the depths [205] 9.1, 9.1, 26.11, 9.6, 11, and 40 as the depth of the lagoon. It was not until the Japanese map was published that the open southern side (as at Onoun) was explained although only hasty surveys were made.

The German map includes a western channel between Falalis and Falulap; but there are shoals with a depth of 4-6 meters at the entrance; they are also charted on the Japanese map. This channel is suitable for canoes only and the same is true of the two entrances in the north, the North Channel between Jalangigereil and Fareiles which leads into the west lagoon (depth of 10 meters and width of 180 meters) and the Tagaulap Channel between this island and Marijong (with a sandbank of 3.6 meters ar a total width of 100 meters) which flows directly into the eastern lagoon.

Voléa is the largest of the islands, having an area of almost one square kilometer; next in size is Votagái in the west with an area of more than 1/2 square kilometer; it is said that in the past it was the leading island of the group and Kadu assured us that this was a fact. Then we have Votagai, Soliap, Falális, Tagaulap, Mariong, Eangaligarail, Faraliēs, etc.

Volóa or Falálap.*

Among the various islands of the group, the main island of Volóa (which is otherwise known as Falálap, the "great land") is the most important. It has a hornshaped spur which projects in the direction of the NE monsoon seas and thus is triangular in shape; it is shown on the map of 1903. The southwestern side was slightly curved like a bay. From here to the tip of the island the distance was almost one kilometer. It was this large and wide aggradation that saved the inhabitants in the typhoon of 1907. According to the Japanese map, the typhoon increased the width of the land towards the NE by about 200 meters; on the other hand, the two northern sides of the triangle in the E and W were somewhat curved inland so that the isoceles triangle was changed more nearly approaching a cap form, as map 5 shows [VMM: see 4: Krämer 207]. Unfortunately due to [208] lack of time I myself was not able to survey the island, but I asked the second officer Gollert to take care of it in my place, and thus we are at least able to visualize what the northern tip looked like 2 1/2 years after the typhoon (map 5) [VMM: see 4: Krämer 207]. In the worse rubble some ponds with brackish water are left standing in places formerly occupied by taro swamps.

*The same as the island of the Mogemog archipelago.

Lütke tells us that the women love the rings from the suckers of octopi which result when the neck is bitten off (a practice on Samoa); the ink of the octopi is used to color the rings.

4: Krämer--221 (1909) 1937 Woleaians
116, 291 Woleai

Children usually go naked. Girls, after they have begun to menstruate, wear a grass belt, the sivisif (Born: siwesiw); Hellwig shows one made of coconut pinnae; another is made of hibiscus fibers. As elsewhere woven mats, gabalabal (Gabalei, . . . om, gaban) (Born: gapalepal, Kotzebue: gapellepel) are the predominant costume of the women. The workday mat is coarsely plaited from banana and hibiscus fibers (Hellwig: gabe); they often have black (lugural) and red (Ligotra European) stripes (see under bülo). The men wear loincloths (Hellwig: garrogiss) and a rain cloak, negau (nego), made from hibiscus fiber strips. The loincloth (Hellwig: kariri, genurs, gelurs) is woven from banana fibers. Born mentions men's mats, known as tor. Children may wear bunches of leaves which are often arranged in a fancy fashion as the girl on Figure 81 shows [VMM: see source]; this leaf protection is called erünnu or tivetio, Hellwig: jongjong vaifil, and is made of hibiscus fibers. Chains worn across the perineum are called chatiletach (Born). A loincloth for boys, with red and black hibiscus fibers (and banana fibers), is known as bülo; Hellwig shows a coarsely woven mat for women which is called by the same name.

Hat, barong (Hellwig: rarong, made of solivars pandanus). The brim is called narrête, the point ungale, the ring at the point ferigeli, the chinband gali and the seams dëdi.

Ornamentation

(see photo 16 and 18) [VMM: see source].

Lütke, in 1828, observed necklaces, and arm and foot bands made of shell and mother-of-pearl. In exchange, the natives asked for glass beads. Belts of coconut shell were two fingers wide and sometimes they had the extra decoration of white shells; they proved too expensive to be acquired by trade.

Ornamentation is certainly not available in abundance; it is either scant or non-existent. Necklaces of little red slabs and of tia (mangle) which are known from Truk naturally occur also on Oleai. Gollert found a necklace of strung fish teeth, but no special finds were made. I received a single pearl, perforated and strung which turned out to be nothing but a tridacna ball. Photographs 14d and 16 [VMM: see source] show somewhat more elaborate decorations, such as a wreath of crinum blossoms which is worn on the head (cf. photo 334)[VMM: see source], a mustache and little goatee, earrings (resembling small tortoise-shell armrings) and other neck and chest ornaments, but all within a modest frame. Chief Rogiol of Tagaulap wore a comb in his hair and a wreath of strung Röhren blossoms; the ornaments he wore in his ears were rather small and his necklace was a piece of plain string. (Photo 16d [VMM: see source]). From his hair boys had made a head-dress for themselves which they used in their play and dances. The lima, the headband mentioned in Schmelts-Krause (their list of skulls and skeletons, page 383) originated on Ku and in any case is not indigenous on Oleai. Also the origin of the other ornaments is doubtful.

4: Krämer--222 (1909) 1937 Woleaians
116, 301, 353 Woleai

Hellwig shows head wreaths, úlevars, which are dried and hung up in the house as souvenirs (Kotzebue: kabulipeu).

4: Krämer--222 (1909) 1937 Woleaians
116, 302 Woleai

Perfumes or aromatic substances are liked greatly but are most scant; a parinarium nut that drifted ashore was grated and rubbed on for erotic purposes. eis, eais and vóngas.

As depilator, Hellwig has the kom made of shell Looconcha castrensis L., and in my own collection there is a kagugú, the nice Cytherea puroglyphica Conrad with a decorative snail shell Natica mamilla Lk. These have been identified by H. Wägele of Stuttgart; the same are found on Palau.

Scent. Krämer shows a parinarium fruit husk filled with an aromatic substance and known as uongas. Hellwig shows an aromatic nut resembling nutmeg, éssid.

Hair oil, Born: loi. The hair is either cut short or it is long in the back. The girls have curls.

4: Krämer--222
116, 292

4: Krämer--222-225 (1909) 1937 Woleaians-1-5
116, 301 Woleai

Necklaces, márremar, of the known type (Kotzebue: maremar) are seen in Krämer. There are also necklaces, kamodj (Born: chamotsch) of red shell slabs, fēpar (Born: feipar and gau) (Hellwig: vaipar); Krämer, kamodj a djolípoi. Figure 82 [VMM: see source] represents a necklace [223] which is called gomalath (Born: chamelath) and which is made of white shell rings and coconut slabs (sagach, Born: tagag), a necklaces of coconut slabs, sagach üle maremar, is shown on Figure 83 [VMM: see source]; the same of coconut and conus slabs, Hellwig called marremarre dagag ma vul (mat). The type shown by Hellwig and in Figure 84 [VMM: see source] from Mariam was called marremarre billigaru*; the conus slabs had white vertical stripes, ladjere vul.

In order to grind rings of a somewhat larger size, square pieces of shell, dagag dibedib, with holes, vurárow, are placed on a stick (Hellwig: ira igek dagag) as in Figure 85 [VMM: see source] and are then ground into the desired shape.

A necklace with fish teeth is shown in Figure 86 [VMM: see source] (Krämer: maramar ni le gui).

Breast ornaments: the larger rings are used for intestine-like chains which are never worn except on the occasion of special festivals. Large rings of tortoise shell occur and are known as bodjaü.

*Hellwig shows a necklace of strands of coconut beads, billigorru, which an old man was able to restring completely within an hour.

4: Krämer--222-225 (1909) 1937 Woleaians-2
116, 301 Woleai

Ear ornaments: the islanders wear ornaments nearly at all times in their earlobes which usually are not lengthened very much. Ears that are made into a larger loop are seen on photo 16 [VMM: see source for photo]. Photo 14d shows a crinum being worn (r) and the tebau ear ornaments which are known and which are not too rare on Oleai. Little beads (pearls) are made of tridacna; they are worn as earrings or are otherwise fitted into the ornaments that the natives like. [224]

Pendants, suasua, occur as on Lamotrek, and the same is true of the triangles of red faubar. At out time wheels approximately the size of a quarter and made of light tortoise shell were very popular, the puodj a dju dju or ale falu as they were called; they may be made in the most varied forms with the greatest variety of detail, but only two types are pictured here.

Hellwig shows a bent piece of marrow from a shrub varalilut; a girl was seen wearing it as an earring. Figure 88.

Hellwig shows a ring made from a rubung ivory-nut from Truk.

Among the pendants of the ears of the breast ornaments are the ceremonial fish hooks, Figure 89, which are cut from a piece of tortoise shell, Figure 90 [225] (5 1/2 centimeters, Hellwig). Hellwig calls them gau bodj. If the hook is to be used the bridge must be removed so that the point and the opening are free. Their importance can be seen from Feis, Figure 197.

Noteworthy are also the pendants of red triangles lanubodj which here appear as failiaurupeg (Feis: faliurepeg) as "stones of Aurepik" since the red shells are mainly found there (cf. Lukunor). These red shells are known as foudja (from dja, blood), and the rings of tortoise shell slabs are called bõs. (See photo 16a).

Bracelets of tortoise shell are called puodj a lagallag, fluted, davidavi, and wide and flat, woroil; Hellwig: lagamu, lakelake. Hellwig shows an armring, djageag, of the trochus snail from Yap; Hellwig: lagelag. Also finger-rings (Hellwig: galagalag a li got) are cut from tortoise shell. Hellwig has a bracelet of hair decorated with a tigere shell. All these bear similarity to the ornaments of Truk and the same is true of a cuff of faubar and roughly cut coconut shell and trochus.

Belts are often made of hair, see also Lamotrek where they are frequently three stranded. Krämer has a djiem e dëdë of hair; about 35 strands are put together in braid fashion. Hellwig: datar e djim hair belt (Born: tschiim). In Krämer's collection an object is called tagach u pöch by Elisabeth Krämer and is a coconut belt for women with meang, white buckles. Belts of coconut and shell of the type described above and represented on photo 14a are not lacking. (Born: tartar held together by white shell, mai jal). The precious belts, taral, have been mentioned; they have been imported from Aurepik, Sorol, Ngulu and Feis. Lütke at his early time learned of their special value.

4: Krämer--225 (1909) 1937 Woleaians
116, 304 Woleai

Tattooing, măk (Kotzebue: mŏck)

Schmeltz-Krause, on page 380, say the following, which they have probably learnt from Kubary: "Most of the men have their entire body covered with tattooing in good taste, with many elaborate patterns in the ears and around the neck; they wear feathers in their hair." At our time ornamentation was much more limited than this description tries to convey.

4: Krämer--228-230 (1909) 1937 Woleaians-1-2
116, 304 Woleai

Figures 91, 92, 93 [VMM see source] demonstrate how beautifully finished the tattoos are in the case of the men of Oleai. The women, generally, wear only small ornaments on the thighs and those are covered up by mats. Sometimes the same is true of the men since the application of large tattooing to the torso is naturally painful, difficult, and expensive. Here we shall merely comment on the execution on Oleai.

The tattooer, taumak, is called in when someone wishes to be tattooed. When all the necessary discussions are over, a big banquet is held the day before work is to begin, as a so-called down payment the tattooer receives many gifts both for himself and his family. Payment for large tattoos is often up to 150 articles--mats, plaited and woven, belts, bowls, boxes with lids, axes, knives, and sometimes even a canoe may be included in the lot, since some of the very large tattoos require painstaking work and great skill. [229] A famous expert in this type of work requires payment proportionate to his efforts. It takes him 5-10 days to outline the designs, gaur, with the rib of a coconut pinna (log) which is dipped into a black color substance (soot of calophyllum nuts mixed with water) like a paint brush. When the pricking in of the color substance has begun, the person who is thus treated must sleep on the side on which the tattooer has worked so that the secretion can flow off. When everything is finished successfully, the person concerned marches through the entire village along the big path in order that all people will be able to see and admire him. He carries a mat which he spreads out from time to time to rest and refreshment is offered to him from all sides.

On the whole he is considered tabu, e.g., he may not eat with women and not have any other contact with them but when it is all over, he may return to his normal daily life. [230]

Tattooing pricks, gálĕt, are special instruments just as lancets are exclusively used for bleeding. The blade is made from frigate-bird bone, and the hammers, oāo or vao are often rather long, pentagonal; the one shown in Figure 94 [VMM: see source] is 45 centimeters long. The bird form is unmistakable. The wood is supposed to be taken from the gâingi tree which is said to be extinct on Oleai. A simpler hammer is shown in Figure 95 [VMM: see source]. It is called daiŏ or daijo and is of ira wood. The pricking is done with the tapered end.

The sap of trees, rumaio or rau is used for the preparation of soot.

4: Krämer--230 (1909) 1937 Woleaians
116, 262 Woleai

The most important food stuffs:

lu, the coconut (Born: nu; djan nelu coconut water; djal, water; bŏr bottle). To pick the coconuts, a seating stick or climbing stick is used, of the type shown in Figure 96 [VMM: see source]. Kotzebue: coconut, ni, taking off the husk, pajŏl.

uót, best species of taro (Kotzebue: eoth)

pulag, high growing taro (Kotzebue: wulach)

fillë, high growing taro (Kotzebue: villa)

uidj, bananas (Kotzebue: ut)

mei, breadfruit (Kotzebue: më)

e mamis, a sort of cucumber

uóu, sugar-cane

faliap, Eubenia malaccensis, favorite of children

gadji, palm juice (Born: gatschi mem, sour: faloba); the product is not good until 14 days after it has been cut.

Born: papaya, gatoruk; Crataeva, jabatsch. Kittlitz says that Tacca pinnatifida occurs in large quantities on the island of Raur (Kotzebue: mogemug).

4: Krämer--230 (1909) 1937 Woleaians
116, 241, 462 Woleai

The men clear the bush; the clearings are known as táravol. The earth, módjor, is broken up with an oar-like instrument, the digging stick golálivol (Figure 97 [VMM: see source]). The women plant the taro, but occasionally men do the job if they know how to go about it. Leaf fertilizer is called vāl.

4: Krämer--230 (1909) 1937 Woleaians
116, 252 Woleai

Food Dishes

djél, crushed taro or breadfruit dough mixed with gadji or expressed milk.

Born: djarong, coconut with bulak pieces.

limelim: taro stems are skinned and cooked with expressed milk or gadji; the same may be done with mar.

4: KrÄmer--230 (1909) 1937 Woleaians

Cooking is the job of the women, who also weave in the cooking house (Lütke). A type of cooking school exists.

Kitchen utensils

Coconut shell (as drinking bowl), tagag e lúul; water bottle, baradjal.

Spoon, itit (Figure 98) [VMM: see source]. We also found tortoise shell spoons from Palau, and Hellwig found drinking tubes.

Eating spatula, Hellwig: gátik (fishtail: perál), atek from turtle bone, Figure 99 [VMM: see source], Krämer shows one 29 centimeters long. It is used for cracking a coconut, scraping it, and eating it.

4: Krämer--231-232 (1909) 1937 Woleaians
116, 412 Woleai

Mortar, fal, Figure 100 [VMM: see source]. Pounder for taro, breadfruit, etc., height approximately 18 centimeters. It may be made of "stone," faisüss Hellwig. Pounding board, al lif. To pound, sugu (Kotzebue: lovis)

Coconut grater, wĕgin Figure 101 [VMM: see source], from Máriam; wood, éelé; shell, pelig. [232]

Bamboo knife, gig (Yap) used for sawing tortoise shell (Kotzebue: cut, kutovi)

Taro scraper, large Becherkoralle.

Taro scraper of pearlshell, Hellwig: sár.

Coconut husking stick, Hellwig: gútubirra is made from knotty root wood; Hellwig shows a foot strap used for climbing, and made of fibers is called laviteg. Hellwig shows a seating board, valevaib, a device carried by climbers of palmtrees (Figure 96) [VMM: see source]; it comes in handy at the time of cleaning, of picking nuts and of draining palm sap. Pick made of turtle bone with a wide blade and a handle (Nil?, Stil?) similar to those found on Palau.

Turdus columbinus is taboo for the men because they would fall off the coconut palm trees.

4: Krämer--232 (1909) 1937 Woleaians
116, 372 Woleai

Fire, eáf, fire plane, moelít; in recent times steel and stones have been carried in small bags, Hellwig: kaigérs, or sigerára; fire-wood, gabát.

4: Krämer--232 (1909) 1937 Woleaians
116, 225 Woleai

Cantova, page 316, tells us about whale (dolphin?) fishing according to the information of a native of Oleai: when a whale enters the lagoon, some canoes immediately paddle to the entrance and attempt to drive the frightened animal into shallow water. The crew jumps out of the boat into the water and spears the fish, and some throw lines around him which are fastened on land. In this manner it is possible to haul the animal ashore. A big banquet is held to celebrate such a catch.

4: Krämer--232 (1909) 1937 Woleaians
116, 262 Woleai

Animal food. Mainly fish, ig (Born: ik).

4: Krämer--232-233 (1909) 1937 Woleaians
116, 251 Woleai

Lütke, page 176, describes what might be called a method of fish conservation: A fire is made in an earth pit and coral stones are placed in the hole. When they are glowing hot [233] they are covered with leaves, the fish are placed on them and, in turn, are covered up by another layer of leaves; hot stones are laid on top. Finally the hole is closed with sand. It is said that fish prepared in this manner remains fresh for a week.

4: Krämer--233 (1909) 1937 Woleaians
116, 252 Woleai

Green scarus is eaten raw in combination with breadfruit dough, mar.
According to Lütke, octopus is eaten after it has been cooked for 48 hours.

Fishing

a. General Information

The fishing line, djal, is made of the fibers of áromē; the epiderm of the bark is removed, the fibers are scraped with shell pieces and dried in the sun.

Born: fishing, seloch; with the spear, koboi; fishing rod, bau; fish hook, cho; basket, boiau; net, jedeng; fishbank, kassutsch; catching of flying fish, tūlimingar (see above dulima...).

The following hooks, ba were collected: (angling stick Hellwig: tigo, wai, hook, wau lü vül) (Kotzebue: gau) (for ceremonial hook see above Figure 89 [VMM: see source]. Hellwig shows an open hook from Falalis).

Krämer enumerates the following hooks: bā lietam;
bā ligátaf, of black mother-of-pearl; djar used for fishing djep;
bā ligataf faibar of red spondylus used for fishing gali; [234]
bā levil for Bonito fishing, karangap

Hellwig enumerated the following hooks:
pā faipar from Votagai (Figure 102a) [VMM: see source] used for catching kalli, mol and dettivars;

pā fai, (Figure 102b)[VMM: see source] from Mariam, with barbs on the outer side;
pā ssär (Figure 102c, d) [VMM: see source] (Hellwig: ba garangap e ssër, of pearl shell) used for catching large ëtam;
fai wai, lures of black pearl shell, waü, used to attract matak' tra, moil, ëtam, and gali.

Krämer shows test hooks, gŏ, used to catch all types of fish (Lamotrek: gobodj); matalipa hooks for balug fishing which is done from the canoe and known as baligat'taf (from gat'taf to move up and down); done on the inner reef, ëliang. The containers for hooks is described in the section on vessels and containers. Hellwig has a coconut box with fish hooks, wai teri pér.

According to Lütke, three types of fish hooks are used on the island: small and bow-shaped, made of wood, length of a thumb, shells, coffer-fish part, lure Gerres (Tinga). 2. Hook made of mother-of-pearl and used for moonlight fishing of Serranus, Bodianus, Labrus, Balistes, etc. 3. Larger hooks for Bonito fishing, taken in tow by the canoe, with coconut pinnae.

Hellwig: fishing kite made of a breadfruit tree leaf, srou e gataug (Lamotrek: gedjeg). It is shown in Figure 103 [VMM: see source] with a lure of shark skin, gëli boggo or koilül li boggo. Length 70 centimeters, width 35 centimeters.

For shark fishing, lomalibóggo, with the lure, tag.
Eel loops are non-existent.

b. Fish Spears

Hellwig: tau of coconut wood; Lütke: hattan a pointed stick.
Hellwig: góbai of areca wood from Yap.
Hellwig: small to lik of song wood; prongs, rumúl; point, metál. dúlimat, to fish on the reef by torch light (dul, torch); dulemangar the same as applied to flying fish.

c. Fish Baskets and Nets (Lütke, page 237).

Driftwood fishing, gabeibei i rël. On November 6, 1909, it was announced that a large tree trunk had been sighted on the northern side of Wolea; we went out and saw it with Agupelior as our guide. The fishermen sailed over the surf at the reef and fastened the baskets to the flanks of the boats. [235] The natives of Mariong caught more than 100 small gray Brassen.

The opening is roofed, and the basket itself has a cupola-like form; this type is known as ulebam. Hellwig: ulepam; roof, rug; 2 chambers next to the opening, peg. Horizontal hoop at the opening, pögepög; bottom on the outside, bássebass; vault, ung; back wall, kab; frame forks in the interior, ula roi; inner side framework, sure; rings, talling lü u le pam.
ulebiou looks like an elongated box.

ulemoroval (...morouel) is club-shaped and thickened on one side.
Hellwig: ū le garer turning basket. It is placed in the water with the open side down. When fish swim into it, the basket is quickly turned up. The strong longitudinal poles, olol, are made of root wood, wogaralle giriau, and the thin ones are of wogarolle lū. Transverse plaiting, gobor; handle and frame, ū.
Hellwig shows another the same but with a hand-maneuvered stick; basket, tangag; wood of the plaited part, jaro.
util is longish and cylindrical, and is held between two canoes.
util is also the term for a net with a frame (Kotzebue: ueh) which was brought back as a model (see photo 19a) [VMM: see source].
Krämer shows a gajap, filet needle; uapes, swimmer; faorem, sinker, Handnet for flying fish, sou, Hellwig: srou; frame [ER: the original text reads Namen, misspelling for Rahmen?] aturtrou; handle, fouwo.
ëteng, net for fishing on the high seas.

According to Lütke, boschebok is the task of the women. They stand in the inland water forming a semi-circle in the direction of the beach, and they lay out the nets close to one another. The men stand on the beach with spears, and drive the fish into the baskets.

Born says that swimming boys arrange the nets in a semicircle. The ends are pulled

ashore and boats cruise around; there is much noise, but it is rare that much is caught. At one time, 1000 salmon-like skibijak were caught in one haul on Paliau.

Upon the arrival of a fishing canoe, all the people run from the beach into the bush and the fish are taken into the house. A fire is lit, the index finger is held over it and then the tongue is touched with it. Finally the distribution of fish takes place.

The fishermen, fita, tõfita, tõse:log, liap, after their return from fishing trips, must stay in the fallap for five months. If they were to act counter to this regulation, they would be eaten by sharks, or the sharks would devour their fish, and their wives would be stolen.

[ER: Some boat songs follow in the original text but are omitted here.][236] In Kotzebue Entdeckungsreise...page 125, the following is said about dolphin catching: "In these waters three types of dolphins occur, those with white, red, and black bellies. When the natives of Ulea notice the animals near their shores, about 80 small canoes set out and surround the group and drive it in the direction of the shore. When they are fairly close to the beach, the men annoy the animals by throwing stones at them until they swim ashore. In this manner large numbers of them are caught. Their meat is very popular. When the bodies are cut up, special techniques must be observed, because the superstition prevails that a wrong cut keeps the animals from the island for a certain period of time. At Svilick (where?) there is only a narrow entrance in the reef; [237] through it the animals are driven into the lagoon but none of them are killed until their

number is fairly large (about 50). On the islands of Ulea, this type of fishing is practiced with especial success. On the other islands, achievements in this art are not quite so great.

Kotzebue Entdeckungsreise...page 132, that children are taught when a frequently caught little fish (probably the sardine sennif of Truk) is on hand: "If it should happen that someone were to get hold of one of this type of fish by the tail and were to lift him in this position with the head hanging down, when the time for the next fishing expedition came, all the fish would seek the bottom of the sea in the same manner, with heads down and none of them could be caught."

Lütke, page 166, says that in October and November there is a shortage of fish and fruit. As a substitute, sea birds are eaten. Fishing is done from 2-4 in the morning and from 8-9. Preceding the fishing trips, sexual intercourse is taboo. Fish-baskets (of volcameria branches) are set out in such a manner that the opening faces the current of the tides; it is necessary to check every other day and for that reason the natives own two baskets at least. The women have small baskets, unababa, with crayfish lures, and without them, in the case of large ouh used in shallow waters and great depths; these are raised by means of weighted hook-sinkers. Oil (chewed from a kernel) is poured out on the water so as to see better. Fishing with a handnet is done by the light of the sun, or at night, when the fishermen hold three coconut fronds as torches in their left hand. Night fishing is known as eddoll.

4: Krämer--237 (1909) 1937 Woleaians-1 -2
116, 412 Woleai

Tools

(Kotzebue: iron, parang; chisel tété; axe, moil; knife, sar; whet stone, fasitte)....
Hellwig has a shell for grating tortoise shell, pelig, falá trig; ray skin may be used for this purpose.
Krämer collected tridacna blades (axes, atílagi; Figure 29 [VMM: see source] shows one with a length of 29 centimeters, and Figure 105 a length of 13.3 centimeters). Adze, gasuéla.
Krämer collected axes with blades.
Krämer collected a hollow-ground blade made of the shell of a mitra snail; Hellwig had one made from a piece of Cassis snail.
Hellwig: ax blade, dallẽ barai; made of tridacna, sum.
Hellwig: ax blades, dallẽ from the large tridacna species known as gi.
Hellwig: hollow-ground ax blade, dallẽ korɒilimang; made from the shell, maidjal (maial).
Hellwig shows one made of conus, kórror; now it is used as a grater, but formerly it served as a hollow-ground ax.
Hellwig: shell ax with hollow-ground blade, dallẽ; it has the form of the Sẽtowal graters.
Whetstones used to be brought from Yap; Hellwig shows one that is a light piece of lava.

4: Krämer--237 (1909) 1937 Woleaians-2
116, 412 Woleai

Pump drill, wuruwur manupok; iron, parang*; iron ax, bosugul; hand drill, vuruvur is made wither with shark's teeth or the bones of frigate birds.

*Hellwig shows a combination drill, ni li baggo ma parang, made from shark's teeth and iron and also serving both as knife and saw. Iron has been available only for about 100 years and was drifted ashore; see also Kotzebue Entdeckungsreise...page 124.

4: Krämer-- 237
116, 322

(1909) 1937

Woleaians
Woleai

Woodwork.

Products: wooden bowls
head rests (classified as furniture)
houses and canoes
(Kotzebue: to rough-hew, falla).

4: Krämer--238 (1909) 1937 Woleaians
116, 388 Woleai

The sap of the breadfruit tree is known as bilis (Krämer: smelled very badly in 1933); a sap that was called rumáio drifted ashore and the same was true of pieces of paraffin.

Vessels

The wooden bowls, tabbi (Kotzebue: tapi) in their form are very similar to those of the eastern islands.* The inside floor is usually truly indented and does not gradually pass over into the side wall. The lugs are often very long and are perforated so that cords can be put through them.

The following types are distinguished:

Wooden bowls [VMM: see source, Figures 106 a-r.]

Bowls without legs.

a. Krämer: (a) longish with the ends rounded off; length 22 centimeters, width 9.2 centimeters, height 6 centimeters. See cross section.

b. Hellwig: (b) from Votagai. In the shape of a canoe; length 31.5 centimeters, width 12.2 centimeters, height 6.8 centimeters; it had a flat bottom and is used as a container for the Yap color substance, ē ngap. Cf. the bird form in figure cross section b'.

c. Figure c, red paint bowl in the form of a frigate bird. Length 35 centimeters, width 11.5 centimeters; cf. Lamotrek. The tail of the bird is bound off. [240]

d. Krämer: eadjal, ladle-bowl with a handle ejal; Figure d, round. Diameter

*Hellwig: parai; handle, erat, elbow, (neck) gepul; blade juncture, kor u lal; lashing, võval.

23 centimeters, height 7 centimeters.

Bowls with Vertical Legs

(Two lengthwise moldings at the bottom)

(Hellwig: perrët tepi, small bowl with two feet.)

e. Figure e, handle slab (Griffplatte?) on top; length 44 centimeters, width 26 centimeters, height 16 centimeters, with a foot of half that weight. The bottom is flat. The material used is breadfruit wood; the same type of bowl is shown in Krämer where it is made of calophyllum wood. Cross section e'.

f. Figure f: the brim of the bowl is slightly curved. Length 31 centimeters, width 23.5 centimeters, height 10 centimeters. The lugs are long and the handle bar is curved. Two low feet are arranged lengthwise. [241]

g. Figure g: the edge is strongly curved. Length 14 centimeters, width 15 centimeters, height 6 centimeters. Cross section g' shows the fundamental bowl shape the feet are short.

h. Figure h: this vessel is wider than it is long, and the plan is eliptical. Length 30.5 centimeters, width 37 centimeters, height 9.5 centimeters. The feet are very low and are attached to the flat bottom. The material is breadfruit wood. Cross section h'.

Bowls with Feet Arranged Sidewise.

i. Figure i: longish bowl with perforated high lugs and handle. Length 23.5 centimeters, width 19.5 centimeters, height 9.3 centimeters with feet 2-3 centimeters high. Cross section i'.

k. Figure k: the form is similar to that of the last bowl mentioned, but the edge is more curved. Length 40 centimeters, width 24 centimeters, height 19.5 centimeters. Material: calophyllum wood.

Bowls with Four Feet.

l. Figure l with a saddle lifted above the lug. Length 38 centimeters, width 27 centimeters, height 13-15 centimeters. Cylindrical feet about 7 centimeters in height.

m. Krämer: tabbi en'nap used for paint (Hellwig: red Yap color substance, e ngap), Figure m. Trough-like in shape. Length 32 centimeters, width 10.5 centimeters, height 7.5 centimeters. The walls have four square indentions each. The feet are stump-like. Cross section m'; lug pictured in m'.

Boxes with Lids, sap.

n. Krämer shows a container for fish hooks in two parts, Figure n. Length 16 centimeters, width 8.5 centimeters, height 6.4 centimeters; it has grooves and is square.

o. Figure o, a container for ba levil. Length 26 centimeters, width 9 centimeters,

height 8 centimeters. Square in shape. The lid has a grip on top and there are no lugs at the ends. Cross section o' and o".

p. Hellwig: sap, Figure p; lengthwise oval in shape with knobs. Length 32 centimeters, width 7.6 centimeters, height 8 centimeters. Wood gálliu (kalu).

q. Figure q, square in shape. Length 26.8 centimeters, width 10 centimeters, height 8.8 centimeters.

Hellwig, 1907, shows the ends to be more oblique, and in Hellwig, 1877, the ends are very sloping and with knobs but there is no grip on top. Hellwig observes one from (Falalap) Voléa; grip-bar like on the lios en mingau. [242]

Bamboo Boxes *

Hellwig: gulugul; lid, sése; fluting, autél; ornamentation in Indonesian fashion. [243]

s. Figure 107a, with the impression b. Length 32 centimeters.

t. Figure 108. Length 35 centimeters.

u. Figure 109a with the impression b. Length 21 centimeters.

v. Figure 110. Length 50 centimeters, diameter 4.2 centimeters.

*Hellwig: Coconut box, ware, for tobacco; lid, pálepal (pilipilál) made of breadfruit wood.

In addition the following were collected:

A fish eating board, rólig.

A bowl with two frigate bird heads.

Bowl in the form of a sitting frigate bird.

ságeag, a Seepocke (?) as paint container; Figure 111.

The types of wood used are cocpnut, and breadfruit wood, mai and nga. ut (Hellwig: bowl); ira; gálliu, kalu (Cordia subcordata); for bowls also calophylla, ragits, are used; Eugenia; kadrio were no longer found after the typhoon.

marevál, hibiscus (guliva).

4: Krämer--243 (1909) 1937 Woleaians
116, 531 Woleai

A large number of patterns occur on the bamboo vessels and containers that have just been described. Amongthem are the ray tattoo designs which in large numbers are shown in Figure 79 of Lamotrek [VMM: see source]; but the ornaments pictured in 107b-109b [VMM: see source] are not very different. As on Lamotrek the houses on Oleai have decorated gables.

4: Krämer--244 (1909) 1937 Woleaians
116, 411 Woleai

There are few weapons on Lámotrek. I only discovered a single club which must have come from Truk. It was found on Vótagai where is was used as the handle for a mosquito net.

Weapons for offensive fighting are limited to knuckle-dusters with shark's teeth or fish spines.

Figure 112, rajerás with shark teeth (a); with two naseus stings, baráli ge váleval (b); with shark teeth, ni li bago.

Kotzebue Entdeckungsreise..., page 61 mentions spears, and slings.

Plaiting.

(cf. photo 19) [VMM: see source]

Kotzebue: to sew, thigi.

As is the case elsewhere, coconut fronds and pandanus leaves are used for plaiting. The latter become withered, mang, over the fire instead of being dried in the sun and wrapt into a roll. This roll, sabil lū mang, is preserved until it is needed.

For scraping the leaves or the stripes, mother-of-pearl shells are used. For plaiting, the wooden piece (wa sigerara) is used.

Mats.

Kotzebue Entdeckungsreise...III, page 62: mat of pandanus leaves, mang; sleeping mat, sagi; the raw materials are banana fibers, kou.

Hellwig shows a small pandanus mat, geagi, which lay in a child's cradle.

Hellwig shows a design of mat 113a [VMM: see source] and the plaiting style b from the Hamburger Museum. Plaiting, faije pe; beginning of the plait in the middle, fōlu; the work is done without a plaiting needle.

Hellwig: vaijepek (cf. above faijepe); stripes, geagi. [245]

Hellwig shows a square little bag, sigerara, of pandanus leaves with a lid, pilipilal; it is shown on photo 5m [VMM: see source]. It is made with the plaiting stick waisigerara (see above).

On oleai too the gaigers bags occur; they are frequently used for steels for striking

fire, and are plaited from pandanus leaves.
Hellwig shows a little bag of coconut pinnae, deibe.

Baskets Without Handles

Krämer: tjuk i le monga, "food basket" for fresh fruits of the fields; shown in Figure 19g [VMM: see source]. It is quickly made from two half fronds and has a braid on the bottom inside.

Otherwise these baskets are known as tug watau or more simply as watau. The long sides are called golongal watau, the upper edge jawale, the outer floor verëlle, the inner bottom lanne, the end sides tawole, the knots vugevug, the green coconut leaves balnu, and the dry leaves epal. A small basket carried by women is called woatau, and a basket for men, ware wotau.
Hellwig shows a watau with a loop at each of the corners, tied with a cord of human hair, tim, and decorated with a shell, tigere. (see photo 5h) [VMM: see source].

Roundweaving baskets occur here:
Hellwig: gabëes; Hellwig: gabedj; the bottom is square. Hellwig; ka'caul is a round high basket with a square bottom.

Baskets With Handles.

Krämer shows a basket known as gat and used for the preservation of food stuffs. Photo 19b [VMM: see source].

4: Krämer--244-246 (1909) 1937 Woleaians-3
116, 285 Woleai

Krämer: gappare; the handle inside is of coconut fiber and is called gappari; illustration photo 19c [VMM: see source], Hellwig: kapolo, kato; [246] kaporo. Hellwig: kaporo, kad; the type is shown on photo 19c [VMM: see source] and has a long handle in the middle.

Hellwig: tug e sari, a cradle; photo 19h [VMM: see source].

Hellwig: tuk ë sari, a basket for a newborn baby, photo 19f [VMM: see source].

The type of plaiting is known as faoagell. The basket has two handles one on each side; in the case of h it is plaited and on f it is twisted from cord (Mariam). Compare the cradles of Lamotrek.

Fans
for Fire, Wind, and Mosquitoes.

Krämer shows a firefan, galipo; the plaiting type is known as taraual and is done one up one down. Photo 19i [VMM: see source].

Krämer shows a firefan, galipo; the plaiting type taraual, 1 and 2. Photo 19k [VMM: see source].

Hellwig: a fan, saipe.

Plaiting patterns.

The pin-wheel, known from Truk, occurs.

Rope Baskets

Krämer: a rope basket, uotaudjo.

4: Krämer--244-246 (1909) 1937 Woleaians-4
116, 285 Woleai

Hellwig: watau sou; this type of basket is no longer made although formerly it was very widespread.
Hellwig: triangular srotur bag of rope with rings, talling.
Hellwig: a small triangular weaving bag for women.
Hellwig: koman or komadle, coconut fiber beetle.

4: Krämer--246 (1909) 1937 Woleaians
116, 283 Woleai

Rope making is known, The strand is known as gologól and the ball as gasseg̈il lü gologól. Fráme, méil, as on Lamotrek Figure 44, [VMM: see sourse].

Kotzebue Entdeckungsreise...III, page 62: rope, tal; thread, kologol.

Hellwig shows a forked netting frame, kasäb; gajab; open ends ëwali.
Hellwig: netting pin, jäf.
knots, bugabug; meshes, métal; completed seine, ading; to place in the water by fathoms, kalligilõgi; the upper line of the float is called tanuabess; the float; úabess is made of actocarpus wood and has a sinker of coral stone which is called vâurem. [247]

h. Weaving.

(Cf. photos 17 and 20) [VMM: see source].

Figure 114 is the drawing of a woman weaving, made from a photo [VMM: see source].

Photo 20 [VMM: see source]shows the identity of the mat with that of Lamotrek. This means that on Oleai, too, there exist three-striped mats with bands across and four-striped mats. The ornaments naturally vary locally. The designs are put in in the course of the weaving and with the weaving needles, dji dab, made from bone, dji, of the turtle or other fish. Figure 115a-c a. Hellwig: cil i daob "bone pattern"; fish bones, daoo rare. Length 17 centimeters.
b. Hellwig: druiitob; head, semel; point, tawol; wood, kaini. Length 27 centimeters.
Hellwig: cil däb, test bone cil le wong.
Krämer shows a weaving needle of wood that drifted ashore.
Born: weaving frame, pap; belting, talletoi; sword, gopop of jengi wood.
Krämer: mür, black pumice stone for dying yarn.

4: Krämer--246-247 (1909) 1937 Woleaians-2
116, 286 Woleai

Hellwig: pumice stone with which old iron parts are scraped. The rust is put into salt water together with crushed kid leaves. In this liquid banana and hibiscus fibers are dyed black.

A bunch of hibiscus fibers, dallivörsik gulivä. Mosquito netting, márup.

Matting for G-strings, karir, genurs.

black stripes	ligoroe
light stripes	ligawassa
fringes	matë rëlle

The types of mats are best illustrated by Elisabeth Krämer's catalogue remarks:

Krämer: kenuj, seven-striped mat of banana fibers, red and green (imported). Weave: ligos, plain weave.

Krämer: kenuj ligadja, the same with 7 red stripes; weave: ligos.

Hellwig: stripes with red borders.

Krämer: kenuj, the same, black and white; weave: gasuitip. Three shed formation.

Hellwig: the first to fourth stripes are green, the selvedge red.

Krämer kenuj, is done in the same manner but more delicately and is trimmed with fringes, sük; materel braids take the place of the loose threads. [249]

Krämer: giligoi, a seven striped hibiscus mat typical for women; weave: gasuitip: three-shed formation with decorative banana fibers. These mats are old and today they are hard to get.

Krämer shows one made in the same manner but in the goilipat weave; see photo 20 [VMM: see source]. Width 49 centimeters, length 197 centimeters.

Hellwig: karir, genus; this mat is beautiful, seven-striped, and black and white in color.

4: Krämer--247-250 (1909) 1937 Woleaians-2
116, 285 Woleai

Hellwig: seven-striped, brownish and sprinkled with 6-7 fine white stripes.

Three-Striped Mats.

Krämer: balüelüf; it is a three-striped banana fiber mat white and green in color (bugarau); the nigos weave is used (plain weave).

Krämer: balüelüf etap is the same with tap, interwining pattern; designs: ngisum tridacna tooth, pub, fish. nigos weave.

Krämer: peig, three-striped of banana fibers. Stripes of red are broken, interwining pattern, tap. Weave gasuitip; three-shed formation.

Krämer: peig, the same as the last but more finely woven. It has three designs: 1. bailimal, birdclaw, 2. ngisum, tridacna tooth, 3. failimat, eye lid.

Krämer: peig ugo tal, the same. It has the designs 1. ngisum 2. failimat 3. bailimal ; the middle stripe is dissolved into three. The weave: gasuiup; see photo 20k [VMM: see source]. Width 48 centimeters, length 203 centimeters.

Krämer: maletilil, ngarevutelil, is a three-striped mat of hibiscus with decorative banana fibers. Weave: goilipat done with a four-shed formation. This type of mat is hard to get nowadays....

Krämer: photo 20h [VMM: see source], 197 centimeters long and 49 centimeters wide.

Krämer: peig, a finely woven mat for women. Weave: gasuitieb; three-shed formation. Pictured on photo 20i [VMM: see source]. Width 47 1/2 centimeters, length 207 centimeters.

4: Krämer--247-250 (1909) 1937 Woleaians-3
116, 285 Woleai

Krämer: Weave: galut. Four-shed formation see photo 20d [VMM: see source]. Length 193 centimeters, width 50 1/2 centimeters.
Krämer: gasuitieb weave, three-shed formation.
Krämer: is very finely woven in the manner of the Ifaluk mats. Length 210 centimeters, width 52 centimeters; photo 20e [VMM: see source].

On that page there are the following mats of Hellwig:

a. kab, gab. Width 61 centimeters, length 260 centimeters. Coarse weave. Photo 20a.

b. kab; banana fibers. Width 66 centimeters, length 252 centimeters. Wotagai, photo 20b.

c. kab. Width 56 1/2 centimeters, length 237 centimeters. Coarsely woven. Wotagai.

f. dorr, torr, pek. Width 45 1/2 centimeters, length 18. 7 centimeters, Mariam. Photo 20f. [250]

g. Width 47 1/2 centimeters, length 178 centimeters. Wolea. Photo 20 1.

Hellwig listed the following terms for a mat which was almost identical with f (see above):

wide black longitudinal stripes	nugurale
narrow longitudinal stripes (red)	nigotra
outer marginal stripe	naretol

4: Krämer--247-250 (1909) 1937 Woleaians-4
116, 285 Woleai

inner marginal stripe	neriwor
stripes across	dabobo (see above tap)

4: Krämer--250 (1909) 1937 Woleaians
116, 484, 502 Woleai

The boats of the Oleai islanders generally sailed only to Feis [VMM: for trading], but occasionally they went to Mokemok (Ululsi) and Yap. They remained on Feis for a month or two and finally sailed back when a good wind came up.

4: Krämer--250 (1909) 1937 Woleaians
116, 437 Woleai

...reng, which was brought from Truk, was looked upon as the money of Oleai.

4: Krämer--250 (1909) 1937 Woleaians
116, 439, 651 Woleai

No tribute was taken to Yap [VMM: by the people from Woleai]. The intermediaries can keep the goods for themselves and pay with their possessions. There is no compulsion. If Oleai sells land, it may give as much as it likes to Inefel. In the past it was said that Oleai belonged to him.

4: Krämer--250-251 (1909) 1937 Woleaians
116, 438 Woleai

Trade goods other than money were: mats, dŏr (tor) and sap, bilis. Furthermore iron and boats should be mentioned [251] for Oleai, whereas the various islands of the Oleai group had special markets. The natives of Raur sailed to Faterai (Ululsi) and those of Paliau, Lolepeleg and Vosavo on East Volea and the island of Mariong to Falalap (Ululsi). Tagaulap, Soluap and Iefang of West Volea took their goods to Maiangeang and Falalap (Ululsi). Falalis and the village of Bigol on Votagai, finally, transported their trade goods to Tulei on Feis.

Types of Houses

fal'lap (fan'nap)	bachelor's quarters
falĕoš	canoe-house (Born: small canoe-shed, thapal)
fal eonnap	see Tagaulap
im	dwelling (imai, . . . om, . . . al, . . . adj,) (Born: im molut; house of wooden planks im pap)
malum	cooking house (Born: malam)
im alipel	birth hut (also called imateing)(Born: im mellipel)
im ali gogobong	ten-night house
im ali fám	birthhut named after fam, birth.
im melagobung	menstrual hut (Born)
imobŏ	sleeping hut on piles (Figure 116) [VMM: see source] named after the floor, bŏ
imepó, fannĕ	storage house(formerly there were many houses of this type, but now there are few)
im motscho	coconut storehouse (Born).

4: Krämer--252-254 (1909) 1937 Woleaians-1 -3
116, 341 Woleai

The dwellings in the Oleai district are almost all hexagonal just like those of Yap, except that they have no stone foundations; Christian proves the latter point on a chart. The basic architectural outlines here, as further eastward, are given by the frame building with wooden walls. That is to say, we are dealing with the rectangular cella to which triangular projections, porches, known as falfaleping, are attached on the side of the gables. For that reason, the roof point must project strongly and may be supported by a post up to 4 meters in height which is called súrung. (Figures 117 and 118 show it on a storehouse and it is also pictured on photo 17b but it is not straight...[VMM: see source for photos). But before we discuss this feature in detail we should add that this post is generally lacking. In that instance the hipped roof of the gable side rests on the triangular projection, if the cella is open to the side of the gable and is directly connected with the space of the building projection as is the case on figure 119 of house 1, Sapei, and house 3 (photo 15a). The interior of house 8, Falel, however, is rectangular similar to the representation of Figure 117. Here the porch constitutes a special room both in front and rear. (Born: im mal paloi).

If the triangular building projection of planks is lacking, a triangular roof frame is erected and supported by the roof top post which is called súrung (shown in plate 17b) or the latter may be omitted and only 1-2 supporting posts be used for the eaves (Figure 120). Under such circumstances the triangle becomes more rounded in shape and as in the case of the [254] last mentioned house brim-like eaves are formed out of three or

four poles. In figure 120 these purlins are made of one piece and are bent around the outside and short rafter-like poles rest on them in both instances.

Thus house 8, Fálel, has a closed square cella and a roundish porch roof both in front and in the rear of the house. It is not only the post, but the various separate supports which may be lacking. Then the overhanging roof is supported by horizontal poles which jut out from the long side of the house and rest on the upper frame of the gable side. At the most support is offered by a yoke, from the overhanging roof of the canoe-house. I saw a house with bent purlins in front of the poles on Votagai. Here, as on Tagaulap, many of the old beautiful houses were left standing, since the islands were spared destruction from the typhoon of 1907.

It has been mentioned that houses without the triangular gable projections are frequent. They are rectangular, made of timber; in short they are simple frame houses.

In one case, that of house 1, Gabengatil of Tagaulap the gable-wall of the cella with its wall fillings and the door in the middle was not as high as the upper frame beam so that there was another one underneath, as is the case with the bai on Palau; that meant that a window existed, but only on the gable-sides. Projecting buildings were lacking.

The house with the roof point post, surung, on Votagai had planks at the edge of the roof on the sides of the gables in the manner of the outer gable frames of the Palau bai which was pierced by the ends of the purlins. They are called eaolim and they rest on

the projecting upper longitudinal frame beams which are called gapilivei and which are approximately 1 meter in length. They, in turn, are supported by a post, sur tavol gapilivei, which rests on the projecting lower longitudinal frame beam, the gogodj levilipeg, or rather on its end which is known as the tavol. The lower transverse beam of the framework of the cella is called gogodj votap and the cooresponding upper beam is the gabilibing. Figure 118.

4: Krämer--254 (1909) 1937 Woleaians
116, 177, 342 Woleai

In our day the houses on Oleai did not have any stone foundations and the same was true of the buildings on Lámotrek.

4: Krämer--254-256 (1909) 1937 Woleaians
116, 342 Aurupik

On Aurepik we found some stone house foundations of two meters in height and it is therefore quite possible that they formerly existed on other islands. One report reads: Gamelei, the father of Metag in Aurepik (here Eaurupeg) with his son Feker built the large foundations under the houses of Aurepik. This was done after a typhoon in which the entire population with the exception of four individuals lost their lives. When the Yap islander Goru came to Aurepik in 1905, together with the district official, [256] Gamalai was still alive but was very old (probably 90 years). He had completely forgotten the Yap language which he had known earlier in his life. Thus the stone foundations of the houses of Aurepik was due to local ideas which naturally may come up anywhere. But they have not been able to assert themselves.

4: Krämer--256 (1909) 1937 Woleaians
116, 132 Woleai

The typhoon of Aurepik seems to have hit Oleai, too, in 1830.

116, 504 Woleai

Large community houses on Oleai were the canoe-houses, faleoā, photo 13 a, b, c, [VMM: see source], which occur throughout the entire island region, and which served the men during the day. These houses numbered three or four on every island and one on Tagaulap and Mariong. The eaves almost touch the ground; gable spaces are lacking.

In addition there existed bachelor's quarters, which for short were called fal'lap, "great house" or falepai, according to Born. I saw them as late as 1907 when I passed Oleai on the way to Truk. Four months later, upon my return to Palau, they had been destroyed by the typhoon and had not been rebuilt. If my wife had not happened to paint a small water color of the southern tip of Paliau and the northern tip of Raur (Figure 80) on the occasion of our first visit with a fal'lap showing in both instances, these testimonies of western society* would have disappeared unknown. [257] These houses stood projected on stone wharves (Born) at the open inner beach and that was why they could be so completely destroyed by the typhoon. The picture with the house of Paliau presents the walled enclosure and many doors, two in the front gable and three in the longitudinal wall. On the occasion of the expedition's visit in 1909 I had the chief Agupelior make me

*I learned on Kapingamarangi that natives of Oleai who had drifted ashore had erected bachelors' quarters; but the building was no longer standing at the time of our visit. These islanders were also credited with the introduction of the breadfruit.

a model of such a fal'lap and the long side of the building is shown on Figure 124 [VMM: see source]. Born says that there was one falepoi on every island and two on Falalis.

The first striking feature was that the framework of the house did not rest on wooden posts, sur, but that there existed no more than four stone pillars, sur, which supported the two longitudinal frame beams called tanelap--in the same manner as on Feis. On the longitudinal beams rest the transverse beams, the gŏusam, on which stand the king posts, bŏt. The two king posts carry the roof tree, ung, which determines the size of the inner gable house. Above it lies the second upper roof tree, the ungaseg or ungnaseg, with the size of the roof itself. Finally, above it, there is a third long roof pole, sogoram (sogoramar), the roof tip of the projecting gable roof. On Figure 125, the three roof beams are shown in front view:

the first, ung, rests on the king posts or the ornamented middle rafter of the gable,

the second, ung ngaseg, is supported by the strong rafters, the vŏi.

and the third, the sogoram, is supported by the thinner outer rafters known as gat. [258]

On the vŏi rafters rest the heavy purlins which are called gapangag and the lowest marginal purlin known as gapilivoi. The small round purlins are named i fag, and the small rafters and the long purlins of the roof eaves are the bailimelug; the long rafters

and the small purlins of the gable are called langolimetalias (Figures 124 and 125).

Gable ornamentation: tēbaų.

the two lateral frames, eao, show shark's teeth, ngi le boggo.

the lower transverse framework, gapileping, shows a triangle pattern ngi sum "tridacha teeth" which are very popular on Palau V, where they are known as klivuk; but the arrangement is different.

the middle plank has black triangles, basal e vulegalei (basal bedjel his foot or tail of the bulegalei, the acanthurus fish.)

the white lozenges with a dot in the middle are called pup and thus are meant to represent the lozenge-like Baliste fish?

Thus the gable ornamentation has the fish as its leading motif.

The interior of the house, like the gable, is divided into two halves:

the half facing the water, jetab fal matalifal, is reserved for the chiefs, the tamol;

the half facing the land, the jetab fal apelifal, is used by the common people, the e aramat;

the interior is called nifal (nim)

the exterior is called lugilifal (lugilim)

Construction.

When a fal'lap is to be built, all the men bring coconut yarn from the various islands.

They place their contributions on the beach and are paid for their work with coconuts.

The women, all dressed up, come to the assembly house carrying food and perform a dance, ur.

The women of the place where the building is to stand sit in the house and do not allow any strangers to enter although they make attempts to get in from all sides. Finally they sit down outside, with the head chief, while the local chief stays inside with the women, to whom he gives coconuts. [259]

When the construction is completed, a great coconut taboo, ëvaü, is declared.

Huge quantities of coconuts are collected and piled up around the building. When the collection is over, the owner of the building invites everyone for a certain day when the house is to be dedicated.

On that day the guests come from everywhere. The women are all dressed in an elaborate fashion, with a great deal of ornamentation, and dance around the house. At the end of the festivity they give their necklaces, etc., to the departing men, after the latter have received their share of coconuts, They all sit on the ground, and the supervisor gives a speech in which he announces that payment is to be made in the form of coconuts. He adds that he hopes that no nasty talk will be heard about his men and that they will all remain in good health. When the ceremony is held on Volea, Falalis is assigned 1000 nuts. Votagai 3000, Tagaulap 1000, Mariong 500, Paliau 500, and Raur 500, After that the group breaks up.

4: Krämer--256-259 (1909) 1937 Woleaians-5
116, 504 Woleai

Stone posts: It is noteworthy that the house of the spirits on Tagaulap has stone posts like the dwellings on Feis (Figure 126) [VMM: see source]. It has been said in the discussion of the religion of the islanders that foreign influence has come in the past and undoubtedly it must be held responsible for these facts. The stone slabs used as house posts are a true characteristic of Feis.

4: Krämer--259 (1909) 1937 Woleaians
116, 352 Woleai

House furnishings are very scant. Wooden hooks for hanging up baskets have been observed. For the head bench, ülül (from Falális) see figure 123 [VMM: see source].

The canoes of Oleai were considered very good.

Besides the large sailing canoe there exists a smaller type (Born: wa mar), and lagoon boats with the same forked tail figure-heads (Born: rassim); only the outrigger and the lee platform are much simpler. On the weatherside, on the baraf plank, where the outrigger begins, there is an enclosure for receiving goods and provisions (Figure 27)

4: Krämer--259-260 (1909) 1937 Woleaians-2
116, 501 Woleai

[VMM: see source]. A fishing canoe is called máluvil (Born: small rowing canoe, tschosmal; the larger type which holds 10-20 men is called wa fetal). Women are good oarsmen.

Krämer mentions bilis, breadfruit sap used for caulking. After 25 years it had a hellish smell. According to Born, cement is made of breadfruit milk, lime, ashes of coconut shell and the juice of pandanus roots.

Canoe Construction
by the sel'lap Robgail

When someone wants a new boat, he discusses the matter with the boat builder, the sel'lap. He picks out a breadfruit tree and it is felled. The tree has or receives a name which later is passed on to the canoe. The sel'lap asks: "How long is the boat to be?" The owner of the canoe-to-be: "Five fathoms." The sel'lap: "All right, let us cut four fathoms." Then the tree trunk, bul, is dragged into the canoe-house on the beach where the boat is to be built. All the men help with the transportation and they are given food for it, fish, taro, coconuts, etc., known as the bai lŭrúr oā. Later while the work is under way, the sel'lap receives three bowls of food daily and on every tenth day fifty bowls for his assistants and his family; this ration is known as the bai le fálĕfal or the bai le oā.

With the broad ax, the adze, gasuéla, the trunk (bul ĕli oā) is given the desired shape; then the stem, the mât or badj, the bab planks, and the outrigger booms, kio* are cut. When they are completed, the sel'lap receives small gifts [261] of mats and faibar, and

*This, the weatherside, is called palietam; the outer side, íketa; fale, below and from it the space underneath with its three parts derives its name: 1. fale báraf (báraf see below, 2. fale fang (fang, grating) or falesĕ and 3. o niáusap.

this contribution is known as the gakŏul lé vá. Then follow the arched luff plank, the faramoi, the gunwales on the weatherside which are called galigasa and the gunwale mesap, which connects the faramoi and badj. Everything is fitted but it not fastened together and is taken apart again. At the time of final joining of the planks, breadfruit sap (bílis) is smeared on the gunwales, and coconut husk fibers are added. Before they are moved into place, the gunwales are held over a fire for a short time. The sap is prepared by collecting the milk which flows from the wounds of the trunk in coconut shells and boiling it on hot stones. The sap is taken out under water and filled into coconut sheaths in which it is kept. Caulking is done just before the canoe is launched.

Now is the time that the thwarts are made, the dó.

1. do le fatefat on the outside
2. mát ongor
3. tívětif
4. doïalü
5. sasakio

Next attention is given to the baraf plank, the luff platform (líbarap) (faraf) and the ülingal (head rest, ülül) ma lĕ masur "his head rest for sleeping."

The diagonal braces, matárafang gird the grating, fang. The grating on the outside, in the direction of the weatherside, is called djodjo lĕlau or lelial a luluei, "sleeping

place of the god."

In order to fasten the fang to the kio (boom) two large bindings, eagatiu le baraf are used.

Now it is the turn of the interior of the canoe, the niva. The bulkheads gábung, are left standing and the hole, logolog, at the joints of the matárafang, between it and the ülingal.

Then follow the four eam stanchions (Figure 128) [VMM: see source] with their firm lashing, fofollam, and above it the transverse pole vasoso and the yoke, valeangelap, for the belaying of the luff stay, ë angalap. Photos 15b and c [VMM: see source] [262].

Furthermore, four djë, crooked outrigger booms with three transverse poles, are added; the one on the outside is called gabidjë, the one on the inside (of the pegs) daried-jë and the one on top at the kio is known as eŏpasa.

The lee platform, ëbep (Photos 15b and c)[VMM: see source] rests on two sua which are placed under the suilap and the kio. A transverse frame plank is known as volivalëbep and on it rest the two superstructure thwarts, the folag and the cross thwart, folag iës. Two frame poles extending alongside the sua are called páliebep and one that runs across on the outside is called valiëbep. The poles of the bottom of the platform are the taragalíebep, the outer grating is called fang ali ëbép, the hole in it vi eli ëbëp.

Born lists the following:

large canoe wa luwë

thwarts to lean against falak
outrigger partitions geimeru, serves as shelter against the wind

Rigging Rope, sos.

mast, gois; halyard for the sail, urur.
luff stay, eángalap; fore and aft stay, tálligas (tënegaj)
lee stay, dáugeta (iketa, lee; itam, weatherside)
gág to steer
bail, gamát
sail, li (eū); yard, juju and its heel áviteg; boom, lim.
sheet, moél (block, gárigerig)
binding of the sail, mobulíra; sections, tëlab, seams across, tëgaro.

Figure 129 [VMM: see source]: paddle, fádul with Singknopf?, róvuj eorior.

When the sel'lap has finished everything but the deck huts which he himself builds only for the great voyage, there follows the great payment, the góu sel'lap in the form of wooden bowls, faibar, mats, mosquito nets, knives, axes, etc., and anything wise that that may be available. In former times this payment might have taken the form of up to 100 wooden bowls but now the number is usually down to 30-50. Finally follow the banquet and prayers.

[ER: The words of some boat songs are given in the text, but they are omitted here.]

4: Krämer--260-262 (1909) 1937 Woleaians-5
116, 396 Woleai

The songs are:

1. Song before the voyage. With or without storm magic (goselefei).
2. Canoe construction.
3. Song after the completion of the canoe.
4. Prayer for the coming voyage offered in order to catch a large number of fish. Request for great heat, because it brings many fish.
5. Song used on the occasion of angle line fishing.]

4: Krämer--267 (1909) 1937 Woleaians
116, 562, 837 Woleai

Mertens says that the women had a lot of freedom and that, as on Feis, they came on board alone without paying much attention to the men. Occasionally they pulled up alongside of the ship in their canoes and called the names of their friends. Everything needs their consent. On the other hand, men have been known to offer their wives to their overnight guests.

At meetings and on the occasion of visits of strangers, the women keep silent.

Lütke says that many terms are taboo (pennant) in the presence of women; in case of negligence, exile threatens the offender.

It has been mentioned that the daurang [VMM: young girl] at the time of first menstruation stays in the imalipel for eight days. During this period of time, youths bring her young coconuts, but she may not have much to do with them.

After her return home, her parents and brothers and sisters ask her what young men have brought her coconuts and she names them all. An admonition follows: it is suggested that she choose one of them for a husband and not to bother with vague love affairs.

4: Krämer--268 (1909) 1937 Woleaians
116, 561 Woleai

Stages in the Life of a Woman

taráivel — girls before menstruation

daurang — girl menstruates and wears the grasscloth which is called sivísif.

nikabal — single or married women who wear the mat gabálabal

malioüteg — married woman with mat. Other terms for a married woman are: ril, fitial, čsagal, djoelevúgetal, djoele, gáneal, čtial, djoele iti telivulemel djal.

nipes — spinsters or widows

esamesoutagel — "her husband dead," widows and widowers. The former is in mourning for a year and usually is a hetaera.

4: KrÆmer--267-268 (1909) 1937 Woleaians -
116, 844 Woleai

For her confinement, the mother-to-be goes to the imalipel. The midwife, valimelau, squats between the legs of the woman in labor and receives the newborn baby. An assistant, surëlifëtël, sits behind the woman in labor and supports her. If the birth is a slow one, she calls tsong, tsong, press, press!

When the child has appeared, the midwife cuts the umbilical cord, the bus; this is usually done with a duck shell (Entenmuschel?), giligil, and without tying it off. If the afterbirth, bëi, does not follow, nothing is done about it or at most, the abdomen is massaged very lightly, which is known as sŏgi.

Born: The birth is announced by a shout which serves as a signal. Position: kneeling with her hands on her thighs or half reclining in the lap of another woman. The umbilical cord is cut with a giligil shell without being tied off. Herbs are chewed and spit on the wound. The placenta, pei, is buried....

If the woman in labor bleeds profusely, nat leaves are steamed over a fire and she sits in the vapor. When everything is over, the new mother goes to the beach and bathes [268] in salt water; other women go with her and massage her. The mother remains in the imalipel for at least four more days during the discharge of the lochia. After ten days she returns to her home. Usually her husband builds her a small imalipel in the dwelling and she stays there with the baby. The daughters of the family also stay in it for eight days when they menstruate for the first time. Soon after birth, the child, too is taken to the beach and bathed in salt water, and the afterbirth is buried. Cradle made of coconut frond plaiting. Photos 19f and h [VMM: see source].

4: Krämer--268 (1909) 1937 Woleaians
116, 846 Woleai

After having given birth, the mother remains in the imalípel for eight days to a month; the hut may be close to her home or at some distance from it. Then she spends ten days in the im ali gogobóng, "enough nights" (from sagon, enough), and five months in the im ali fam, which is probably to be translated as to "give board."

The parents or the closest relatives of the mother take good food to these houses in order that the newborn baby may grow to be healthy and strong. Good care is given to the child. Special cradles are available for them and square frames with cord netting which are covered with a pandanus mat, geagi. (Photo 7). [VMM: see source].

Hellwig: üloid, frame; wa lüloid, net; üloid, rings; taling.

4: Krämer--268 (1909) 1937 Woleaians
116, 584 Woleai

The suitor talks to the parents, and if the girl agrees, she follows him to his house. The husband presents the girl with mats, turmeric (rang), etc, and sometimes even with land; he may make these gifts to her or the family and of course the latter is most welcome.

4: Krämer--269 (1909) 1937 Woleaians

Name giving: According to the information of the native, Kadu (see Kotzebue, Entdeckungsreise... Vol. III, page 134) "the chiefs give their first-born the name of their father, the second son the name of the father of their wife, the third again the name of their own father and so forth. The masses of people on the other hand, give their first-born the name of the father of their wife and the later children other names." That is to say that here we are dealing with a mixture of father and mother rights. And the first and the third sons would have the same name! According to the genealogical table of Agupelior this would not be true; or maybe it is no longer true?

Sick people often like to assume different names and this sort of thing is also frequent for lovers.

4: Krämer--269 (1909) 1937 Woleaians
116, 614 Woleai

Sibs, geilang.

1. gailang ali Volea
2. Sauel
3. Gofalu
4. Mongaulifadj
5. Saufaladjik
6. Sor

Marriages between members of the same clan may take place as the table of house #6 proves. A marriage between relatives is also recorded for house #8.

For Namoluk Hambruch names Gatamak as 8. This clan Gadamak is said to have come from Uonë (=Oleai)

4: Krämer--269 (1909) 1937 Woleaians
116, 643 Woleai

Chief, tamol.

According to Kotzebue, Entdeckungsreise... Vol III, page 134, the brothers of the chief are first in the line of succession and after them follow the sons of the firstborn.

Stages in the Life of a Man

boy	tharemal
youth	taremál
man	mal
old man	tógobei
very old man	málelap

(Kotzebue: maul; lance, tilleg; to throw, kattevi; to hit, jel; to miss, tarami; a sling, kaul). War was almost unknown, as were spears, clubs and slings. The native, Kadu, expressed his distaste for war (see Kotzebue, Entdeckungsreise... Vol. III, page 90, 134) which he had come to know among the Rataks; he had been wounded in some hostilities. "There one does not know anything about war and fighting; there one man does not kill another man, and anyone faced with warfare had his hair turn white."

4: KrÆmer--270 (1909) 1937 Woleaians
116, 766 Woleai

Upon the death of a chief, everything becomes taboo and only the foods most necessary for subsistence are excepted. The hair is cut short. Mourning is called ðragagou. The dead are wrapt in mats (a stone is included with the body) and the bundle is tied firmly. It is taken out to the high seas and there is dropped overboard. If no rope is available, a grave, mas, is dug and after the burial, a mound marks it. Over the grave (pei), a burial hut (imalipei) is erected, and a fence is set up around it; coconuts are laid within the enclosure. Occasionally the coconuts are grated and the shavings are used for the hair; the preparation is called gavet. After a few months, large quantities of coconuts have been accumulated owing to the taboo (which may last up to ten months) and then the festival of the dead is held. It is a great banquet, gagieg, with dances, ur. The women bathe on this occasion, and put on many ornaments, whereas the men do not do anything of that kind. The food is distributed among the guests and the coconuts are divided up in a manner similar to that described in connection with the fal'lap ceremony. Taro, breadfruit, fish, etc, are distributed, but no pigs; the visitors take their share home with them.

Navigation

When a chief wishes to go on a voyage, for instance to Feis, he tells his people to get a boat ready. He himself, before setting out on his voyage, uŏfalū, spends a month in the fal'lap, which women may not enter. Here he also spends five months upon his return from his first voyage, one month after his second voyage and half a month after the third; after the fourth this period of time has been cut down to five days. No seclusion is necessary after additional voyages. In outside places no taboos are observed. This rule does not apply to fishermen.

4: Krämer--271-272 (1909) 1937 Woleaians
116, 396 Woleai

Making the boat ready implies mainly caulking (bosĕliva) in order that the canoe will not leak. It is done with uedj "cement" mixed in the following manner: coal of coconut husks is crushed with lime and the juice of expressed young husks is added, and the juice and powder mixed.

The lashings are checked. The deck huts, gaimoém, are made anew, and the ropes and the sail and, in short, the entire rigging. The hull of the canoe is painted over.

When everything has been completed, the canoe is set afloat, and as soon as a strong breeze arises, the "maiden voyage" takes place in the inland waters. If it is successful, the canoe is passed as ready for service. The captain hires four or five men as sailors, jŏliva; one stipulation is that the crew must go willingly and that the men must not be forced to accept the jobs.

The women are told to prepare provisions for the pallŭ and the jŏliva; breadfruit dough, mar, leads the list as the only preserved food. [272]

When there is a good breeze from the east (gótimei) everything is taken on board. Special care is taken that there may be sufficient supplies of young coconuts for drinking, and old ones for eating. Twenty to thirty coconut water bottles are included among the provisions; they are filled with fresh water. Finally the pallŭ comes with the storm magic. It is suspended from the deck hut, the space in which the pallŭ lives on the voyage.

Prerequisites for a Successful Voyage to Feis

favorable seas, djeger ali ĕle métau

favorable winds, djeger ali gūi (gūi, month of August)

during the good season, murilíefang, which is the name for the monsoon period at the end of the gui month. At that time, the star măl (Sirius) is visible in the sky and in the north the ŭgelík is seen.

When e álimeto appears in the morning sky, the wind is favorable (on the return voyage it is the gáp, Spica and the eramoi=aremoi, Arcturus). Unless these stars are out, the sails are hauled in and the canoe is left to drift until the stars become visible once more.

The voyage is divided into stages, gátag; a certain number of them apply to one course. The first gátag, for instance, is determined by the period of time needed by the canoe to sail out of sight of the island; it is checked by a member of the crew who climbs the mast for a better lookout. The first course by the ŭgelik lasts until the fourth gátag (northwesterly direction); the second course is taken by the constellation magĕreger, the Pleiades, and amounts to only one gátag (west); the final course is taken by the măl and it includes only two more gátag (northwesterly).

4: Krämer--272 (1909) 1937 Woleaians
116, 502 Auripik

The voyage from Woleai to Arurpeg (Aurepik) includes four gátag [VMM: see 4: Krämer 272] of a course taken by the tubutumur, the setting Antares.

The voyage from Oleai to Ifaluk has three gátag [VMM: see 4: Krämer 272] and is taken by the star ëliol, the Belt of Orion (E); if the wind is favorable, the distance may be covered in 8-12 hours. (First gátag, Oleai is visible; second gátag, sailing on the high seas; third gátag, Ifaluk is sighted). The voyage from Ifaluk to Lamotrek is made by the constellation ul, the rising Aldeboran, and is divided into five gátag. Three gátag are taken by the tagal-ügelik, one by the tagalemailap (Atair rising in the east)... and one by the tagal e golëgo.

Vŏu

lugáiapal is the term for any place where the sun happens to be at zenith, e.g., the tropics. Anything north or south is considered this side and that, peigil ma peigil.

The native, Kadu, mentions the visit of Palau (see Kotzebue, Entdeckungsreise... Vol III, page 31).

Lands (falu) in the south, countries of the black people:

In the East, South of Pikeram:

Faluelnugaraurau

In the West, South of Bunat (St. Davids):

Faluĕlidjel
Faluĕlikelau

Faluelnumáu	Faluĕliep
Faluelnúdja	Jĕvisi
Faluelnutétĕn	Námofizi
Faluelluiól	
Faluelnauporoi	Mores

These statements are of importance in view of the special nautical experience of the Oleai islanders due to old-established contacts of the Carolinians and Melanesians, but nevertheless localization is extremely difficult. In Lukunor-Namoluk Nudja is listed, which probably is the known island of Nusa at the northern tip of Tombara. Ṇumau here may be identical with Numul there; Nuiol may equal Nuol, etc., so that the Melanesian places in the past [275] most likely must have been known over a wide area.

4: Krämer--275 (1909) 1937 Woleaians-1-2
116, 502 Woleai

Kotzebue, Entdeckungsreise... Vol. III, page 127: "The two boats which Cantova saw, together with four others were on the voyage from Faloilep (Faroilap) to Ulea when they were seized by the west wind and scattered. Most of the crew and the passengers in these canoes were natives of both the island groups mentioned, and we assume that the canoes themselves must have come from those islands. The first, larger canoe, which carried 24 persons and had three cabins, is described in all detail because of some of its strange features: "a strange canoe, little different from the type common on the Marianas."

Through Chamisso, the shipwreck of the native, Kadu, became known. He was cast adrift and floated eastward and drifted around on the open seas for eight months. "The meager provisions saved lasted for three months, and for five months they lived without fresh water, merely on the fish they were able to catch. To quench their thirst, the native, Kadu, dived deep down into the water to bring up cooler water and, in their opinion, less salty water in a coconut shell. The northeast trade-wind finally carried them to the group of Aur of the Radack island chain where they had landed in the west of Ulea. A very old man on Eap had once spoken to the native Kadu of Radack and Ralick; mariners from Eap once were said to have drifted to Radack and to have come ashore at the island group of Aur; from there they found their course back to Eap by way of Nugor (Nukuor) and Ulea. The names of Radack and Ralik were known to a native of Lamureck whom we met on Guajan. Frequently boats of Ulea and the surrounding islands drift to

the islands of the eastern chains. Five natives of Lamureck are still living in the southern group, Arno of the chain of Radack; the same fate, along the same route, took them there."

These strong changes in the current are due to the equatorial counter current which extends over an area of approximately 100 nautical miles north of the equator to the west and east. On the surface, it seems to disappear before the monsoon seas of the NE; but under the surface it is active with elementary power, especially at times when calms make sailing impossible. That means that boats north of the line may drift from the extreme west of the Carolines to the Ralik-Ratak Islands.

Many additional shipwrecks might be listed but they are exceptions due to irregular weather conditions and wrong currents. A report of Mertens proves the reputation of the Carolinians as navigators as early as 1800. Mertens tells us that on Oleai the captains of native boats had shown letters to foreign visitors which had been given to them by white captains in order that, when the occasion arose, they might take them to Governor Don Luis de Torres on Guam.

Cases of ships driven off their course are known in large numbers.

Days of the Month (moon days).

See Kotzebue, Entdeckungsreise... Vol III; page 63.

1. segóuru new moon	1. lingiling
2. ëleng	2. sigaur
3. mesëleng	3. mesul
4. mesán	4. meseven
5. mesëvis	5. neselim
6. mesoval	6. mesaul
7. mesëtiu	7. mesevel

29. iéjaf	29. evan
	30. etav

It is obvious that the names do not agree absolutely accurately but are somewhat changed, but naturally the moon and its phases are the basis for the determination of the month. Since only 13-14 days are needed from one full moon to the next, the thirty days listed by Chamisso are really too much, and the same is true of the 29 I have received. This might explain that for "year" simply seikmaruou is listed which has the meaning of twelve. [277]

Division of the Day (day, rāl)

sunrise	tagajeál

Lütke, Vol. III, page 144 ff., observed the marks of scars on arms. They are the result of small cuts made during childhood through treatment with the poisonous milk of the cerbera.

Bleeding is done frequently, and the same is true of the puncture of purulent sores with the scarificator which is called fidjefidj i le vag or i le môr, depending on its use.

The former is shown in Figures 134a and b [VMM: see source]. Krämer shows one with a shark's tooth; another with claws of a crayfish; the latter are shown in Figures 134 c and d. Hellwig collected two of bamboo, wai, or frigate bird bone, or spines, falaliik, of the fish felang; the latter is used mainly for instruments to open ulcers or hydroceles.

Figure 134 e [VMM: see source] is more drill-like with a shark's tooth (Hellwig: length 35 centimeters).

The wound left by the puncture is not bandaged or covered in any way.

Lütke tells us that acanthurus stings or sharks' teeth are used for bleeding, etc.

Testicles, failimor, are readily removed in the case of inflammation of the scrotum. It is opened with a knife, the testicle is taken out and cut off. Bandaging is done with leaves. Vadjegëlog had both testicles removed.

The Caroline hand is called got úmel. A boy who was suffering from it happened to injure the second joint of the fourth finger as he was cutting palm vines. When the cut resulted in bleeding, the finger straightened out.

In our day we did not actually find any sacred buildings, but the imaliẽlus, "the house of the spirits," [279] of Eangelaf (see Kotzebue, Entdeckungsreise...page 57, name of the god: Engalap) shown in Figure 126 [VMM; see source] and located near the im Marúaru on Tagaúlap clearly points in the direction of old sanctuaries although the house itself in this particular instance is attributed to foreign influence. Raketip and his wife Lẽtago came to Tagaulap from Faróelap (Fároilap) where Uapei was worshipped as alus. They remained on the island and erected the im ali ẽlus. After many years Raketip and his wife returned to Faroelap. Here too, Eangelaf (Volea) was a secondary deity, and small containers of oil with vut wreaths were hung up on the house beam. On Falalis in the house Moelifal, Iletilimar was looked upon as alus.

Alúelap lived in the house called Fatsomai (sharp "ts") in heaven; the good souls, ngol go there, whereas the bad are sent to the im aliaf* the "house of fire."

*Unknown on Lamotrek.

Some records of 100 years ago are still available and are discussed below. The following ought to be mentioned here: Aluelap lived in the house called Fatsomal (sharp "ts") in heaven; the good souls, ngol, go there, whereas the bad are sent to the im aliáf* the "house of fire." Temples and sacrifices are not known (see Kotzebue, Entdeckungsreise ... Vol. III., page 129). Aluelap, the alus ecelap** is credited with the creation of Oleai. Down below in the depth known as i lăl he spoke to his brother Saulal: "Make a reef come up. Make some large and some small." And he also told him to make the ocean and the fish. Saulal is the god of the sea in the shape of a siren, with a human body and a fish tail.

Límagei is the mother of both. Litóbeo, their sister, sat above in heaven and tore the threads of life of the humans so that they had to die. These threads*** extended from heaven down to earth to the people who breathed through them. Their life did not stop until Litóbeo cut their thread.

*Unknown on Lamotrek.

**Kotzebue, page 128: the god (tautup) of Ulea is called Engalap; Eóngelap is the spirit of Volea.

***melovai, my thread of life; eŏli mélovas, our threads of life.

Aluélap married Illámalun. Their children were Lúgeileng* (= lúgelleng) and Simĕlegóror who made all things, the sun, the moon, the stars, canoes, houses, wooden bowls, tattoos, etc. His name is said to mean "all things" but Simĕ is probably to be explained as simes "death" as can be seen below in connection with Simĕlegĕreger.

Ligereger was a quarrelsome goddess of unknown origin. At one time she had an argument with the moon and she called to him:

simĕ Ligéreger, simĕ serĕl! (simes, dead)
dead Ligereger dead thou!

i.e., when I die everyone shall die!

The moon replied: it is better if it is the way it is with me.

The young moon (ĕlúelang) is the youth,
and the waning moon (tógovei) old age! [280]

Lúgeileng, the oldest son of Aluelap came to Veisálop* and married a woman

*According to Kotzebue, Vol. III, page 129: His mother is Leteugieul from Ulea; page 56: God, tautup, the same term that is used on Yap. The invocation on the occasion of sacrifices was wareganam gure tautup. People, tautup.
**from sólop, earth.

of whose origin nothing was known.* She bore Olefat. Lugeileng had gone away for some time but he returned when she was still pregnant. She was very big but could not give birth. Lugeileng told this to his father Aluelap and the latter sent him back to Veisalop with the suggestion that he place a bellik shell on her head when she felt pains and was frightened. He did as he was told, and suddenly Olefat rose from the head of the woman. The baby cried a great deal. When his mother worried what might be the matter with him, he said: Give me a coconut. His mother immediately went and fetched one and wanted to crack it. But the child said that all he needed was a hole in it. When his mother had made a hole in it, Olefat sucked at it and, bending his head back to do so, he noticed his father Lugeileng in heaven. Then Olifat told his mother to light a fire and when smoke rose from it he got into the cloud and went up to heaven on it. Thus he came to Lugeileng. Olifat was evil; he was never satisfied and changed his appearance continuously. At one time he came with a swollen leg, then with an inflamed testicle, sometimes tattooed and sometimes handsome and sometimes ugly but never changing.

* Kotzebue, Vol. III, page 129: Lugeleng had two wives, one in heaven and one on earth, Hamulul and Tarisso (Elamalor; page 146 and Tarisso page 147). The latter was unequalled for bearty and other gifts; she gave birth to Olifat. Cantova earlier wrote that Tarisso came from Falalu (Fananu).

Whatever he had just taken on, he threw off very quickly.

He went to Mores in Melanesia, and it is said that there he devoured some human beings.

Finally Olefat was killed in a strange place. When Lugeileng brought this news to Aluelap the latter said: "Let everything come up that is of any value; I shall destroy the place." As a punishment he dispatched flies, mosquitoes, sharks, etc.

Lütke tells us a few things about the religion, but it is uncertain whether everything deals with Oleai. There is also doubt about the following report by Freycinet, which does not seem to be without importance for the total picture and therefore shall be treated here: Hammo or Hammulap can be seen only by a few, but they hear him and serve as media for his orders, through shamanism. Even children may be the carriers of his news. The obsessed howl and have convulsions. Shamans are covered with oil, painted, and carry two lances; they shout as they approach. They attack the sick person who rises and tries to defend himself. They fight, then throw away the lances, and dances of the rods are performed for days and sometimes for weeks until the sorcerer is definitely the victor. Thus the will of Anulap becomes known. An annual festival is celebrated for Anulap and lasts for an entire month. It means that the men must stay away from women often up to two months. No sail may be hoisted, and during the first week no boat may set out to sea. Strangers are not allowed to land on the island. Four days before the main celebration, coconuts and breadfruit are gathered. The morning of the principal day is spent fishing. [281] Then everyone goes to the temple, led, which is an ordinary house. It is closed for one night. The next morning after sunrise, while the population is assembled, the chief enters the house through the northern door. He is elaborately ornamented and carries a stick in his right hand, with which he apparently feels his way. He looks down in front of himself and mumbles to himself. His brother, leading a small group of islanders, enters the house just before the chief through the

door on the southern side. The people are seated, but rise when the chief enters and sits down on three beautiful mats. Then the others may also sit. No one else is allowed in the sanctuary. The brother goes up to the provisions that are set up and takes a little from each one of the fifty dishes. He gives the largest fish and the biggest coconut to the chief with a basket and cracks 50-60 nuts for him. The rest he distributes among the people present and then sits down next to his brother to partake of the breakfast with him. As remuneration for his services, he receives the husks of the nuts, which are of great value for the making of ropes. Within half an hour everything is over. Now the house is once more accessible for anyone. Only the ashes must not be touched. Sick people usually stay in the building, but not alone for fear of Anulap.

4: Krämer--281 (1909) 1937 Woleaians
116, 776 Woleai

The three gods of the Carolinians* are Alouhilap =Alúelap, Lougheling =Lugeileng, and Olifad =Olefat.

*The same are mentioned by the native, Kadu see Kotzebue, Entdeckungsreise... Vol. III, page 129. In other instances 7 gods are named: Ligopoup, Kantal, Alouilap, Litefeo (see Litobeo), Houlagouf, Lougheling, and Olifad.

4: Krämer--281-284 (1909) 1937 Woleaians-1-C
116. 173 Woleai

The origin [VMM: of the three gods of the Carolines] is explained in the following manner: since eternity there existed a goddess Ligopoup, the creatoress of the universe. She made Aluelap* the inventor of the sciences. His son is Lugeileng** whose mother is unknown (Ilamalun). He had two wives, the divine Ilamoulong (Ilamalun), and the mortal Tariso who was of a rare beauty (the same is said by Kotzebue, page 129, and also the following is presented there); she gave birth to Olefat four days after the beginning of pregnancy. The child was completely covered with blood, bit off his umbilical cord and started walking immediately after he was born; but he would not allow anyone to touch him and when someone wanted to help him to get cleaned up he said that he would take care of himself. He rubbed his body against coconut trees and that is the reason why they are often so red. When his mother gave him a young coconut to drink, and he bent his head back and looked up he noticed his father Lugeileng, [282] and he addressed

---

*The same in Kotzebue, Vol III, page 129: according to Cantova (Freycinet, page 115 Eliulup) he is the son of Sabukur and Hamelul and his sister is Ligobuud. Eliulup married Letöhiöl of Guliai and they had a son Lugheileng, whose name has the meaning of "center of heaven;" then he adopted Reschahuileng (Krämer: who is he?) a youth from Lamotrek. Ligobuud had three children.

**Lugeileng had two wives (according to Cantova) a divine one who gave birth to Karrer and Meliliau; the other came from Falalu. The reference is to Tarisso.

him right away. And immediately he and his mother climbed up to heaven. When Olifat entered heaven, he came upon children who were playing with a shark which they had tied by its tail.* The fish pretended to be paralyzed in order that he might remain unnoticed and for that reason the children were afraid of it.** Olefat wanted the fish but none of the children would let him have it, with the exception of the boy who was holding the line. He gave the line to the stranger and thus Olefat could play with the animal. After some time, he returned the line to the boy and told him not to be afraid in case the fish should become wild, for he would not do him any harm. Olefat made magic as a punishment for the other children who had refused his request. And the shark suddenly got big teeth and he bit the unobliging children.

And Olefat thus punished all those who did not give in to his wishes and they were many in number since they did not know the god.*** Once he asked the workmen engaged in

---

* In Kotzebue we find the statement that they were afraid of him and did not touch him because they thought him leprous.

**Kotzebue, Vol. III, page 130: "in order to remain unrecognized it pretended to be leprous. The children thus kept away and did not touch it."

***Kotzebue adds here: "Since no one knew him, and he had not yet come to his father who was the only individual who recognized him, they threatened his life."

the construction of a house for a knife with which to cut the coconut fronds that were to be used to cover the roof. Only one of the men listened to his request, and all the others were transformed into statues.

Lugeileng and Aluelap knew that Olefat had gone to heaven. When they learned of the transformation of the workmen, they asked the man who had been spared this fate whether he had met anyone. His reply was that he had not met anyone but a kandoura bird (and that was the shape Olefat had assumed). They told him to call the bird. But the bird was frightened by the voice and escaped. Lugeileng told the workman to call once more, but without saying that the bird should come to him as he had done before. As a matter of fact he was to order the bird to stay away because its presence would be most unwelcome to the chiefs. The man obeyed the order and forbade the kandoura to enter the house and to occupy the place of the more important people. But the kandoura acted counter to the command. When the kandoura had come, Lugeileng called all the metamorphosed people. They all came much to the surprise of all those present. For only Aluelap and Lugeileng knew that the child was Olefat.

The construction of the house was continued. When holes were to be dug for wall posts, Olefat took this task upon himself. This pleased the other men greatly because they hoped that that would give them a chance to kill him in revenge for what he had done to them and for fear of what he might think up for the future. But olefat guessed their intentions [283] and supplied himself with red earth and with coal and coconut leaf ribs,

which he hid carefully. Then he dug the holes but he included niches in order that he would be able to hide. When he had finished his work, he announced it. And the men took one of the posts and dropped it on him and filled the pit with sand and believed they had suffocated Olefat. But Olefat escaped into the niche at the side, and chewed the red earth, and threw it out. His murderers thought that what they saw was his blood. And when they observed the coal which was chewed in the same careful manner, they thought that it was gall and jumped to the conclusion that their victim was dead. In the meantime Olefat was busy drilling a passage through the post with the rib of his coconut leaf. And he climbed up through this channel and sat down on top without being noticed. It is since this time that the trees have hearts. (This sentence is omitted by Kotzebue).

When the work was completed, the workmen got together to eat. Olefat asked an ant* to pick up a little piece of coconut for him. The ant did what it could. Olefat with his divine powers, changed this very tiny piece into a whole nut and spoke loudly: "Look, I shall crack my coconut." At these words the men turned and were surprised at the fact that they had not killed the speaker. Now they realized that he was an alu (Kotzebue: alus) Thus they abandoned their murderous scheme and told him to take food to Thunder. Olefat happily walked off, but as a precaution he took a stick with him. When he entered the house of Thunder he said: "Stop, I am tired from carrying food for your crooked

*In Kubary, the ant has another task, and not that of bringing food.

mouth!" Thereupon the thunder was about to fall over him but Olefat slipped into his bamboo stick and thus saved himself.* Thus he executed his order without harm to himself which greatly surprised his companions. They sent him out once more with fish food of the botete de espinas** as the Spaniards call it. Olefat left once more armed with nothing but a shell. When he entered the house of the fish, the latter held the door and wanted to prevent him from going out. But when night fell, he placed the shell on the upper jaw of the fish and walked over him. That is the reason why this fish has an indention in that part of the body.

Finally he was given food for the long-mouthed fish, which was called fela. When Olefat did not find him at home he handed the food to those who happened to be around and left. They told it to the fela when he returned and asked who had brought him the food; but the others did not know him. Then he took a hook on a long line and [284] threw it in all directions. Thus he caught Olefat in the north and managed to kill him.

When Olefat did not return the workmen celebrated. But Lugeileng went to search for his son and when he found him lifeless and full of worms, he woke him and asked him who had killed him. Olefat answered that he was not actually dead but merely asleep.

---

*Kotzebue adds here: "The Thunder could not find him and thus stopped pursuing him."

** bote, blow; espina, sting; probably the synanceia which had an indention for the stings. The ray is called raya; this is omitted in Kotzebue.

4: Krämer--281-284 (1909) 1937 Woleaians-6
116, 173 Woleai

Lugeileng called the fela fish before him and with a stick beat its upper jaw. That is the explanation why the upper jaws are shorter than the lower ones. Thus the three gods brought justice into the lives of the people.

4: Krämer--284 (1909) 1937 Woleaians
116, 802 Woleai

Counting. For counting a string with knots is used; Kotzebue, Vol. III, page 89 says that in this manner the native, Kadu, kept track of the months of his stay on Ratak. Hellwig shows a specimen (Figure 133) [VMM: see source] with which Géaf, the owner of a house counted his palm trees. (100=100).

Kotzebue, Vol, III, page 132: "Several people may not eat fruit from the same cluster of bananas. Only the person who has eaten one of the bananas should eat the others."

[ER: The formula for storm magic follows, but is omitted here.] The rain and the storm shall pass. The sorcerer uses his wand while he speaks these words.

Above it was mentioned that the sorcerer's wand was taken on board and details have been discussed in the section on Lamotrek. I heard about the ray stings on Volea, that Paluelap carried a spear with ray stings with him on his journey and that he punished wrong doers with it. Ray stings were considered fearful weapons.

The name Aluluei here again is derived from alus levêi, the spirit of travel. One says.

i bale vai	I travel
go bale vai	you travel
oa levei	the boat travels, voyage, canoe for high sea voyages.

I found a gosilifei 52 centimeters long and with four ray stings (two of them had broken off in the typhoon of 1907) in Mariong in the canoe house called Falefō; Figure 132c [VMM: see source]. An old form is represented in Figure a, Krämer which instead of the head has only a slab and where the body is made of two sticks. Another old specimen is in the Museum in Hamburg.

4: Krämer--285 (1909) 1937 Woleaians
116, 538, 177 Woleai

The repertoire of stories was meager and it seems that the tradition and relation are not furthered very much.

A certain substitute is the long story of Palúelap which was mentioned in connection with Pollap.

I heard it on Lámotrek and recorded it there and that fact ought to serve as some indication that it came from a region further east, from Bon'nap [VMM: see 4: Krämer 291]

The Story of the Sons of Paluelap, Rongerik, Rongelap, Aluluei and Faravai.

Paluelap of Polap had two sons, Rongedjik and Rongelap. The latter took little notice of his father. Rongedjik, the younger, always gave part of the food that he was given or that he was given on Truk and other islands to his father, on the other hand, and for that reason his father loved him and introduced him to the secrets of navigation. When Rongelap heard and saw this, he was angry and complained and beat his father and his father asked him why he was behaving as he did, and Rongelap asked: "Why don't you pass your knowledge on to me?" And the old man answered: "What reason would I have for doing it?" Rongelap replied: "But you happen to be my father!" "That is true," said Paluelap, "but you do not take care of me like your brother, and because he has been good to me he has learned everything." But to pacify his son, he started to instruct him, too, but not very thoroughly. When Rongelap went out on a voyage he missed his destination. He came to a large coconut palm bearing fruit, which stood in the middle of the ocean, and he told a man to climb the tree and to throw the nuts to him into the boat which was waiting below. But a large black lizard sat on one of the nuts that were thrown down; it seized Rongelap and bit him in half and he toppled into the ocean.

When Rongelap did not return Paluelap said to Rongedjik: "Your brother has not returned; go and look for him at the palm tree!" Rongedjik quickly sailed to the spot and he found the crew of the canoe of Rongelap and he asked them: " Where is Rongelap?"

Their answer was: "He lies in the salt water!" and they told his brother about the happenings. And Rongedjik practiced some magic which his father had taught him, and thus he found the two parts of the body of his brother and he put them together. When he had returned to life, Rongedjik asked him what he had done and Rongelap answered: "I have slept."

Rongedjik had more questions: "What? Didn't you lie in the water? Why did you try to pick the nuts?" Rongelap answered: "We were hungry!" Thereupon Rongedjik brought the nuts and they ate.

When they had finished their meal, Rongelap wanted to leave and started on his course. His brother called to him: "Whence are you sailing? The course which you are steering does not take you to any land." Rongelap did not pay any attention to the words of his brother [286] and sailed off. After a long voyage he found a man called Sauperon who was standing on a reef and fishing. Rongelap asked him for some fish but he refused to give him any. Rongelap flew into a rage: "If you don't give me any I shall kill you." And the fisherman seized him and drowned him. Rongedjik sailed after him and asked for his brother. He was pointed out as his body drifted in the water. Rongedjik asked the dead man: "What are you doing?" And the body answered: "I am sleeping." "No," he called, "you are dead." And he made magic once more and Rongelap revived.

And again they took a meal together. And Rongelap wanted to sail away. His brother

warned him: "You will not find any land and you will lose your life once more!" But he did not heed this renewed warning and left and Rongedjik followed him to protect him.

On his way, Rongelap saw a large taro and he tried to pick it. But the plant dived down into the water like a fish. Rongedjik watched and he jumped into the water and brought up the taro and the brothers ate it together.

Rongelap continued on his voyage. Next he came to the small island of Pianipaluelap where two old women lived in a hut. They were sisters of his father Paluelap and they were busy plaiting a sail for him. Rongelap had lost his sail and he wanted the new one, but the two women would not give it to him in spite of his threat to kill them. "It is better to die than to give the sail away," they called. When Rongelap lifted his arm for the fatal blow, it suddenly became paralyzed; Rongedjik found him thus and asked him what he was doing. And he told him of the happenings and said: "Don't you see that I am unable to deliver the blow?" And Rongedjik replied: "Do you really want to kill the sisters of your father?" "Yes, they are not good!" Then the younger brother asked the two old women for the sail and they gave it to him most willingly, and he handed it over to his brother.

The evil spirit of Rongelap was not yet broken. He sailed off once more and his younger brother followed him. Soon Rongelap ran out of food and water. When Rongelap was lamenting this fate, Rongedjik called: "What, don't you know the water of Paluelap?" There were great breakers around them but Rongedjik made his magic and brought water

up from the ocean although they were far from any land. He gave this brother a drink; the latter was by now overcome and the evil within him was conquered and he gave in and returned to Polap together with Rongedjik. Remorsefully he went before his father and from this time on he strove to treat him well.

At that time there was a kulung bird on Truk which devoured so many humans that almost all villages were wiped out. The bird also ate all taro, breadfruit and coconuts. From Truk it went to Poloat and acted in a similar manner and then it moved to Sog. [287] Sätowan, Namodjek, Ifaluk, Voleai, Aurupek, Feis, Mogemog, Sorol, Eap, Ngolu, and Bannoë. And on the way back it came to Polap.

Inesavo, the daughter of Paluelap, had been ordered by her father to receive all canoes coming from other islands and to take them to the village. When the Kulung came flying she said: "Come, you may have some food." "What," shouted the Kulung, "all the other places have not had enough food to fill my stomach and this small spot is to satisfy my appetite? Yours is mockery!" Inesavo took a taro and crushed it, put it into a coconut shell and poured expressed milk on it; then she cracked a young coconut and took both into the house where the Kulung sat. The Kulung laughed: "That is to be my food?" The girl answered: "Go ahead and eat, there will be enough." And the Kulung ate and drank and he could not finish it; more and more new food grew in the bowl. When his stomach was so full that he could not eat any more, he wanted to return to Truk.

Inesavo and Paluelap gave him more food to take with him on his flight--200 huge baskets filled with taro and two gigantic coconuts; all this they fastened under his wings or tied around his neck. The bird flew off completely satisfied and happy. But when it was over the open sea Paluelap made effective magic so that the wind died down, and the Kulung fell into the ocean and was devoured by sharks.

The wife of Paluelap was pregnant. He said to his sons Rongedjik and Rongelap: "The boy, Aluluei in the womb of my wife hears everything; when he is born he will soon sit around the house." And that is what happened. Aluluei had extraordinarily evil powers. When Paluelap took a meal he always gave food to his youngest son. His two older brothers hated him for this privilege, and favoritism which was obvious at all times. They constructed a large canoe but they did not supply it with outrigger booms. And their father asked: "Why did you not cut any outrigger booms?" The two sons answered: "Send us your men so that we shall be able to cut the two booms." Paluelap told the little Aluluei to go into the bush and to cut the booms. Ringelap first ordered the boy to climb a faliap tree. While he was working on top of the tree, the two brothers threw stones at him so that he fell off. And they "scratched" him and beat him until he died. When they had killed him they wrapped the body in coconut leaves, weighted the bundle with stones and dropped it into the ocean. Then they returned to their work.

Paluelap came and inquired about his youngest son, although he knew quite well what had happened. He went into the bush and made magic, and called Aluluei back in the

form of a spirit invisible to the others. As a protection against attacks, he set many eyes into his head* so that he was able to look in all directions and his eyes were like the stars on the firmament. Paluelap from now on suggested to him continuous theft and told him to carry off anything that he could get hold of, coconuts, taro, women, etc. [288] And Aluluei did as he was told. Soon Rongedjik and Rongelap came to their father and shouted: "who is it who takes all our belongings? Who is it?" Paluelap answered: "I don't know. But if you wish to find out make a canoe** with a hut on deck and set it

*That explains the janus head of the storm magic.

**A finished canoe had to have rigging and the father told the sons to get it ready. He showed them the sheet. When they asked for the name of the rope he said it was moel, because it means to scratch, and because they had scratched Aluluei. Similar words of vengeance were:

halyard	urur to snatch away
stay	tenegaj
luff stay	eangalap to fight a great deal
bail	gamat to leave underneath upon death
sail	eu rope around the neck upon drowning
rope	sos blood, dja.

And the two were so startled and frightened that they did not dare ask any more questions.

afloat; then he will come." The two brothers did so, and when Paluelap saw the canoe afloat, he sent men into the bush to call: "How beautiful is the canoe of Rongedjik and Rongelap." Aluluei soon heard their calls and in visible form went to the beach and looked at the boat which was indeed magnificent. He went on board and observed all details and then returned to the bush. When the two brothers noticed the man aboard their canoe, they told Paluelap about it. And the old man asked: "How many deck huts are there on the canoe?" Their answer was: "One." "Very well" the father went on, "you will have to build a second one." They did so, and when the second hut was finished and stood on deck, Paluelap once again sent people into the bush to proclaim the beauty of the boat. Aluluei heard it and thought: "That is good for me." He called 40 rats together and went aboard the canoe with them while Rongedjik and Rongelap sat on the beach and in amazement saw the boat set sail. They only saw one single man and could not understand how he alone was able to do such heavy work. "That must be our dead brother Aluluei," they said. When Aluluei went on board he took sand and pandanus along. When he had sailed out on the high seas, he dropped the sand and an island resulted. He took one of the huts on deck with him ashore to live in it and he planted the pandanus. He dwelled on his sand island, Pialaluluei, for a long, long time and lived there long after his two older brothers were dead.

In the meantine a fourth son, Faravai, was born to his father. He also was instructed in the art of navigation, of which Aluluei was now considered the god; and one day he set

out with five canoes to visit some of the outside islands. When he was on Truk, he and his four companions received gifts of food. The other four men took part of their fish and coconuts and laid them aside as a sacrificial offering to Aluluei, but Faravai put away only the skin of the fish and the coconut husks and covered them with taro leaves as his tribute to the god. Aluluei, who saw everything, noticed it and said: "All have given me good things, but Faravai has not had enough to give to me." [289]

When the five boats sailed homeward, to Polap a storm arose and shattered the canoe of Faravai. The other four reached their native islands, but Faravai was forced to try and see how far he could get on rafts. He arrived on Pialaluei. When Faravai stepped ashore, Aluluei sat with his back to him and said: "Ah, you are coming, Faravai?" The latter was surprised that the stranger who had never seen him should know him, and he asked him: "What is your name?" and Aluluei replied: "Don't you know me? How is it possible that you should not know me although I know you." Faravai spoke: "I don't know you!" and Aluluei: "What, you don't know me? I am Aluluei." And the questions and answers went on:

"What are you doing?"

"Nothing. Whence are you coming?" Faravai related his adventures.

Aluluei thereupon said: "Well. Come and twist some rope for me."

"I am hungry."

"I have nothing to eat. Look at my land. But here are taro-leaves and underneath them the skins of fish and coconut husks."

"That is not good food."

"What, that is not good food, although you yourself have given it to me; now go eat it yourself."

"But over there lie taro and fish and breadfruit."

"Yes, they were given to me by your four companions and they do not belong to you."

Faravai became very sad. Aluluei continued:

"Here is a bellik shell with water; you may drink it."

"Oh, that is nothing at all."

"Go ahead and dring it, it will be sufficient."

Faravai drank and drank and quenched his thirst. Then once more he started to complain of hunger and Aluluei finally said:

"Go to the water where there are fish. Catch them."

Faravai saw a karangab fish and he went and was easily able to catch it by hand and he took it ashore and lit a fire. Upon order of Aluluei he cut up the fish to fry it. First he removed the tail: thereupon the flesh disappeared from the legs of Aluluei; then he cut off the belly of the fish and the body of his brother vanished and the same happened to his intestines, the head, the back and the sides. As soon as he cut off any

part of the animal, the corresponding parts of Aluluei's body disappeared and when Faravai looked around he noticed a skeleton sitting next to him. And he shivered with fright.

"What is the matter with you?" asked Aluluei

"I am dying, I am dying."

"No, don't be afraid of me, I shall not eat you."

"Why do you do such evil?" [290]

"You have not treated me right. In the future consider the following: the tail belongs to me and the belly with the stomach, and the back and the eyes of the fish."

"All right, I shall remember and observe this."

Now Faravai did not feel like eating but Aluluei said:

"Do eat. When you get home always lay the mentioned parts aside as belonging to me. Not until you have eaten the others may you eat my share."

"That is fine. I shall now go home."

"All right."

"But I don't have a ship."

"Delouse me."

Faravai did so but became scared when he noticed the eyes hidden under the hair. He trembled:

"What is wrong with you?" Aluluei asked.

"You have eyes in your head and on your head."

"They do not matter, they are not eyes, but stars."

And he explained all their names to him, the stars of the east, the north, the west and the southland. Then he said:

"Now you can go."

He drew the outlines of a canoe in the sand and uttered a magic formula, and suddenly a beautiful canoe was afloat in the water. Faravai set out on his voyage to Polap, but his canoe broke on the way, because it was made of phantom sand. A shark swam towards him. And Faravai called: "Take me to Polap."

But the shark would not take him. Then there came a dolphin.

Faravai called once more: "Take me to Polap."

But the dolphin did not want to take him. Finally a turtle came as his saviour. She let him ride on her back and took him to Polap. When they arrived outside the reef she said: "Well now get off." But he begged her to take him a little closer to land. When they approached the beach, the turtle once more asked him to get off her back, but he wanted to ride a little further, and even when they stood on land he ordered her to take him up to his house. When he had finally arrived there he called his people and shouted: "Catch the turtle." And they caught, and killed and cooked her.

Faravai had two sons who were his confidants in all matters: they were Vorieng who married bad women, and Falus who married good women. Vorieng desired the wife of

Falus. He thought up a scheme to remove his brother. He invited him to sail with him to Truk to get mats, turmeric, red shell slabs, and breadfruit dough. Falus sailed with him and they were lucky in their purchases. When the canoe was on the return voyage and was once more approaching Polap, [291] Vorieng was astern steering while Falus was holding the sheet. Vorieng called to his brother that he should come aft and take over the steering job. When he came, Vorieng pushed him so that he fell overboard into the ocean. "Save me, save me, Vorieng!" he called, but Vorieng answered: "No, you shall die," and he left his brother behind. Vorieng reached Polap alone and told the people that Falus had lost his life. Then he married his brother's wife. But Falus swam and found a bamboo, and he crawled into it and thus drifted to Polap. His former wife happened to come down to the beach and Falus called to her: "Don't you know me?" 'What," she said, "you are not dead." Falus told her what had happened. Both went into the house, and Falus hid under the roof. Vorieng was in the large canoe-house, and told his wife to cook taro because others had already gone out fishing.

The wife cooked a large quantity of taro and took it into the living house. Falus came down from his hiding place under the roof; he climbed into a large wooden bowl from Truk and the woman covered him with the taro so that he could not be seen at all. Then she called to Vorieng that the taro was ready and that they could eat. When the fish were hauled in, Vorieng had the bowl brought into the canoe-house. Many people got

together for the fish meal. Vorieng touched the bowl to dish out the taro, and Falus bit his hands. When Vorieng suddenly saw his brother, whom he had believed murdered, he was so frightened that he died. Falus climbed out of the bowl and told the people of the evil deed of his brother. Then he distributed the food and was mindful of the shares of Aluluei, Paluelap and Vorieng. And all the people ate and rejoiced.

DRUCK UND EINBAND VON J. J. AUGUSTIN IN GLÜCKSTADT-HAMBURG-NEW YORK
PRINTED IN GERMANY

IV

V

Vorwort.

Meine Arbeit auf den Karolineninseln ist mit diesem Bande beendet. Die Manuskripte waren nach 26 Jahren noch vorzüglich erhalten und werden zum Nachweis und Nachschlag mit denen der übrigen Expeditionsteilnehmer im Hamburgischen Museum für Völkerkunde aufbewahrt. Ebenso die Lichtbilder, von denen im Text oft nur die Originalnummern angegeben wurden, da nur wenige auf den Lichtdrucktafeln gebracht werden konnten. Im Text sind zahlreiche Seitenverweisungen vorhanden, da ein Namen- und Sachenindex erst am Schlusse des ganzen Werkes erscheinen wird. Im übrigen gibt das ausführliche Inhaltsverzeichnis genügend Aufschluß. Die Eingeborenenwörter sind in einzelnen Fällen an verschiedenen Stellen etwas verschieden gebracht, absichtlich, damit erhellt, wie in den einzelnen Fällen gehört wurde.

Zum Schluß sei auch hier der Deutschen Forschungsgemeinschaft, der Hamburger Wissenschaftlichen Stiftung und dem Herausgeber Prof. Dr. Thilenius der schuldige Dank dargebracht, daß sie es ermöglicht haben, das umfangreiche Expeditionswerk herauszubringen, das in der Geschichte der Völker einzigartig dasteht.

Augustin Krämer

I. Verzeichnis der Farbtafeln.

[Tafeln am Schluß des Bandes].

Tafel 1
Junge Frau von Lámotrek (E. Kr. 34)

Tafel 2
Inneres des Boothauses Aboi (Je boi) auf Lámotrek (E. Kr.)

Tafel 3
Das Haus No. 10 Faludj des Zauberers Molodádjeg auf Feis. Am Giebel Weiheboote *gáobl;* neben dem Häuptling der Weihekorb *botau;* am Ramenbalken Blütenkränze und zwei Matten (links Feis, rechts Mogemog); rechts Häuser des Gehöftes, ein Papayabaum, Crinumbüsche. (E. Kr.)

II. Verzeichnis der Lichtdrucktafeln.

Eigene Lichtbilder (A. Kr.) außer Taf. 5, 6, 7b, 11, 12, 20, 21, 26b und 28.
Besonders die Bilder von Feis sind vielfach mangelhaft, da die Platten verdorben waren.

Tafel 1
Lámotrek a) Die drei Häuptlinge Sûkurang (Mitte) H 24a, Boésu (links) H_4 und Urûpo (rechts) H 10 (Kr. 380)
b) Westbucht, Blick auf Boothaus Aboi und Lugal nordwärts (Kr. 391)
c) Blick von Lugal südwärts nach Lewis' Haus Ngalangisét. (Kr. 374)

Tafel 2
Lámotrek: a) Vólimar H. 2. (Kr. 374)
b) Ikisera H. 25 (Kr. 391)
c) Tilibou H. 10 (Kr. 378)
d) Ikelur den Ikisera besprechend (Kr. 393)

Tafel 3
Lámotrek: a) Meropomar und Ngasegoul (Mitte) (Kr. 385)
b) Eaumal und Ligaur (Kr. 379)
c) Frau mit Kind. (Knotenmatte) (Kr. 372)
d) Bessie Lewis, Halbblut (Kr. 373)

Tafel 4
Lámotrek: a) Inneres Boothaus Faletaipu mit Weberinnen (Kr. 388)
b) Cordiagebüsch s. Plan Lámeteg (Kr. 384)
c) Urupo mit Zauber und Horn (Kr. 377)
d) Sturmzauber am Strand (Kr. 1024)

Tafel 5
Lámotrek: Netze u. Körbe, a—n (Ph. Hamburg)

Tafel 6
Lámotrek: Webmatten, a—i (Ph. Hamburg)
a) Kr. 515. b) Kr. 511. c) He. 2268. d) Kr. 512. e) Kr. 510. f) Kr. 463. g) He. 4620. h) He. 2313. i) Kr. 508

Tafel 7
Lámotrek: oben: Webmatten, Slg. Tübingen: a) Kr. 400, helle Streifen, bräunlich, Herkunft unsicher. b) Kr. 412, feine Männermatte *mattei* von Mogemog. c) Kr. 410a Setoval bräunlich. d) Kr. 416, Mustermatte von Bessie angefertigt. e) Kr. 405, f) 404a. g) Kr. 401, bräunlich, *lügülli widj.*
unten: Schüsseln, Wiege, Zauber, Stößel, Spatel, Cassisschnecke Stuttgart (Ph. Linden. Museum)

Tafel 8
Lámotrek: a) Haus 12 Eaupil mit Knaben (Kr. 382).
b) Gehöft 25 Olibaba mit Holzscheiben (für Schüsseln) (He. 45)
c) Haus 25 des Ikesera (Kr. 1023)
d) Haus 25 des Ikesera (Kr. 1025)

Tafel 9
Lámotrek: a) Gehöft 6 Volledj (Kr. 376)
b) Gehöft 16 Lémar (Kr. 409)
c) Boothaus (b. Jeloi); Inneres; Wohnung A. u. E. Kr. (Kr. 390)
d) Grab- und Geisterhaus Rolimei (Kr. 397)

Tafel 10
Lámotrek: a) Marolipei, H. 8 (auf Stützen), und Iserep (Kr. 375)
b) Skelettmann Auroliga (Kr. 383)

c) Togauo, Legarētipa (stehend), Dagaurang im Fischkorb, Faimara (rechts), an der Traufe ein Hauszauber (Kr. 402)
d) In der Webschule (Feis) (Phot. 237)

Tafel 11
Elato: a) An der Binnenseite (Ham. 104)
b) Boothaus Lotóa orn. Sparren (Ham. 53)
c) Boothaus Lotóa mit Boot und Gruppe (Ham. 54)
d) Boothaus Lotóa, Inneres, Schmuck-Traufenbrett und Sparre, Bindung (Ham. 48)

Tafel 12
Elato: a) Wohnhaus mit Wohngiebel (Ham. 107)
b) Boothaus (Ham. 108)
c) Boot am Strand und Sturmzauber (Ham. 111)
d) Weihehaus für Gott Füs (Ham. 109)

Tafel 13
Oleai: a) Boothaus A Ungàlél von der See (S.) aus (Kr. 292)
b) Boothaus Ungàlél von der Seite (Kr. 291)
c) Tanz vor dem Boothaus. W. von A. (Kr. 323)
d) Häuptling Agupeliór vor seinem Haus 19, Galéngatagoi (Kr. 302)

Tafel 14
Oleai: a) Familie des Oberhäuptlings Agupeliór (rechts von ihm: Letaigoluk, Letaséguiol und Fetal; links von ihm: Levólimar, Fauas und Lotjelimar) (Kr. 318)
b) Haus 2, Nefaibugor, Hausherr Rangitaliba (H. 17) (links von ihm Mann Laigelik und Tochter Lielimar; rechts Leavilipei und auf ihrem Schoß Logafeuvi, dann Ilertúmar) (Kr. 301)
c) Haus nach dem Taifun auf Falális (mitten Frau Imalifam, rechts Faladis) (Kr. 300)
d) Volelngei und Meilega (Kr. 304)

Tafel 15
Oleai: a) Gehöft 3, Matalik (Kr. 287)
b) Segelboot am Strande (Kr. 288)
c) Ausleger eines Segelbootes (Kr. 290)
d) Häuptling Rogiol von Tagáulap (Taf. 16d) in einem Boot sitzend; Schrift an Diagonallatte darüber (Kr. 294)

Tafel 16
Oleai: a) Oberhäuptling Agupeliór (Kr. 342)
b) Malitil, Häuptling von Davokúol (war auf Samoa) (Kr. 338)
c) Danáliba, Haus 15, mit Crinumblüten; Ohrschmuck (Kr. 337)
d) Rogiol (s. Taf. 15d) von Tagaûlap (Kr. 343)

Tafel 17
Oleai: a) Gehöft auf der Insel Tagaûlap (Kr. 346)
b) Haus mit ungedecktem Giebel auf Falális (Kr. 299)
c) Weberei vor Haus 15 Limaraurau (Kr. 369)
d) Segelnähen (Kr. 363)

Tafel 18
Oleai: a) Hauswand und zwei Kinder, Dainer und Guruam (Kr. 310)
b) Lagajoten und Sarafalimal, Haus 2 (Kr. 317)
c) Halbblut (engl.) Lélopi, Haus 20 (Kr. 341)
d) Knabe mit Crinum (Kr. 329)

Tafel 19
Oleai: Flechterei, Fischkörbe, s. Taf. und Text, Wimpel K 236a (Phot. Hbg.)

Tafel 20
Oleai: Weberei, s. Tafel und Text (Phot. Hbg.)
Oleai: Webmatten, a) He 1776, 260 cm lang, 61 cm breit, b) He 1851; c) He 1778; d) Kr. 953, 193 cm lang, 60 cm breit; e) Kr. 957; f) He 1640; g) He 1584; h) Kr. 377, 197 cm lang, 49 cm breit; i) Kr. 946; k) Kr. 374; l) He 4631.

Tafel 21
Feis: a) SO, Hohlkehlenspitze und überschäumter Fuß im S. (Kr. 229)
b) Felswand mit Hohlkehlenfuß als Gang. S. (Kr. 226)
c) Oberhäuptling Tulei (Kr. 243)
d) Zwei Feisuner (Kr. 250)

Tafel 22
Feis: a) Ehepaar (Kr. 244)
b) Mann, Fischnetze, Hausgiebel (Kr. 236)
c) Frau (Kr. 246)
d) Mädchen (Kr. 248)

Tafel 23
Feis: a) Süßkartoffelpflanzung auf der Hochfläche (Kr. 212)
b) Gehöft 8 Valebési (Kr. 266)
c) Gehöft 19 Falekil aus Westen (Kr. 264)
d) Gehöft 32 Faipar aus Osten (Kr. 265)

Tafel 24
Feis: a) Haus 29 Maiur mit Eigner Rong (Kr. 262)
b) Tatauierung der Karolinier aus Lütkes Atlas Pl. 28
c) Inneres des Boothaus D (Plan) Faluióng (Kr. 241)

Tafel 25
Feis: a) Begräbnis des Rag: Grab graben (Kr. 235)
b) Einsenken der Leiche (Kr. 233)
c) Grabhaus mit Cassisschmuck bei Haus 19 Galengatagi (Kr. 295)
d) Verteilung des Erbes des Rag (Kr. 251)

Tafel 26
Feis: Flechterei, a)—e) Körbe f) Fischkorb, g) Matte, h) Meßleine (Hbg. Ph. 239) (?)

Lámotrek-Gruppe.

I. Entdeckung und Erschließung, Allgemeines.

1. Angaben der Segelhandbücher S.-H. u. P. J. P.

Position: Lamotrek mitten etwa 7° 27′ N.-Br., 146° 23′ O.-L., genau Elato 7° 29′ 30″ N.-Br., 146° 19′ O.-L.; P. J. P. gibt an 7° 28′ u. 146° 24′.

S.-H. S. 34: Lámutrik-Inseln (Lamotrek, Swede) liegen etwa 42 Sm westlich von Sátuwal auf einem dreieckigen Atoll. Die Ecken des Dreiecks bilden im Südosten die Insel Lamutrik, im Norden Puch und im Westen die Falaite-Insel; die beiden letzteren sind unbewohnt. Mitten auf Lámutrik liegt ein Moor, in dem Taro und Zuckerrohr wachsen. Auf Lámutrik ist eine Handelsstation der Westkarolinengesellschaft mit einem weißen Händler.

Durchfahrten zur Lagune gibt es mehrere. Besonders empfehlenswert ist die Durchfahrt südöstlich von Puch; die Durchfahrt weiter südöstlich und näher bei der Insel Lámutrik ist wegen der Klippen gefährlich, die dort in der Lagune liegen. Im Süden des Atolls sind außer einer guten Durchfahrt einige Bootsdurchfahrten.

Ankerplätze sind in der Lagune.

Lebensmittel: Enten, Hühner, Eier und Früchte sind beim Händler auf Lámutrik zu haben.

Eingeborene: Lámutrik zählt nur 200 Einwohner, die als Wiederankömmlinge gelten können. Vor 60 Jahren hatte nämlich die Flutwelle eines Taifuns die Bevölkerung teils vernichtet, teils zur Auswanderung nach Truk, Jap und Saipan veranlaßt, von wo sie später teils zurückgekehrt ist.

Wind und Wetter sind ähnlich wie auf Jap: von Mai bis September herrschen Stillen und unbestimmte Winde, meist jedoch solche aus dem südlichen Quadranten, von Dezember bis Mai der Nordostmonsun[1]. 1903 wehte der Nordostmonsun von Januar bis Mitte April; bis zum November blieben östliche Winde vorherrschend, aber die Luftströmungen waren unregelmäßig, Südwestwinde zwischendurch häufig. Von November bis Januar kam der Wind meist aus Südosten bis Nordosten. Taifune im ganzen recht selten, doch wird eine um das Jahr 1845 erfolgte Entvölkerung der Inseln auf einen Taifun zurückgeführt; der schwere Taifun vom 28. März 1907 machte sich auch dort durch Verwüstungen bemerkbar.

[1] Richtiger Passat statt Monsun, da eine eigentliche Monsunzeit, wie im Indischen Ozean, hier fehlt.

2 LAMOTREK-GRUPPE

Karte 1.

Regen fällt in allen Monaten, doch kommen nach den bisherigen kurzen Messungen auf die fünf Monate April bis August 1540 mm, also 56% der Gesamtsumme. Am trockensten ist der Februar mit nur 52 mm; Januar, Februar und März erhalten mit zusammen 331 mm nur 12% der Gesamtregenmenge.

Elato-Inseln, etwa 5 Sm westlich von den Lámutrik-Inseln, liegen auf einem 4 Sm langen, nordsüdlich gestreckten Riff. Die Gruppe besteht aus vier Inseln, von denen Elato im Norden die größte ist. Die Bevölkerung betrug 1903 nur 90 Menschen und ist durch den Taifun vom 28. März 1907 wohl noch verringert worden

Durchfahrt zur Lagune liegt im Osten; sie ist etwa 90 m breit und hat 9 bis 11 m Wassertiefe.

Ankerplatz. Das britische Kriegschiff »Sphinx« ankerte im Februar 1862 in der Lagune auf 20 m Wassertiefe. Der Ankerplatz lag etwa ½ Sm südlich von der Westspitze der Insel Elato; das Schiff blieb 10 Tage dort und schlug dort Feuerungsholz. Wasser wurde durch Graben von Löchern erhalten.

Toas und Ulor liegen südlich von den Elato-Inseln auf einem von jenen getrennten Riff.

Dazu Sonderplan auf Karte 93 des R. M. A. v. 1903, r. oben.

Olimaráu-Inseln (Ham. Olimarauo, Gesch. 2 von Füs) liegen nordöstlich von den Elato-Inseln; sie sind unbewohnt. Zu dieser Gruppe gehören die beiden Inseln Olimaráu und Falipi. Erstere liegt im Nordosten, letztere im Südwesten des gemeinsamen Riffs.

Sonderplan auf Karte 93. s. unten bei P. J. P.

Das S.-H. S. 5 bringt nach Hans Meyer, »Das deutsche Kolonialreich« eine Regenmessung für Lámutrik.

Monat	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	Summe
Br. 7° 26′ W L 146° 30′ O	144	52	135	294	236	342	327	341	153	264	208	244	2741 mm.

Daran schließt sich eine Abhandlung über die Winde an, von denen bei Lukunor schon die Rede war (Bd. 6 I S. 30).

P. J. P. S. 504: Die **Lamotrek-Inseln,** ungefähr 5 Meilen östlich von den Elato-Inseln, bestehen aus 3 bewaldeten Inselchen auf einem dreieckigen Atoll Die Lamotrek-Insel, 107 Fuß (32,6 m) hoch bis zu den Spitzen der Bäume, liegt am östlichen äußersten Ende des Atolls. Die Passage, ungefähr ¾ Meilen südlich der Puguet-Insel, der nördlichsten Insel, ist die weiteste und beste von denen, die in die Lagune führen, aber während des Nordostpassates setzt eine schwere See in die Lagune hinein und deshalb ist Vorsicht nötig. Es ist auch eine 2 Kabellängen weite Passage mitten in der Südseite des Atolls; aber ihre Lage ist schwierig zu entdecken, aber sie ist gut, wenn der Passat stark ist. Die nächste Passage westwärts ist ungefähr 1½ Kabellängen breit; alle übrigen Einlässe sind eng.

Ankerung möglich an der Westseite der Lamotrek-Insel (Br. 7° 28' N, L. 146° 24' O) geschützt gegen nordöstliche Winde, aber es ist berichtet, daß bei westlichen Winden die See recht rauh sein kann. Landen kann man an einem sandigen Strand an der Westseite der Lamotrek-Insel. 1930 waren 165 Bewohner auf Lamotrek-Insel, eingeschlossen 1 Japaner.

Die Inseln Pugue und Falaite waren unbewohnt. Wenig Geflügel und Schweine erhältlich; Fische sind reichlich.

Karte 772.

Die **Elato-Inseln** sind etwa 20 Meilen südöstlich von Olimarao-Insel und bestehen aus 2 Atollen. Auf dem nördlichen sind vier Inseln, von denen die größte Elato ist, am nördlichen Ende; sie ist 101 Fuß (30,8 m) hoch bis zu den Spitzen der Bäume, und sandig.

Auf der östlichen Seite des Atolls, ungefähr eine Meile südwestlich von Elato-Insel, ist ein Eingang in die Lagune ungefähr eine halbe Kabellänge breit mit Tiefen von 5—6 Faden (9,1—11 m). Im Februar 1862 fuhr H. M. S. »Sphinx« in die Lagune und ankerte in einer Tiefe von 11 Faden (20,1 m), ungefähr ½ Meile südwärts vom westlichen Punkt von Elato-Insel. 1930 waren 72 Einwohner vorhanden.

Das südliche Atoll, an dessen südöstlicher Seite die Inseln Toas und Ulor sind, ist vom nördlichen Atoll durch eine ungefähr 1¼ Meile breite Passage getrennt. Eine enge Einfahrt durch das Riff ist ungefähr 2 Kabellängen nördlich von der Taos-Insel, die, ausgenommen von kleinen Fahrzeugen, schwer zu durchsteuern ist.

Dazu Sonderplan auf Karte 772 der Admiralty nach Japan. Karte von 1925.

Die **Olimarao**-Insel liegt an der nördlichen Seite des atollbildenden Riffes ungefähr 95 Meilen südsüdöstlich der Insel Gaferut[1]; sie ist mit Kokospalmen und andern Bäumen bedeckt; ganz um die Insel ist der Grund abschüssig und ist ungeeignet für Landen.

Auf Falifi am westlichen äußersten Ende des Atolls wachsen Bäume üppig, aber es sind da keine Kokospalmen.

Das Atoll hat keine ständigen Bewohner, sondern wird gelegentlich von Elato-eingeborenen besucht.

Es sind Untiefen an der Nordwestseite des Atolls, wo immer Brecher auf dem Riff sind, und es ist keine Passage in die Lagune. An der südlichen Seite sind zwei flache Passagen, von denen die östliche eine halbe Meile, die westliche 3 Kabellängen breit ist. Es wird berichtet, daß die Tiefen in der Lagune gleichmäßig sind und keine Gefahren zu bestehen scheinen. (Karte 772.)

[1] Farnalip Krämer.

5

2. Entdeckungsgeschichte.

Bei Meinicke S. 358 heißt es: »Lamotrek (Lamurec, Namurek) 1797 von Wilson entdeckt und Swede, Haweis und Low benannt.« (Krusenstern, Haweio.)

Palau I S. 14, 15 und 180 ist ausgeführt, daß die Namen der Inseln der Lamotrek-Gruppe schon 1696, dem Pater Clain auf Samal (Filipinen) von verschlagenen Karoliniern mitgeteilt worden seien, und zwar Lamurrec mit Puc und Falait (s. S. 16), dann Ylatu (Elato) und Lamuliur. Auf Clain's Karte (Palau I S. 17) von 1706 steht Falú oder Lamuirec mit Taramit (Falait?) und oben auf der Karte, davon getrennt, statt Elato die beiden Inseln Olutil (Oletel S. 17) und Falipe (Falipi), für Lamolior die beiden Tauas (Toas) und Olor (Olor), daneben westlich Olimarau (Olimarau). Zugleich wurde mitgeteilt, daß Lamurrec die größte sei und daß hier der König aller Inseln wohne (Palau I S. 15). Kotzebue III S. 99 gibt an, daß die Oberherrschaft um 1800 auf den König Toua von Oleai übergegangen sei.

Es gilt also auch für hier, was ich Truk S. 3 von den Karoliniern als den Kennern ihres Archipels gesagt habe.

Daß aber die Gruppe schon vor 1797 auch den Weißen bekannt war, geht aus Wilson's Bericht hervor, der als Capitaine empfangen wurde. Es sind also vielleicht schon französische Schiffe dagewesen. Von diesen hat der Capitaine Le Gèntil de la Barbinais 1715 Guam besucht, und zwar auf dem Wege von Peru nach den Marianen, wobei er bei seinem WNW-Kurs nach der Fahrt durch die Ralik-Ratak nördlich von den Karolinen nach Guam gelangte, wie es die meisten der spanischen Weltumsegler gemacht haben (s. Palau), wodurch eben die Zentralkarolinen erst so spät bekannt wurden.

Nach Le Gentil haben Bougainville 1766—69, La Perouse 1780—90 und d'Entrecasteaux 1791—93 den Pazifik durchfahren; sie blieben aber südlich des Äquators. Erst Maurelle 1780—81 kam wieder nach Guam, dann Marchand 1790—92 auf dem Wege von Hawaii (1828 Tromelin s. Feis). Es verlautet aber nichts in ihren Berichten, daß sie südwärts ins Gebiet von Lamotrek und Oleai gekommen wären; es ist wahrscheinlich, daß sie auf Guam mit Zentralkaroliniern zusammentrafen[1], die auch sowiewo durch ihre Verschlagungen nach den Philippinen über die Weißen wohl unterrichtet waren. Sie hätten aber *capitano* sagen müssen[2]; so bleibt das französisch gesprochene Wort noch unerklärt.

[1] Chamisso berichtet, daß sie in Guam einen Mann von Lamureck trafen.
[2] s. Namonuito Band 6 I S. 199.

Capt. James Wilson, Ship Duff[1], berichtet (S. 293ff.) von Süden kommend: Oktober 1797: »Am 25. bekamen wir ein niedriges Boot in Sicht in W z. N und beobachteten alsbald, daß einige Boote auf uns zukamen. Etwa 9 Uhr a. m. kam eines längsseit ohne die geringste Angst und Zögerung, weshalb wir annahmen, daß sie mit Europäern Bekanntschaft gemacht haben müßten; ihre häufige Nennung von »Capitaines« bestätigte diese Vermutung. Diesen ersten folgten noch mehrere andere, die ihre Fischhacken (aus Schalen gemacht) und Leinen und Kokosgarn etc. gegen alles tauschten, was ihnen gegeben wurde; und wenn mehreren von ihnen erlaubt wurde, an Bord zu kommen, zeigten sie eine beträchtliche Zeit lang keine Neigung zu stehlen. Jedoch die in den Booten gaben uns Grund, unsere gute Meinung, die wir uns gebildet hatten, zu ändern, da sie die Ruderringe stahlen, was die geschickten Freundschaftsinsulaner vergeblich versucht hatten; und daneben wurde ein Bursche gefangen, als er eine Pumpenstange in sein Boot hinüberreichte. Da wir an solche Sachen gewöhnt waren, trieben wir sie für diese ersten Plünderungen nur von Deck; aber als wir beim Essen in der Kabine saßen, hörten wir sie, als sie an der Arbeit waren, den Bolzenkopf vom Ruderring abzuschlagen, woraufhin der Kapitän einige kleine Schüsse unter sie feuerte, was sie augenblicklich davongehen machte. Gerade zu dieser Zeit wurden William Tucker und John Connelly nahe unter dem Stern schwimmend entdeckt, in der Absicht, nach den Booten zu entkommen, wobei sie durch ihr Zaudern verrieten, daß sie fürchteten, daß man ebenso auf sie schieße; aber der Kapitän, wütend wie früher über ihre Undankbarkeit und Täuschung, und Willens, vom letzteren sich zu trennen, sagte ihnen, daß, wenn sie gehen wollten, möchten sie es nur tun; er würde nicht auf sie schießen. Connelly antwortete: »Danke Ihnen, Herr«, und beide schwammen zu den Booten, und wurden von den Wilden mit großem Geschrei empfangen. Bald danach, als eine Brise von NO aufkam, nahmen wir unsern Kurs wieder auf und ließen sie zurück. (Hambruch hörte auf Elato von den Eingeborenen, daß sie sich des Anari noch erinnerten, der als Steuermann stets Streit gemacht habe.) Connelly hatten wir mit Gewalt von Tongatabu fortgebracht, weil er die Missionare bedrohte. Während seines Aufenthaltes an Bord hatte er sich ruhig betragen, und er war in die Schiffsbücher als ordentlicher Seemann eingetragen worden, der mit seiner Lage zufrieden war, bis seine letzte Handlung seine Heuchelei bewies. Die gleiche Macht betraf auch Tucker, der auch wieder eingesetzt worden war, und der oft sagte, daß er glücklich sei, daß er wieder gegriffen worden sei, nachdem er in Otaheite[2] weglief; und vielleicht sprach er so seine Gefühle aus, da Grund zur Annahme war, daß Connelly ihn zu diesem letzten Entschluß über-

[1] s. Fahne I S. 128 u. II S. 363. Litt.
[2] Tahiti.

redet hatte. Wenn Connelly wirklich ein Botanikbucht-Verbrecher[1] war (wie wir seither gehört haben), so möchten wir vermuten, daß er aus zwei Gründen gehandelt hat, aus Furcht vor Arbeit und der Furcht vor Strafe, wenn er in England gefangen wird; denn was Tucker betrifft, so hatte sein Betragen es längst klar gemacht, daß er von seinen sinnlichen Leidenschaften völlig beherrscht wurde; das ist um so mehr zu bedauern, als er der einzige Sohn einer vortrefflichen Mutter war. Dieser Fleck, auf dem sie ihre Tage zu verbringen gewählt haben, ist nur eine kleine Insel auf dem Schoß der Tiefe, die nicht mehr als 2 bis 3 Meilen Umfang hat und wo die Bequemlichkeiten und Notwendigkeiten des Lebens so spärlich sind, daß wir annehmen mußten, daß ihr ganzer Lebensunterhalt nur aus Fisch und Wurzeln, Kokosnüssen und vielleicht Brotfrucht besteht.

Die Eingeborenen sind keine starke Rasse; ihre Hautfarbe ist dunkles Kupfer, ihre Gemütsart lebhaft. Wir sahen keine Frauen. Ihre Boote unterscheiden sich von allen, die wir bisher gesehen hatten, da sie an beiden Enden hoch erhoben waren und rot bemalt: sie haben Ausleger und segeln mit beiden Enden nach vorne. Ihre Segel sind beinahe in derselben Art wie die einzelnen Segelboote der Freundschaftsinseln[2] gemacht. Die Breite der Insel ist 7° 22′ N und Länge 146° 48′ O. Wir nannten sie nach dem Weggelaufenen Tucker's Insel[3].

Mit leichten Winden aus NO rückten wir auf unserem Kurs nach W fort, Tucker und seinen Gefährten zurücklassend, damit sie über die schlechte Wahl, die sie getroffen hatten, nachdenken konnten, eine Wahl, nach allem wie es schien, so voll von Erbärmlichkeit, daß wir uns nicht denken konnten, daß eine dritte Person gefunden werden könnte, die ihrem Beispiel gefolgt wäre; aber so ist die Macht der Gewohnheit und der entnervende Einfluß der Trägheit, daß Andrew Cornelius Lind zum Kapitän kam, und ernstlich bat, man möchte ihn doch auf dem nächsten Eiland, das entdeckt würde, aussetzen. Dieser Bitte wurde nicht allein zugestimmt, sondern man gab ihm auch das Versprechen, daß er eine Auswahl nützlicher Gegenstände haben sollte, mit denen er an den Eingeborenen wohltun könnte, und um ihn besser einzuführen, und ihm eine Wichtigkeit unter ihnen zu geben.

26. Oktober 1797. Als wir etwa 10 leagues[4] weiter westwärts gekommen waren, sahen wir um Mitternacht eine andere Insel[5] im N und um 4 Uhr a. m. zwei mehr in NW, und als der Tag bald darauf anbrach, zählten wir sechs solcher kleiner Inseln, die äußersten Spitzen von NW z. N nach NO z. O: nach der südlichsten (Lamolior) steuerten wir und hatten bald eine große Zahl von Booten um das Schiff, in eines von diesen Andrew stieg, nachdem er Abschied von seinen

[1] Die convict of Botany bay, der Bucht östlich vom Sydney-Hafen, die dorthin von England bei der Kolonisierung von Ost-Australien gebracht wurden, sind bekannt in dieser Redensart. Dieses System gibt Frankreich noch in Cayenne aus.

[2] Tonga.

[3] so wurde Sittoval genannt, das 7° 22′ und 147° 8′ liegt.

[4] 1 league = 3 Meilen.

[5] Lamotrek-Gruppe.

Schiffsgenossen genommen hatte, und er wurde mit Freude von den Wilden aufgenommen. Das Boot, das ihn aufnahm, ging bald ab, und als sie wegpaddelten, stand er auf und winkte mit der Hand, denn er schien mehr gehoben (elated) als niedergedrückt durch seine Veränderung. Das sorglose Leben, das er auf Otaheite geführt hatte, die ungehinderte Leichtigkeit, mit der alle seine sinnlichen Appetite dort befriedigt worden waren, mit seiner Abneigung zur Arbeit und die Aussicht auf ihre Notwendigkeit, welche eine Rückkehr nach Europa ihm vor Augen hielt, drängten ihn mächtig, ein müßiges Eingeborenenleben auf diesen wenig versprechenden Inseln seiner Heimat Schweden vorzuziehen, das, wie er wußte, nur Vorteile für den Fleißigen bot[1].

Die folgenden sind die Sachen, die der Kapitän ihm gab: 2 Handsägen, 2 Beile, 1 Hammer, 10 Spiegel, 18 Messer, 300 Decksnägel, 2 Rasiermesser und einige Kleinigkeiten daneben; dies, mit dem was er noch sein eigen nannte besonders eine Bibel, wird ohne Zweifel ihn als einen Gewinn für die Eingeborenen darstellen und mag ebenso ein Mittel sein, den andern beiden einen Dienst zu leisten, mit denen er nach unserer Meinung streben wird zusammenzukommen. Die Eingeborenen dieser Gruppe, ihre Boote, Geräte und Gier nach Eisen usw. waren genau gleich wie bei Tucker-Insel. Der Nachmittag kam trüb und regnerisch, was aber keineswegs ein Hindernis für die Boote war, von denen uns viele folgten, bis ihre Insel außer Sicht war; und als wir sie in einer Bö nordwärts halten sahen, schlossen wir, daß sie zu einen Platz in jenem Viertel gehen wollten.

27. Um 10 Uhr a. m. kamen wir in Sicht einer anderen niedrigen Insel im SW und wir änderten unsern Kurs um nach S von ihm zu gehen; als sie im Westen von uns war, sah es aus, als ob es zwei Eilande seien: Hier kamen auch viele Eingeborene heraus und handelten, wie die andern getan hatten. Etwas, was wir als eigentümlich und bemerkenswert beobachtet hatten, war, daß bisher auf unserer Fahrt durch diese Inseln keine Frauen erschienen waren; daraus schlossen wir, daß die Männer entweder mehr eifersüchtig als ihre östlichen Nachbarn sind, oder daß sie ihren Weibern einen höheren Wert beilegten; oder vielleicht hatten sie in einiger Zeit sie vor gierigen Besuchern verteidigen gemußt. Die Breite dieser Schwesterinseln 7° 14′ N, Länge 144° 50′ O (Ifaluk). Um 4 Uhr p. m. lagen letzte in O z. N, 2 leagues. Gerade vor Dunkelheit sahen wir eine andere Insel in WNW, 3 oder 4 leagues ab; und steuernd um nach S von ihr zu gehen, um desto besser alle Gefahr auf den Wege zu vermeiden, lag sie um Mitternacht in NNO.

28. Um 4 Uhr a. m. am 28. entdeckten wir andere Inseln, und mittels unserer Nachtgläser konnten wir die äußersten von WNW nach N z. W ausmachen. Um diese Zeit war Windstille, die anhielt; und bei Tagesanbruch zählten wir 6, die

[1] daher die Benennung »Schweden-Insel«; Krusenstern führt auch »Hawes« als Namensgebung auf.

nach ihrer Größe den Anspruch auf Inseln verdienen mochten, und 7 Inselchen oder Kaie[1], allen zusammen geben wir den Namen »13 Inseln« (Oleai).

(Fortsetzung bei Oleái.)

Zu erwähnen ist noch, daß Sētoval (Sātowal) im Osten von Lamotrek nur 37 Seemeilen von diesem entfernt ist, ungefähr so weit wie Ifaluk von Oleai. Zehn Sm NNO von Ifaluk ist (s. S. 8) auf der Karte 93 eine Untiefe eingezeichnet, die 12 m Wasser haben soll; dabei steht aber »vermutlich noch flacher«. Natürlich ist sie den Eingeborenen wohl bekannt: Auf Lamotrek hörte ich, sie heiße Fas (= Stein?), und liege bei Niedrigwasser trocken. Dann schlagen die Seeen dort zusammen, so daß Wassersäulen von großer Höhe aufspritzen, die man zeitweilig von Ifaluk aus sehen kann[2].

Nach dem Vorgange auf der Duff'schen Reise, der Landung des Schweden Cornelius am 26. Oktober 1797, wurde Lamotrek die Schwedeninsel benannt, eine zu große Ehre für einen faulen, abtrünnigen Matrosen. Um jene Zeit scheint Ilematip (s. S. 29) Häuptling auf Elato gewesen zu sein, wie Hambruch erfuhr.

1801 kam nach Espinosa (s. Palau I S. 175) eine amerikanische Fregatte »La Lidia« nach den Karolinen und passierte Iselook (Ifaluk) und die Gruppe Lamursek. Es scheint aber diese Auffindung nicht ganz sicher, auch wurde nichts über die Inseln mitgeteilt, soweit bekannt.

1828 passierte Dumont d'Urville die Stelle von »Lamourseke, sah aber nichts. Bei Cheyne 1852 (s. Palau II S. 364) steht Swede Islands 6 Inseln in St. Raper's Table beschrieben usw.

Um 1860 soll das englische Kriegschiff H. M. S. »Espiègle« Cpt. Ryle die Gruppe besucht haben. Von ihm sollen die Brotfruchtbäume auf Elato umgeschlagen worden sein — aus unbekannten Gründen.

Am 5. April 1880 kam dann der Engländer Lewis nach abenteuerlichen Fahrten um Australien und Samoa in die Gruppe, als erster Händler. Er lebte etwa 11 Jahre auf Lamotrek, heiratete eine Chamorro-Frau (Tochter s. Taf. 3[d]), deren Schwester an den Händler Friedländer in Yap verheiratet war ging dann selbst nach Yap, verlor aber dort sein Geld, so daß er um 1900 wieder hierher zurückkehrte.

Regierungsvertreter haben nach 1900 nur selten die abgelegne Insel besucht. Das D. Kolonialblatt 1906 S. 263 zeigt einen Besuch auf, der hauptsächlich den Schildläusen an den Kokospalmen und der Verhinderung des Genusses von saurem Palmsaft galt. Aufenthalt 1.—3. Dezember 1905 (s. Oleai).

Expedition s. E. d. S. I S. 261: A. und E. Krämer verweilten hier vom 21. Nov. bis 10. Dezember 1909; Hambruch auf Elato vom 20.—25. Nov.

---

[1] engl. kayes, womit kleine Stein- und Schuttanhäufungen, wie die künstlichen Bollwerke, gemeint sind.

[2] Dies bestätigt meine für die Atollbildung wichtige Angabe, daß auf einem Riff Dünungen aus allen 4 Himmelsrichtungen zusammentreffen (Entstehung der Korallenriffe 1927, S. 34).

Daß ich mit Frau zur Überfahrt nach Truk nicht das Expeditionsschiff, sondern den Postdampfer »Germania« benutzte, zeigt wie Lamotrek zu jener Zeit schon an den großen Verkehr angeschlossen war. Freilich holte sie nur die Copra; von Weißen besucht war die Insel noch nicht.

3. Anthropologie (vgl. Feis VII²).

Messungen liegen von Lámotrek nicht vor. Hellbraune Zentralkarolinier. Die Bilder zeigen, daß edle Typen hier vorhanden sind. Zwar sind die Haare in Einzelfällen (Taf. 2a Volimar) locker kraus, aber das Gesicht zeigt nichts negritisches. Es ist sogar eine gute Bebartung vorhanden, die Ikisera zeigt (Taf. 2b) dessen Gesicht man an europäische Typen angliedern könnte; denn die Nasen sind wohlgeformt und haben nicht die malaiische Stupsnasenform. Diese erscheint etwas mehr bei Bóesu und Urúpo (Taf. 1a), aber Sukurang von der gleichen Familie hat sie nicht, der nur eine stärkere Jochbogenausladung aufweist, die freilich durch seine Magerkeit unterstützt wird. Auch die Mädchen (Taf. 3a, b) zeigen sehr gefällige Formen und angenehme Züge, ebenso die Frau (Taf. 3c) mit ihrem breiten Gesicht. Bei dem Halbblut Bessie Lewis (Taf. 3d) wirkt die britische Beimischung sich nicht als Vorteil aus.

Über Hambruch's Untersuchungen auf Elato liegt nichts besonderes vor.

4. Demographie.

Bevölkerung.

Wir hörten, daß auf Lamotrek nur noch 220 Bewohner vorhanden seien; um 1890 seien es noch 300 gewesen, und in früherer Zeit 1000. Das stimmt mit den Angaben der Verschlagenen von 1787 überein, die 1400 Bewohner angaben. Bei Freycinet S. 101 heißt es, daß auf Lamoursek 2000, auf Elato 1200 und auf Ulor 180 Bewohner, auf Puk 170 und Falati 130 vorhanden gewesen seien, also um 1800. Sogar auf Goulimarao (Olimarau) seien 225 gewesen. Während unseres Aufenthaltes herrschte viel Influenza und Ruhr, so daß eine weitere Senkung angenommen werden darf P. J. P. (S. 4) sagt, daß 1930 sogar nur noch 165 Bewohner auf Lamotrek vorhanden waren, auf Elato 72.

Es war also um 1800, als der König von Lamotrek über fast alle Koralleninseln herrschte, zweifellos eine reiche Bevölkerung, wahrscheinlich sogar eine Übervölkerung vorhanden, die allgemein einen Rückschlag erfuhr (s. Oleai).

5. Sprache

s. das General-Wörterverzeichnis am Schluß.

Bei der Kürze des Aufenthalts war eine genaue Aufnahme der Sprache auf Lamotrek nicht möglich; da kam die Anwesenheit eines geistig regen englischen Händlers, Herrn Lewis, sehr zustatten. Ich übergab ihm ein Heft des Wörterverzeichnisses vom Hamburger Museum, in das er seine Einträge machte, die allerdings nur einen Teil des Heftes füllen, aber doch einen Überblick über den Wortschatz geben. Die englische Lautgebung muß dabei in Rechnung gezogen werden. Das übrige geht aus dem Text hervor, wie z. B. das über Haus, Boot usw.

Auf Elato hat Hambruch sprachliche Aufnahmen gemacht und da Lewis bei 306 aufhört, so ergänzen Hambruchs Aufzeichnungen weiterhin das Fehlende, obwohl damit nicht gesagt sein soll, daß die Sprachen von Lamotrek und Elato völlig gleich sind. Die Niederschrift beider habe ich zumeist gelassen. Das Wörterverzeichnis siehe am Schluß mit Oleai und Feis zusammen.

Hinsichtlich der Konsonanten tritt hervor, daß *l* für *n* ungemein stark in Anwendung ist, weshalb Lamotrek statt Namotrek, wo es auftritt, gesetzt werden muß; ferner wird gesagt *alus* statt *anu* Geist (Truk S. 318), schon Wilson klagte, daß *l* und *n* oft nicht unterscheidbar seien.

Merkwürdig ist ferner, daß der Engländer Lewis für den *dj*-Laut (s. Truk S. 20) meist *rs* sagte, ebenso wie er das *n* dem *l* vorzog, obwohl das *l* auf Lamotrek deutlich herrschend ist.

th dem englischen ähnlich gebildet, aber hinten am Gaumen durch Kehlkopf gebrochen.

Die auf Lamotrek vielfache Gegenübersetzung von Gutem und Schlechtem[1] drückt sich in den Wörtern mit *ila* und *tip*[2] am Anfang, aus; gemeint sind gute und schlechte Gedanken

ilalang	im Himmel	*tipenlang*	weitere gute Eigenschaften sind:	
ilalal	auf der Erde unten	*tipelal*	*ila mellau*	Leben
			ilafegér	aufmerksam, ehrlich
ilāfalū	auf dem Lande	*tipelifálū*	*iladjóafidj*	fleißig
ilāfang	im Norden	*tipélifang*	*ila talingāfi*	gehorsam
ilāeaur	im Süden	*tipeliaur*	*ilagatōdjig*	sparsam, gütig
ilagétēu	im Osten	*tipeligóteu*	*ilamamai*	gutgesinnt, edel
ila ilitou	im Westen	*tipelilitou*	*ilafōggo*	liebevoll, einträchtig.

Dagegen sind schlechte Eigenschaften, die aber doch auch mit *ila* beginnen (s. Kokospalme S. 44) folgende:

[1] s. die Gesch. von Lemoupēp, S. 144.

[2] *t. le ngol* f. den Meteor, d. h. Bild. = photomachen.

ilamēs	Tod	*ilatalingeai*	unaufmerksam, nicht hörend
ilangau	schlechte Gedanken		
ilāmau	harsch	*iladjorau*	träge
ilamodjog	diebisch	*ila gatōlap*	verachtend, stolz

Ein Wort für Dank und Feindschaft fehlt.

6. Mission keine am Platze,

doch ist von Truk und von Westen her Einfluß vorhanden.

15

II. Landbeschreibung und Siedlung.

Die einzelnen Inseln sind schon oben S. 1 erwähnt. Die größte, zugleich die Hauptinsel Lámotrek hat keinen besonderen eigenen Namen, sondern heißt nach der Lagune, an deren Ostspitze sie liegt; sie ist von S nach N etwa 1250 m lang und in der Mitte etwas über 700 m breit; nach Süden und Norden spitzt sie sich

Karte 2.

zu. Das Nordkap heißt Luguliong. Im Westen der nördlichen Hälfte, am Binnenwasser, ist eine Ausbuchtung, die als Landungsstelle dient. Hier liegt auch die Siedlung. Eine Karte der Insel wurde vom I. Offizier des »Peiho« vom 20.—26. 11. 1909 aufgenommen (Karte 2). Sie zeigt die Tiefen der Bucht, deren Südkap

Paliauei heißt, während die Nordecke Uŏlebuguí »an der Ecke« genannt wird (s. Haus. 30, Karte 3).

Die Bucht ist durch eine Barre von der ca. 30 m tiefen Lagune getrennt; die Barre hat von N nach S die Tiefen 9, 3, 7, 12, 14, 16 m; landwärts von der Barre ist wieder eine Tiefe von 19 m, die dem Lande zu rasch sich verringert. Diese Tiefe heißt Mólog wie der Siedelungsplan Karte 3 zeigt; südwärts endet sie in einem Bootkanal *tauali vá*. Es liegen hier also ähnliche Verhältnisse vor wie beim Ostbecken des Onoun-Atolls bei der Insel Pisaras, die nur viel kleiner als Lámotrek ist und aus der Reihe des Ringgürtels ostwärts verschoben (s. Bd. 6, I S. 191, 193). Die hübsche Lage des Dorfes an der Bucht zeigt Abb. 50; die Siedlung liegt an der westlichen hohlen Seite, einem weit geschwungenen Bogen. Innerhalb dieses ist im Süden eine kleine Sonderbucht, die aber auf Karte und Plan 3 wenig hervortritt, aber auf Taf. 1b deutlich sich zeigt. An ihr liegt das Boothaus Aboi, in dem wir wohnten. Südwärts klingt sie in den breiten Sandstrand des Caps Paliauei aus, wo das Faktaipu liegt und das Gehöft des Händlers Lewis (s. Plan 3) Taf. 1c zeigt alles deutlich.

1. Inseln der Lámotrek-Gruppe und Namen

bestehend aus 3 Atollen.

1. im O a) **Lámotrek** oder Lamutrik (Karte 93) oder Namotrek, richtig Lamodjek (s. Gesänge, und Truk S. 20) von *lámo* oder *namo* »die Lagune«, und ist *trek*, *tjek* »klein«, obwohl sie die größte von den dreien ist und länger (7 Sm) als Oleai, das nur 5½ Sm lang ist, aber kürzer als das bekannte Mokemok im W, das von S—N etwa 20 Sm mißt. Es wird aber auch gesagt, das *rĕk* sei gleich *rak*[1], die Jahreszeit, d. h. die Jahreszeit, weil hier immer gut Wetter sei; dann bleibe das t unerklärt[2].

b) **Falaite** (Karte 93) im W des Atolls, richtiger Faleit oder in alter Zeit Faleitabut; das Wort stammt von *feiabut* »Unglückskind«, weil die Leute früher dort wild gewesen seien; jetzt unbewohnt.

c) **Puch** (Karte 93) = Pik kleine Insel, im Norden des Ringes, meist Búiŭg gesprochen; das Wort stammt von *buik* Knabe (Palau) und hört sich auch oft so an; unbewohnt. Östlich von der Insel die gute Durchfahrt Taualibúiŭg. Im Westen der Insel eine Bootpassage Metaliár. Zwischen Pik und der Hauptinsel ist noch eine Durchfahrt, die auf der Karte 93 gefährliche Durchfahrt benannt ist (s. K. 1).

[1] Palau III S. 325 *rak*, Truk S. 302 *rás*.
[2] auf Cantova's und Torre's Karte steht Lamurrek.

Wenn man auf dem Riff östlich von dieser Durchfahrt, an der Südseite, also im Binnenwasser südöstlich fährt, kommt man an einen Vorsprung des Riffes, auf dem Sand ist; das ist das Sandcap Mongalepí; zieht man von diesem eine Linie nach Süden, die das Binnenwasser querend, das südliche Riff trifft, früher an dem Stein Faisar (bei letztem Taifun verschwunden), so hat man die *sósor*-Grenze (s. u. S. 47), die den Bezirk der Insel Lamotrek westwärts abschließt; östlich der Linie ist kein tabū, aber westlich muß gefastet werden, wenn man früh mit dem Boot über die Grenze westwärts fährt; auch das Rauchen ist dabei verboten.

2. **Elato** oder auch nur Elat gesprochen, weil so das Seegras[1] heißt, nach dem das Atoll und die Hauptinsel benannt ist, die im Norden des Riffes liegt. Das Riff ist nierenförmig, Bucht nach O mit Booteinlaß in eine kleine Lagune, die nur den Nordteil einnimmt (Japan Karte). Im Südteil scheint nur wenig Binnenwasser, das von dem nördlichen getrennt ist. An der Südspitze die Sandinsel Falipī, mitten (O). Die Insel der deutschen Karte mitten (W) Oletel (Ham. Oletul); Kari (Ham. Kare Riff), Tamas sind auf Japankarte nicht vorhanden. Hambruch nennt noch Merekang „scharfe Spitze", Oilipī „auf dem Sand", Toeirul „sanftes ruhiges Wasser."

3. **Lamolior** unbewohnt, 2 Sm südlich vom Elat-Atoll. »Lagune des Südens« mit Inseln Toas und Olor (Deutsche Karte Ulor).

4. **Olimarau** unbewohnt[2], Namen von *vol*[3] »gegenüber« »dem blauen Meer« (Truk *madau*); 26 Seemeilen nordwestlich von Elato. Besuch zum Schildkrötenfang. Hambruch hörte, daß um 1899 der letzte Eingeborene von Olimarau auf Lamotrek gestorben sei (S. 166 u. 182).

Faiju s. S. 164.

2. Siedlung Lámotrek. Aufnahme 1909.

Das große Dorf liegt, wie erwähnt, am westlichen Binnenstrande, und zwar in der Hauptsache an der Ausbuchtung (Karte 2 und Abb. 50). Der bewohnte Teil der Insel heißt *gápilam* (s. Haus 19).

Ein Gehöft mit zugehörigem Land heißt *bókut* oder *búkut* (Abb. 51 S. 109). Ein Gehöft besteht aus Wohnhaus, Vorrathaus, Kochhaus und Bluthaus.

Man teilt die Gesamtsiedelung ein in den »Süden« Jaur, wo die *fal* Boothäuser a) Faletâipu und b) das innen schön geschmückte (s. Farbtaf. II) Jelói

[1] Enhalus Truk *ibino*, Palau *gar*.
[2] nach Freycinet S. 101 sollen auf Goulimarao um 1800 an Einwohnern 225 gewesen sein.
[3] über das V vor O s. bei Oleai — Voleai.

s. H. 10 u. 14.

Das schon von H. 2a, 10, 14 u. 23 bekannte Ehepaar, lebt auch hier nicht fest. Das Gehöft, das in der Nähe des *fal* k) desselben Namens steht, wird gerne von den schwangeren Frauen der 1. Sippe benützt, im 10. Monat, kurz ehe sie ins *imatamai* (s. S. 89) ziehen.

Schon oben S. 17 sind die Bootshäuser *fal* insgesamt erwähnt. Sie gehören den einzelnen Häuptlingen, und diese besitzen auch das Land, auf dem sie stehen, in kleinerer oder größerer Ausdehnung; dieses Land ist auf dem Plan durch

punktierte Linien gekennzeichnet. Einzelne Angaben befinden sich bei den Gehöften.

b) Die Boothäuser und ihre Besitzer sind:

fal	Eigner	Haus
a) Faletaipu, früher Häuptlingsplatz, der nicht betreten werden durfte.	Sukurang u. Selábo	24a
b) Aboi (auch Eaboi und Iéloi) Taf. 1b u. 9c, Abb. 53.	Bóesu	4
c) Lúgal Taf. 1b.	Lólit	5
d) Kulong †	Faragaus	1
e) Falemara	Sukúlubo	14
f) Gatia rákés »nahe am Calophyllum«	Mélsor	24a
g) Voriétag oder Boerieitug	Urupo	10
h) Gauárag (auch Gauosag) »Platz des Grolles«	Ikeséra	25
i) Falemareg		
k) Uélibugui oder Uóle		30

c) Häuptlingsreihe.

Lámotrek	Elato (Ham.)
1. Súkurang (Haus 24a S. 26)	1. Mailipue 1909
2. Angareisuk »die vom langen Fischen lockigen Haare des Sukurang«	2. Fetal e tauuo
3. Teliméra oder Iteliméra, s. S. 26	3. Lóngarále
4. Uámop	4. Mangiléi
5. Gogoiaim	5. Laremát
	6. Moilt
	7. Laliigúr
	8. Ilematíp (S. 9)
	9. Foiemelaú[1] oder Oroéihaú

Lam.: Da die ersten 3 Brüder sind, so handelt es sich hier nur um etwa 3 Generationen, so daß die Überlieferung nicht über 100 Jahre hinausreicht. Es wurde nur berichtet, daß die Häuptlinge früher sehr mächtig gewesen seien, was den Angaben von Clain (s. S. 5) entspricht. Zu Lütke's Zeit könnte Gogoiaim gelebt haben. Cantova nennt Mattuson als Oberhäuptling 1722.

Von Elato gibt Hambruch 9 Häuptlinge *(pimóon, tamól)* an. Wie weit der 9. zurückreicht, ist nicht ermittelt.

[1] zu seiner Zeit sollen die ersten Weißen gekommen sein. (Wohl 1797 Duff.). s. S. 6.

3. Siedlung auf Elato (Ham.).

Von Hambruch aufgenommen. Plan fehlt.

a) Hauszählung Elato.

Größtenteils primitive Hütten, da seit dem Taifun 1907 noch kein rechter Aufbau erfolgte.

1. Ettiatiū, Buschhütte.
2. Kū ūēi, Gebärhaus.
3. Kochhaus, *māl ūm*, zugleich Schlafhaus für Menstruierende.
4. Haus für Wöchnerinnen, *im a fāliē* (s. Haus S. 89).
5. Ilaroēi, Oleaigäste.
6. Būōl i būgi, Oleaigäste.
7. Tāūiērās, Oleaigäste.
8. Fazefāl, 1 ♂, (♀ gestorben), —.
9. Faliōp, 3 ♂, 3 ♀, —, 1 Md.
10. Im mo gitigit.
11. Legóūria, 5 ♂, 3 ♀, 1 Kn., 1 Md.
12. Fāl e giliaū, 1 ♀.
13. Gitóū, 4 ♂, 2 ♀, 2 Kn. Oleai-Leute von Uazagǫr[1], die auch hier einen festen Wohnsitz und Haus haben, und bald in Oleai, bald in Elato hausen.
14. Pāūūil, 3 ♂, 4 ♀, —, 1 Md.
    Kochhaus aus dem Deckshaus eines gestrandeten Schiffes.
    Steinfundament des ehemaligen »großen Hauses«, *mā/fūrz*.
    Reste des ehemaligen »Großen Hauses«, *eǫūr e lāp*.
15. Olegesārs, 5 ♂, 5 ♀, —, 1 Md.
16. Nogūr, 5 ♂, 3 ♀, 1 Kn., 1 Md.
17. Lūgāl, japanische Händlerstation, verlassen.
18. Uōlēl, Leute von Pāū i ēl, hierher.
19. Kātigālū, 2 ♂, 2 ♀, 1 Kn., 1 Md.
20. Kolūng, 1 ♂, 1 ♀.
21. Uōlipār, 4 ♂, 3 ♀, 1 Kn., —
22. Kūsorōlo, 4 ♂, 4 ♀, 1 Kn., 1 Md.
23. Kāti e fāl, Haus des Häuptlings, 4 ♂, 1 ♀, — —.
24. Rolegorāl, gehört zu 23.
    Am Hause Tatauierung der weibl. Scham , *māk e boāy*.
25. Matal ie eāl, wird zur Zeit der Mückenplage bewohnt, da hier frischer Wind zu sein pflegt.
26. Mērekām. Gebär-, Wöchnerinnen- und Bluthaus der Oleai-Gäste.

[1] Votagai?

Gehöfte:	13	♂	41
Gebäude:	26	♀	32
		Knab.	7
		Mädch.	7
		Zus.	87

Alte echte Elato-Leute sterben aus.

Es sind nur die auf Elato Ansässigen gezählt. Nicht die etwa 180 Köpfe zählenden Oleai-Leute, die seit dem Taifun von 1907 hier Obdach gesucht haben, eingepfercht in elenden Hütten. Sie gedenken bald wieder nach Oleai überzusiedeln.

b) Familie, Gesellschaft.

Familien, *gr i lang*.

Auf Elato sind vier Familien vorhanden, von denen je zwei und zwei unter einander heiraten, und ferner 2 Familien, die das niedere Volk bilden.

Die Vornehmen:

1. Mā̃lipūe ∞ 3. Mā́ńā̃ li fūs
2. Gemā̃rēńg ∞ 4. Ẓā̃ fēlę

Das niedere Volk:

5. Ali ū lia
6. Ẓā̃ ūll.

Nr. 2 hatte früher den Vorrang; sie wurde von 1 verdrängt. Der erste Häuptling auf Elato ist Angehöriger der Familie Ẓā̃ fēlę.

Beim Häuptling erbt der Bruder, dann die Neffen, die Söhne der Schwestern. Der leibliche Sohn hat keine Macht. Die Brüder erben dem Alter nach.

Alle Männer können aus den niedrigsten in die höchsten Familien heiraten.

awūār, Gurkenbaum. Sie sind gemeinsamer Besitz, und die Früchte werden an die einzelnen Häuser verteilt.

Es gibt ein Mutterrecht, entsprossen aus dem Recht der Arbeit und der Pflicht; denn der Mann tut nur wenig; der Ehemann hat mit der Familie nichts zu tun, nur der Mutterbruder.

Der Frau gehört das Haus. Bei der Heirat geht der Mann in das Haus der Frau (s. Truk); ausgenommen er wohnt im eigenen Familienhaus, das aber beim Tode an den nächst älteren Mann aus der Familie des Mannes fällt. Die Kinder erben von der Mutter; der älteste Sohn geht voran, dann die jüngeren, die einen Vorrang vor den Schwestern haben.

Der Heiratskontrakt besteht darin, daß 2 Körbe Nahrung (Nuß, Taro, *mar*) ausgetauscht werden. Damit ist die Zeremonie beendet. Bei der Heirat gibt der Mann seinen, die Frau ihren Willen kund; die Verwandtschaften kochen Essen, das ausgetauscht wird. Auch bei der Geburt eines Kindes wird nichts entrichtet.

c) Stammbaum des *tamol* Mâlipue.

sonst nach dem Tode des Mâlipûe *tamol* gewesen.

d) Besiedlung von Elato.

Mǫtéijâmâû ♂ und Hawûm ♀ kamen zuerst nach Elato. Sie kamen von Lamûtšêχ, nachdem sie dort wie in Pig, Pikelôt, Setûân Kinder gezeugt hatten, jeweils einen Knaben und ein Mädchen, die dann als Stammeltern auf den betreffenden Inseln angesehen werden. Auf Elato gelten Lôîi ♂ und Lemâû û râle ♀ als Stammeltern; Lôîi ist dort 1. Häuptling. — Ifalûk, Farôîlip usw. wurden nicht von dem Paare besiedelt.

e) Geschichte.

Unter Ilematîp (S. 29) kamen die ersten Weißen nach Elato.

In alten Zeiten kam ein Häuptling Teiâr aus Truk mit seinen Leuten, unterwarf Elato und herrschte. Unter ihm kamen die Leute von Ifalûk herüber und schlugen alle Bewohner von Elato tot. Von den Ifalûk-Leuten wurde Elato neu besiedelt. — Môz war der Häuptling. Damals wurden auch sämtliche Leute von Nâmoliâûr erschlagen und die von Lamûtšîk stark dezimiert. Elato ist eine Kolonie von Ifalûk.

f) Karten.

Auf Lütke's Carte générale de l'Archipel des Carolines, 1828, steht Namourrek, Elato, Namoliaour und nahebei I. Satahoual. Das Schiff fuhr nordwärts von Fayeou Occid. vorbei.

Plan nach Karte des Reichsmarineamts Nr. 93. — 1903.

Karte Japan 1925, die als Unterschied gegen die früheren Karten die Lagune von Elato nur klein, dem Nordteil angehörend zeigt; mitten ist jedenfalls eine große Barre; es ist also anzunehmen, daß die während der 100 Jahre seit Lütke sich so verengt hat.

4. Taifune.

12. Dez. 1900 soll ein kleiner Taifun gekommen sein. SW-Wind im Januar gilt als schlechtes Zeichen.

1907. s. den Taifun von Oleai, der die Lamotrek-Inseln nicht so hart traf.

34

III. Stoffliche Kultur.

1. Tracht.

a) Kleidung und Schmuck.

(Vgl. Tafel 1—3, 10 und Farbtafel 1 und 3.)

Europäische Kleider fehlen.

Die Kleidung beider Geschlechter gleicht sich der von Truk und Umgebung an: Männer[1] tragen die T-Binde, Knaben gehen nackt, die Frauen tragen ihre Webmatten, und die heranreifenden Mädchen bedecken sich vorn und hinten gerne mit einem Blätterbüschel (Taf. 3a, b). Dieser Schurz heißt *titi*, wie ja auch auf Samoa[2] die Mädchenschürze genannt werden.

Hier werden dazu Farnblätter[3] an der Sonne getrocknet, dann folgt das Kauen *(nürei* E. K.) des Stengels, bis er weich ist. Zwei Stück werden darauf mit zwei

Abb. 1a Abb. 1b.

Blütenkopfkränze.

Stück zusammengebunden, dann von rechts und links je zwei neue darauf gelegt, und die Stiele in einen Zopf verflochten, während die Spitzen mit den Knien festgehalten werden. Auf Taf. 3b sieht man deutlich die Stiele nach oben herausschauen, das Bild zeigt auch recht schön den **Schmuck,** den die Mädchen anlegen. Als Duftgeber wurden noch genannt Parinariumnüsse, angetrieben und an den Häusern von den Frauen aufgehängt. Elato: *aiss* (s. Truk S. 97); s. Oleai.

Blütenkränze, Stirnbänder, Ohrgehänge, Halsketten aus Kokosringen *(éffirre* He.) und Scheibchen, *dagág*, aus weißen Muschelscheibchen

[1] He. 2168 Spitzhut *solivars* (fadj Pandanus = *vars*, Hut auf Truk *saim)*, so auch die lufttrockenen Pandanusblätter, die zum weiteren Trocknen noch um einen Stock gewickelt werden. Elato.

[2] Dort aus den Blättern der *ti*-Pflanze bestehend (Dracaene Samoa-Inseln II S. 290). Hier ist es meist Farn *djidji* oder *djifadjif* (Kr. 472 = 3228 II), der also auch namengebend hier sein kann. S. Bd. 61 S. 134.

madja, daneben kleine Scheibenringe aus Conusböden, *mat* und *vul*[1], und Plättchen von roten Muscheln, *faibar*[2] (*faubar* Truk).

Die Überladung, wie sie im Trukgebiet üblich ist, kommt hier und westwärts nicht mehr vor, und klingt ab nach dem schmucklosen Palau, an das der *telau* — Zwei-Kugel-Hänger erinnert (Palau III S. 21 Abb. 12) s. Taf. 2a.

An Blütenkopfkränzen beobachteten wir einige entzückende Gebilde, so ein grün und weißes aus Premnablättern[3] und Dolden der Fragraea (a); ein anderes grün, weiß, gelbes aus den weißen Blüten des Salzwasserbusches Scaevola[4] und den gelben der Trion fettia procumbens (b). E. Krämer hat beide aquarelliert; hier sind sie gezeichnet, Abb. 1.

Abb. 2. Kopfkranz.

Einen eigenartigen Kopfkranz erhielt ich von einem Mann. Die Spitze eines halbierten Kokoswedels ist zu einem Kreis gebunden und an die von der Blattfläche befreiten Fiedern sind Zylinderchen angesteckt, die aus jungen Brotfrüchten bestehen sollen, Abb. 2 (Kr. 486 = 3241[II]); junge Brotfrüchte sind auf den Koralleninseln etwas Kostbares und tabuiertes, so daß man nicht leichtsinnig sie abbrechen wird. Entweder handelt es sich also um einen Brotfruchtzauber, worüber nichts zu erfahren war, oder ein Zweig mit jungen Früchten war abgebrochen.

Ohren: Gehänge, *suasua*, an den erweiterten Ohrläppchen: Ringe (s. Armringe) und Kettchen, aus Kokosschale, Patt und Conus, aber nicht in dem Übermaße wie auf Truk. Auch Uhrräder ähnliche Ringe und *tebau* kommen vor (s. Oleai S. 223 und 224).

Die schönen Gehänge in Yap I S. 25 Abb. 19, stammen nicht von Oleai, sondern von Sovol:

Hellwig gibt verschiedene Namen für den Schmuck an: 2162 *udjaūdj* aus Kokosperlen und Conusböden in 4 Abteilen; 2194 *marrigiau* oder *madsí*... mit Pterocerasknöpfen; 2199 große Kokosringe *lēlle mangár* (Uhrrad *lēli mangál*), halbmondförmig (= Fischschwanz) *pera līg*; 2224 *búrai*, 2135 *borói* große Schildpattringe (Truk S. 107 *bodj*), auch auf der Brust getragen; 2233 Schildpattringe *borál lágelag*, wie auch die Patt-Armringe genannt werden, neben *lagál*; 2260 und 80 Kokosperlenkette mit einzelnen *faubar*; 2319 rote Pilgermuschel.

Halsketten, nicht viel getragen, *marremarre*[5], aus 3—7 Reihen Kokos-

[1] wie Truk S. 95. [2] He. schreibt auch *vai parre* und *vai i par*. [3] Truk S. 419 *lior*, und Fragraea *[mosor*.
[4] Truk S. 421 *not* und Trionfettia *hun*, *liodot*. [5] Girlande *mar* S. 119.

perlen, (He. 2158 *billigorru)*, ähnlich in der Fläche gereiht wie im Bd. 6 I Abb. 15 u. 16, zeigt Abb. 3; ein Muschelstück (Blänker) hängt auf einer Bindeseite. He. 2280 = 6053[II] bemerkt, es stamme von Ifaluk. Auch dreieckige *faipar*-Stücke dienen als Hänger, wie in den Ohren (s. Oleai-Feis). Eine einfache

Abb. 3. Halskette He 2280.

Abb. 4. Halsband, 70 cm lang.

Halskette (He. 2260 = 6035[II]) hat nur einzelne, getrennt von einander eingeflochtene Kokosringe (He. *éffirre)*; das Flechtband ist aus Bananenfaser *χóloχole wüs* (Abb. 4).

Armringe s. oben S. 35 bei Ohr. S. auch Taf. 3b; aus Patt (sehr klein solche für die Ohren) und Trochusringen.

Die Haarschnüre s. bei Korb S. 68.

Die Haare werden meist kurz getragen; eine besondere Frisur tritt auch bei längeren nicht hervor. Besonders kurz trug sie die Weberin Dailemar, Abb. 5.

Abb. 5. Dailemar.

Abb. 6. Einstecker.

Nach Cantova S. 312 lassen sich die Häuptlinge der Westkarolinen lange Bärte stehen, um ihr Ansehen zu heben.

Kämme sind vorhanden, aber weder so häufig, noch in den vielen Formen wie auf Truk. Einen breiten Stäbchenkamm mit 3 fingerförmigen Strahlen zeigt Taf. 10a, einen einzinkigen Einstecker (He. 2301 = 607311) mit Fregattvogel und Hahnenfedern s. Abb. 6; ein ähnlicher (He. 2333) ist alles, was gesammelt wurde.

Zur Epilation dient die Muschelklammer (He. 2306 = 607811), Abb. 7, *kúm'u* s. *kom*, genannt. Die vorzüglich genau schließenden Schalen, die durch ein Band von Haaren verbunden sind, entstammen der Muschel Tapes litterati *kûm*. (s. Yap Taf. 8 Nr. 1 *gum* oder *gom)*, Palau IV S. 371 *gum*, s. Oleai S. 222.

Abb. 7. Epilator.

Gürtel.

Sie heißen *gabidj* (He. *χapéss*, angetan *tetár*) und sind meist dreistrangig; auch bekam ich für einen dreistrangigen, angeblich eingeführten, den Namen *tagágapaki* (Kr. 471 = 322711), wobei *paki* oder *pake* die Stege sind, die Breithalter, von denen bei Truk S. 109 als *fêken* schon die Rede war; diese sind aus weißen Muscheln oder aus der *leang*[1] (Truk *leangeéo* Pteroceras), oder auch aus Perlmutter und Schildpatt gefertigt; die Stränge bestehen zumeist aus Kokos-

Abb. 8. Gürtel, 3 strangig.

scheibchen oder -Perlen, selten aus Patt[1], wie die feinen, kostbaren, schönen Westkarolinengürtel, die *taral* von Oleai (s. S. 225), die aber immer, wenn sie getragen werden (s. Taf. 3b), eingeführt sind (Truk S. 107). Taf. 3b zeigt einen solchen siebenstrangigen bei dem Mädchen rechts, während Taf. 3c den üblichen dreistrangigen bei einer Frau zeigt; s. auch Abb. 8 zeigt. Das Mädchen links auf Taf. 3b zeigt einen einfachen Strang zum Festhalten des *titir* (s. o.), auch Photo 372 (Taf. 3c) zeigt einen solchen. Meist sind sie aus Menschenhaaren geflochten, wie die Korbbänder Abb. 42. Diese Haargürtel nennt man *toradja djiem*[2]. (He. 2146 = 3923 *tetáre sîm* von Elato.)

[1] He. 2222 = 600211 zeigt 5 unfertige Gürtelstege aus *leang*, *pakiligil*, wobei *paki* wieder auf den Steg hinweist; Bohrloch *lal wura wura (burabura* Drillbohrer S. 62); daneben eine Menge zugeschnittener Schildpattstücke *boats dibbedib* (Truk S. 107 *bodj)*. [2] Kopfhaar *djim, sim*.

4: Krämer OR21 Woleai

b) Tatauierung, Bemalung.

hat hier nicht oder nicht mehr die strenge Ordnung der Westkarolinier, nicht mehr, wahrscheinlich weil das Bild von Lütke im Bd. 6 I Abb. 24 zeigt, daß sie vor 100 Jahren auf Lukunor, wenigstens teilweise, noch vorhanden war. Dies ist auch nach den Worten von Kittlitz S. 10 anzunehmen. Jetzt hat sich auch auf Lámotrek die Ordnung aufgelöst, und es ist der Schmuck meist nur in Ornamentgruppen an den Beinen vorhanden wie die Abbildungen zeigen, besonders reich bei den Frauen. Die Männer dagegen schmücken die Beine wenig oder gar nicht, ziehen aber die Arme heran, wie Abb. 9 von zwei Innenseiten zeigt, die zahlreiche Musterreihen übereinander zeigen, dabei offenbar Speerspitzen *rasüm* (Abb. 9 b). Die Außenseiten der Oberschenkel (Abb. 10 a—d) zeigen meist nur zwei senkrechte Musterreihen von Haizähnen oder Fischen, von denen der *pup* (Nr. 23) (Truk S. 150 Fig. x Balistes) und der *küe* (Nr. 26) (Truk S. 113 Fig. i *ku*, Doppelform erscheint erst in Pollap Bd. 6 I S. 257) besonders bevorzugt sind; diese erscheinen aber auch bei den Frauen, Abb. 11 a, b (Frau Netailemoar) u. Abb. 12 neben den vielen andern Mustern, die aus Abb. 79 ersichtlich sind. Die Anordnung zeigen die erwähnten Abbildungen, von den die bei der Frau Loalimul (Abb. 13) besonders reich ist; bei ihr ist eine Platte an der Seite, nach vorn von der Gesäßbacke, also über dem Hüftgelenk; von da zieht ein breites Schmuckband an der Außenseite des Oberschenkels nach dem Knie hinab, wo einige Ringe, die an der Seite offen sind, das ganze Bein umziehen; in der Kniekehlengegend sind dann noch einige lose Muster.

a b

Abb. 9. Armtatauierung.

Erwähnenswert ist noch, daß der Mons veneris das schwarze Dreieck *puáre* zeigt, über das schon von Palau III S. 35 berichtet ist, allerdings auch auf Ponape (Joest S. 90) vorkommt, aber nicht auf Truk, beobachtet wurde. Als Hausornament *māk e boár* sah es Hambruch auf Elato, hier S. 30. Taf. 11 b.

Über die **Ornamente** (Abb. 79 s. Kunst) wäre noch zu sagen, daß die schon erwähnten Fische auch gleichnamig auf Truk vorkommen, aber dort Delphine sind, nur nicht in Doppelform. Gleich mit Truk ist auch der übliche Haizahn. Aber die weiteren Muster sind meist anders, und ebenso sind die Bezeichnungen ganz verschieden. In der Form gleich ist das Kreuz *langetor* mit dem *blutal* von Palau

Abb. 10. Oberschenkeltatauierung der Frauen.

40

Abb. 11. ♀

Abb. 12. ♀

III S. 39 Fig. t; dagegen die Strahlensonne auf Abb. 13 wieder gleich mit Fig. z in Truk S. 150.

Für die vielen Bezeichnungen auf Abb. 79 fehlt, von den erwähnten abgesehen, die Bedeutung. Der ornamentierte Hausgiebel (wie z. B. in Palau) heißt *tabau*, ist also bekannt.

Abb. 13. ♀

Über die Ausführung wurde nichts besonderes bekannt. Hacke wie ein Geschwürsöffner (Abb. 134) aussehend. Den Ruß für die schwarze Farbe gewinnt man statt aus *savani* Nüssen (He. 2138), aus angetriebenem Harz *h urú*, das auf mildes Feuer gelegt und mit einer Kokosschale überdeckt wird, die man mit Blättern abdichtend bedeckt; der Ruß schlägt sich dann innen nieder. Auch Paraffin *rās* oder *matiga* (= Fett, weil die Eingeborenen es für Fischfett hielten) trieb an, ist aber dafür nicht brauchbar.

Über **Bemalung** nichts besonderes bekannt. Gelbwurz (S. 58 Ges. XV) wie auf den andern Inseln im Tausch erhandelt, aber selten gebraucht. Die rote Farbe der Boote usw. stammt als rote Erde, *lap*, von Yap oder Truk. Die von Yap gilt als die bessere (s. S. 97). Daher Farbschüssel *tabbi en lap* mit Pinsel *goleliē* (s. S. 64 u. 97).

2. Ernährungs-Wirtschaft.

a) Arbeitsteilung.

Den Frauen liegt ob: Feldarbeit, Feuerholz holen und Kochen; die Männer treiben Fischfang. Über jährliche Lebensmittelknappheit s. S. 193.

Abb. 14. Holzspaten.

Für Tarofeldbau sind Spaten vorhanden (He. 2234 = 6021[II] *kóa:* (vgl. Kokosöffner), auch *otēlipoa)* vgl. Ku. Bd 6 I S. 50; eine nette, gefällige Form zeigt der Spaten (He. 2244) Abb. 14, der 62 cm lang ist.

b) Koch- und Eßgeräte.

Kochen *üm.* Feuermachen s. Truk S. 124, Büchse für Stein und Stahl, *gaigers*, He. 2210; auch *gulegul*, s. S. 65.

Die Kochschnecke, Cassis cornuta (He. 2098 *maiāle, mēal*, s. Truk *moēal)*, ehemals viel benützt zum Kochen, jetzt als Wasserbehälter geschätzt; s. auch Taf. 7 vom Linden-Museum Stuttgart.

Kokoshülsenöffner (He. 2223 = 6003II), *kóát* (s. Spaten), Holz *kaingi*.

Die Kokosraspel ist sehr einfach, zweibeinig, Abb. 15, (He. 2302 = 6074II *waigin* oder *wegang*, Sitz *mattótu* aus Brotfruchtbaumholz) 67 cm lang, 20 cm hoch. He. 2319 nennt als Klinge eine rote Muschelschale *belig*[1] (Truk *perri* Venus m.); es wird aber meist ein Stück Kokosschale als Schaber, *metál*, benutzt, festgehalten durch Verschnürung *(gágá* He. 2092).

Abb. 15. Schabschemel.

Abb. 16a, b. Spatel.

Spatel in Fischform *falalio* (He. 2252 *itik eü le wong)* aus Schildkrötenbauchpanzer, Abb. 16a, 17 cm lang; Abb. 16b, rippenförmig mit Öse 21½ cm lang (Kr. 453 = 32091I) zum Schaben und Essen. Knopf *arrepél*. He. 2324 aus Perlschale; s. auch Taf. 7 Linden-Museum Nr. 41269.

Abb. 17. Löffel.

Löffel *itit*. (He. 2220 = 6000 II 12 cm lang, Abb. 17 nach Palauart mittels Holzpresse hergestellt (Palau III S. 125), He. Griff *erál*, Rand *narél*, Höhlung *lál*, Bauch *lúgul*. Ein Sorol-Mann, der zu Besuch war, brachte den Löffel mit. Sonst dienen die Spatel als Löffel.

Stampfer aus Corallenstein (He. 2299 = 6071II *vai lu pó(a), vairúpo,)*, nicht so schön wie die von Truk S. 125, aber doch eigenartig mit Stufen und Hut an der Spitze, Abb. 18, Höhe 15½ cm; meist sind sie aus Holz (He. 2289 Holz *kil* =

Abb. 18. Stampfer.

Abb. 19. Holz.

Abb. 20.

[1] He. 2113 *pelig* Spitze einer Kokosnuß zum Brotfruchtschaben; Spitze *topalle*.

tia Mangle?), Kopf zylindrisch (vgl. Palau III, S. 97, Abb. 87 u. 88) Abb. 19, oder kegelförmig mit Ösenaufsatz, Abb. 20, Höhe 20—23 cm; letztere Form fand ich auch fast ganz gleich in Weimar und ähnlich (Ösenaufsatz rhombisch) in Berlin (VI 25378), ferner im Linden-Museum Stuttgart Nr. 41245 (s. Taf. 7).

Einen großen Mörser (75:65 cm) *annif* genannt, machte sich Ikisera. Abb. 21.

Abb. 21. Großer Mörser.

Zange aus Kokoswedelstil (He. 2094 = 5894II *umär)*.

Feuerfächer (He. 2112 = 5889II *saipe*, Truk S. 126 *sëiva)*.

Messer *ser*, wenn Perlschale s. Abb. 40 Faserschaber, *djële* gleich Truk S. 125; eigenartig die Scheide *tangitangi lü djële* aus einer Schildkröten-Gurgel (He. 2310), oder aus Kokosbast *üdi* (He. 2311).

Trinkröhre (He. 2160 = 5933II *mangauru)* Bambusröhren, um bei Wassermangel aus Wasserlöchern mit schmutziger Oberfläche Wasser zu saugen (vgl. Buschmann SW-Afrika).

Gefäße s. S. 63; Bastklopfer s. S. 62. Hängebrett für Essen *failupö*.

c) Nahrungsmittel, Kochen.

lü	Kokospalme	Feigen	*gouall*
mei	Brotfrucht	Crataeva	*gavudj* (Truk *abut)*
uidj	Banane	Zuckerrohr	*uóu*
uot	Edel-Taro	Pflanze	*fatógi*
fillë	großer Taro (Truk Waldtaro)	ähnlich	*burak*, *bullok* (Truk *pula* u. *mulek)*

Der Tarobau ähnelt dem von Palau. Die Feldarbeit heißt *gelligel*; meist sind es Sümpfe, *buorü*, in denen der Taro angepflanzt wird; ein Feld im allgemeinen *bol*, ein Einzelstück *buonnü djemalü*, ein Komplex *bonnap*[1]; sind die Rüben reif, folgt das Herausnehmen *üfül (uot)*, *gebuá (bullok)*, Abschneiden *djarü* des Krautes (= Setzling *bagü)*. Abschaben des Schlammes von der Rübe *üüegarre*, waschen *djiri*. Das Gründüngen (wie auf Palau) *uállü uot*, d. h. hinlegen der Blätter nach Abrupfen, *go uallü*, und sammeln in Körben, *djuge*; weghäufen des Leberkässchlammes *djioie medjaro*. Dann werden die Setzlinge eingepflanzt. Der Edeltaro braucht etwa 6 Monate; er macht Seitentriebe, *töallag o li uot*; *burak* und *fillë*[2] brauchen länger; *fillë* soll auch gut sein kurz vor der ersten Blüte, auch noch kurz nachher, etwa 9 Monate nach Pflanzung.

[1] Es heißt auch: ein Feld setzt sich zusammen aus großem Stück *djeadjüual*, einem kleinen Stück *ddjalo* und *eaballüngüpei*, einem kleinsten *eagullung*.

[2] s. Bd. 6 I S. 238.

Hambruch nennt:

Nahrungspflanzen.

Sumpftaro	*uōt, file*	Papaya	*papuā*
Bergtaro	*bulāk*	Zuckerrohr	*uāū*
Brotfrucht	*mai*	Süßkartoffel	*gamōti*
Banane	*uīs*	Pandanus wird nicht genossen	
Feige	*faltap*	Kokospalme	*liu*
Gurkenbaum	*awūs (gavudj* Kr.*)*	Huhn	*māluk* } Tiere
Kürbis	*kālāvās*	Hund	*gāldgo.* } Tiere

Worte um die Kokospalme.[1] (Wachstum usw.)

iláfat[2]	ich pflanze

Fieder	*sĭĕalli*
Fiederrippe	*loch*
Fiederstreifen	*sigerára* (s. S. 67)
junge Fieder	*uvudj* (s. Zauber)
Blattscheide	*ŭdi*
Blütenscheide	*ŭilliu.*

Obwohl die Kokospalme als Nahrungsquelle an erster Stelle steht, wird doch auch der Brotfrucht, *mai*, große Beachtung geschenkt. Deshalb sind die Tabu's, die der Brotfruchtgott Sauaur (s. Religion) (s. auch Truk S. 324) auferlegt, von besonderer Wichtigkeit. Im September sucht man die Zauber, die Orakel für die Reise nach Guam herauszufinden, welche Boote gut und glücklich sind. Dann beginnen die Brotfruchttabus. Es dürfen jetzt keine Bäume geschlagen werden, kein *bulis*[2] gewonnen, keine Holzschüsseln und Holzkasten, keine Netze geflochten (auch keine Stilnetze *róu*). Man darf keinen Faden drehen, keinen Kalk brennen, keine Pandanusblätter für Segel bereiten usw. Im Juli erst ist das Ende der Brotfruchtreife, das *samóimai*.

Dann das feierliches Festessen *iles* abends, das besonders zurückkehrende Fischer oder Seefahrer erhalten, die bis dahin gefastet haben; dabei kleines Gebet, um Übles abzuwenden.

Wie Truk S. 131 wird auch hier Brotfruchtteig, *mar*, bereitet; er soll vortrefflich zum *tak*-Belone-Fisch schmecken.

Brotfruchtdauerspeise *már* auf Elato (Hambruch).

[1] He. 2223 = 600311 ist ein zweispitziges Stück Hartholz (*karngi*), wie eine Pfrieme aussehend. (s. S. 42)
[2] Fritz, Milchsaft des Brotfruchtbaumes s. bibs S. 93.

Wenn die Brotfrucht reif ist, wird sie gepflückt, die Rinde abgeschabt, in Körbe gelegt und für 5—6 Stunden in Salzwasser gelegt; darauf läßt man das Salzwasser verdunsten. Zunächst tut man die Früchte dann in seichte Gruben, die mit Blättern ausgekleidet sind und deckt sie mit Erde zu. Vierundzwanzig Stunden müssen sie hier liegen, bis die Früchte ganz weich geworden sind. Die weiche Masse wird dann mit Blättern gehörig durchgeknetet und in tiefe, ausgekleidete Gruben gepackt, mit Steinen zugedeckt, wo sie nun viele Monate und Jahre sich hält.

Zum Essen wird 1 Teil *mâr* mit 3—4 Teilen Wasser versetzt und die Masse in einer alten Kleidmatte tüchtig ausgewrungen; darauf gebacken oder gekocht, und soll eine nahrhafte, allerdings nicht sehr wohlschmeckende Speise sein, zu der hauptsächlich Fische gegessen werden.

E. Krämer notierte die Herstellung auf Lámotrek so: Unreife Brotfrüchte werden geschält, entkernt, in einen Korb gefüllt, der einen halben Tag lang in stilles Seewasser gelegt wird. Dann werden sie in einen andern Korb gegeben, der mit *fillē*-Blättern ausgelegt ist und 24 Stunden lang aufgehängt. Dann kommen sie wieder in einen neuen Korb, der mit Brotfruchtblättern ausgelegt ist; er wird eine Woche lang aufgehängt. Darauf wird ein Loch von 1 m Tiefe gegraben und mit viel Brotfruchtblättern ausgelegt; darauf kommen Bananenblätter und darauf die Brotfrüchte; darauf wieder Brotfrüchte und Bananenblätter. Statt Brotfrucht kann man auch *gull*-Blätter nehmen, die noch länger haltbar sind. Während eines Jahres werden die Blätter aber alle 3 Monate erneuert. Viel Regen macht den *mar* faulen. Herausgenommen wird der Teig in Süßwasser geschlemmt, bis die meiste Säure heraus ist; dann wieder gekocht, aber immer nur soviel, als zu einer Mahlzeit gebraucht wird. Ein Gericht heißt *lūggum mēlli mare*: Wasser von 2 alten Kokosnüssen wird in den *mar* geknetet; dann eine halbe Nuß geraspelt; ein Teil mit wenig Wasser ausgepreßt und gekocht, der andere mit mehr Wasser ausgepreßt und mit dem *mar* vermischt. Dieser letztere Teig wird schichtweise auf Blätterpakete gelegt; auf jede Schicht kommt dann von dem ersten Teil, der gekochten Kokosmilch, etwa 3 Lager. Dann wird mit Kokosfiedern zusammengebunden, in etwa 4 Brotfruchtblätter und ein Bananenblatt gegeben und im Ofen gekocht.

Worte zur Kocherei.

Geräte oben S. 42.

Ofen	*um*
Loch für Ofen graben	*earūa um*
Feuerholz	*saffi*
Feuer	*eaf*
Steine für den Ofen	*faiūl um*

heiß	*apuósch*
heiße Steine auslegen	*räggú puori*
Schälen[1] des Taro	*faletti uot*
Taro einhüllen	*tügguluggu uot, iffëri uot*
Blatt	*drö (drôk* reife Kokosnuß)
Zudeckblätter	*üff el um*

Viel Taro wird mit Kokospreßmilch gekocht, wenn Feste gefeiert werden, z. B. bei der Essenslieferung *pailügogo* für Leute, die bei einer Beerdigung geholfen haben.

rouari uidj, unreife Bananen werden von der Hülle befreit, und in Topf mit Wasser und Kokospreßmilch gekocht.

3. Fischerei.

a) Allgemeines.

. Der *alu* Saulal[2], von dem schon bei Truk S. 359 die Rede war (s. auch Religion), ist für viele Tabûs verantwortlich, die beim Fischen gebraucht werden. Er hat ja auch eine innige Beziehung zum Meer, in das er seiner Schlechtigkeit halber (vgl. Olifat S. 147) tief hinab gesteckt wurde, weshalb ja auch die Seelen der Schlechten nach ihrem Tode zu ihm wandern. Er hatte 3 Diener: den Alusitét, auch sein Sohn genannt, der kommt, wenn jemand ein Tabû bricht (s. Gesang unten); den Pónerol und die Lepériperûodj (von *périper* schneiden = *falafal* s. Bootbau, und *uodj* Riff also „Riffschneider"); er sendet sie zur Hilfe für die Menschen. Durch Soulal erhielten sie die Schildkröte, die er hart und stark machte. Wollen die Menschen aber Nutzen von ihm haben, müssen sie seine Gebote halten, die Tabû's z. B. ein Mann muß nach Beischlaf 10—20 Tage warten, bis er wieder fischen darf, den Blänker *pâ* für den Bonitofang darf er einen Monat lang nicht berühren, sicher nicht vor dem nächsten Neumond, und bei Flederfischfang (s. u.) muß der Fischer sogar 2—3 Monate warten, bis er wieder zu seinem Haus gehen darf.

Auch die Wasserlöcher, in denen die Kokosfasern geweicht werden, darf der Fischer nicht berühren; sonst muß er 4 Tage lang warten, und darf auch 4 Tage lang keinen Bonito essen, wenn er Kokosfasern geschlagen hat; auch wer Kot berührt. Alles gilt auch für die Frauen; sie dürfen überhaupt keinen Bonito essen, so lange sie im *imatamai* sind, und nach dem Verlassen 3 Monate lang nicht. War eine Frau im *imafatiu*, (s. Haus), so muß sie noch 10 Tage warten.

Von den Tabûs westlich der *sósor*-Grenze wurde oben S. 17 schon berichtet; *sósor* heißt der Fischgrund im Binnenwasser hauptsächlich westlich der genannten Grenze. Wenn man dort fischen will, so darf nach 10 Uhr Nachts kein Feuer im

[1] mit Muschel *pelligelli ralat*.

[2] er gilt als der älteste der beiden Brüder des Alselap s. S. 144.

Abb. 22. Zeremonialaxt.

Dorf mehr sein und es darf auch nichts mehr gegessen werden. Die Boote, die dorthin fahren, müssen zuerst die Inseln Puſk (Búiûg) und Faleit anlaufen, ehe sie mit dem Fang beginnen. Bei Tabubruch sollen Beine und Gemächte anschwellen.

Zu den Heiligen Handlungen gehört auch das Töten der Fische mit der Zeremonialaxt *tellē i lolomai* (Kr. 443 = 3197II u. 477) die auch beim Bootbau (s. S. 92) gebraucht wird, s. Abb. 22. Für die Frauen sind verboten auf Elato der *goruriâp*, *sonmalol*, *sóu* (Makrele) und der *skipiiaχ*, der auf Satoan heilig ist und vor dem man sich verbeugen muß.

b) Rifflese; *guis* Fang.

Die Löcher auf dem Riff sind durch den Kies erkennbar, der neben ihrem Eingang liegt. Mittelst eines 2—3 Fuß langen dünnen Stockes untersucht man die Höhlung, ob etwas darinnen ist. Der Octopus kommt dann heraus und wird gespeert. Bogen *liketáfedj*, Pfeil *eaûten* sehr einfach. Fischspeer He. 2235 = 6014II *tolig*, Holz *vas*, Zacken *rúmul*, *χobailitêto lig* aus Kokosholz, Spitze *metale χobai*, Ende *sabille*. Elato He. 2171 = 5944II.

c) Angelfischerei.

Von den westlichen Haken war schon bei Lukunor (Bd. 6 I S. 53) die Rede. Einige Abbildungen 23a, b, c Kr. 498—506 zeigen die breiten Blänker und die nach unten gedrückten Hacken, während die von Lukunor ähnlich denen von Ralik (s. dort) mehr nach oben streben (vgl. Naûru Hambruch), Länge ca. 6cm.

Unterbringung der Haken in Büchsen *sóp* (Kr. 479 = 3235II). Der ursprüngliche Haken war aus Kokosschale geschnitten, wie er bei Feis abgebildet ist, das mit einem solchen emporgezogen wurde.

a b c

Abb. 23. Drei Fischhaken.

Die Fischleinen meist aus Kokoshüllenfasern (s. Seilerei) gefertigt. He. 2157 = 5930II Elato *djalûig* (S. 72). Auch Angelruten (He. 2339) sind vorhanden.

Für das Drachenfischen, *gedjeg*, ist eine dünne Leine, *dja lûga*, aus *dromá*-Faser (He. 2296 = 6066II) nötig; der Drachen wird stets neu aus einem Arto-

carpus-Blatt gemacht; als Köder Haihaut *goilül lü baggo*, in die sich die Hornhechte verbeißen[1] (s. Lied unten).

Fischen mit der Handleine vom Boot aus.

Am Haken als bester Köder Octopus. Der beschickte Hacken wird mit Schlipknoten um einen Stein gebunden und dieser vorsichtig versenkt. Liegt er am Meeresboden, so stoßen die meisten Fische langsam nach unten, um den Köder zu bekommen. Beim ersten Zittern der Leine muß die Leine mit einem Ruck angeholt werden. Hat der Haken gefaßt, so zieht man den Fisch herauf, wobei er aber häufig von Haien weggefangen wird, die um Lamotrek häufig zu sein scheinen. Ist dies der Fall, so muß man die Haie erst wegfangen, um ihnen möglichst die Beute abzujagen und den Haken wiederzubekommen[2]. Die Fische sind aber im Haimagen schon nach einer halben Stunde so verdaut, daß der Fisch kaum mehr kenntlich ist. Ein schwarzer Hai, *modjog*, ist deshalb gefürchtet.

Die *lukapá*-Haken (He. 2232 = 6011[II], *pa sar*, Abb. 23a) sind für *gali* und *etam*, die besonders bei Nacht gefangen werden; der *etam*-Seebarbe ist nachts nahe der Kabbelung im stillen Wasser der Riffeinlässe, bei Ebbe innen, bei Flut außen.

Abb. 24. Fischhaken aus Schildpatt.

passár (He. 2068) Blänker Perlschale, *faipar* (He. 2077) oder *sárrurod* (He. 2076). He. 2032 Perlschalblänker mit Eisenhaken ohne Widerhaken; Kr. 498—506 = 3252—59 neun Haken aus Schildpatt, von denen einer (499) einen Widerhaken, *rom*, nahe der Spitze, außen hatte; Blänker schwarz, rötlich aus Meleagrina. Der *páluk* (Abb. 23b) (Kr. 470 = 3226[II]) ist für *etam* in der Nacht. Auch He. 2239 = 6018[II], Abb. 23c, wird dafür benutzt mit einem braunglänzenden Blänker aus Tigermuschel (Cypraea) *ûpuil*; als Blänkerbärte nimmt man Hühner- oder Fregattvogelfeder (Eláto) oder Gras *bûgor*, wie der *pa wai* Haken aus der schwarzen Perlmuttermuschel *wai* (He. 2063).

Der Schildpatthaken, *gôbodj*, Abb. 24 (Kr. 469 = 3225[II]), (He. 2208, 2249 u. 2274), (He. *χâ bors, χalû daidjau*) dient für größere Fische, *daidjau*, Breite ca. 5 cm; Die stark nach innen gebogenen Spitzen heißen *lámagap*. 1910 nicht mehr im Gebrauch. Über Angeln für Zauber s. d.

Der Fang der Flederfische, *mangar*, geschieht mit dem Winkelhaken (Palau III S. 77 Abb. 62a) s. S. 335, und zwar im Dezember. Auf Sêtowal wird er noch geübt, wenn die Boote von Poloat zurückgekehrt sind. Dann gehen die Fischer ins Bootshaus, und die Zauberer singen nun ihre Lieder, z. B.:

---

[1] Auch Fang mit der Schlinge *lóma pâgo* zwecks Gewinnung der Hautsehnen *gûlulil* für den *tag*-Fang (Belone) mit Drachen (s. o. S. 48). Hautsehnen bleistiftdick, oft 1—2 Fuß lang.

[2] s. Gesang S. 53 Haivertreibung.

Saual *ã gō caitalebóng*[1]	Saulal, ich träumte in der Nacht,
gel e lut epelepel	du springst sehr viel
e lon e fō leoai	in die Mitte meines Bootes.

Die Treibangel, *pil*, wie sie ähnlich schon bei Onóun[2] abgebildet ist, wird nun fertig gemacht (s. auch Truk S. 142). Der winkelförmige Haken wird aus der Kokosschale geschnitten, und an die verkorkte Kokosflasche als Schwimmer gebunden. Der Haken muß natürlich einen Köder haben; dieser ist ein Stück jungen Kokoskernes, das man aus der Schale mit dem Spatel herausgehoben und mit einem Bambusmesser in Gestalt eines Octopus zurechtgeschnitten hat; dieser Köder wird mit einer feinen Bananenfaser an ein Ende angebunden. So wird die Treibangel ausgesetzt und von der Sonnenseite her beobachtet.

d) Bräuche beim Fischfang.

Später folgen weitere Verbote und Zauber, und es folgt auch das Nachtfischen mit der Fackel.

Der Fang der Fledermäuse dauert vom Dezember ab fast die ganze Passatzeit; erst wenn der Fang zu Ende ist, kann der Fischer, nach 4 Tagen, in sein Haus zurück.

Der Fang *(búil)* des Bonito *garangāp*, (Truk S. 142 *karangāp*) ist noch in Übung. Der erbeutete Fisch ist aber nur heilig, wenn er mit dem Blänker *pa (bā)* auf See gefangen ist, was ganz den polynesischen Gebräuchen entspricht[3]. Von den Tabugebräuchen wurde eben schon berichtet; sie sind besonders streng.

Schon der frisch gefangene Fisch wird alsbald mit einem *ēār*-Zweig von allem unreinen befreit; ein Ruf begrüßt seinen Fang. Der Fischer, der frierend heimkehrt, wird verlacht. Wer nichts fängt, erfreut sich nicht des Wohlgefallens der Frauen. Fasten in der Passatzeit nötig, dagegen nicht im März bis September. Abendessen, *ilea*, s. S. 45.

Beim Landen legt man die Fische sanft hin, mit dem Kopf landwärts. Sie werden am Schwanz angefaßt und getragen. Beim Tragen darf der Fisch nicht geschwungen werden; trifft der Träger auf dem Wege jemanden, so darf er nicht stehen bleiben. Am Hause niedergelegt, muß er längs dieses liegen, den Kopf nach der See zeigend. Dann wird zuerst der Ofen, *um*, in Gang gebracht. Brennt er und ist heiß, dann erst wird mit dem Zerteilen des Fisches begonnen. Dazu legt man ihn auf den Rücken und hält das Bambusmesser (nicht Eisenmesser) in der Rechten. Auch ein Kokoswedelstiel darf in Anwendung gezogen werden. Es wird ein Quer- und ein Längsschnitt gemacht, dann wird mit dem Zeigefinger losgelöst und die Bauchhaut nebst der der Kehle abgerissen, im Rauch eines Feuers gewirbelt, das man auf einem Kokoswedel *róurou* angezündet hat, in Brotfruchtblätter, *magárigar*, gewickelt und in den Ofen gegeben.

---

[1] *sal* träumen, *bong* Nacht. [2] Bd. 6 I S. 222.

[3] s. A. Krämer, Die Samoa-Inseln Bd. II S. 195. Im Netz gefangene Bonito sind wie andere Fische.

Die Eingeweide, zuvörderst der Rogen werden roh gegessen, nachdem sie etwas im Rauch geschwenkt sind, ebenso das Herz; die übrigen Eingeweide werden gekocht. Der abgeschnittene Kopf, die Schulterstücke, dann der Schwanz ohne Knochen, die Rückenstücke, alles wird auf Blätter ausgelegt, dann eingewickelt und auf heißen Steinen gekocht. Das Kleid für den *karangāp*-Fisch heißt *magárigar* (s. o.). Dann sind die Tabûs beendigt.

Wenn ein Fischer das Tabû der Frauen gebrochen hat und nach dem Fischen krank wurde, gilt der Alusitét (S. 122) als Urheber, und ein Zauberer spricht deshalb zu ihm ein Gebet, 2 Kokossträuße, *meseli pálū*, in den Händen haltend.

Ich gebe einige Gedichte im Urtext wieder, obwohl sie angeblich von Oleai stammen; aber Agupelior von dort kannte sie nicht. Über den Anzug s. bei Zauber.

e) Gesänge beim Fischfang.

I. Sang (unübersetzt).

1. *ē lámu fēlivot*
2. *pingarō gamáiva*
3. *ngaregē le tāt e melē-*
4. *isámelāū bagoēla*
5. *seraudla*
6. *igabūa*
7. *isetilimē*
8. *imetau vēla*
9. *igerigerig*
10. *igamálamal*
11. *metal e fale ángilē*
12. *i sū ēgelū*
13. *vótavol ē góragor*
14. *i sagordgumo*
15. *góbēle mágut* S. 173 Z. 15
16. *ma gobēle ivas*
17. *ma gobēle sōusóu* (*sou* wegfahren eines Bootes).

II. Sang.

VI. Regenvertreibung.

vólorigi taratogó	Mit jungen Wedeln wegtreiben den nahenden Regen.	*vólorig* 2—3 jährige Kokospalme, *toroi* wegtreiben. *taratog* Regen kommt!
taraéa fisigia	treibe fort mit Feuerschnelle,	*taraeúa* beendige das,
gauvária gomalóa	sehe zu, kläre auf,	*vāri* sehen, *melemel* klären
ē langia	daß ich sehen kann.	

VII. Vertreibung einer Windhose *saubarērē*[1].

Alle Mann schlagen schreiend mit Tauwerk um sich im Boot.

1. *e siu siu bāleiō*	Es steht auf die Wasserhose;	*siusiu* aufstehen, *balei* östliche Wasserhose.
mogologologū mogologō teleā	jage (sie) weg, jage (sie) weg mit der Axt,	*gológolog* wegtreiben
tiuorōdjo divorodjō	herab kommt Dunkelheit,	*rodj* dunkel, *liu* herab.
ngērangngērang boē taigóa	gelbe dich ein, wolle dich mit Reng beschmieren!	*taig* = *teik* Truk S. 116, gemeint der Wasserhosengeist,
5. *boē rigi lēvā*	Willst du rennen auf dieses Boot?	*rik* rennen
farag i lēva	Gehen auf dieses Boot?	*farag* gehen
ngeisataraga bāum ia	Nimm deine Hand weg von uns,	
songosong le pē limál	ärgerlich (wie) die Hand eines Mannes	*song* ärgerlich
ē maratīlo	Maratilo,	Name für Wasserhose
10. *ē loūliar ēia*	zum Regenbogen, geh!	*ēia* geh weg!

VIII. Haivertreibung.

Es wird Arznei ins Meer geworfen, damit die giftigen Fische kommen und den Hai vertreiben.

lāūleaṗ ērāleaṗ	lāū von Yap, ēra von Yap,	*lau*, *lou*[2], *nō* Synanceia, *ēra* Seeigel mit roten Stacheln.
buūtog bóurur	kommt spielen,	*ur* spielen, tanzen
djuli tágēām	spielen auf deinem Boot.	*tatág* an Bord sein, *tágeiom* dein Fahrzeug
lālōr, lālefang	Dünung aus Süd, Dünung aus Nord,	
5. *lalabélabal metāū*	die große Dünung des Ozeans.	aus NO, soll die Fische bringen.

Auch beim Walfisch wehrt man mit Gesang ab, damit er das Boot nicht ramme, man bemalte sich mit Gelbwurz und Lavendel, sprang auch ins Meer, oder zerrieb die Kräuter hinein.

---

[1] *ētibasō* und *saubarērē*, s. auch *balei* Z. 1, haben schon viele Boote vernichtet, weshalb unter der Besatzung immer ein Sangeskundiger zur Beschwörung zu sein pflegt.

[2] *lou* Palau IV S. 354.

IX. Bootsgesang beim Passieren einer Untiefe.

Der Sänger winkt mit den Armen das Unheil ab.

rangatĕ, rangatĕ		
bouteregerengír	es will kratzen,	*ngerengér* das Schaben beim Auflaufen
bou tangerangár	es will kratzen.	
oá limetá	Was ist das für ein Boot?	
5. *vā li garangāp*	Das Bonitoboot.	
oá limetá	Was ist das für ein Boot?	
vā til	Ein *til*-Boot	Fisch *til* Sardine
vaurûr	Glück auf,	
vadjépdjep	ein volles Boot.	

X. Boot zum Fischen fahrend.

Limagél, Limagél	Limagei, Limagei	Geist S. 106, 109
gagārávoi	hilf zur Ausfahrt	Bootausfahrt bei Buik.
ţālaróti labeláb	unter großem Regen.	*aroit* = *gorów* Regen poet
lĕsĕt mādjedjil	Das Meer (sei) glatt,	*madjiedji* glatt
mĕllĕ sagadjeli eál	auch mach glatten Weg	*mallĕ* auch, *djeli oder rali* glatt
beigaue sĕil Lamodjek	früher das Boot L.	
itī tiróg lĕseti tót	.. .. das Meer bald.	*tot* = *djot* wenig, bald

XI. Fischlied.

Lemagél, Lemagei	Lemagél, Lemagei	Geist
imīmiamó	bewahre	
gotol ĕ vávāi gotolīg	das Grundberühren des Bootes, die Berührung,	Grund *got* berühren galt als schimpflich
gotolī váe	das Grundberühren des Bootes	

XII. Der Fang des Bonito *garangāp*[1].

1. *i buro* Faier	Ich trete auf, Faier,	Faier sei ein schlechter Gruß bei Saulal S. 144
a ţĕlă ma djĕl ĕdó	zu leiten sein Auge, zu kommen,	*ţel* belehnen, leiten, daß sie wollen kommen.
ĕdó	zu kommen,	*ĕĕdo* kommen, Truk *etto*.

[1] Tóropou (s. Haus Nr. 16 S. 24) bekam den Gesang von Berĕlug auf Póloat, der nach Saipan verbannt wurde; sein Sohn Eábau war 1910 noch auf Póloat (Bd. 6,2 S. 127 nicht genannt).

tágŭ ălĕ boĕ ĕil	der Taku da und Eil wollen	*tagu*[1] männlicher Bonito; *ŏil eil* andere große Art.
5. *bŏ falu*	aufs Land	
boĕ ĕ găl ĕ ăitog	wolle herwinken schnell,	*gal* winken, *itog* her, *ilog* weg, *gailog*[2] schnell
boĕ faliú ĕ mĕ e ăĭul	er wolle aufs Land der Eil	*sefesef* schnell, *ŏrodj* nahe uns
sáfesaf ali ŏro	schnell in meine Nähe	
mădjiliŏro igel	siehe, daß nahe uns der Fisch,	*madj* = *mes* sehen, d. h. aufpassen, daß nichts geschieht, was denFisch abwendet.
10. *ngaráitiu ĕ ădŏ*	hinab, er komme,	*tiu*[3] hinab (ins Wasser), *ta* hinauf ans Land Fritz: *tau* weit
ĕ ădo, ĕ ădo beibéilong	er komme, er komme, treibe herein,	
béibei táuo	treibe.....	*táuo* von außen herein?
ĕ ădo, beibeilóngo	er komme, treibe herein,	
garangăp ale faliuéi Lamodjeg	den Bonito nach meinem Land Lámotrek;	
15. *boĭgallĕla ĕ ăs*	nachkommen den As,	*ăs* (*ias* S. 57) feiner Name für den Bonito, *ligăsamai* halbarmlang, *igelap* ganzarmlang (Z. 27)
ĕ boĕtog váretok	sie sollen kommen zu sehen	*vĕr* sehen, Fritz *uĕri*.
mórumor lĕset	das Hüpfen der Wasseroberfläche	das rippelnde Wasser von den Schwänzen, Oberfläche *áitel*
faliuéi Lamodjek	(für) mein Land Lámotrek.	
ipagúi tărădjig	Erfülle mein kleines Begehren	*ipagui* ein Stück abschneiden, für Wünsche die die *alus* stützen, damit sie passen.
20. *i pagúi táralap*	Erfülle mein großes Begehren,	
emĕtŏráidjig	daß ich sehe die Seebarbe,	*met* = *mes* sehen; die 2 alus, Foraidjig der Mullus *uŏrik*, u. Forailap = Bonito
emetorailap	daß ich sehe den Bonito.	

[1] Palau *teku* Albacor, Truk *toku*. [2] Fritz *kai*. [3] Truk S. 49[3].

56 LÁMOTREK-GRUPPE

góbuitiu Móroa	Du komm herab, Móroä,	Windgott s. S. 383 von *mor* Sturmwind
goſelẽta tílevẽ	du treibe die *til*-Fische da,	*til* s. S. 60
25. *búdjei* Lugeílleng	die Sprossen von Lugeileng;	
ígarang ẽl igákit igalᵘlap	da tanzt das Wasser, da kleine und große Fische,	s. Z. 15. *igelap*; *ig* Fisch.
igadjili metáu	Fische vom fruchtbaren Meer;	*gadj* Seegeruch
erádj agálẽ gangi	die Wale tun essen;	*radj* Wal (Truk *rau*),
gamóromor átag	laß es aufquellen!	*gangi* essen, *átag* hinauf (Póloat).

XIII. Bonitolied.

1. *meisere, meiser*	Lauf gut, lauf,	*sér* auf etwas hinauflaufen, das Boot.
meisere málog	lauf gut, zerstreue,	wenn das Boot durch den Bonitoschwarm läuft, wird er zerteilt.
málog gataſalátog	zerstreue, kommet zurück	
ſaliuái ſalibái	unter mein Boot, unter meinen Haken	*jan* unter
5. *meisere meiser*	Lauf gut, lauf,	
meisere málog	lauf gut, zerstreue,	
meisere meiser	lauf gut, lauf	
meisere budj	lauf gut, häßlich Ding;	*but, djõbut* zerbrochen, häßlich
meisere meiser	lauf gut, lauf,	
10. *meisere málog*	lauf gut, zerstreue,	
meisere meiser	lauf gut, lauf,	
meisere mudj	lauf gut, *mudj*	kleiner schwarzer Fisch, mit 2 Dornen am Schwanz.
málog gataſalátog	zerstreue, kommt zurück	
ſaliuai, ſalibai	unter mein Boot, unter meinen Haken	
15. *bólik matadjá*	stinkend wie ein Rotauge.	Beryxart, wurde so beleidigt, daß er biß.

Weitere Fortsetzung:

XIV. Ruf aus der Ferne an die Fische aller Inseln, herzukommen.

1. *i uili ingai gatáma*	Ich leite gerade in die Tür	1. Z. 13, *uilli*
iás ali faliuẽi Lúgeileng	den Bonito, in mein Land, Lúgeileng,	Gott S. 122.
i boẽ angámo	ich will greifen	*angámo* auch das Messen der Bäume
mei li Ratak	die Brotfrucht von Ratak,	
5. *boá mei li faliuẽi* Lúgeileng	will Brotfrucht in mein Land, Lúgeileng,	
i vili ngai gátama	ich leite gerade in die Tür	
iãs ali faliuẽi Lúgeileng	den *ias*, in mein Land, Lúgeileng,	*ias* S. 55
i boẽ angámo	ich will greifen	
mai li faliuẽi Lúgeileng	die Brotfrucht für mein Land, Lúgeileng,	
10. *i vili ngai gátama*	ich leite gerade in die Türe	
ias ali faliuẽi Lúgeileng	den *ias* in mein Land, Lúgeileng,	
i boẽ angámo	ich will greifen	
mai li Falopei	die Brotfrucht von Ponape	
boẽ mai	ich will die Brotfrucht.	

So beliebig wiederholt für alle Inseln.

Dann folgt:

15. *i bura sólol*	ich betrete den Erdboden,	
ngẽ fangilẽ sólol	ich erwecke den Erdboden,	
ngẽ sólol e Sóleda	den Boden des Sóleda,	
ẽ solol e batabáta	den Boden, den feuchten;	*pẽta* »brakisch«, auch »mischen« von Flüssigkeiten; *bãtamata* weichreif, feucht
i boẽ sa uẽti	ich will warten	
lẽ fõl Lóbul	beim Haus Lõbul	*fõl* = *fal*, Haus des Sóleda, nicht im Himmel, mehr unten im Luftraum,
lẽ fã séram	unter dem Himmelslicht,	bis du kommst!

mĕ Edjäfa *ŭloul*	und Edjäfa, der wurde	die Seegurke Synapta, als Geist, der die Brotfrüchte wachsen macht, unterirdisch vordringend und die Früchte durch Bewegung treibend.
maugóug alelóng	geboren in der Nacht,	
ĕ sauet ĕ ralit	(bringt) die junge Frucht an die Zweige.	*sauet* junge Frucht; Lam. *ralil* Zweig, 181b. *rahl*.
gumúge mai	Leite du die Brotfrucht,	*gumú* führen, *gumúg* du führe, *i gomúg* ich führe dich.
i sa vórog e mai	ich sehe die Brotfrucht,	
ia bŏla djudju	ich will sie sammeln	
ma uoi tol igiér	von dem Land der Fichten.	*tol* Land, Grundstück (Truk „Berg"); *gier* gemeint die redwood-Fichten Kaliforniens, deren Größe die Brotfruchtbäume erreichen sollen!
‖: *o mai ia* :‖	‖: Heil der Brotfrucht :‖	

Eine Art Fortsetzung vom *garangăp*-Gesang ist der

XV. Gesang[1] über die Curcumablätter.

óngonik, die in der Hand zerrieben werden (Palau III S. 40 *reng* = *ong*).

1. *iasŏu rékerek*	Ich setze in Reihen,	*rĕkerĕk* in Reih und Glied
iasŏu măitok	ich setze sie in gute Richtung her,	
leióng ali veila véitok	meine Curcuma wird sie bringen,	*ong* = *reng* s. o.; *ŭaitog* = *veitog* = *veila*
veiveităt̆ok	bringe sie her	*veivei* bringen
5. *ĕgiom ĕgă ăs i*	deine Matte, du Fisch da,	*ga* = *go*, *ăs* = *garangap* s. Ges. S. 55 = Z. 15;

[1] Was das Singen betrifft, so hielt der Vortragende seine Stimme annähernd im tiefen C, nur selten 1—2 Töne nach oben schwankend. Dabei wurde der Text deutlich ausgesprochen. Vormittags 11 Uhr, konnte ich diesen tiefen Ton kaum erreichen.

giegi Matte, *giom* deine, dein Lager.

tomareirei recht viele *ngareirei* zahlreich
lisĕtil faliuĕi Lamodjeg an die Oberfläche, mein Land Lamodjeg *sĕt* Meer

iasŏu rĕkerĕk
iasŏu măitok
10. *leióng ali veila veitok*
vei vei tătok
} s. Zeile 1—6

Der Sang wird bis hierher öfters wiederholt, zuerst für den *garangăp*, dann für den *tágu* (S. 55), dann für den *eil*, dann für den *til*, dann für den *uŏrik*, dann für den *mamodjek*.

ĕ gióm go tágu deine Matte, du Bonito,
i uílli ngai gătama Ich leite gerade in die Tür *ngai* oder *mai* s. Z. 5.
iăs faliuĕi Lúgeileng den *ias*-Fisch, in mein Land, Lúgeileng,
15. *i boĕ angámu* ich will greifen
iăs faliuĕi Lúgeileng den *ias* für mein Land, Lúgeileng,
mai li Lamodjek die Brotfrucht von Lamodjek,
mai li faliuĕi Lamodjek Brotfrucht von meinem Land Lamodjek.

Hier schließt sich ein Brotfruchtgebet mit an, das *gatóketok ali mai*, das Bringenlassen von Brotfrucht. Die zerriebenen *ongorik*-Blätter werden zugleich geschüttelt und ausgestreut.

f) Netze *djāŭo, djrou.*
(vgl. Tafel 5.)

Schwimmer *ugopĕs*, Senker *faurem.*

Die Herstellung geschieht wie üblich (nach Hellwig) mit dem Maschenstab *djāf*, der die Breite der Masche *metăl* (»sein Auge«) haben muß, gesichert durch den Knoten *búgabug* (He. 2095). Das Garn ist um den Schützen *kadjāp* geschlungen, dessen gabelförmige Enden *ewăle* oder *kadjāp* heißen.

Während der Maschenstab aus *arŭr*-Holz zu sein pflegt, ist der Schützen aus Bambus, *budi*, der aus Westen (Yap) stammt.

Das Garn, *gologól*, (s. S. 72) wird aus den Hüllenfasern junger Kokosnüsse bereitet, die zuvor 3—4 Monate im Wasser liegen müssen, ehe sie mit dem Bastklopfer, *pelai* oder *komang*, bearbeitet werden. Dann werden sie auf dem Oberschenkel (oder

mit Drehapparaten) (s. Abb. 44), zu Kardeelen, *mut*, gedreht, deren 2, seltener 3—4, den *gológól* geben.

Hergestellt aus Kokosgarn.

garom Masche bleistiftdick, rechteckig, Netz ca. 2 m lang und 1 m breit, von 2 Männern gehalten, s. unten.

ugali vomei Masche Fingerdick *(vómei* Tiefwasser)

ugalei Masche 4 Finger dick

ieting (aating) Masche 6 Finger dick.

Schwimmer oben *náres*

Senker unten *baurem*

gal Netz nach Ifaluk-Art, ein Sack an 3 Henkelschnüren, an denen er aufgeholt wird; in den Sack wird unten ein lebender Fisch getan; Durchmesser ½—2½ Fuß; als Köder *rō* und *gidjegidj*. Gefangen meist Scarusarten, oft 5—10 von ½—1 Fuß Länge in einem Zug.

ū til (tin) dient zum Fang des kleinen (5—8 cm lang) *til* = Fisches S. 60, der Sardine ähnlich; *gosi met a til* »fangen Auge des *til*« heißt ein Gesang, der am 4. Tage nach dem Fangbeginn von den Frauen angestimmt wird, und der mit einem allgemeinen Aufschrei endet, denn die ersten 4 Tage dürfen sie noch keinen *til* essen, zumal da der Fang anfangs noch recht spärlich ist; man ißt den *til* unausgebeint, indem man ihn den Kopf voran in den Mund steckt, weil sonst der Fang schlecht wird. Das Netz ist ein langer Sack, dessen Mund durch zwei gleichlaufende Stäbe gesperrt gehalten wird; ein weiterer Stock läuft mitten über die beiden, wie ein Stiel. Wie groß der Fang dieser Sardinen ist, zeigt die Zählung bis zu einer Milliarde (s. Feis Schluß).

ugalei (wie *garom* oben) als Netzsack dienend, wenn durch *rul*-Leinen (Palau III S. 86), hier *rob* genannt, ein Trichter auf der Riffplattform bei Ebbe hergestellt wird, durch den die Fische in den Netzsack gejagt werden. Das *ugalei*-Netz ist oft im Halbkreis aufgestellt; als 2. Sack kommt oft noch ein Korb *u le moróuel* (s. o.) hinzu, (s. *kesókes* Palau III S. 87 Abb. 80a) für *garom* sind es meist *modj*, *márafas* usw.

Ein Ramennetz, *djrou soiloile* (He. 2225 = 6005II), zeigt Taf. 5a.

Der Rāmen heißt *atil*, die Gabel *ekan*, die Verfalzung *básebas*, die Verschnürung *vōtō*, die Masche *metál*, der Knoten *bugabug*, die Netzzipfel *fangál*, der Griff *komásu*.

He. 2169 = 3942II Fischnetz *djrāuō*, vorderer Ramen *gatille*, hinterer *vaibále*.

He. 2195 = 5969II Fischnetz *djrāuū*, Rahmen *atil* (s. o.).

Kr. 489 = 3243II. Taf. 5b ist ein Seelenfangnetz des Ikelur (s. Palau IV S. 74 Gesch. 29), *djrou i alus* genannt, weil man damit auch ausgetriebene böse Geister fangen kann.

Gesammelt wurde noch ein großes Fischnetz Kr. 485 = 3240II.

g) Fischkörbe

ū (Truk S. 143), *ūl marāuel* (*moróuel* S. 61).

(vgl. Tafel 4 und 5.)

Entleerung bei winkeligen Körben nicht durch Umkippung, sondern mit einer gebogenen Hacke *tangak* (He. 2100 u. 2307).

h) Treibholzstämme mit Fischkörben bewaffnet *(gabêibei)*.

Treibholzstämme wurden schon früher als willkommene Bringer von Fischen gemeldet, die sich um sie versammeln. Beim Suchen[1] und Finden nehmen die Eingeborenen den Hut[2] ab, und stehen im Boot nicht mehr auf, weil es der *alu* Tautup verübeln würde. Ehe sie nun die Körbe an den Stamm binden, singen sie ein Lied an den Tautup, so z. B.:

go vôlebu iai Tautup	Du bring Glück mir, Tautup,
go vôlebu ẽai êrei Tautup	du bring Glück mir, Tautup,
gali a baâi[3] *galiabalei ũ*	gib guten Fang mir, mach erfolgreich den Korb
vole vã i vai	auf meinem Boot,
‖: *galiabaâi rok* :‖	gib recht guten Fang mir,
ẽ bõẽpulêlipei[4]	es will sich freuen mein Herz
vôli va[5] *i uai*	in meinem Boot
lugul[6] *efaliõ* Lamotrek	außerhalb meiner Heimat Lamotrek.

Danach bindet man die Fischkörbe *ũ le moróuel*[7], seitlich an den Stamm; einige hintereinander, den Boden des Korbs nach oben und die Öffnung nach hinten, auf der Leeseite. Der achterste gilt als der beste. Darauf macht man den Stamm fest und nimmt ihn ins Schlepp. Meistens werden Brassen, *rell*, gefangen.

Das Anbinden der Körbe an den Stamm gilt als nicht ungefährlich, weil auch Haifische den Treibholzstamm zu umschwärmen pflegen; die Eingeborenen erzählten, daß jüngst ein Hai einen Fischer gebissen hätte, der einen Fisch im Mund hatte.

Fischkörbe werden im Binnenwasser 1—2 Faden tief versenkt; man merkt sich die Peilung vom Lande und pflegt sie dann ohne weiteres zu finden. Das Hochheben, *buẽ* oder *pio*, geschieht mit dem *kaſáigo*[8], Hebhaken, der in Palau III S. 82 Abb. 67 schon abgebildet wurde; von *pio* heißt auch ein Korb *ũ lepio*, sonst *ũ le ſato*. (Es gibt auch eine Harke *tangak*, He. 2100 = 58_{77}^{II}, zum Herausheben der Fische aus dem Korb.)

Aber in den Durchfahrten und weiter draußen wird in 7—8 Faden, ja gelegentlich in Tiefen von 20 Faden versenkt; dann müssen die Senksteine *ſaiṗis* auch groß sein, und man wählt solche Tiefen auch nur im März und April, wenn geringer Strom ist und während Niedrigwasser; sie wissen meist genau den Platz, suchen mit den Haken, heben an, lassen fallen, damit der Haken eindringt und holen dann den Korb auf. Weitere Korbarten:

---

[1] Das absichtliche Suchen heißt *tôjema*, eigentlich »weithin sehen«.
[2] Sonnenschutzspitzhut s. Truk S. 181.
[3] *galiaṗ* (*b*) guter Fang, Glück.
[4] *pul* glänzend, hell.
[5] *vôli va* im Boot.
[6] *iuk* mitten, *lugul* außen.
[7] Vom Verbum gehen zum Fang: *ẽ le moróuel* er ist gegangen.
[8] He. *ŧavaigo*, Holz *kaini* (He. 2298 = 607011), He. 2100 ein Schürhaken ähnliches Zweigstück von 84 cm Länge.

ûs'sŏ zum Fang des Sandmullus *sŏ*, bei dem kein Köder in Anwendung kommt, nur Sand um die Mündung gehäuft wird. Wo Seegras, *pom*, vor dem Sandstrand liegt, setzt man die Körbe in dieses, nicht in den Sand.

û le pâm für die kleinen Sandbarben *uorik*, für die ein Köder *pa* (= *pa* Blänker) aus *rakum* oder *rakung le bĕap*, den Landkrebsen, eingegeben wird. Eingang *ûsig* (He. 2294).

ûlam kleine Körbe für Knaben mit Köder in Flachwasser; runde Form.

4. Geräte, Gefäße und Waffen.

Das Handwerk erfreut sich keiner besonderen Pflege. Beim Schmuck wurde schon erwähnt, daß die guten Stücke meist von den Inseln im Westen und Osten eingetauscht sind.

a) Geräte.

(vgl. Tafel 7.)

Eine Beilklinge, *ētiligi*, erhielt ich noch (Kr. 495 = 3249^{II}) (Truk S. 146 *ē dinnigi*)

He. Tridacna *djim* (Tr. *sim*), Cassis (2213).;

He. 2114 = 5891^{II} ist ein Hohlmuschelbeil *korolimang*;
aus *lēang* Muschel von Elato.

He. 2136 Eláto Muschelbeil *marâli délla* (Klinge *délla*), Terebra *talingawat*, Klingenlager *rodjâl ĕ (rosâl ĕ)*, Nacken des Stiles *apirri güle*, Griff *erálle*, Verschnürung *vâvâ*, Holz *djálo*., Zeremonialaxt *tellē i lolomai* s. Fischerei Abb. 22, Bootbau S. 92; Klinge, Meißel *pérogol*, Axtschlag *tellē i faleſal*; *apúnga sillē* Ton des Schlages.

Abb. 25. Stuhl.

Drillbohrer (He. 2115 = 5892^{II}) *burabûra* Elato. Scheibe aus Patt, Bohrspitze Haizähne. Handbohrer s. Abb. 134e.

Zum Glätten des Holzes dienen Korallensteine *faiürr* (He. 2312) (Truk S. 147 *fauir*), oder Rochenhaut (He. 2325 u. 2273 *gillivai*) und Bimsstein *miûr*, *mür*, der angetrieben wird (He. 2159) (s. Bootbau S. 96).

Bastklopfer, *kománg*, He. 2288 = 6060^{II}, Holz *kaini*, von Pik (S. 16) stammend; mit Knopf am Stielende, s. Abb. 94 u. Bd. 61 S. 223.

Hauptprodukte: Holzschüsseln, Haus und Boot, kleine Idole, Vögel (Farbtaf. 2). Unter den kleinen besonderen Gegenständen befindet sich ein Stuhl (Kr. 945 = 3656), der von Ikesera einem Deckstuhl, wie er sie auf den Schiffen

sah, nachgebildet wurde. Photo Nr. 1026 zeigt Ikesera auf dem Stuhl sitzend (Abb. 25).

Über Bemalung s. Bootbau S. 97.

b) Gefäße *tébbi* (He. *tapi*) Teller *rölig*.
(vgl. Tafel 7.)

Herstellung aus Holzklötzen oder Scheiben, die an Taf. 8b vorhanden waren. *bóati* = Nasen sind vorhanden, wie die Abbildungen zeigen (wie auf Truk, Palau usw.). Die Schüsseln sind in verschiedener Form vorhanden: Fuß rundlich

Abb. 26. Holzschüssel.

Abb. 27. Holzschüssel.

(Kr. 451 = 3206[II]) und erhöht; die ganze Höhe ist 13 cm, die Breite der Schale 32 cm; der Rand der Schale ist oft fast sechseckig[1], Abb. 26 (a); der Fuß kann aber auch zweibeinig sein (b). Zwei hohe Füße mit Bodenplatte hat die Rundschüssel Abb. 27 (Kr. 452 = 3207[II]) für bequemeres Essen; die ganze Höhe ist hier 25 cm, die Länge der rundlichen Schale 24½ cm (He. 2091 Fuß *perél*).

Abb. 28 zeigt einen niedrigeren Fuß (He. 2335 = 6103[II]) denn dieser ist nur 6½ cm hoch; er ist eigentlich ein niedriger Hockerstuhl mit 4 Beinen, auf dem eine längliche Schale von 21 cm Länge und 13 cm Breite ruht. He. 2336 ist ähnlich geformt.

Abb. 28. Holzschüssel.

Abb. 29. Fischeßbrett.

Abb. 29 ist ein Fischeßbrett (Kr. 491 = 3245[II]) das keinen hohen Fuß hat; aber eine kleine Erhöhung ist doch auch rechts auf der Abbildung zu bemerken; ist es spitzoval, 42 cm lang und 22 cm breit, und hat am Rande eine kleine Leiste,

[1] Eine Holzschale in Weimar ohne Fuß zeigte das Sechseck deutlich.

die wie ein Zaun wirkt; an einer Seite ist in ihr ein Loch für die Aufhängeschnur.

He. 2226 = 6006[II], *tapi lemálu wulól*, längliche Form wie Palau III Taf. 5 Nr. 15 u. 18, aber nicht rotgefärbt und ohne Perlmuttereinlage.

Drei Schüsseln sind auch im Lindenmuseum zu Stuttgart mit Lamotrek bezeichnet: eine flache ovale Nr. 41247, eine rundliche, flache breitgequetschte Nr. 41263, und eine tiefe ovale mit 2 Vogelköpfen anstelle der Nasen, der Fuß niedrig, ein geschlossenes Viereck darstellend Nr. 45454, s. Taf. 7 unten.

Deckelschüsseln (s. Truk S. 155 Abb. 123 u. S. 156) vorhanden. Die oben S. 48 erwähnte Fischhakenbüchse, *sóp*, ist ein solches truhenähnliches Gefäß, s. Abb. 30. Länge 12,4 cm, Breite 3,8 bis 6 cm, Höhe 4 cm; He. 2227 Deckeldose *sáp*: Kasten *bassobasso*, Deckel *gárebal*, Knopf *bóatil*, Rand *nadjel*, öffnen *sugi*.

Abb. 30. Deckelkasten.

Merkwürdig ist eine mit griechischen Figuren verzierte Deckelschüssel, eine sitzende an der Breitseite, und eine stehende an der Endseite. Sie soll von einem Spanier Gulio verfertigt sein, der beim Taifun 1907 auf Lamotrek war; 77 cm lang, 27,6 cm hoch und 27,5 cm breit. Abb. 31.

Die Vogelschüsseln gleichen denen von Truk S. 155. Kr. 493 = 3247[II] hat einen hufeisenförmigen Fuß, da die beiden Vogelfüße ihn bilden, Abb. 32. Länge 37 cm, Höhe 20½ cm. Vorwurf der Fregattvogel; He. 2229 nennt sie *tapi e gataf*, Zweck Farbschüssel für Yapfarbe; *tapi e láp* heißt Kr. 453 = 3208 und ist fußlos, deshalb aufgehängt; 48 cm lang, mit Malholz (s. oben Spatel *falalio*, s. S. 41, 42), da eben die Schüsseln für Farbe verwendet werden, Abb. 33.

Abb. 31. Figurenkasten.

Eine dieser sehr ähnliche Form ist in Berlin VI 25365, s. Oleai, und eine mit geducktem spitzen Kopf und Gabelschwanz von Elato, Berlin VI 29471, 50 cm lg.

Zu den Gefäßen rechnen auch die Kokosschalen, von denen eine, He. 2282 = 6054[II] *dagág a tál*, auf einen runden Fuß gesetzt ist, Abb. 34; sie hat auch

4: Krämer OR21 Woleai

einen Henkel und soll von dem 7—8jährigen Jungen Malüvit erfunden worden sein, der sie auch selbst zum Tausch brachte. Hier handelt es sich natürlich um

Abb. 32. Vogelschüssel mit Fuß.

Abb. 33.
Vogelschüssel ohne Fuß, hängend.

Abb. 34. Trinkschale aus Kokosnuß.

fremde Beeinflussung, oder man muß es als altes indonesisches Traumgut auffassen, da ja gefußte Schalen, gelegentlich auch mit Henkel, in Westindonesien vorkommen. Zweck zum Trinken von Wasser oder *garri* (Palmsaft) (13,5 cm breit).

Die Büchsen aus Kokosnüssen heißen *wäre*; sind entweder in Nußform, He. 2327 = 6096[II] Abb. 35; Länge 15 cm, Breite 8 cm; oder sie haben Deckel *(pelipelal* He. 2104) und Boden, He. 2246 = 6023[II] Abb. 36; Höhe 7 cm. Zweck: Aufbewahrung von Fischhaken, Arznei usw.; auch als Feuerholzbüchsen, *gulegul*, werden sie verwendet. Aber auch Büchsen aus Bambus gibt es, die wie

Abb. 35. Kokosbüchse, längs gespalten.

Abb. 36. Kokosbüchse.

Abb. 37. Bambusbüchse.

Abb. 38. Gefäß.

Abb. 39. Zierat auf Bambus

in Indonesien geschmückt werden. He. 2228 = 6008II Abb. 37 ist mit *arepél e bulugale* »Schwänze des b.« und mit Haizähnen ausgestattet, in 6 Reihenbändern. He. 2329 6098II Abb. 38, 24 cm hoch, mit 2 Bändern, von Fischen und *kurugago* (s. Abb. 79 Nr. 31); He. 2330 = 6099 Abb. 39 zeigt verschiedene Ornamente Nr. 9, 11, 22, 33, 43 und die *pup*-ähnlichen Männchen, 23; halb und gedoppelt. He. 2118 hat eine Ritzzeichnung von *kirigi*-Spitzen.

In Berlin VI 7749 ist ein Bambusrohr mit vielen Ritzzeichnungen an Vögeln, Kreuze, Sonnen, Zähnen, ähnlich, wie sie von Oleai abgebildet sind.

c) Waffen.

Bei der friedlichen Art der Bevölkerung fehlen Keulen und Speere. He. 2161 = 5934II, it 2176 Schlagring *radjevas*, mit Fischstacheln *ig e valeval*.

5. Maaße.

Christian's Angaben S. 391.

gal, sigal	1 Fingerlänge	= 3 Zoll
ruagal	2 Fingerlängen	= 6 Zoll
siligal	3 Fingerlängen	= 9 Zoll
fägal	4 Fingerlängen	= 12 Zoll
ang, siang	1 Spann	
ruang	2 Spann	
siliang	3 Spann usw.	
rolibos	½ Elle	
gopa	1 Elle	
sipap	von Fingerspitze bis Brustmitte.	
singaf	1 Faden	
sigip	1 Fuß	

6. Flechterei. *feifei* oder *feifeu*.

spalten *gassiei*.

Bastklopfer s. S. 62.

Perlschale *baura*(?) zum Glätten der Streifen und Schaben der Fasern Abb. 40 (Kr. 473 — 3229[II]) (insbesondere der Bananen, früher nicht abgebildet). s. u: S. 75.

Abb. 40. Faserschaber.

a) Matten.

Matten, zweiteilige Kokosmatte *girre* (Truk S. 162 *hinni* oder *hiri* S. 164).

He. 2278 = 6051[II] Abb. 41 *gilli*, kleine Kokosmatte für Wasserableitung, wenn bei Regenwetter Auswaschungen des Bodens an der Hauswand entstehen, durch welche das Wasser nach innen fließt; mit einem Griff wird die Matte an der Notstelle zwischen die Matten der Hauswand geschoben, so daß das Wasser abgelenkt wird. Von Hellwig bei Haus 24a Imeailap beobachtet. (Größe 30 cm).

Abb. 41. Wasserabwehrmatte.

Kr. 478 = 3234[II] *gillitilimes* Abwehrmatte (s. Medizin und Zauber).

He. 2258 = 6033[II] Kokosmatte *ulaf* für die Schutzhäuser auf der Bootplattform (Ifaluk-Mann). Pandanusmatte *hidhi* (Truk S. 162), die wie alle Pandanusflechtereien vorzüglich auf den Koralleninseln hergestellt werden, so auch von den Trukinseln eigentlich nur auf der Riffinsel Pis.

b) Körbe:

Über Korbflechten s. Truk S. 168. Einige von Lamotrek und Elato sind hier auf Taf. 5 abgebildet. Zunächst seien erwähnt die aus Pandanus gefertigten Taschen, die Deckelbehälter, wie unsere Futterale aussehend, und die offenen Taschen.

Deckelbehälter.

Taf. 5c: He. 2158 = 5931[II] *sigerára*; so heißen auch die Fiederstreifen an der Meßleine (Kr. 458) *tal i felefel*.

c) Offene Taschen.

Taf. 5l He. 2261 = 6036[II] *gaigérs* von Lamotrek; He. 2102 eine gleiche *gaigérs* von Elato; Taf. 6m He. 2261 = 6037[II] *gaigérs* mit Henkel. He. 2257 = 6032

ist ein ebensolches Täschchen *gaigers*; die verflochtenen Pandanusblattstreifen heißen *faitoi*, die absteigenden *ealle*, die aufsteigenden *ifak*. Hellwig schreibt auch *gaigerrē*[1], während ich für Taf. 6f (Kr. 461 = 3217[II]) *gaigadj* verzeichnet habe. Das r bei Hellwig deutet ja auf den dj-Laut hin, vgl. Truk und Djuk.

Taf. 6k Kr. 480 = 3236[II] *gatofadj* ist gröber geflochten, er dient zu Essen aufnehmen. m. *gaigers*, f. *gaigadj* und k. *gatofadj* haben einen Henkel, der bei f. zwei Beine jederseits am Ansatz hat; während k. u. m. den Ansatz in den Ecken des taschenförmigen Korbes hat, so stehen die 4 Beine von f. in der Mitte der Seiten, die aber schon geöffnet erscheinen.

Ebenso ist dies bei den Kokosblattkörben Taf. 5n Kr. 454 = 3210[II] *büro* und 5e Kr. 481 = 3237[II] *gad*, für Hochzeitessen der Fall, die gegenüber dem Pandanusgeflecht sich etwas roh und flüchtig gearbeitet ausnehmen. Dieses Wort *gad* oder auch *gadō* (Kr. 459) (He. 2318 *kad*) wurde mir auf Truk nicht bekannt.

Abb. 41. Haarschnur.

Auf Oleai heißt ein Korb *gad* oder *kaporro* (He. 2285 *kaporro*, Körbchen aus Kokos, Lamotrek); *gad-gadō* erscheint oben (k) in dem Worte *gatōfadj*, also ein *gatō* aus Pandanus *fadj*, und will sagen, daß der *gad*-Korb aus Pandanus gefertigt ist und demgemäß feiner, besser; ob in *gaigadj* oben 6f. sich auch *fádj* verbirgt, ist wahrscheinlich.

Eine Tasche *djotudrē* He. 2093 = 5868[II] *drotūare* von Elato hat eine Öffnung *ewālē* und Ringe *talinal*.

Nr. 5c *gad* zeigt nun die beiden Enden nach oben strebend, während die folgenden 3 henkellosen Kokoskörbe g, h u. i gerade im Gegenteil nach unten weisen.

Es sind die schon bei Truk S. 174 (Abb. 146a u. b), erwähnten *wotau*-Körbe, von denen ein aus Pandanus geflochtener auf Taf. 16c dort abgebildet ist, der dem Taf. 6e hier abgebildeten und oben *gaigers (gaigadj)* genannten gleicht; Truk S. 174 wird der Kokosfadenkorb *boddou* (He. *bōtau* und *bodau*) genannt, und He. 2251 = 6027 nennt ihn von Lamotrek *watauro* mit Henkel *djālē*, so daß also ein Korb in abgebildeter Form, sowohl aus Kokosfiedern als auch aus Schnur *wotau* oder *boōtau* heißt.

In der Sammlung sind vorhanden, aus Kokosfiedern hergestellt: Taf. 5g Kr. 456 = 3212[II] *wotau*; Taf. 5h Kr. 457 = 3213[II] *wotau*, Verschluß mit Haarband, an dem Schnecken hängen; Taf. 5i He. 2267 = 6041[II] *watau*; auch He. 2202 = 5976[II] *watau* ist mit einem Haarband versehen; es heißt da: mit 3 Verschlüssen

[1] He. 2111 = 5858[II] *gaigērse* oder *gaigerre djelā* mit innerem Abteil *djelā*; mit Haarschnur.

durch Haararmbänder *sim* und Schnecke *tigere* (Elato). He. 2321 = 6091[11] ist ein solches Haarband, das Abb. 42 zeigt, das auch gelegentlich als Armband getragen wird; es ist 75 cm lang. Die Schnecken sind Doliumähnlich.

Da die ganze Herstellung eines *wotau*-Korbes bei Truk unterlassen wurde, sei sie hier nachgetragen. Die 4 ersten Flechtstadien a—d sind bei Truk S. 172 auch vorhanden.

d) Technik beim Korbflechten.

Der *bottau*-Korb

nach Aufnahme von Elisabeth Krämer

Von einem jungen, schon grünlichen Wedel einer alten Palme werden je etwa 18 Fiedern gleicher Länge abgezählt und die beiden, zum Flechten bestimmten Wedelhälften rechts und links von dem Wedelstiel abgetrennt, und diese beiden Stücke, die die beiden Korbseiten geben sollen, werden zum Flechten vorbereitet, so wie es im Band Truk S. 173, Fischkorb, beschrieben ist. Es wird nämlich das Stück mit der Rippenseite der Fiedern nach oben gelegt und mit dem Daumennagel von den beiden Rändern jeder Fieder (die ja beim jungen Wedel zusammengefaltet liegen), ein schmales Stück heruntergespalten (Truk S. 172 Abb. 142a), so daß etwa die Breite von 1½ cm übrig bleibt. Diese abgespaltenen Fiederränder bleiben an der Hauptrippe (»Seitenstrang des Wedelstiels«) hängen, wo sie zum Schluß mit einem Stück dieser Hauptrippe heruntergerissen werden. Nun wird jede zusammengefaltete Fieder auseinandergebogen und in der Mitte ihrer Rippe gespalten (Truk b), so daß aus je einer Fieder deren zwei geworden sind. Nachdem das Flechtgut 4 Tage in der Sonne gebleicht worden ist, beginnt das Flechten. Es wird dadurch ermöglicht, daß die eine Fiederhälfte in ihrer Richtung bleibt die andere im rechten Winkel gefaltet über sie hinweggebogen wird in entgegengesetzte Richtung (Abb. 43c). Danach wird 3—4mal »über eins« geflochten (Abb. 43d). Dies gibt später die eine Seite des Korbes. Bei der anderen kreuzt die aus ihrer Richtung gebogene Fieder nicht über, sondern unter die gebliebene (e) und wird dann ebenfalls »über eins« verflochten. Ist die Flechtung auf beiden Korbteilen gleich weit vorgeschritten, z. B. dreimal, so werden sämtliche Fiedern mit dem Fingernagel in 4 Teile gespalten (f), und von nun an die schmalen Flechtstreifen mit einander verflochten (g), wie man sehr deutlich sehen kann auf dem Lichtbild des Korbes Taf. 5g. Bei diesem Korb kommen nun mehrere Reihen Flechterei über 2 (Köperbindung), darauf ein ebensolches Stück über 1 (Leinenbindung) dann wieder über 2, wie es auf Taf. 5g deutlich zu sehen ist, bis jede Korbhälfte als geflochtenes Dreieck fertig ist (h), dessen Basis den Ausgangspunkt der Flechterei bildet, nämlich den Seitenstrang des Kokoswedels, an dem die Fiedern angewachsen sind. Diese beiden »Seitenstränge« werden auf die Flechterin zugekehrt, nebeneinander gelegt und da, wo sie einander berühren

und die Fiedern zusammen stoßen (bei Stelle a), werden diese genau nach dem Muster sorgsam in einander übergeflochten, erst die dicken natürlichen, dann die gespaltenen bis unten hin.

Es folgen die beiden anderen Seiten nach Zusammenbiegen des Geflechts

Abb. 43c—g. *bodiau*-Korb.

und eine offene Röhre ist entstanden. Ist der Korb lang genug, so werden die Fiedern der einen Richtung zu einem Schutzrand, der das Geflecht vor

dem Auflösen schützen soll, umgebogen (i), zu 2 und 2 (α, β). Die zwei ersten Fiedern, nach vorn rechtwinklig gebogen, werden hinter die zwei folgenden gesteckt, diese machen es ebenso mit den nächsten und so weiter, um den ganzen Korb herum. Die Fiedern der anderen Richtung (γ), hängen heraus, diejenigen der vorderen Korbseite kreuzen die der hinteren. Letztere werden nun alle in Richtung der ersteren gebogen, damit der Zopf (k), der den Korbboden bildet,

Abb. 43h—k. Sedise-Korb

geflochten werden kann. Er ist bei diesem Korbe besonders kunstvoll, dreiteilig mit 2 Streifen, statt einem geflochten, erinnert er etwas an Peitschenschnur.

Jedes Zopfglied nimmt zwei neue Fiedern, abwechselnd von rechts und links auf, die durch die nächste Zopfmasche (oder -glied) überflochten werden. Die Überflochtenen bleiben rechts oder links herausragend bis zwei weitere hinzugekommen sind, dann kommen sie, die vorletzten daran und werden mit dem Zopf verflochten.

Auf diese Weise entsteht ein fester, flacher Zopf, der den inneren Korbboden

bildet. Ist diese Flechterei am anderen Ende des Korbes angelangt, so werden die vorhandenen Fiedern weiter als freier Zopf verarbeitet und wie üblich mit Knoten gesichert und durch eine Masche des Korbes gesteckt.

Nun wird der Schutzrand aufgelöst und die Fiedern so gebogen, daß sie gleichfalls zum Zopf klar liegen. Dieser zweite Zopf, der den äußeren Korbboden abgeben soll, bewegt sich in entgegengesetzter Richtung wie der innere, wird genau so gemacht wie jener und endet, wo der andere anfing. Auch hier wird das freie Zöpfchen der restlichen Fiedern in die Korbmaschen gesteckt.

Endlich sei hier noch erwähnt, daß auch der Rundkorb, He 2109 = 5883, *kapéas* oder *apéase*, vorkommt, der schon von Truk S. 169 Taf. 17d u. 18e u. i als *abéas* gemeldet ist.

Ebenso der **Fächer**, He. 2112 = 5889[II], *saipe* (Truk S. 175 *áliba* oder *saiba*). Spitze *botili á lipe* (s. Truk *áliba*), Griff *eráll(e)*. Ein *gáliba* (Truk *áliba*)-Fächer wird für Zauberzwecke gebraucht (s. Abb. 68).

7. Seilerei.

Über die Anfertigung von Schnur, *gólogol*, s. o. S. 59; Handbewegung beim drehen nieder und auf, rechtshändig *(gel)*, linkshändig *golemong* (*mong* links).

Abb. 44. Seildreher.

Der *gólogol* ist rechtsdrehend, zweikardeelig, elastisch (Kr. 448); ein Bund von 3 Schlingen *vóngalima* (K. 450 Abb. 610) dient zum Auffangen des vom Boot abgelösten Schwimmers; die Schnur ist 3 mm dick; *mut* Kardeele (Kr. 449). Rolle He. 2108 *baidjórro* Netzflechten S. 60, Fischleinen S. 48.

Der *golomong* ist ein aus 4 Kardeelen links gedrehtes Tau, für die Takelage, gedreht durch Handbewegung auf und nieder. Seil *pelitél* (He. 2096).

Seildreher He. 2140 = 5920[II] *waitilidja* Elato, 2297 = 6067[II] *bait*; also erstes Wort *bait ili djó* »Dreher für die reife Nuß[1]« (Truk S. 127), auf Truk nicht beobachtet, aber in Póloat Abb. 44, He. 2297 = 6067 zeigt den *bait* und seine Teile: Stock *kalaniál*, Querstab *páile*, aus Holz *nga*, Bambusröhre *ngat*, Knopf unten *korodjöl* (He.).

[1] s. auch oben bei Schüssel He. 2091 Schnur *djál* oder He. 2296 Fischleine *djálüga*.

8. Weberei[1].

von Elisabeth Krämer.

Als wir am 22. November 1909 auf die Insel Lámotrek kamen, war uns gerade ein großes Sterben vorausgegangen, eine ansteckende Krankheit, die viele Männer, Weiber und Kinder dahingerafft hatte, und da diese Menschen ihre

Abb. 45a—g. Schmuck-Webstühle von Lamotrek.

Toten schmücken und umgeben mit dem besten, was sie haben, so war der größte Teil der gewebten Kleidmatten, und davon die schönsten und feinsten, mit beerdigt worden. So kam es, daß ich nicht alles an Weberei dieser Insel zu sehen bekam und vorlieb nehmen mußte mit dem, was da war. Freilich waren die Frauen fleißig dabei, neue Matten herzustellen, und ich konnte diese Arbeit von

[1] s. Spinnengöttin S. 147.

Anfang an verfolgen und studieren. Daß die Weberei auf dieser Insel hoch geachtet ist, zeigen die vielen, geschmückten Webegestelle, oder Webstühle, die wir auf anderen Inseln der Karolinen nichtgesehen haben (Abb. 45 a—l). Ihre

h i k l

Abb. 45 h—l. Schmuck-Webstühle von Lamotrek.

Bretter dienen zur Aufnahme der Kette und Gegenstemmen der Füße der Weberinbei ihrer Arbeit. Abb. 46. Die Vorbereitung der (fortlaufenden) Kette geschieht, wie auf Truk, Tabi und den meisten anderen Inseln an den schon beschriebenen Kettpflöcken, die in gewissem Abstand von einander in die Erde

Abb. 46. Orn. Webstuhl mit Kette.

gesteckt werden, und um diese wird in bestimmter Ordnung der fortlaufende Kettfaden gelegt. Das Material der Matten ist wie überall in der Südsee Hibiskus- und Bananenbast.

a) Hibiskusbastgewinnung.

Man nimmt Gerten von einer buschartig wachsenden Hibiskusart, oder, lieber noch, solche von der selteneren baumartigen, und entrindet sie in möglichst

breiten Streifen. Diese werden für 4 bis 8 Tage in Meerwasser gelegt oder in den Tarosumpf, dann herausgenommen und der Bast von der harten, äußeren Rinde befreit, so daß er schmiegsam ist. Nachdem diese Baststücke in Süßwasser gewaschen und aller Saft herausgespült ist, werden sie getrocknet, geteilt, in dünne Fäden gespalten, die aneinander geknotet das Material für die Längsfäden (Kette) geben. Sie haben eine helle gelbgraue Farbe von Natur, werden aber auch schwarz gefärbt verwendet.

b) Die Bananenfaser.

wirkt heller, feiner und seidiger und bildet bei manchen Frauenmatten einen hübschen Gegensatz zu den matteren Hibiskusfäden.

Von einem Bananenstamm werden für den Gebrauch die äußeren 7—8 Blattschäfte abgetrennt, die zurückbleibenden inneren sind zu weich. Mit einer Perlmuschel, in die eine Höhlung geschliffen ist (s. Abb. 40), wird jede dieser fleischigen Schäfte, die man auf ein Rundholz gelegt hat, ausgestrichen, bis alles feuchte Blattfleisch herausgeschabt ist (vgl. Kusae I S. 172) und die meisten Fäden zum Vorschein kommen, die dann gewaschen, getrocknet, in gewisser Dünne abgeteilt werden und an einander geknotet, das Bananengarn abgeben.

uidj	Bananengarn.
gassäi uidj	Bananenschäfte vom Stamm abtrennen.
ligätang	Seitenrand jedes Schaftes.
raruidji u. *ra ri uidji*	ausschaben (der Schäfte).
puai	Perlmuschel mit ausgeschliffener Höhlung.
bigugal	schwarz gefärbtes Bananengarn.
gilifer	Hibiskusbast.
tafä engang	spalten mit dem Nagel (Hibiskusgarn).
litelli moei	loses Material zum Anknüpfen gerissener Fäden auf dem Webstuhl.

c) Das Färben.

Sowohl *-gilifer*-Hibiskusbast, wie *uidj*-Bananengarn, färbt man schwarz, um Muster hervorzubringen. Das Garn wird vorgefärbt in einem grünlichen Saft, bestehend aus zerstampften Terminalienblättern und Wasser. Darauf wird schwarzer Bimstein mit Wasser auf Eisen abgerieben, junge Kokosnußhüllen in die Flüssigkeit geworfen, auch eine besondere, angetriebene, fette Erdart dazugetan, und in diese farbstoffreiche Flüssigkeit werden die Fäden für 24 Stunden gelegt. Darauf ausgespült und getrocknet. In neuerer Zeit kommen auch vereinzelte rote Fäden bei den Matten vor, diese sind dann mit künstlichen, erhandelten Färbmitteln, rot, grün, blau und lila, hergestellt und nicht ortsecht.

So z. B. Kr. 518 mit 3 roten Streifen, ähnlich Kr. 519 *(najelle malu galapal* mit schmalen Stichen *gukudj)*; Kr. 460 *dōr peig* (s. S. 77) mit drei grünen Streifen, ebenso Kr. 520; Kr. 521 *paliäläuf*, am Rand je ein roter Streifen, mit 3 Streifen, 1 rot zwischen 2 grünen (ähnlich Taf. 7e); He. 2272 am Rand je 2 grüne, mitten 3 = grün, schwarz, grün; Kr. 515 ähnlich, Streifen gesprenkelt, rote Querornamente *galut ma dab*.

d) Mattenarten.

1. Mattenart.

(Vgl. Tafel 6, 7, 10).

Die siebenstreifigen Matten aus Hibiscus werden von Frauen getragen, während siebenstreifige Männermatten aus Bananenfaser bestehen.

Die *ellepat a le gilifer* ist eine solche Frauenmatte aus Hibiscus mit sieben schwarzen Streifen und sechs hellen Zwischenräumen von gelblicher Naturfarbe, in denen einzelne Gruppen von den weißglänzenden Bananenfäden Wirkung (Effekt!) bringen. Auch in die schwarzen Streifen sind weiße Bananenfäden eingereiht, abwechselnd einzeln und zu zweien, und dies so fein und dünn, daß sie den Eindruck von schwarz nicht abschwächen. Bei den erwähnten meisten Doppelfäden im schwarzen Streifen ist eine Schmuckwirkung gleich losen schwarzen Maschen erreicht, wie sie in Kusae Bd. I S. 185 u. 186 beschrieben ist; es sind hierzu vier Fachbildungen nötig, während die ganze übrige Matte nur mit den 2 Fächern der -Leinenbindung gewebt ist; Vierfachweben der Zierstiche heißt *gásuitiēb*, Zweifach- oder Leinenbindung = *aláli pelách*. Ich bezeichne jetzt diese Webarten mit den eingeborenen Namen; ebenso Bananenfaser = *uidj*, Hibiscus = *gilifer*.

garier ist der Name für die siebenstreifige Männermatte aus *uidj*. Sie ist feinfädiger als die Frauenmatte, bei ganz besonderer Feinheit heißt sie *garier hénusch* (Taf. 6i).

Meist besteht Leinenbindung = *aláli pelách*, aber auch Drei- und Vierfach-Bindung = *gásuitiēb*, mit der beschriebenen Zierwirkung im schwarzen Streifen kommt vor; *galut* heißt eine siebenstreifige Matte, bei der das Muster in *gásuitiēb* auf beiden Seiten gleich erscheint. Es ist Vierfach-Bindung.

Von gestreiften Matten kommen noch vor: *marŭp* aus *gilifer* mit 5 oder 6 Streifen, grob, in Leinenbindung und oft mit Händlerfarben getönt[1]. Die schwarzen, grünen oder dunkelblauen Streifen sind unterbrochen durch weiß, rot oder andere Farben, die Zwischenräume erscheinen einfarbig hell. Diese Matten sah ich nicht weben, sie kommen auf Sētoval vor und mögen von da her vertauscht sein. Sie sehen neuzeitlich aus; und tatsächlich erfuhr ich, daß die umliegenden Inseln Sētoval, Pollap u. a. früher nicht gewebt hätten, weil es tabū für sie war.

[1] s. Kr. 522 von Elato, grobe *garŭr*-Matte, E. K. *palialuf* s. hier oben.

Bei den charakteristischen dreistreifigen Matten, die nun beschrieben werden sollen, kommen als weiterer Schmuck die in Schußrichtung durchgezogenen schwarzen Musterungen hinzu, die Querbänder an Anfang und Ende der Matte darstellen. Schwarze *gilifer* Streifen werden während des Webens zwischen jedem Schuß mittels eines Holzstäbchens durch die Kettfäden geflochten und durch den folgenden Schuß befestigt. Das ist Flechtweberei namens *dab*.

2. Mattenart.

Die *peig*-Matten sind dreistreifig, aus feiner, weißer *uidj*-Faser mit schmalen, schwarzen Randstreifen, und einem breiteren schwarzen Mittelstreifen[1], dessen Gestaltung wechselt. Er kann ein- oder zweimal durch weiß unterbrochen sein[2], auch kommen ganz schmale rote Fäden in der Mitte vor, Taf. 6a—f.

Über die abnormen Farben s. S. 75.

Dazu kommt bei den meisten *peig* noch die *dab*-Musterung, Querstreifen an Anfang und Ende, die bei diesen feinen Matten sehr zierlich sind.

Die schwarzen Streifen in der Längsrichtung sind *uidj* oder *gilifer*; die *dab*-Muster werden immer mit *gilifer*-Fäden hergestellt, die sich in ihrer stumpfen Schwärze gut von dem glatten, hellen *uidj* abheben.

Ich hatte bei meinen Webestudien eine große Hilfe an Bessi (Taf. 3d), der Halbbluttochter des englischen Händlers Lewis. Sie sprach gut englisch und konnte mir vieles erklären; auch war sie selbst eine geschickte Weberin und verstand meinen Lerneifer gut. Um mich mit den verschiedenen *dab*-Mustern bekannt zu machen, webte sie für mich eine besonders schöne, reiche Matte (Taf. 7d), die ganz mit Quermustern durchgearbeitet war, (Abb. 49). Sie trägt den Namen: *najile malugalep al -dab o fasch* und gehört zu den dreistreifigen *peig alali pelach* (mit Leinenbindung). Der breite Mittelstreifen ist unterbrochen durch zwei weiße und einen roten Streifen. Auch bei der Flechtarbeit, *dab*, sind neben schwarz auch rote und grüne Fäden verwendet, die ein Zugeständnis an die Neuzeit bedeuten. Die Muster jedoch sind echt und haben Namen und Bedeutung. Angeblich stammen einige von andern Inseln. Fängt man am oberen Ende an so kommt zunächst

1.	A. *uassüch*	Anfangsmuster.
2.	B. *langodab*	ein winziges Börtchen, das zur Einfassung eines Musters dient, unmittelbar über C.
3.	C. *sepasse iliuil*	Kanusegel mehrerer Boote, die miteinander segeln.
4.	B. *langodab*	s. B, unmittelbar unter C.
5.	D. *uadj*	Halstatauierung eines Mannes.
6.	B. *langodab*	s. B.

[1] Kr. 511 (Taf. 6b) hat drei breite Streifen *peig na tas*.

[2] s. Taf. 7c u. d, letztere *gasuitlib*-Typus s. S. 76, Kr. 513 *gasurlib* ähnlich.

7. E. *fäsilümat* Auge (von Faraulap)
8. B. *langodab* s. 6. B.
9. D. *uadj* s. 5. D.
10. F. *uägüpä* unerklärt.

Abb. 47. Muster der Matte. Taf. 7d. Reihenfolge s. Index.

11. G. *garrach* Pflanzenmuster von Ifaluk.
12. H. *ngingi* Halstatauierung vom Mann.
13. J. *bub (pup)* ein Fisch (s. Truk S. 150 x).

14. K. *päülümel* fliegender Vogel.
15. J. *bub* Fisch s. 13.
16. C. *kusae* Muster von Kusae.
17. M. *fäülümat* Auge, von Ifaluk (s. 7.)
18. C. *kusae* s. 16.
19. N. *gogotjub* s. 12.
20. O. *pöulul* »runde Sache«.
21. P. *ngilipaggo* Haizahn (Truk S. 188 b).
22. Q. *ligongare* Ifaluk-Muster.
23. R. B = Bessi, die Flechterin.
24. S. *fatarigavüong* aufgereihte kleine Seetiere.

Die Mehrzahl dieser Flechtmuster haben eine unrechte Seite, doch sind auch solche darunter, die auf beiden Seiten gleich erscheinen. Sind solche letzteren bei einer feinen *peig*-Matte verwendet, treten auch die Ziermaschen in den schwarzen Längsstreifen auf beiden Seiten gleich hervor, so haben wir es mit einer seltenen, wertvollen Matte zu tun, einer *peig galut*, Taf. 6h (s. S. 76).

Daß es auch *peig* ohne *dab*-Muster gibt, ist schon erwähnt und zeigt Taf. 6d u. f. Schließlich seien noch die *lugüllü uidj* erwähnt, Matten aus grob gespaltenem Bananenbast, vergröberten *peig* vergleichbar. Wie bei den *peig* gibt es verschiedene Abarten: 1. ganz schmucklos weiß, 2. mit schwarzen Streifen an beiden Seiten, mit und ohne *dab* Taf. 6h, 3. mit einem Mittelstreif neben den Seitenstreifen, also dreistreifig. 4. Dreistreifig und mit *dab* verziert, an beiden Enden grobe, einfache Muster mit starkem schwarzen *gilifer* hergestellt (Taf. 6c). Alle diese *lugullü uidj* haben Leinenbindung. Außer den einheimischen Webereien sieht man solche aus Truk, besonders bei den Männern ist die einfarbig weiße Bananenmatte, *aliel*, beliebt; eine gelbliche Abart heißt *garite; ngäremus* und *pazutiu* sind zwei Arten Frauenmatten aus Truk.

Worte:

fisudab durchflechten (von *dab*-Mustern)
djuidab Durchflechtstäbchen
famalüdab Muster vom *dab*.

e) Technik des Webens.

Kette wickeln.

Kettpflöcke *maiuel*. Zum Vorbereiten der hier, wie bei aller Südseeweberei, fortlaufenden Kette dienen 5 Kettpflöcke, die in bestimmtem Abstand von einander in die Erde gesteckt werden. Ich konnte 4½ Handspannen messen vom 1. bis zum 5. Pflock. (Abb. 48).

Es wurde von rechts nach links gezählt und die Kette für Leinenbindung gewickelt in der üblichen Weise, so daß bei Nr. 2 die Litzenschnur eingelegt wird, Nr. 5 das Kreuz bildet, Nr. 3 das hintere Spannbrett, (übertragen Kettbaum) und Nr. 4 den Trennstab.

Abb. 48. Kette scheren.

Die beiden Fächer der Leinenbindung werden bei der Kette vorbereitet durch eine Doppeltour. 1. Hälfte: Der Kettfaden beginnt vor 1 und läuft hinter 2, vor 4, von hinten um 5 herum, kreuzt und hinter 3 nach 1 zurück. 2. Hälfte: hinter 2 (Litzenschnur herumgelegt) hinter 4 und weiter um 5 und 3 zurück. Diese Doppeltouren bleiben immer das gleiche, nur daß die Litzenschnur den Kettfaden einmal rechts, einmal links vom Pflock 2 erfaßt.

Zwei Doppeltouren stellen sich in Zahlen folgendermaßen dar, wobei nur der Pflock genannt ist, der vor dem Faden bleibt. 1, 2 und 5 sind immer gleich und bleiben unerwähnt; von rechts nach links gewickelt heißt es:

2
4 L 2
2
4 2 L x

soll die Farbe gewechselt werden, beispielsweise von weiß auf schwarz übergegangen werden, so wird gleich nach Nr. 1 abgeschnitten und der schwarze Faden angeknotet (x rechts von 2).

Für die feinen weißen *uidj*-Fäden im schwarzen Streifen ist nur ½ Doppeltour nötig; so wickelt man 2½ Doppeltour schwarz, ½ weiß *uidj*, wieder 2½ schwarz. Das gibt nachher beim fertigen Stück, z. B. den gestreiften Männermatten, die weißen, gleichartigen Fäden im Schwarzstreifen.

Bei der zuerst beschriebenen Frauenmatte wechseln dünne Einzelfäden im Schwarzstreifen ab mit den Ziermaschen, wozu 2 weiße *uidj*-Fäden nötig sind, die in einer Doppeltour gewickelt werden. Auch zwei weitere Fachbildungen kommen für diese Wirkung hinzu, die in der Kett-Bereitung nicht berücksichtigt werden, sondern erst später beim Weben nachträglich geschaffen werden müssen.

Ist die ganze Breite der Matte auf die Kettpflöcke gewickelt, so wird sie in der üblichen, vorsichtigen Weise von 2 Frauen abgenommen, auf den Webstuhl gebracht und auf ihm geordnet; Kette ordnen *gaporette*. Zwei flache Stäbe und mehrere dicke Baststücke werden eingewoben, sie dienen als Breithalter, und an ihnen werden die Kettfäden so verteilt und geschoben, bis sie in der ge-

wünschten Mattenbreite liegen. Das Weben beginnt mit Trennfach und Litzenfach, um bei allen Matten in Leinenbindung so bis zum Schluß zu bleiben.

Nun gibt es aber auch die erwähnten *gasuitiēb*-Matten mit den schwarzen Schmuckmaschen. Die hierzu nötigen Fachbilder werden eingefügt, nachdem die Matte etwa handbreit in Leinenbindung gewebt ist. Das Schwert ist durch das Litzenfach gesteckt, die meisten Zierfäden der Kette im Schwarz liegen oben, die angrenzenden schwarzen sind unter dem Schwert und über dem nach hinten gerückten Trennstab. Es wird ein flaches Bambusstück, der *gasuitiēb*, hinter dem Trennstab so durch die Kette geführt, daß es nur die zu Ziermaschen bestimmten, dem weißen *uidj*-Faden benachbarten, schwarzen Fäden bedeckt und alle anderen über sich läßt. (Abb. 49). Ist der Stab darin, so wird er gleich beim folgenden Fach mit dem Trennstab zusammen gebraucht, so daß die von ihm bedeckten Fäden nicht hoch können, sondern unten bleiben und dort auf der Rückseite der Weberei die schwarzen Maschen geben. Der nächste Schuß im Litzenfach läßt sie wieder unten, und erst im folgenden Trennfach wird der Stab zurückgeschoben, so daß die Fäden wieder erscheinen. Sie waren dreimal bedeckt und bildeten so auf der Rückseite die Masche.

Abb. 49. Webgeschirr.

Trittweise[1]: Trennstab mit *gasuitiēb*
Litzen
Trennstab
Litzen
Trennstab mit *gasuitiēb* etc.

In dieser Weise wird weiter gewebt und nur am Schluß in Handbreite Leinenbindung wie am Anfang, und das gibt eine Matte mit einseitigen losen Maschen, wobei die Unterseite die rechte Seite wird; sie hat 3 Fachbildungen. Soll die Matte vorder- und rückseitig gleich sein, so tritt noch eine zweite Litzenschnur

[1] technischer Ausdruck, vom Leinenwebstuhl entnommen, meint Reihenfolge der Fachbildungen; ebenso Effekt S. 76.

dazu, die dieselben schwarzen Fäden erfaßt und mit den Litzen zusammen hebt, um die Ziermaschen auch vorderseitig hervorzubringen.

Trittweise: Trennstab mit *gasuitiëb*
Litzen
Trennstab
Litzen mit 2-Litzen
Trennstab
Litzen
Trennstab mit *gasuitiëb* usw.

So entstehen auf beiden Seiten lose Maschen, hebt die sonst unten bleibenden, weil dem Trennfach angehörigen Fäden, mit hoch, so daß diese dreimal unbedeckt vom Schuß bleiben.

9. Handel (s. Navigation).

Auch hier vornehmlich Handel mit Truk, worüber dort S. 95, 161 und 301, schon berichtet ist. Auf letzter Seite wird der Tributfrage mit Yap gedacht. Mir wurde darüber folgendes mitgeteilt: Eine Frau Lefagemai von Lamotrek vertrieb nach Westen, und gelangte nach Yap, wo sie von den Häuptlingen freundlich aufgenommen wurde. Als sie sich zur Heimfahrt anschickte, erhielt sie Geschenke an Gelbwurz *reng* (z. S. 58) für sich, aber auch für alle Häuptlinge der Inseln die aber dafür zur Tributleistung verpflichtet werden sollten.

Hambruch erfuhr auf Elato: Yongelăp (Yap I S. 307 Yänólop ältester und höchster Gott) war auf Yap, wohin ihm Abgaben entrichtet werden mußten. Die Lamotreker und die von Sëtoval bringen ihre Sachen nicht direkt nach Yap, sondern nur nach Oleai, von wo aus nach Westen gefahren und in Gatspär gelandet wird. An dieser Fahrt beteiligen sich Leute von Ifaluk, Fáraulip und Aurepik, die sich alle auf Oleai versammeln. Die Fahrt geht über Sorol, Uĕjü (s. Feis) und Mogemog. Wie Mogemog den Handel von Feis mit Yap zu monopolisieren versucht hat, s. Feis.

Seit Alters wurden von Lamotrekern die Fahrten nach Guam (s. Navig.) ausgeführt zwecks Handel mit Tauen, Faden, Matten, Muscheln usw. Die ertauschten Sachen verhandelten sie nach Poloat, von denen sie Gelbwurz *räng* und rote Muscheln *faibar* erwarben, ohne daß aber dadurch etwa die Poloater von ihren Fahrten nach Guam sich abhalten ließen; aber sie frugen deshalb sozusagen um Erlaubnis auf Lamotrek an, da dieses über die See bis nach Poloat und Ifaluk herrschte (s. die Namen der Meeresteile S. 125). Hinsichtlich Yap noch folgendes: sie sandten ihre Handelsgegenstände nach Oleai, nach Vótagai, denn sie fürchteten die Yaper als Leute mit stärkerem *mádjemadj*-Zauber hinsichtlich

der Taifune und Krankheiten. Lamotrek's Sachen gehören den Häuptlingen Rúebong[1] und Inefel; Rúebong ist der Große, Inefel sein Gehilfe.

Als der Händler Lewis zu Gogilrau[2] kam und ihm Vorwürfe machte, warum er seine Kinder auf der Insel verdürbe, sagte er: Wir sind es nicht, es sind ihre eigenen Götter, die sie verderben, weil sie die alten Tabûs gebrochen haben; Alúelap gebe ihnen die Frauen zum natürlichen Gebrauch, aber sie mißbrauchten sie.

10. Haus.

a) Anlage, Baumaterial.

(vgl. Farbtafel 2, 3 u. Tafel 4, 8, 9, 10, 11 u. 12.)

Wie die Häuser liegen zeigt Abb. 50 und Plan 3. Ein Gehöft mit seinen Nebenhäusern Abb. 51 s. die Siedlung S. 17.

Auf Lamotrek ist das Ramenhaus aus Werkholz ebenerdig[3] für Wohnzwecke durchaus vorherrschend; fast alle Abbildungen zeigen es; am besten sieht man deine Bestandteile, die übrigens im Bd. 6 I (Inseln um Truk) S. 69 u. 70 schon

Abb. 50. Siedlung an der Lagune, im Vordergrund *imatamâ*-Hütte.

gezeigt wurden, auf der Abb. 52 u. 59: doppelter, oberer und unterer Ramen, Wand aus Brettern, darin Tür sowohl an der Giebel-, wie an der Langseite (s. Abb. 51).

[1] Yap I S. 312 Rúepong von Gatsapár (Taf. 5[3]). [2] anderer Name von Agupelior auf Oleai?

[3] Dr. Herbert Tischner erwähnt in seinem Buche »Die Verbreitung der Hausformen in Oceanien«, Leipzig 1934 S. 56 Steinfundamente für Lamutrek, was auf einem Mißverständnis beruhen muß. Hambruch nennt nur für Elato das Steinfundament eines ehemaligen großen Hauses S. 30, Siedlung 290, s. aber Oleai. Für die Werkholzhäuser kann man nur einen gehobenen Plankenfußboden annehmen, wie ihn der Bd. I Inseln um Truk S. 70 Abb. 54b zeigt. Das Buch wird S. 2 der H. S. E. gerecht.

Giebel abgedeckt durch Gräting mit Kokoswedeln oder Matten darauf. Von außen zeigt Abb. 72 deutlich die Giebelseite des Hauses Lëmar, an dem man auch Reife von jungen *ubud*-Fiedern sieht, weil es durch Zauberspruch gereinigt worden ist. Meist ragen die unteren Längsramenbalken über die Giebelseite so hervor, daß man eine Planke auf die beiden Enden legen kann und so eine Bank schafft (Taf. 8c). Sind auf die Tampen Pfosten aufgesetzt (Taf. 8a) oder ist auf die Tampen ein Balken aufgelegt, der zur Stützung der gleichfalls vorragenden Firstspitze in der Mitte eine Stuhlsäule trägt (Taf. 8d, s. auch Oleai), so entsteht eine Veranda, die offen oder zugedeckt sein kann, wie Taf. 9a zeigt.

Abb. 51. Gehöft mit Nebenhäusern. Hütte rechts *imafatiu*.

Alles dies wurde schon bei Lukunor gezeigt, dem östlichsten Vorkommen dieses Ramenhauses. Es kann auch ein Walmdach an den Giebel angesetzt sein, das dann durch ein paar Stecken unordentlich gestützt ist (E. K. aqu. 33, H. 4 Légauo, s. auch Oleai).

Auf Elato findet man den Giebel durch ein halbkegelförmiges Dach abgewalmt und der untere Teil, die Hauswand, wird durch Kokosmatten gebildet (Abb. Taf. 12a). Auch findet man vom First aus direkt Kokoswedel angehängt, den Ansatz nach oben.

Solche Halbkegel sieht man als Walmung auch an den Boothäusern (Abb. 53) die aber ringsum unten offen, also ohne Wände sind. Hier sind die unteren

Abb. 52. Gehöft Bómaras, H 24 b, mitten hinter Papayabaum Saualik's Grabhaus.

Abb. 53. Boothaus Abui.

Ramenschenkel nicht vorhanden, sondern nur der obere Ramen ist da und besteht aus viereckigen behauenen Balken (Taf. 9c). Sie sind oft reich ornamentiert, wie z. Teil auch die viereckigen Pfetten (Farbtaf. 2 u. Taf. 4a)

Die kleinen Häuser sind zum Teil auf den Boden unmittelbar aufgesetzt; es berühren die Traufen (s. Abb. 50 u. 51) fast die Erde, weshalb auch das Blut;

Abb. 54. Vorratshaus *imspo*.

haus *imafatiu* heißt, von *fátogitiu* »setze es hinab«, weil es auf den Boden gesetzt ist. Selten stehen Häuser auf Pfählen (Abb. 52) oder es ist eine Steinerhöhung vorhanden. Vorratshaus Abb. 54. Dagegen werden gerne Korallenkiesel ums Haus herum gestreut; seltener ist eine Steineinfassung *(óror)* vorhanden Abb. 68 oder Balken Abb. 52. Beim *im* ist die Dachtraufe häufig 1—1½ m über der Erde.

Bei den sechseckigen Häusern Abb. 55, die bei Oleai stärker auftreten und dort auch näher beschrieben sind, tritt unter den Vordächern häufig eine

Abb. 55. Sechseck mit kleinem Walm.

Ornamentierung des Giebels auf, die in 2 Fällen, Abb. 56a u. b, wiedergegeben ist. Die Muster sind Fische, Rauten, Haizähne usw. (s. die Zusammenstellung Abb. 79). Über die Ordnung näheres bei Oleai. Man könnte an-

nehmen, daß eine Entlehnung von Oleai vorliegt, wenn nicht auch sonst noch eine große Zierlust hervortrete, so z. B. an dem Boothaus Aboi, von dem E. Krämer ein Aquarell (Farbtaf. 2) angefertigt hat, um den Eindruck zu ver-

Abb. 56. Giebelschmuck a u. b (Lugalap).

mitteln. Was dort an Mustern an den Innenseiten der Rahmenbalken und an den Sparren (vgl. Truk Taf. 23 u. 24) vorhanden war, geben die Abb. 57 im einzelnen wieder. Ähnliches sahen wir auf Oleai nicht, und auch nicht die prächtig geschmückten Webstuhlgestelle, die bei der Weberei gezeigt wurden.

Abb. 57 Im Boothaus Abot (s. Farbtafel 2).

b) Die Arten der Häuser.

fal'lap	»große Häuser«, wohl eine Art Tempel, s. Religion und Oleai.
fal	das Boothaus, Haus für Fremde.
im	das Wohnhaus
meripann aie, imepō	Vorratshaus (Planken Abb. 51)
mālimes, malum	das Kochhaus (Herd *nim, lim*)
fēlang	für Feuerstelle, erinnert an das *faláng*. Truk S. 221
im ali pel und *im faliu* (S. 30)	das Bluthaus, s. Familie
imareipel	Haus für Schwangere
imutamāi	Gebärhaus, s. Familie, S. 111
imaligat	Haus für Kind (*im alipel* Sētoval).
imalifam und *im ale gogóbong*	s. S. 113 und Oleai.
im ali bōlebol	Zauberhaus, S. 151.

c) Benennung der Haustelle.

Mittelraum	*lim*
Veranda	*fāliping* (Giebel kurzweg auch *tēbau*, s. Feis), Querramen bei abgedeckter Veranda *abilebing*
Giebelmatten	*úngolim*
Dach	*tēbau, gili* (s. Stuhlsäule)
Türöffnung	*galam*
Türöffnung Giebelseite	*aleping*
Türöffnung, Seite	*alepēig*
Oberer Längsramenbalken	*pēig* (vergl. Matte S. 77)
Unterer Längsramenbalken	*gogodj ale peig*
Oberer Querramenbalken	*tāp*
Unterer Querramenbalken	*gogodj ale tap*
Wandbretter	*bāb*
Eckpfosten, Türpfosten	*djul, sul*
Fang	*fāng* (s. Feis)
Stuhlsäule	(*tēbau* s. Giebelmatten) *suretái bōt* (s. Feis)
Unterer Firstbalken	*ónugodjik*
Oberer Firstbalken	*óngolap*
Große Sparren	*uói*
Kleine Außensparren	*gāt*
Pfetten	*gapangág*
Diagonalleisten	*gaimodm*

Dachstäbe	*cás(o)*
Schlafbalken	*ülül*
Feuerstelle	*fĕlang* (Kochhaus)
Zaun (Steine)	*áioi* (s. o.)
Umzäunung	*orór.*

d) Hausbau.[1]

Es gibt hierzu eine eigenartige Einrichtung, nämlich ein Gestell, das eine Art Balkenheber darstellt, Abb. 58. He. 2305 = 6071[II] ist ein Modell von 72 cm Höhe; er notierte *ligāse rumrum* für den Balkenheber; Gestell *wūsal*, Kopfteil mit Kreuzleisten *vaiṗ*. Hellwig: Dient dazu um die schweren Balken auf ihr Lager zu bringen oder davon wegzuheben. Hebebäume werden zwischen die Sprossen des Gestelles und der Leiter von beiden Seiten in Hebellage gebracht und der auf dem Kopfteil aufliegende, an den Kreuzleisten festgelaschte Balken durch die Hebelkraft gehoben. Bei größeren Neubauten (Bootshäuser) verwendet man Balkenhebegestelle verschiedener Größe bzw. Höhe. Der Anhub eines Balkenendes durch Hebebäume vom Boden aus endete mit dem Auflegen des Endes auf die unterste Gestellsprosse; zur Weiterhebung auf die nächste wird das Gestell weiter herangerückt, und so fort bis zum Kopf zumeist wird der Apparat aber benutzt zur Erneuerung von Pfosten *sul* in den Bootshäusern, für deren Balkenhöhe er von vornherein gebaut wird. Seit Jahren soll solch ein Apparat nicht mehr in Gebrauch gewesen sein.

Abb. 58. Baugestell.

Haustüren vorkommend als viereckiger Ramen, durch Gitter oder Parallelstäbe gefüllt, 90:50 cm.

[1] Baumeister *ulilap* s. S. 92.

e) Hausrat.

Innenraum (Abb. 59) meist leer.

Neben Holzhaken *taumi* (He. 2103) zum An- und Aufhängen von Körben usw. (Geräte Abb. 25ff.) Gretings (= Aufhängegitter) *váng* (He. 2314), aus Pandanus-

Abb. 59. Innenraum.

holz, zur Aufbewahrung kleiner leichter Gegenstände (He. 2314 = 6085[II], Taf. 7 s. auch Abb. 75). Wir trafen auch einen Lehnstuhl, *limasa*, Abb. 25 (s. auch Phot. 1024), den Ikisera sich angefertigt hatte, um wie ein Weißer zu sitzen.

11. Boot.

Wie bei der Navigation s. S. 121: erhellt, ist Alúluel der Gott der Schiffer, aber auch Lugeileng ist eng verbunden mit der Seefahrt.

Als Bootbauer aber steht er an der Spitze. Er hat viele Gehilfen als Sélang, Semalegóror, Sémadjek usw. die S. 144 bei der Religion näher bezeichnet sind, sowie auch dort ihre Ämter genannt werden.

a) Tabus, Zeremonien beim Bootsbau, Technisches.

Hier wird der Bau des Reisebootes eingehend behandelt; wegen der Abbildungen ei auf Lukunor in Bd. 6 I Inseln um Truk S. 74 verwiesen. Der Oberzimmermann *sêllap* (Truk S. 242 *silêlap)* und sein Gehilfe *rolifêleſêl* dürfen während dem Bau eines Bootes keine andere Arbeit tun, höchstens Dachdecken; erst nach dem 5. Tabûtag *póuſar* (s. S. 95) macht *álisulaṗ (Alúelaṗ)* die Zeremonie *lulur*, worauf die Gehilfen frei sind, der Oberzimmermann selbst aber erst nach dem Schluß es ist.

Während auf Palau III S. 185 das Schlagen des Baumes mit vielen heiligen Handlungen verbunden ist, geschieht es auf Lamotrek ganz ohne Zeremonie. Das Fällen eines Brotfruchtbaumes heißt *komádj ali mai*, das Schleppen des gefällten Stammes *urur ali mai*, wobei alles hilft. Man holt ihn nämlich zum Strand, wo er behauen werden soll. Um ihn schleppen zu können, umgibt man den liegenden Stamm mit Kokoswedeln, deren Fiedern untereinander verflochten werden. Sowohl Stamm als Wedelstiel werden gekerbt und festgebunden, so daß sie beim Ziehen nicht abrutschen können. Dadurch werden Schleppseile gespart, und durch Leichtermachen des Klotzes. Eine ganz rohe Bearbeitung findet nämlich meist schon im Busch statt, unter Überwachung des Gottes Simalegodjúat (s. u.). Wenn der Stamm dann am Arbeitsplatz in der Nähe des Strandes liegt, beginnt die Bearbeitung, das Behauen *fdleſál*[1] mit dem Dexel. Dabei findet gelegentlich eine Ausstellung der Zeremonialaxt statt (vgl. Palau III S. 187), die schon S. 48 erwähnt wurde; die Klingen aus Tridacna wurden schon S. 62 erwähnt (Abb. 182).

Die Behauung wird mit Fasten begonnen; Frauen dürfen auf den Arbeitsplatz nicht mehr kommen, sonst müssen aber keine besonderen Tabûs eingehalten werden. Nach dem Fasten werden junge Kokosnüsse getrunken und ihr Kern gegessen. Das Brechen der ersten Nuß, *gilegil*, ist heilig; es heißt nach dem Stocke *got*, als Handlung *molegot*. Die Nuß wird vor dem Brecher und vor dem Stock hingelegt und der Geist Tautúp[2], der Geber angerufen.

Das Essensgebet heißt:

alesû sêpôê	Geist, (blicke nach) außen	d. h. wende mir den Rükken zu, damit ich essen kann, etwas Taro und Augen vom Fisch
menêgilegil galêi	meine erste Nuß, mein Essen,	*gilegil* (s. o.) oder *kakilet* das erste Brechen und hauen
uômigami Tâutup	ich gebe es dir, Tautup!	Zuwerfen der Fischaugen und des Taro

[1] Vgl. Truk S. 146 Dechsel *selle, falafal*. [2] S. auch Gesang bei Medizin, wo der Arzneimann *tautafê* heißt.

Dann beginnt der erste Axthieb *kakilet* (s. Z. 2), die rohe Bearbeitung, noch ohne Leine.

Es folgt die weitere Zurichtung des Brotfruchtbaumstammes, in den Gesängen kurzweg *mai* genannt. Bei Erläuterung des 2. Gesanges durch Faragau (Haus 1) kam heraus, daß in alter Zeit die Stämme innen im Schlagraum und außen auch mit Öl getränkt und angekohlt wurden, zwecks leichterer Weiterbehandlung mit dem Dechsel. Aber die Behauung mit der Axt, der 1. Axthieb und die erste Arbeit wenigstens, war immer allenthalben fachmännisch wichtig und allein kunstgerecht; eine weitere wichtige Handlung, die aber noch ohne Zeremonie stattfand, war

1. das Kiellegen *tilegab* (*solegab* der Kiel), wobei der Kiel roh ausgearbeitet wurde, damit die Linien gelegt werden konnten. Dieses erste Abschlagen des Holzes heißt *kuṗ*. Beim Kiellegen wird den ganzen Tag gefastet, nur Kokosnuß getrunken, namentlich wenn die Leine, *tal e ṭáleṭal*, gelegt ist. Erst am Abend das Nachtmahl, *iles*. Am zweiten Tag, am Tage darauf, geschieht
2. das *gapileval*, was »Kiel des Buschese« heißt. Es bedeutet das Abmessen des Stammes für den Rumpf *bul* mit der Leine *tálefálźel*[1], Abb. 60, die nur für Boote benutzt werden darf; wird sie verletzt, so ist es eine schlechte Vorbedeutung; sie darf nicht geknüpft werden. Erst wird die ganze Länge gemessen, dann, durch Zusammenlegen der Leine, die Hälften, die Mitte *lug* (Abb. 61a). Ebenso werden die Viertelteile gemessen und markiert. Denn direkt unter 2 dieser Viertelmarken sind die beiden Enden *(ṭétang*, Oleai *ṭátang)* des zu tiefst liegenden Kieles *gapiálei*. Von den *ṭétang*-Spitzen steigt der Kielgrat ein wenig an, beiderseits in der Längsrichtung bis zu der weiteren Ecke *gom*; die Strecke zwischen beiden Ecken *ṭétang* und *gom* (Oleai *ṭalegóm)* heißt *gapiléisaṗ*; die Strecke endlich von der *gom*-Ecke bis zum Bug, wo die Gallion sitzt, heißt *ṭaisaṗ* (Oleai *ṭátoṓ)* (Abb. 61a). Die *ṭétang*-Ecke richtig zu legen, ist wichtig, ebenso den Kiel zwischen

Abb. 60. Meßleine mit Zauberknoten.

[1] Es gibt 4 verschiedene Meßleinen *tál*, a) *tál i motáisam* (Geist der 1. Sippe S. 114), b) *tal i ugulu*, c) *tal ṭgedj* (dazu 4. Bootbaugesang S. 105), d) *tal i gudj* (dazu 2. Bootbaugesang). Für jede Meßleine ist ein besonderer Gesang nötig; auch wechseln mit ihnen die Tabû's; weiteres s. u. Vgl. Truk S. 242.

beiden *fétang* gerade zu machen, damit das Boot nicht giert[1]. Zu beiden Seiten der oberen Längsleine, zur Messung der Länge, wird je eine rote Linie mit einem Pinsel (s. S. 41) gemalt, denn schwarz würde die Geister erdrücken. Im senkrechten Durchschnitt durch den Bootsleib mitten (*lûg*) treten folgende Linien in Erscheinung: Der Kiel *gapiâlei*, darüber die Aushöhlung *djöliſadj*, wie ein »Pandanusblatt« aussehend, darüber als obere Abgrenzung die Kante *ulut*, die auch schon auf dem Längsbild, Abb. 61a, angedeutet ist. Die *ûlut*-Linie bildet innen die

Abb. 61a, b. Boot in Bau: a Seite, b von vorn.

Grenze der Bilsche. Über ihr ist die Schiffseite *órol*[2], am oberen Ende verdickt *lugulepal*; auf diesem Bordrand liegt eine Holzlatte als Reeling *mesép (papa le vá)*, festgebunden durch einen Strang *ngareliva*. Besondere Sorgfalt wird auf die Aushöhlung über dem Kiel, den Bilscheraum (He. *niua)* verwendet. Der Boden, *laudâlol* Gräting, wird mit Kokosfiederrippen in 3 Teile geteilt, ähnlich wie die Deckfläche die 3 roten Linien hatte. Dann wird ausgehöhlt, ohne die Schotten *kábong* zu vergessen. Dann wird eine Leine an der *orol*-Seite gelegt. Auch der Bänke *tô*[3] wird gedacht: 1. *tolefatefat* 2. *metangór* oft mit *failo* = Verstärkung (Truk S. 229 *faulo)*
3. *tipalefang* 4. *ti válim*
5. *sáragio* 6. *fatamat* mit dem unteren Ossitz.

Alles dies geschieht am zweiten Tag. Dann wird die Leine zusammengerollt. Während des Behauens werden oft als Arbeitszeichen viele Matten ausgehängt, und die Passierenden mit dem Gruß *fâro* angerufen, damit sie nicht durch Übelwollen etwas verderben.

---

[1] s. Truk S. 242.
[2] Von dem Gotte Semalegóror, der die feine Form am Boot überwacht, s. Religion u. S. 121.
[3] Auch Schotten S. 266 oder Sitz, da die Bänke auch *fólog* heißen; *fo* die Last; Truk S. 228 *só*.

3. Tag: *vēlap*. Das Ganze verbessert und die genauen Größen der Flächen bestimmt. Die oberste Linie gibt die Grenze für die Arbeiten. Alles darunter liegende bedeutet heilige Arbeit; was darüber sich befindet, ist gleichgültig. Alles dreht sich also um den unteren *búl*-Teil, von dem man so viel als möglich stehen läßt. Die Planken werden dann zurechtgeschnitten, für beide Enden das Gallionstück, unten *padj* genannt, wo es in einen staffelförmigen (s. Bd. 6 I Abb. 60a Sopon) Ausschnitt über der *gom*-Ecke eingepaßt wird, alsdann die Strecke *faisap* (s. o. 2.) bildend; sie reicht, wie ein Oberschenkel, bis zum Knie *borolemet*, wo das Holz sich nach innen zu wendet, so daß die Ferse *monga* Sëlang (S. 149) wieder in den nach außen weisenden Fuß übergeht, den gabligen *metál i va* »Schiffsauge« (Bd. 6 I Farbtaf. 2 und S. 102. Die beiden Gabelzinken heißen *mongarēdj*, die obere Fußsohle *seapolimet*.

4. Tag: *vēdjik* ein Tabūtag, weil feinere Ausbesserung des am Kiel Vorbereiteten vorgenommen wird. Alles wird überholt und feiner nachgearbeitet, auch die Planken. Hier sorgt der Gott Mesélseit (s. S. 122).

5. Tag: *póufar*. Jetzt erst steht das Boot auf dem Kiel. Es ist auch ein Tabūtag, an dem nichts behauen wird, nur Aufbauarbeit geschieht. Die hergerichteten Planken werden aufgesetzt, aber nur vorläufig geheftet mit Bast von Hibiscus *(gilifau)* und mit Keilen *djib* oder *kadjór* versehen, was eine scharfe Aufmerksamkeit und Überwachung erfordert. Dabei betet man zu Bórumai[1] = steigendes Wasser *bor*, gut *mamai*, d. h. schöne Flut; *lulur* = Gesang:

Bórumai *go boē dju*	B., du sollst geben
ngaliēi mellauāi	mir mein Leben
mērāmu Bórumai	von dir, B. *mērem* von dir

Das Boot wird mit Kokosnüssen und Essen für den Gott gefüllt.

Jetzt können die Gehilfen vom Baumeister entlassen werden. Das endgültige Aufsetzen der Planken geschieht mit Kokoshüllenscheiben *pal ali va*, die man dazwischen legt, nachdem Artocarpusharz *bilis*[2] aufs Holz gegeben wurde, das aber auch nach dem Einsetzen aufgetragen wird, indem man eine glühende Blattscheide neben den mit *bilis* armierten Stock hält. Naht *péret*; besonders schwierig das Annähen des Gallionstückes *padj*, das *bauuipadj*. Das Nähen durch die Löcher mit *gólemong*-Schnur (S. 72) heißt *yógeyog*.

[1] Gehört zu Semalegóror, s. S. 122.

[2] Die Brotfruchtstammilch *ralimei* (s. u.) wird in Kokosschalen gesammelt; man läßt sie sich setzen, gießt das Wasser ab und wäscht den Satz in Seewasser, dann in Kokosblattscheide gewickelt und aufbewahrt; jetzt *bilis* genannt.

6. Tag: *kabukio* mit Tabûs. Zum »Einpassen, *kabuk*, der *kio*-Auslegerbalken« werden Ausschnitte, *uós*[1], gemacht. Man paßt möglichst genau an. Die *kio* ruhen in Lee auf den *geligesá*[2]; in Luv auf den *faramoe*. Zum Festschnüren bohrt man unter die *uós*-Ausschnitte „Löcher" *ngata le olotráol* (Abb. 61c). Der Bohrer *kabuiabui* ist gleich einem Meißel, neuerdings aus einem Eisenstück, *búrubur*, gemacht, sonst nur für Kokosscheibchen (s. Schmuck) gebraucht — in alter Zeit ein Madreporenstück. Beim Durchstoß des Bohrers geschieht ein Zauber. Es handelt sich darum, die bösen Geister zu vertreiben. Es geschieht dies durch den Ruf aller Anwesenden: *ēho! ēho! ēho!* Dem folgt ein großer Lärm durch Schreien, Schlag auf die Arme usw[3]. Dann wird alles vorläufig oder dauernd angeschnürt. Dazu werden auch die *sórang* gemacht, die Einschnitte zwischen den Löchern für die Schnürungen.

Abb. 61c.

7. Tag: *votaṗ*. Der Bootsleib wird aufgestellt, den Kiel auf *longēs*-Hölzer gesetzt, kleine Holzbalken, die mit Kerben versehen sind, in die der Kiel hineinpassen soll; ist der Einpaß nicht genau, hilft man mit Kokoshüllen nach. Steht das Boot gut und richtig, kann besser gearbeitet werden. Alles wird jetzt für die Dauer gemacht. Dabei wird alles gut gerichtet und in Form gebracht, wegen Schwinden des Holzes beim Trocknen. Alle kleine Stücke werden jetzt auch hinzugefügt.

8. Tag: *kámor* mit Tabûs. Hauptsächlich erfolgt jetzt das Glattmachen des Bootleibes. Durch Ausspannen der Leine gewahrt man die unebenen Stellen; sich heraushebende werden abgehauen, aber nur in feineren Schnitzeln. Das ist das *kalúl ali metál e boédj*, das »Schönmachen für das Gesicht des Kalkes«. Die Kalfatermasse, der Zement *boédj ali va* »Kalk für das Boot«, wird nämlich aus gebranntem Kalk bereitet, der mit möglichst viel Kokosholzkohle gemischt und dann mit Wasser von den jungen Kokosnußhüllen angerührt wird[4]; er wird dann in Löcher und Spalten gepreßt, und das überstehende mit Calophyllum-Blättern geglättet. Die Kalfaterung darf aber erst erfolgen, wenn das Boot keiner Erschütterung mehr ausgesetzt ist, auch muß vorher das Schönmachen

[1] Gleiches Wort wie Korallenriff, weil der Ausschnitt ebenso fest und traghaft sein soll.
[2] *olotrau* der Bund der *kio* am Leebord außen.
[3] Vgl. Palau III S. 353. Totenbestattung.
[4] Es wird auch die Fixierungsmasse für Schwarzfarbe aus Manglerinde *ualisóng* zum Einpressen *(buiiiong)* benutzt, s. S. 97.

beendet sein, wobei auch Rochen- und Haihaut benützt werden, oder Korallen. Das *fér* »abreiben«; s. *faiür*.

Nach dem Kalfatern kommt erst die Bemalung. Vorher muß aber noch die Ausgestaltung des Auslegers mit dem Schwimmer *tam*, das *fai eám* (beim Tabū *val e vé*, wohl »Buschzauber« s. o.) erfolgen, das Festbinden der Gabelstützen *ám* an den Auslegerbalken *kio*. Dabei wird gefastet, denn das *anganga sórosol*, das »Arbeiten am frühen Morgen« ist dabei nötig.

b) Bemalung.

Das Bemalen kann jetzt stattfinden, wird aber meist noch verschoben. Nach Zementeinsetzen, *bedjē vā*, an beiden Seiten des Loches wird, nach 4 Tagen mindestens, das Boot ins Wasser gesetzt; dabei wird die Feierlichkeit, *gafé̱fei*, ausgeübt: Das Boot wird mit jungen Kokosfiedern *úbudj* (s. Zauber) geschmückt; alle Fischerboote, die vorbeikommen, werfen Fische hinein, so daß sich ein Essen schon daraus ergibt. Es ist ein großes Festessen des neuen Bootbesitzers an den *sellap* und die Gehilfen, wobei Gaben an die Götter nicht fehlen. Aber noch fehlt die Takelung und der Segelaufbau, deren Namen alsbald verzeichnet werden. Jetzt folgt als Weihe, der *tárabos*-Gesang (s. S. 102 Nr. 1), die letzte heilige Handlung vor dem Aussegeln. Alle Tabūs werden jetzt gelöst.

Wenn das Bemalen noch nicht erfolgt ist, wie oben bemerkt, so geschieht es jetzt: der untere Teil des Bootleibes wird schwarz *le djól le vá*, die obere Grenze *máted gol*, die seitlich ansteigenden Schrägungen *lēllap*; über der Fläche das einzelne Längsband *far*, über und unter dem der Leib rot erglänzt (Bd. 6 I Farb. Taf. 2).

Die rote Farbe *lap* kommt von Yap (s. o. S. 64 u. 149); das Färben wird *madjágos* (von *dja* rot) genannt. Die rote Erde wird mit Wasser in der Farbschüssel *tabbi lap*[1] angerührt und mit dem Pinsel *gololiē* aus der Kokosblütenscheide aufgetragen; bei großen Flächen nimmt man eine Kokosnußhülle. Wenn die Farbe trocken ist, überzieht man sie mit Artocarpusmilch, *ralimei*, die oben schon erwähnt wurde.

Die schwarze Farbe *rēl* aus Hibiscusholz *(maraſai)* oder Kokoshüllen (nicht Schalen) wird gleichfalls mit Wasser angerührt. Man fixiert sie mit einer Masse aus der abgeschabten Haut und dem Saft der gestoßenen Ipomoea *djaival* Ligadjelap ist Gott der Maler, s. S. 122. Schwarz-rot gestrichen, wie Farbtaf. 2 im Bd. 6 I Inseln um Truk zeigt, ist das Boot erst segelfertig für die große Reise. Farbschüssel und Pinsel dürfen nicht verlegt werden.

Der Name für das Boot wird nach dem Baum gegeben, der den Stamm lieferte, oder nach dem Land, auf dem der Baum stand.

Der Zimmermann und seine Gehilfen erhalten nach dem Abschluß die Bezahlung, er selbst 10—20—30 Handelsgegenstände, je nach Größe des Bootes.

[1] s. S. 172[1].

c) Benennung der Bootsteile (vgl. Band 6 Inseln um Truk S. 77).

Boot	*vā*
Luv	*baraf* (Truk S. 229 u. 230 *faraf*)
iketa	Leeseite
maitam	Windseite
tabóli va	Steven
lugulipal a va	Mittschiffs (auch *autéliebēp*)
sua e bēp	die Planke
oālemoél	die Planke für *ebēp* einsetzen
malemēsóro	»Ding das schläft«
móliva, âmo	Stirne (He. *nénnepal*)
moreliva, maimor	Achterteil
peli ebēp	innerer Teil
peigeli ebēp	Seite
autéli ebēp	Mittelteil
üüli ebēp	Leehälfte.
Kiel	*solegab, djiligep, gapialei* Abb. 61a. (He. Kiellinie *drüli χapille*, Schnabel mit Ansatz *patülle*, Gabelschwanz *metál i va* (Fregattvogelschwanz *galiele gataf*)
Kielplanke	*bul*. Leereling *kerikesá*, nach vorne *mesáp*, Luvreling *faramóe*,
Boötrumpf	nach vorne *mesáp*; Planke darunter *langolúor*, darunter *bāb*
kio, gio	Auslegerbalken, *rē* oder *djē* krumme Auslegerbalken
fang	Gräting (Luv); s. Feis u. Haus S. 91.
metárafang	Diagonalstange
oāsōso	Querstab
soso	Lasching (He. 2 Längshölzer *wadjódjo* oder *soso*).
oā leángelap	Joch
válieng	Klampe für Luvstag *eángelap*
eám	die Stützgabel, Pflock (He. *djamalivá*)
tam	Schwimmer (Floß) (He. *tam, tāmē*)
gapísē	Verbindungsstange der 2 *eám* (He. Gabelsteifen *sä*)
tari ês̄ē	Verbindungsstange der 2 *rē*
bui a tam	Loch am Schwimmer (He. *vié tam*, Spitzen des *tam* = *tawót tam*)
fōlag oder *folog*	Sitzbänke (s. S. 94), Mittelbänke mit Reeling *langolü*, Mastkule *labu*, Innenbank *djo*.
bárong	Luvhaus
gáimoém	Leehaus auf Leeplattform *ebēp*, ruhend auf 2 Balken *sua*, deren Anfänge unter *valimoel* stecken[1].

[1] Planken *faliebēp*, Bedürfnisloch *ngata li ebēp*, überstehend *uáliong* für Leestag *taueta*.

Rau unterdaubal, nicht eingezeichnet.

Abb. 61. d—p.

góis, gáüs Mast, *mes* Stänge, *úrur* Fall.
ɛ́ingelap Luvstag, über dem *telinga le uór* am Mast fest, unter der Bindung *bedjebedj ali gois*, die Mast und Stänge vereint.
tɛ̄ūtea[1] oder *taugata*[1] Leestag oben an der Stänge fest.
taligadj Vorder- und Achterstag, am Mast fest durch Schlinge *selinga le uór* (Abb. 61n), Klampe dafür *matongáro*.

d) Weitere **Steke und Knoten** (s. Handbuch der Seemannschaft 1899 II. Teil S. 40ff.), hier Abb. 61:

(m) Webleinstek *kotalipoi*.
(n) Kreuzknoten *bogolimar*.
(l) Balkenstek *kolliva* (Fall an Raa fest).
(i) Weitere Kopfschläge *kat*, Längsleine *valigaſáraſar(vl)*.
(k) Doppelte Kopfschläge *kat epalval*.
(o) *vóngalima* vierfache Schlaufe für Auffangen des Schwimmers, wenn das Geschirr in See zerbrochen ist (s. S. 72).
(p) *gómes* zwei Schlaufen zum Aufhängen von Wassergefäßen, wie Kreuzknoten.

e) Das Segel.

Das **Segel** *üa (longaliu* zwei lange Stangen, auf denen das Segel ruht), wird am Mast mit dem Fall (Abb. 61d) *úrur* gehißt, das an der Raa *djudju* mit dem Balkenstek *kolliva* (l) fest ist; daneben ein Hilfsfall *sós* (d). Am Baum *lim* ist die Schot *moél* (d) fest; daneben, dem Hals zu eine Schlaufe *talitor* (d), ein Stück Seil, an beiden Enden fest, wie ein Bogen herabhängend, so daß man Tauwerk zur Entlastung der Schot anbringen kann. An der Spitze des Baumes hängen noch zwei Bändsel *ápiteg* (d) herab, zum Verschnüren mit dem eingekerbten Ende *gobur* der Raa, oder mit dem Bug (vergl. Die Samoainseln Bd. II S. 258 Abb. 29). Das *gobur*-Ende ist wie ein Messergriff; nach der Raa hin verjüngt es sich dolchähnlich, und diese Verjüngung ist zur Verlängerung der Raa angeschnürt; *fēfē* das Zusammenschnüren zweier Hölzer. Im übrigen zeigen Raa und Baum zahlreiche Umschnürungen, die der Anlaschung des Segels dienen; sie heißen *mop*; die einzelnen Ringe sind durch einen Längsfaden *(i) vl* verbunden (s. Kopfschläge *kat)*; an diesen *mop* der Raa wird das Segel alsbald nach der Fertigstellung befestigt, aber nicht an den *mop* des Baumes, damit dieser noch entfernt werden kann, zum Herrichten des Segels. Dieses nämlich besteht ja aus »Kleidern« *sail, sälil, ruiel*, die Mattenstreifen, die zum Dreieck durch Naht *góruseg* vereinigt werden (s. Taf. 17d); die Horizontalkleidernähte enden mit je einer Schleife *gakit* (Abb. 61h); mit diesen Schleifen streckt man die genähten Streifen; auch führt man durch sie, wenn der Wind stark weht, ein Tau *tàligakit*, das an beiden Nocken festgemacht,

[1] Nur nötig, wenn zu Anker der Mast stehen soll.

als Ersatz für das fehlende Holz an der 3. Seite. Zum Glätten der Kleider dienen auch Stäbchen *djífel*; das Strecken heißt *gameil*, das Krachen dabei *sángarenger*.

Um dem Segel bei frischer Brise Festigkeit[1] zu geben, dienen etwa 62 *tēlap*-Schnüre (d) t, die von der Raa senkrecht herunter zum Baum ziehen. Oben an der Raa läuft je eine Schnur durch zwei *mop*-Ringe (Abb. 61e), während sie unten am Baum einzeln frei enden (d): jedes Ende wird mit einem Schlag an der Querleine *vatēlap* (e) vt befestigt (auf d nicht zu sehen); die überhängenden Tampen *tabotēlap* werden wie eine Schnur gedreht, zusammengewirbelt, und längs des *vatēlap* auf das Liek *dautel* gelegt. Der Rand des ganzen dreieckigen Segels wird nämlich durch ein Tau, das sogenannte Liek, *dautel*, (s. Samoainseln II S. 258 Fig. 29) stark gemacht, wie auch unsere Liekbändsel zum Anschnüren des Segels an Baum und Raa dienen. Da die Matte gegenüber unserem Segeleinen recht brüchig ist, wird sie umgeschlagen und das Liektau eingeschlagen und vernäht (f). Oben auf den Bund werden aber noch zwei Leinen mit angeschnürt, wie (e) und (f) zeigt, die *vatēlap* vt und die *valifárafar* vf; an ersterer werden, wie erwähnt, die *tēlap*-Schnüre unten festgemacht; die *valigafárarfar* aber dient zum Festmachen des Segels an der Verschnürung von Raa und Baum (i), deren verbindende Längsleine auch *valiga fárafar* (vl) heißt. Die Tampen des Liek und des vl werden an der Gabel des Baumes festgemacht (d rechts unten); die vt an den Nocken von Raa und Baum, da sie an der 3. holzlosen Seite nicht vorhanden ist; dort heißen Liek und vf auch *tali metálü*.

lálebógol die Leine, um das Fall beim Segelfieren nahe an den Mast und zum *eangelap* herzuholen

tal e rúopin[2] Leine mit gleichen Zwecken, nur sind beide Enden frei und schließen Mast und Fall ein

talitarák Reefleine (wie Ralik)

Pagaie *fatúl*; wie ostwärts kommen geknöpfte Paddeln vor (Palau III S. 182 Abb. 164)

Ruder *fatul e bupo* (Truk S. 229 *fedil a bú*), *fatul ülül*; Proviantraum *fō*; Schott *gábĕung*, Ösfaß *gámat*, Unterbank *iselimát* für ösen *gamát*.

Die Gallion ist der bekannte Gabelschwanz (Truk S. 227) mit einer Gabel *seapolimet*, an deren Fuß eine Einschnürung ist, die nach dem Gott Sĕlang (s. S. 121) *mong a* Sĕlang »Stirne des S.« benannt ist, da er hier als Erfinder der

[1] Bei starkem Wind wird auch das Segel klein gemacht, dadurch, daß man das Mattensegel von Raa und Baum loslöst, etwa bis zum Ansatz des Falles *urur* und der Schot *moíl*. Das frei werdende wird dann nach dem Hals hin zurückgeschlagen, und hier möglichst durch ein Netz noch festgehalten, damit das Segel nicht zu sehr ausbaucht, weil dann das Boot zu sehr anluvt. Natürlich wird auch durch Reefen die Segelfläche verkleinert; *talitarak* Reefleine (wie Rälik).

[2] *ɔ:ukopin* Boot Yap.

Gallion gilt; die beiden Zinken der Gabel heißen *mong a redj* »Stirne des Seevogel *redj*«, s. S. 95, 3. Tag.

Die Gabelzinken heißen auch auf Oleai *mongo* Sēlang; eigentlich heißt die Gabelkerbe so, bzw. *gilimel*[1], und der Grat, der außen von der Kerbe zum Kiel zieht, wird *falegilimel* genannt (*fale* = »unter«). Innen, nach dem Bootsraum zu, liegt unter den 2 Zinken eine kleine viereckige senkrechte Platte *nalimat*, und die schiefe Fläche weiter nach unten *atâlulibodj*. Die Spitzen der Gabelzinken aber heißen *móngoros*. Alles dies auf Oleai erfahren.

f) Bootsgesänge.

Es gibt viele Bootbau-Gesänge. Es gilt der Grundsatz, daß jeder auf seine Weise die Götter zur Hilfe anruft, diese oder jene, damit das Boot schön werde und Glück habe für die Reise usw. Insbesondere hat jede Meßleine ihren eigenen Gesang (s. S. 93 Anm. 1).

1. Bootsbau-Gesang
von Ikelûr (Haus 3) für *tárabos* S. 97.

1. *go temâ ligagerúa*	Du mein Vater befreie,	*géroa* austilgen, hier gemeint schlechte Eigenschaften und Fehler des Bootes.
go boē lē ligagerúa	Du sollst befreien	
tabatabalóg tudj osomē lugolīm	bei mir weilend die bösen Geister an der Außenseite des Hauses,	*taboeai* begleite mich, *tudj* Korb und Haus.
5. *i gánga boédji sellē*	ich vertilge den Schaden der Axt,	*gánga* essen, *boédj* Hitze, übler Einfluß.
itang boédjī sellē	ich beklage den Schaden der Axt,	
go sa li pata go sa li djál	du bleib in Verbindung, du mach es gut.	*sa* paeteritum, *pat* mit etwas in Kontakt kommen. *djal*, *ral* glatt.
	Glück des Bootes angerufen:	
eálo gol ea lo mal	Gib ihm Glück, gib ihm Wasserdichte	*gol* Glück, *mal* Wasserdichte.
ēlango puisil iketa	es soll gesehen werden das Loch an der Leeseite;	*lang* sehen; *puís* Loch, bildlich für den Einmarsch der Bönito.

[1] Angeblich von *itigul* außen, da diese Kerbe nach außen (vorn und hinten) sieht.

10. *garótarot a lametaũ*	das reinigt den Ozean!	von den Fischen; *g.* zusammenlesen, aufräumen.
meípil fárãmoi	Glück für den *faramoi*,	die Mastfußplanke, wo *baraf* endet.
meipil iketa	Glück für die Leeseite,	Z. 9.
meipil garãtalibódj	Glück vertreibe das Übel!	*bodj* s. Z. 5.
go silei páta go silei djalu	du bleibe bei ihm, du mach es gut!	Z. 7.

2. Bootsbau-Gesang

von Faragáu (Haus 1) für die Meßleine *tal i gudj* S. 93.

1. *busigi, busigi*	Erleuchte mich,	
sárama sárama	mache klar,	*maláma* hell polynes.
bulobúlei lalóṅ	erleuchte mich unter meiner Brust,	*lalo* unten polynes.
saramáramei lalóṅ	Mondlicht unter meiner Brust.	*maram* Mond.
5. *sẽlápo eai*	Meine Geschicklichkeit	
ngei i tókolei	(in dem), was ich nicht weiß,	*ngei* und, daß poet.
ngei i pókulei	daß ich es weiß,	
bóngoleur madj	den reifen Vollmond.	
fetál odi sõso	Es kommt das Schiff der Weisheit,	*fetál oai* gesagt, wenn Wind kommt, *fetát* kommen oder gehen machen.
10. *fisior fisior*	brenn' es gut in Form	*fis* brennen, *or* Form[1].
(ubudj vaivei	schwacher rechter Arm).	
võlebu djigidjig	Glück kleines	s. 1. Ges. = S. 108.
võlebu lábelab	Glück großes	
võlebu eĩla	Glück heute,	
gãng garáfal	ich Wurzelplätz,	*vágar* Wurzel, gemeint für Weisheitbau.
15. *irigirigiri tõgo*	laß es rennen zu mir,	*i dok* zu mir = *tõgo*; *rikerik* rennen.

[1] In alter Zeit wurde in die erste Aushöhlung des Baumstammes, die der Schiffsraum werden sollte, Öl gegossen und angezündet, um die Form innen auszubrennen; auch außen wurde der Baum angekohlt, ehe die Tridacna-Axt angesetzt wurde.

itáfetōgo	schnell zu mir,	*taf* schnell, damit eine Gasse entsteht.
garamālo	nicht verborgen (vor mir),	*mal* verbergen.
(gier gier) tālurigi tālulap	(Treibholz) wenig, viel,	*gier* (s. S. 234) das amerik. Rotholz, hier als großer Treibholzstamm gedacht.
lugálapal Lamodjek i	mitten in Lamotrek	
serágila giemar	segeln... (Axtschlag?)	*térak* segeln, *ser* auflaufen, festkommen.
serāvódjik serāmátang	nicht pelzig, nein flink,	*vodjik* Glieder eingeschlafen; *mátang* sichere Hand.
matangatang alipéi	schnell und sicher ist meine Hand,	
mērara lipei	flink ist meine Hand;	*mérra* schnell.
beigaue	früher,	s. Bd. 6 I S. 187.
mauru lēbong	schlafend in der Nacht,	
iredjagi maiuái	verfolgte mich mein Brotfruchtbaum;	*edjagli* jagen, verfolgen.
beigaue maropei	früher, mein Augenwinken	d. h. meine Hand sei flinker als mein Augenwinken.
rēsagol golāgo	erreichte es nicht, der fallende Regen.	*sógola* nicht bekommen, *taigolāg* es hascht dich nicht, *ūl* Regen (Póloat)
gielūtē valutē	seid nicht so flink der Regen	
modjo rāso	der *modj*, der Wal,	die 3 Fische sind dem *sellap* (S. 92) vorbehalten, und wenn 100 da sind und kein anderer.
gudju gūdjugudj	der Goldfisch, der Goldfisch, der Goldfisch.	

3. Bootsbau-Gesang. Ikelūr[1])

roros i lepéi,	Festgemacht am Arm,	*roros* festmachen, *pa. péi* Arm, meist *uudj* r. Arm = *róros*.

[1]) Urupo (10), Ikesera (45) und Ikelūr (3) machen selbst keine Boote.

kémálau mai uiĉi valéia	mach gut meinen Bootstamm heute,	*kemálau* gut machen, helfen, *mellau* Leben.
isériḍj ípola	mach (mich) stark, daß ich kann.	*i pola* ich will, eine Arznei.
vólebū segúdjūg	Glück kleines,	s. 2. Ges. Z. 1, 2.
5. *vólebū labelab*	Glück großes,	S. 108.
vólebu tagerálei	Glück komme heute,	
imelāu	ich lebe,	
nga ai melāu ralei ia	und mein Leben (soll) heute (anfangen).	
iáfela mai uiĉi eia	Wo soll ich schlagen, meinen Brotstamm?	d. h. anfangen, zugleich Axtschlag.
10. *iáfela mai uiĉi emamai*	Wo soll ich schlagen, meinen Brotstamm gut?	*fela* = *fáleſál* behauen.
e melāu mai uiei	es lebt mein Brotstamm,	S. 150[3].
e melāu mai uiei rálei ia	es lebt mein Brotstamm heute!	

Darauf kommen alle Helfer und arbeiten.

4. Bootsbau-Gesang

von Urupō (Haus 10) für Meßleine *tal i gédj* s. S. 93.

1. *roro silipēi roro silipēi*	Fest am Arm, fest am Arm,	s. 3. Ges. Z. 1.
e mámai felāi ei	daß gut mein Werk sei,	*felaiom* dein Werk von *fléſel* behauen (Ges. 3, Z. 9)
ē gādj felai ei	daß fein mein Werk sei,	
ē gādj maĭ uiei	daß fein mein Brotstamm sei	
5. *nga iuá nga iuá*	und so und so,	
idi gúlag	(bis) fertig (das Boot).	
Limesi, Limesi	L.	Göttin, soll ihm Lugeilengs Sachen zur Stärkung übergeben.
ueiti ubútel maral	nimm weg seine Kokosfieder und sein Halsband	*ubud* Truk S. 179, *maral* = *maramar*.
9. *lē malé'lál* Lugeileng	von dem jungen Mann L.	L. S. 122.

5. Gesang

Límagei, Límagei	L., L.,	Männlicher Geist, dabei Axtschlag.
i sâ fela	ich schlage	*sa* eigentlich für praeterit.
mai uiai il Lugêleng	meinen Brotstamm, L.;	
gamâmâi mai uiâ il	mach gut, den Stamm da;	*il* da.
5. *e fidja mai uiai il*	fein ist mein Stamm da,	
e mellâ uiai il	es lebt mein Stamm da,	
ngâua, ngâua	und so, und so,	
i ai gulag	bis fertig.	

107

IV. Geistige Kultur.

1. Gesellschaft.

a) Familie.

Auch hier wie auf Truk usw. starkes Mutterrecht, s. S. 31[1]. Die Frau besitzt das Haus usw. Initiation nicht vorhanden. Die jungen Mädchen holen schon früh Feuerholz, richten den Herd, kochen usw., mit 10 Jahren gehts ins Tarofeld. Als Fest bei der Pubertät — *gabuitiu* — ein kleines Essen mit Taro, Bananen usw.; die Männer liefern gelegentlich junge Kokosnüsse, Fische und Schweine. Während 3—4 Tagen wird das Mädchen 3—4 mal täglich gebadet, mit Curcumagelb, *reng*, eingeschmiert. Oft tanzen Frauen dabei (s. S. 143).

Geburt (über die Geburt hoher Frauen s. Gesänge S. 108).
Hebamme *vdie maleh*.

Der Zauberer (s. S. 152) wohnt auf dem Grundstück bei dem Haus der Schwangeren; in seiner Hütte bereitet er die Arzneien. Alle Leute hier dürfen nur Kokosnüsse, nicht anderes Wasser trinken; 3—4 Monde lang je einmal macht er die *tafei i lólomai*[2] (s. S. 111 u. 140) als Arznei gegen Blutverlust, denn der Saft vom abgebrochenen Stengel der Pflanze ist rot wie Blut. Bei den Gaben ist Fasten für alle vorgeschrieben. Der Zauberer *vak* hat eine Axt wie beim Bootbau; mit ihr bildet er einen *djep*-Fisch, einen Caranx, nimmt eine Holzschüssel, schlägt viermal hinein und macht dann die Arznei. Der Fisch wird dann, an eine Angel gebunden, Abb. 62 der Schwangeren auf den Leib gelegt, den Kopf nach oben. Dann schlägt er mit der Axt in der Rechten 3—4 mal auf den Fisch, hebt diesen dann mit dem Angelstock, um symbolisch die Krankheiten mit fortzunehmen; *djep* heißt springen, wovon der Caranx als Springer seinen Namen hat; er soll bewirken, daß so auch das Kind herausspringt: zuerst kommt das Wasser *djal*.

Abb. 62. Zauberangel.

[1] s. auch Bd. 6 S. 268.

[2] Ilolumai ist nach E. Krämer ein alter Medizinmann, der die Arznei *(tafle)* zuerst angefertigt hat. Honorar 1—2 Matten. Wenn Wehen da sind, folgt die vom Gatten bereitete *tafli ali ngérok*; zur Wehenmehrung, damit das Kind schnell kommt, dient die *tafli ali gauli ali modsh, ptengi* pressen.

Der Nabel wird abgebunden, *gogoi budj*. Das Kind bekommt gleich die Brust, bald auch schon Palmsaft, Kokoswasser usw., nach 3—4 Monaten Fisch und Taro. Das Nähren dauert bis zu 3 Jahren. Nachgeburt, *pai*, wird begraben. Danach Meerbad. Hilfe auch das Treten *jajä*, damit sie dünner wird.

Über die Gebärhäuser, *imatamai*, und die Zeit nach der Geburt s. unten.

Menses s. das Bluthaus, *im a fatin*, S. 89, wo die Frauen 4 Tage zu verweilen pflegen. Feier der 1. Menses nicht geübt, ebenso nicht Pubertät (s. Pollap). Kindesmord fehlt.

Gesänge *alis, rong*[1].

Für die Säuglinge werden Wiegen gebraucht, die aus einem viereckigen Holzramen bestehen, mit einem Netz ausgefüllt, auf dem eine Matte liegt (s. Taf. 7).

Bei der Niederkunft hoher Frauen (s. S. 111) werden folgende Lieder vom Zauberer gesungen:

1. *alis als bölebol* Zaubergesang. *bolebol* verbergen, bedecken (Zauber).

1. *völebu läpelap*	Glück großes,	S. 105 usw.
völebu läpelap	Glück großes,	
vällibüd lësi valibüd	Glück und Glück,	
täbö, täbö	nicht riechen!...	bezieht sich auf die Ausflüsse.
5. *tälagarü, tälagarü*	? ?	*garu* 2.
tafaliüalä matalësi	Gedreht der Mund, die Augen,	das Kind soll nicht als Fußgeburt kommen.
vällibuš, i lämagä, lämagä	Glück, keine Angst,	*tafal* drehen, *ala* Mund u. Hals, *mag* Befürchtung.
gogusovi matalä illësi	blase nach dem First, das Auge,	*gusovi* Wasser im Mund abblasen, *illësi* = *tsaisi* es muß sein.
kusave	blase	poetische Form.

Zwei Knaben, *djari legusegus*, die mit der Schwangeren leben, blasen am Schluß des Gesanges eine Arznei aus wildem Ingwer, *tölilefadj*, aus dem Munde.

2.

1. *völebu djigedjig*	Glück kleines,	
völebu läpelap	Glück großes,	
völebu lësi tagom	Glück?	s. Ges. 1 Z. 1. *lësi*.
völebu ësarafiom	Glück du beliebst zu sein	

[1] S. das vieldeutige Wort bei Truk S. 256 Anm. 1 und S. 273 Anm. 2.

5. *èvavósilom avotamom*	auf der Mutterseite, auf der Vaterseite,	*vosilom* Mutter und Verwandte *votamom* Vater und seine Verwandte.
beigaue	früher,	
mólu Lugeileng	der Mann Lugeileng	s. die Götter S. 122.
ma Alúelap	und Alúelap,	s. die Götter.
raidjugál egasiálíu	die Geister fragen von unten:	Geister = Schüttler, von *djug.* schütteln, damit das Kind kommt. *gasiálíu* fragen von unten.
10. *marolílo forolól?*	Wer trägt das Amulett?	das *fórol* besteht aus zwei Ketten kreuzweise über die Brust, 2 um Handgelenke, 1 um Hals (Abb. 70).
ómárá djóbut é mél,...	der Schmuck des Weibes, Frau ...	Antwort! s. Pollap Bd. 6 I S. 268 *dróbut.*
fórol íl;	dies ist das Amulett;	wie eine Zigarre, umwikkelt mit Faden, eine Seite weiß, die andere schwarz, *ligaboddj* und *ligaról.*
béigáue	weil früher.	S. 141.
goloro féla?	Wo starrst du hin?	*tovof* starren.
15. *goloro falabóom*	Du starrst dein Glück an.	
goloro féla	Wo starrst du hin?	
goloro féserá fiom	Du siehst deine Liebe.	
goloro féla	Wo starrst du hin?	
goloro djágu	Du starrst so dahin	*djág* verstärkende Partikel
20. *lugálapal i faliuei* Lamodjek	mitten auf mein Land Lamotrek,	
nga gouólebu djóbut é mél ...	du glückliches Weib Frau ...	
Lemagei, Lemagei	Lémagei, Lemagei.	
25. *sasepé émo*	Nun hilft ihr	*sep* helfen, *ka sep* hilft.
forolé mara djobut mél ...	das Amulett des Weibes, Frau ...	s. Z. 10.
beigaue	weil früher.	
goloro féla	Wo starrst du hin?	

gotoro fëia faliong	Du starrst nach deinem Land.	
30. *gotoro fëia ia*	Du starrst wohin?	
gotoro fëia bukutom	Du starrst nach deinem Gehöft,	s. S. 17.
nga vólebu djobut mël ...	und Glück für das Weib, Frau ...	
Lémagei, Lémagei	L., L.	
fëfaragimo	mache die Mutter schön glatt,	bildlich, *farag* in Matten legen, glätten.
35. *fórolo mara lepël djobut mël ...*	ihr Amuletthandschmuck des Weibes, Frau ...	s. Z. 10.
ikile semëa	Wo soll ich anfangen zu schneiden?	*kilesi* schneide es, das Glück, es herbeischaffen.
ikilesemeilang	Ich schneide im Himmel.	
ikilang semeia	Ich schneide wo?	
40. *ikilesemeia au*	Ich schneide	
taurilei	Ausgang für mein Kind.	*taur* hinausgehen, *tauralog* hinausgegangen.

Heirat[1] heißt *röle kannei*, von *rölim* der Hausgenosse und *kannei* geben, denn der Mann erhält alles von der Frau; bei der Siedlung wurde ja schon erwähnt, daß der Mann meist ins Haus der Frau zieht. Polygamie deshalb selten. Heirat der Mädchen schon mit 10 Jahren und aufwärts, Männer erwachsen. Es wird nur angefragt; die Eltern geben die Zustimmung oder die Absage. Nahe Verwandte heiraten nicht. Vor der Ehe Freiheit. Eheliche Treue selten. Heirat ist zwischen nahen Verwandten dann möglich, wenn diese nahe Verwandtschaft über den Mann geht, also auch hier ganz im Sinne des totemistischen Mutterrechtes. Daß diese Heirat nicht zwischen Mitgliedern eines *gailang*, einer Sippe, stattfinden darf, wurde oben schon erwähnt, und auch, daß sie innerhalb der ersten Sippe zwar möglich ist, aber nur zwischen Mitgliedern der 3 Zweige (S. 114). Es können also so nahe Verwandte als Vettern und Basen heiraten, wenn sie beide nicht von 2 Schwestern, sondern von Bruder und Schwester stammen, oder gar von zwei Brüdern.

Es geht eben alle Verwandtschaft durch die Frau, im Sinne der Blutsverwandtschaft. Nach Cantova S. 311 kommt Levirat vor.

Besondere Heiratsgebräuche sind nicht vorhanden. Die Familien des Mannes

[1] Wort auf Olkai und Ifaluk (nach Angaben auf Lamotrek) *eshag*, auf Sötoval *hilin (helmei* meine Frau), Bd. 6 II. S. 142 *hilulei*, Truk S. 154 *fulwei*.

und der Frau tauschen, meist 2 Tage, nachdem der Mann im Hause der Frau schlief, Essensgeschenke aus; dies heißt *aūtéli got*, nach dem Inhalt des Korbes *got*, der neu sein muß.

Über die Geburt s. o. S. 107.

Wie auf Tobi, so fanden wir auf Lamotrek besondere Gebärhäuser, *imu-* oder *imatamdi* genannt, wie sie auf dem Plan schon hervortreten. Beim *im* Nr. 30 wurde schon erwähnt, daß dieses von den vornehmen Frauen gerne benützt wird, um etwa im 10. Monat dort die Zeit zu verbringen, ehe sie zur Niederkunft ins *imatamai* übersiedeln. Besonders die Erstgebärenden erhalten dort ihre Arznei, die *tafei ilólomai*, die ihnen (S. 107) in jedem Monat einmal gereicht zu werden pflegt. Dabei sind natürlich Zauber *bólebol* (s. S. 108) vorhanden, weshalb das *im* Nr. 30 auch als *im ali bólebol* bekannt ist. Niemand darf sie während dieser Zeit besuchen, höchstens den Müttern und Schwestern ist es gestattet sie zu sehen, und natürlich auch den Bediensteten, die das Essen holen, das von den Anverwandten an die Grenze *(róros)* gebracht wird. Alle Fruchtbäume auf dem Lande des Hauses sind tabû. Im allgemeinen bleibt die Frau einen Mond (E. Krämer 10—20 Tage) ihrem Wohnhause fern; der Monat heißt *alilálang*; es gibt aber auch kleine Monate, *álilalang a het* genannt, die nur 10 Tage lang sind und die Mindestzeit der Abwesenheit darstellen. Zwischen Frauen der Häuptlinge und des Volkes ist ein Unterschied. (s. Gesang).

Wird ein Kind geboren, wenn der Mond nicht in Sicht ist, also zur Neumondzeit, bis zu 2 Tage vor oder 2 Tage nach, dann bleibt die Wöchnerin nur 10 Tage; geschieht die Geburt, wenn der Mond zuerst gesehen wird, also am 2.—3. Tage nach Neumond, dann muß die Frau bis zum 26. Tag, dem *romálefal* (s. die Mondtage S. 134) warten; das wird dann ein großer Monate *álilalang e lap*. Wird aber das

Abb. 63. Zauberstrauß (S. 111).

Kind nach dem *romálefal*-Tag geboren, so ist die Wartezeit meist nur ein kleiner Monat. Beim Verlassen des *imatamai* wird die Mutter mit einem Zauberstrauß aus Farn und Kokosfiedern *earüjü lübobo* gereinigt, Abb. 63. Zwei Zaubergesänge für die Entbindung s. S. 108, Trennung von Mann und Fau nach der Geburt 3—4 Monate. Ehetrennung selten. Kinder bleiben bei der Frau.

Das Zauberlied für Purifikation ist folgendes:

Reinigung nach Wochenbett.

Ein Zauberstrauß *sarüdjü* (Abb. 63) wird für das *sarüdjü lü böbö* (s. u. *sägöböbö* und S. 113 = Anm. 1) gebraucht.

Lēmagei, Lēmagei	L., L.,	Geist s. S. 54, 106, 109.
i bälē rälog(o)	ich nehme fort	
faributosäril(e)	das Unreine vom Kinde da,	*faribut* od. *falabut*, *djarifam* Nährkind
feläta saril	laß kommen das Kind	in sein Haus, *feläi* Mädchen.
5. *me uädjö äail*	und nicht komm es auf meine Leute,	*djo aai* meine Leute; es = das Unreine.
baigaue	weil früher	S. 109 Z. 13, S. 104.
sätafa güi	wir haben geschnitten den *gui*,	*täfataf* schneiden, gemeint: das Blut floß auch von diesen Fischen ebenso wie von der Gebärenden.
sätafa rås o	wir haben geschnitten den Wal	
töläbalab e metau	von der großen Dünung des Ozean.	
10. *ƥängeƥäng mälüg*	Sie lärmt draußen,	außen an der Seite die See.
gaidjüdju ma gädji	wir trafen zusammen mit der Ratte	wir *(gai)* sind Genossen mit der Ratte; Bescheidenheit! Ratte auch heiliges Tier.
ƥangeƥänge djē ƥangeƥang	Es donnert, oh es donnert,	
feilogē fēlog	sie kommt, sie kommt!	

Ehescheidung, *moemoe*, wird durch die Familie des Mannes in die Wege geleitet, und zwar sucht man ihn durch Geschenke zu lösen; lösen oder brechen heißt *moemoe*; ist dies nicht gut in Ordnung gebracht, kann eine Bestrafung

einer Partei durch die andere noch nach vielen Jahren bei Neuheirat, selbst bei Tod stattfinden, durch Wegnehmen von Booten usw. Erst nach der Lösung, ist der Mann wieder frei.

Schwangerschaftstabus. Arme Frauen des Volkes bleiben 4 Tage im *im ale gogóbong* »die Nächte auffüllen« zu Reinigung; man spricht ihren Namen nicht aus; dann erst gehen sie ins Wohnhaus *im*. Auf ihnen lastet, *sêgê bôbô*, das Tabû der Häuptlinge. Häuptlingsfrauen lassen am Abend des Abganges vom *imatamai* die Zeremonie des Gesanges mit dem Wedel von *legát* über sich und die Dienerschaft, die mit ihnen waren, ergehen; dann gehen sie direkt ins *im*. Nach dem ersten Kinde bezieht die Häuptlingsfrau möglichst bald ein *imalifam* (s. Oleai), das möglichst weit draußen am Luvstrand liegt, in dem nachts immer ein Feuer brennt für Wärmung des Kindes und zur Abschreckung der Geister, die sich vor Flamme und Rauch fürchten. Ihre Männer arbeiten während dieser Zeit nicht im Tarofeld, und alle Fruchtbäume sind tabû; nur das Toddy schneiden ist erlaubt. Vier Monate bleibt sie draußen. Im 1. Monat darf die Frau nicht zum Wasserloch, im 2. Monat darf sie ins Tarofeld, aber nicht arbeiten. Nach dem 4. Monat ist das Kind *gaadk* und kann weggenommen werden. Kinderwiege, ein viereckiger Ramen mit Netz, wie wir ihn im Gebrauch sahen Abb. 64; ein Stück auch in Stuttgart Nr. 41250 s. oben. Taf. 7.

Abb. 64. Kind in der Wiege.

Die Frau Ledjélimar vom Haus 10 wußte die Geisterbeschwörung und Reinigung, die die Frauen durchmachen, nachdem sie das Geburtshaus *imatamai* verlassen haben. E. Krämer notierte das Folgende: Meist verlassen mehrere Frauen beim sterbenden Mond zusammen das Haus, und versammeln sich mit ihren Matten und mit Essen um das Bluthaus von einer derselben. An diesem sitzt die Beschwörerin, macht sich aus Farnen vier *ôulapê* Zauberknoten aus Kokosfiedern (s. Abb. 63), und einen Strauß *ealûs ûrû poêpoê*[1], den sie mit folgenden Worten sachte im Kreise schwenkt:

Ilamagge, Ilamagge	Ilamagge, Ilamagge, der *alus*
lipôpôrôlago	nimm fort

[1] *alus* Geist, hier der Knotenorakel s. S. 376, wie ja auch hier aus jungen Kokosfieder und Knoten gemacht werden; vergl. oben *sarâja lô bôbô*.

[2] Krämer

faributosärile	das Schlechte vom Kind,	s. S. 102 Z. 3.
felätta särile	den Zauber vom Kind,	Zauber vom *imalamai dro* Leute, Verwandtschaft, *aile* mein
5. *mëño dro erdile*	von meinen Leuten	
baigaue	vorher	s. Bd. 6 I S. 187, Z. 4., S. 104, Z. 24.
ejä te vagüe	ist geschnitten der Fisch	*güe, ku* Delphin
ejä te vardjo	ist geschnitten der Wal,	
lo le parreparre meddau	aufs Riff braust die See,	
10. *püngepünge mëlügge*	donnert dahinter;	auf die andere Seite.
gaijuju magëji	du triffst die Ratte.	*ädj* Ratte. S. 112, Z. 11
püngejünge jë püngepünge	Donnern über Donnern,	
faitoggo jë faitog	kommen über kommen.	

Die Sippen *gailang*.

1. Mongaulifadj, Truk S. 260 Nr. 21 Mongulufadj, von Poloat stammend (s. Oleai) auf Pollap Nr. 2, auf den übrigen östlichen Atollen fehlend. Über den Ursprung heißt es, im Norden von Eap soll eine Insel Gáferudj gelegen haben, wahrscheinlich Sëpen, das an klaren Tagen von der Nordspitze, von Rumung aus, zu sehen gewesen sein soll. Ihre Einfahrt war schneckenförmig. Die Insel Sëpen soll um 1830 noch vorhanden gewesen sein, und war an Stelle des Hunter-Riff der Karten. Das Wort Gáferudj bedeutet wohl »Ende von Land« und soll dem Namen Fároilap zu Grunde liegen. Auf der Insel waren viele Kokospalmen und auch ein großer Pandanusbaum, *fadj*, mit 3 Zweigen:

   1a. mittlerer Hauptstamm *ngoli/adj*, dem der Oberhäuptling Sukurang angehört, und Joseph (s. Haus Nr. 24a S. 26); mit ihrem Tod ist der Zweig abgebrochen.

   1b. Haupt Urupo (s. Haus Nr. 10), weiter Sopong (Haus Nr. 11), Volimar Nr. 22a), Meireg (Nr. 24b), Somar, Rangemai (Nr. 24b), Sukúlubou[1] (Nr. 14), Ikisera (Nr. 25).

   1c. Haupt Boésu (Nr. 4), Tilipou (Nr. 14), Gasepabau (Nr. 9), Alefamal (Nr. 26).

   Es heißt, die beiden Häupter Súkurang und Boésu stammen von zwei Schwestern, wodurch die zwei Hauptzweige 1a und 1c entstanden.

   Die 3 Zweige können ineinander heiraten; aber innerhalb eines Zweiges darf nicht gefreit werden. Als Geist, *alus*, der Sippe gilt Mótaisam, der früher ein mächtiger Häuptling war; sein Vater Uúsam ist Geist von 3. Auf Sétoval[2] vorhanden mit dem Zweig Katamáng (Truk 31 Ketemang).

[1] s. Bd. 6 II S. 160 Sugúribou Haupt.

[2] Bd. 6 II S. 137 nichts davon bei Gadamán erwähnt.

2. Saufaládjik fehlt im Osten; soll ein Kind von 1. sein, deshalb alles gleich; auf Ifaluk soll Gofalü an zweiter Stelle sein, die auf Soról Nr. 1 ist, Mangaulifadj Nr. 2.
3. Sâuel, auf Truk Soualei; Geist Uâsam s. o. Auf Sētoval Volíra.
4. Boll ausgestorben, auf Truk-Póloat Boël, Pollap Boal.
5. Sorr s. Truk 10 usw. Geist Lebá, der auch für alle gilt.
6. Gailang ali oléa s. Oleai; auf Sētoval Falemei[1] (s. Truk 19), s. auch Truk S. 263 Nr. 32 Sou Oley.
7. Uisúsu s. Truk 17, Pollap 8 (s. Bd. 6 I S. 269). Geist wie Nr. 1.
8. Rak, Truk 19 Rek, Geist Gabós auf Ifaluk Nr. 5.

b) Häuptlinge *tamol*.

Über die *tamol* sagt Cantova S. 312, verschiedenes Sitzen auf Thron, Nahen in gebückter Haltung, Fuß- und Handkuß, lange Bärte (s. S. 37).

Die Reihe der Häuptlinge (s. o. S. 29) ist nicht groß, also Überlieferung in dieser Hinsicht schwach. Auch im täglichen Leben tritt das Häuptlingstum wenig hervor; so erhalten die Häuptlinge bei Essensverteilung nicht mehr wie die übrigen. Trotzdem haben sie ein Ansehen, wie bei Lúkúnor (Bd. 6 I S. 90) zu sehen war. Eine Ehrerbietung tritt z. B. darin hervor, daß nicht auf der Bank *mótog* Segel gesetzt werden darf, sondern man paddelt, bis man von der Untiefe frei ist. Daß sie zu Macht kommen können, namentlich im Kriege, geht aus dem Bericht des Pater Clain 1697 hervor, wonach damals Lamotrek als die Beherrscherin der Karolinen (wohl nur der zentralen Teile von Múrilo bis Feis) galt. Es war also ein Königtum anscheinend in alter Zeit hier vorhanden.

Der Häuptling ruft zur Versammlung. Werden die Leute gerufen, so kommen sie im Gänsemarsch nach Alter und Rang; der Korb ruht unter dem rechten Arm, die linke Hand faßt hinter den Rücken der rechten. So geht es in langsamen Gang.

Auf Elato erfuhr Hambruch: Zwei Häuptlinge beherrschen die Insel, der Oberhäuptling *tamōl oi i lap* Mailipue, und der Unterhäuptling *tamōl i gītegīt* O'Mairang; ihm folgt der *óū rongāre tamōl*; vordem war es der Verstorbene Saporóu; jetzt ist es sein Bruder Djigedjūgol.

Der Oberhäuptling ordnet die laufenden Arbeiten an: Rodung des Busches, Arbeit an den Palmen, in den Tarofeldern, bei Hausbauten, Bootbau, Fischfang usw. Der Unterhäuptling ist der Sprecher, der an das Volk die Befehle *jadjóual* des Ober- vermittelt. Der dritte Häuptling gibt die Anordnungen des

[1] Bd. 6 II S. 157 bei Fānimei nichts davon erwähnt.

zweiten weiter und überwacht die Ausführung. Gelegentlich werden Ratsversammlungen der Männer abgehalten *fagilili e tōχ*, in denen die laufenden Geschäfte beraten werden. Erbfolge gleich wie in Faraulip. Stirbt die Familie des 1. Häuptlings aus, so wird die 2. zur 1. Der 3. bleibt Nr. 3; aus der Familie des 2. wird ein neuer *2. tamol* gewählt.

c) Recht.

Nach Cantova S. 313 Hauptstrafe für Verbrecher die Verbannung.

Dem Oberhäuptling steht das Recht der Bestrafung zu, wenn das Volk nicht selbst eingreift.

Als Strafe, *gária*, dient besonders für Diebstahl das Festbinden des Diebes an Pfosten mit Schwärzung des Gesichtes.

Mord, *limalau*, soll nie vorgekommen sein, weil eben Feindschaft und Raubgier kaum vorkommt; dagegen Totschlag, wenn zwei Parteien wegen eines Zankes mit einander fechten.

Dem Ehebrecher wird alles weggenommen; Schüsseln, Boot, selbst Schlafmatten.

Beschimpfung der Mutter wird ertragen, aber nicht der Schwester.

d) Krieg.

Herstammung S. 162 von Olifat.

Wenig im Innern vorhanden, weshalb die Waffen (s. S. 66) so ziemlich fehlen. Es muß allerdings früher anders gewesen sein, nach außen mindestens, wenn der König von Lamotrek (s. S. 5) über weite Gebiete herrschte. So hörten wir, daß vor noch nicht langer Zeit Ifaluk die Lamotreker angriff, weil diese zwei Bootsbesatzungen von ihnen erschlagen hatten.

Betreffs Elato hat Hambruch einiges Wichtiges erfahren. (S. 31.)

Cantova S. 317 hat einiges vom Krieg der Westkarolinier erzählt, was natürlich nur von einzelnen Plätzen (Faroilap usw.) gelten kann, da Feis z. B. sehr friedlich ist. Daß vergiftete Knochenspitzen an Speeren vorhanden waren, ist wenig wahrscheinlich. Streiter in 3 Klassen: Junge Leute, größere Gestalten und 3. ältere Leute. Steinwürfe und Lanzen. Ende mit Triumphgeschrei.

e) Tod *mas* und Bestattung.

Beim Tod von Häuptlingen kommt deren Ansehen zum Ausdruck durch die Tabūs, *tap* genannt, zu Ehren der Toten im besonderen *bai (bei)*; so ist das *bailimas* eine Tabuierung des Besitzlandes durch Umhängen von Kokoswedeln (S. 120).

bailigógo[1]	den Toten festmachen
bailikelik[2]	den Toten aufs Meer nehmen
bailigóifar	das Tragen des Toten *(áfar* Schulter)
oai li róro	Aufheben des Toten auf die Schultern
bai li djup	ein totes Kind in den Armen halten
kábong	das Lebewohl, der Abschied.

Der 1. Todesfall eines neuen Mondes wird mit 4 Tagen Arbeitstabū betrauert. Einige Familien, die den Toten nahestehen, sammeln viele 1000 (oft 20—30000) Kokosnüsse, was viele Monate, ja bis zu einem Jahr dauern kann. Alle werden vor das Bootshaus gelegt und baldmöglichst an alle Leute und Kinder zu Ehren des Toten verteilt.

Ebenso geschieht es mit dem Taro, von dem 200—1000 Stück an gleicher Stelle aufgehäuft und verteilt werden. Wenn die *bai*-Tabū fertig sind, erhalten auch alle Mattenbringer Kokosnüsse, ebenso die Frauen, die den Toten hinten und vorne mit *reng*-Gelbpulver angefüllt haben. Einzelne Personen, die mit dem Toten zu tun hatten, werden mit Essen besonders abgelohnt.

Geliebte Verwandte werden mit Wasser von jungen Kokosnüssen gewaschen und das Waschwasser wird dann getrunken. Mumifikation kam früher vor; oft wurden die Mumien am Firstbalken des Boothauses aufgehängt und später beerdigt. Auch wurden hohe Häuptlinge auf Bahren gelegt und Holzschüsseln unter sie gestellt, um das Leichenwasser aufzufangen (Truk S. 272—274). Wegen des Gestankes stecken sich die Angehörigen Lavendel *(uārong)* in die Nase, die deshalb durchbohrt wird. Lewis sah noch ein totes Kind in solchem Zustand. Wir sahen die Aufbahrung eines Kindes das eingegelbt und reich geschmückt war. Abb. 65a u. b zeigt es.

Tod eines Kindes

von E. Krämer.

Ich hatte schon einige Zeit ein Kind schwach wimmern hören; als es mit der Mutter das Geburtshaus verlassen hatte, war es ganz in unserer Nähe untergebracht. Es wimmerte viel. Das Haus, in dem es war, war nicht ganz dicht, und während der Nacht regnete es stark.

In der folgenden Nacht ertönte plötzlich laute Totenklage; man sah in der Ferne Fackeln. Das Heulen war bald vielstimmig und währte die ganze Nacht. Morgens fand ich das tote Kind in dem Hause von 2 Weibern umgeben, die laut und scheußlich heulten. Es war mit etwas *reng* (Gelbwurz) bemalt und ein wenig

[1] *pai legogo* Bezahlung *pai* für das Festmachen *gogo*: erstes Essen für die Helfer beim Einbinden der Leiche, baldigst.

[2] *likelik* lassen, wegwerfen der Leiche, *pai* Bezahlung = Essen, oft mit *pai legogo* zusammen.

a

b

Abb. 65a, b. Totes Kind geschmückt.

geschmückt. Als ich da war, nahmen die Eltern das Kind hoch, bemalten es noch mehr und schmückten es. Währenddem wurden viele Gaben gebracht, *faubar*-Ketten, Armringe, Gürtel, Fischhacken und besonders viel Matten. Das Kind wurde dann auf eine 7-streifige gelb-schwarze Matte getan und zu seinen beiden Seiten kam je ein Tarosetzling zu liegen (a). Der Vater sah sehr traurig aus, aber die Mutter steckte sich alsbald eine Zigarette an, während die Heulweiber das Kind aufnahmen und es beklagten. Die Mutter heulte nur wenig mit, während die übrigen Frauen und Kinder des Hauses sich schweigend verhielten. Das Kind sollte nicht begraben, sondern im Hause aufbewahrt werden, wie es auf Truk geschieht. Es hieß, die Mutter sei schuld am Tode des Kindes, weil sie sich einmal sehr über schlechtes Essen erzürnt habe; der Zorn sei ihr in die Milch gefahren, worauf das Kind gekränkelt habe. Es herrschte die Sitte, die Toten in sehr viele Matten zu hüllen; gelegentlich werden die Leichen ins Meer versenkt (s. o.).

Grab.

Abb. 52 zeigt ein Haus rechts vom Pfahlhaus, das Grabhaus des Saualik, der mit Sopi in Verbindung stand, ganz rechts eine Hütte über dem Grab von Sopis Adoptivmutter (s. H. 1 — S. 19).

Auf dem Grab des Rólimei stand ein Haus *áruat* (Taf. 9 d). Das Lichtbild zeigt, daß ein kleines Satteldach von zwei First-Säulen getragen wird; die Eckpfosten sind nicht sicher zu erkennen, nur vom Ramen ist der quere Giebelbalken vorhanden, der durch Schräglatten mit Säule und den anscheinend schiefen Eckpfosten vernagelt ist. Der Giebel ist durch senkrechte Stäbe abgeschlossen, die durch 3 Schnurlinien untereinander markisenartig verbunden sind; unten ist das Grabhaus durch Kokosmatten ringsum umzäunt.

Der Seefahrer Rólimei wollte von Yap nach Mókemok, verfehlte diese Gruppe aber und gelangte schließlich nach Póloat; als er von dort heimkehren wollte, kam er nach Lámotrek, wo er starb.

Wenn ein Begrabener kein Grabhaus hat, so wandert sein Geist des Nachts grollend und heulend umher, wodurch die Leute sehr in Angst geraten.

Deshalb werden die Toten hier vielfach in Matten gewickelt, das Bündel dann mit einem Stein beschwert und im Meer versenkt.

See-Bestattung.

Der Platz ist südlich von der Insel Lámotrek, 100—150 m ab, an einem Taualivá genannten Platz, der ja wie die dort vorhandene Bootpassage (Karte 2) heißt. Der Tote wird in Webematten[1] eingewickelt. Bis zum 4. Tage bleibt die Trauerfamilie im Totenhaus; dann macht der Älteste eine lange Girlande *(mar[2])* aus

[1] Als Lewis von Yap kam, sah er viele Fremdlinge auf Lamotrek an Hunger sterben, die aus Mangel an guten Matten in einfache Kokosgeflechte gewickelt wurden. [2] *pilleмar* das Binden des *mar* s. S. 35.

Blüten und Blättern, und seine Leute bringen sie zum Seeplatz, die Götter Aluelap, Saulal usw. anrufend mit Gebeten um Glück und Schutz vor dem Tode. Dann werfen sie die Girlanden ins Meer. Nach der Rückkehr verlassen die ferneren Verwandten das Totenhaus; nur die nächsten bleiben noch, bis der Mond fertig ist. Während der ganzen Zeit ist Arbeit verboten.

Nach 5—6 Monden ist das *fi*: alle Sachen des Toten werden in Wasser von jungen Kokosnüssen gewaschen und man trinkt das Waschwasser danach.

Beim Einwerfen der Leiche ins Meer tauchen einige Leute hinterher als Abschiedsgruß[1].

Dann wird rasch zurückgepaddelt. Alle machen sich eine Kopflochdecke (Truk S. 92) aus einer Schlafmatte *lúgelug* und bedecken sich damit; auch die Kopfhaare werden abgeschnitten.

Hambruch erfuhr auf Elato: Zunächst vom Erbe S. 31. Weiter:

Der Tote wird im Hause aufgebahrt und am gleichen Tage bestattet. Er sieht dabei nach Süden. Die Leiche wird in Matten eingenäht, geschmückt und mit Steinen beschwert außerhalb der Lagune vom Kanu aus versenkt. Vier Tage später wird ein großes Essen veranstaltet, an dem alle teilnehmen, die Matten u. a. geliefert haben.

So starb vor kurzem der Mann Săperóŭ. Sein Bruder ist Ẓigĕlŭgŏl ♂. 11 Frauen lieferten die Matten (Kleid- und Schlafmatten) zum Begräbnis, und zwar die Frauen aus der Sippe des Saperóŭ; 5 gehören zu seiner engeren Familie:

Ẓagabăs ♀, *χroligaléa* (Gattin)
Tăñewaga ♀, *măneaŭ* (Schwester)
Leigomăŭ ♀, *faziloăl* (Tochter d. Saperóŭ)
Tamllimŏĭ ♀, „ „ „ „
Eŏleiijĕñ ♀, „ „ „ „
Lŏiiflt ♀, „ „ „ „

Takŏf ♀	lieferten die Matten	Lagajŭŭmăl ♀
Păñĕlioa ♀		Lagalẹŭmăr ♀
Wŭĭmăr ♀		Lagatŏĭilŭl ♀
Elóŭbŭt ♀		Lizéineŭzăk ♀
Năñafĕlitĭp ♀		
Lagapéiumăr ♀		

Alte Frauen unterliegen unterdes dem Totentabu, *ŏlelimĕs* (s. S. 116 *băilimas)*, während sie mit dem Sohne des Saperóŭ im »Großen Hause« wohnen. Das währt 4 Tage: *fáa ŭ pón*. Der Häuptling legt das Tabu auf. Sie müssen im Großen Hause bleiben, weil Saperóŭ hier aufgebahrt ist. Nach 4 Tagen gehen sie wieder in ihre Häuser heim.

[1] Vgl. Palau IV Gesch. 16 S. 45.

Saperóū ist in den Himmel gegangen.

Saperóū hatte zwei Häuser, Kokospalmen, Taro, Kanu. Das Eigentum wird folgendermaßen aufgeteilt: Sein Bruder erhält die Häuser, ebenso die Palmen und den anderen Besitz, wofür er die Witwe und den Sohn erhalten muß. Nach seinem Tode erhält seine Schwester den Besitz, und erst danach fällt er an den Sohn Saperóū's zurück.

Die Sippenverwandten bleiben 4 Tage im Tabū, die engere Familie bis zum Ende des Monats. Am Hause werden Girlanden aus Kokosblattfiedern aufgehängt, um die Geister abzuwehren.

f) Feste und Tänze.

Cantova S. 315 sagt einiges über den Tanz der Westkarolinier, z. B. daß der Häuptling zum Schluß eine schöne Matte in die Höhe hält, die dem gehört, der sie zuerst zu greifen vermag.

Müller Yap. I S. 309 sagt, Lugëlëng ist *tamē rang ko toru*, der Tanzzauberer des Himmels; so auch auf Lamotrek s. Religion u. die Gesch. 1 von Jat und Jol mit dem Himmelstänzer.

Tanzstab *gurrugurru* (He 2097—5874II). Holz *songo*, Knopf *olále*, Ansatz zum Aufhängen *tawólo*.

g) Spiel und Sport *ur*.

He. 2132 = 5912II ist ein kleiner Webstuhl, der von Kindern zum Spiel aufgestellt und bearbeitet wird.

He. 2133 = 5913II Spielboot *vá* mit Kinderpaddeln (He. 2308 = 6080).

Fadenspiel	*gaſiſ*
Ballspiel	*gáreſa* (s. Feis)
Windrad	*gadjogoiá*, 4strähnig
Fangspiel mit Wurf ins Salzwasser	*tūgūrik*

livövö Brotfruchtblüte, sich bewerfen damit; man duckt sich dabei nieder. Der Getroffene scheidet aus.

porettetiu buai »nicht erlaubt lachen«: es wird ein Kreis gebildet, in dessen Mitte 1—2 Leute sind, die die andern zum Lachen bringen. Wer lacht, wird ins Wasser geworfen.

2. Wissenschaft.

a) Navigation, Erd- und Himmelskunde.

Beim Boot S. 91 wurde schon erwähnt, daß Alúluei der Gott der Schiffer ist, wie bei der Religion S. 150 zu sehen; dort wird er als Sohn des Paluelap als Alulúi genannt, während er auf Truk S. 319 mit Alúelap gleich gesetzt wird. Auch seine Gleichheit mit Palúelap wird behauptet. So hörte ich auch, daß neben 5 Göttern 17 Hilfs-Navigatoren vorhanden seien; sie heißen:

Götter:

Alúelap S. 144
Lugéileng
Eidjal
Ólofat s. S. 147
Alúluei s. S. 143 Anm. 1.

Hilfsnavigatoren:

1. Alulápelap
2. Maselēlog
3. Tarailemetaū
4. Vórieng (s. Pollap)
5. Faludj
6. Gapiumolefádj „Pandanusfrucht"
7. Sābug
8. Fágara
9. Olopélipen
10. Madjebol
11. Lēbútobut
12. Uman

Zimmerleute:

Ligedjllab
Semēligóror
Semeligodjúat
Sēlang
Meséiseit

Die große Zahl der Geister erklärt sich daraus, daß jeder Schiffer seinen eigenen Geist hat[1], während Lúluei allen gemeinsam ist.

Schiffsführer *pallü* ist wie Truk S. 244 usw.; er schläft in See im *barong*, während seine Frau im *gaimoém* haust. Bei Truk S. 230 heißt es, daß der *pallü* im *kimoém* auf der Leeplattform schlafe, was aber westwärts der Frauenplatz ist; deshalb ist dort ein Loch, *ngatalie bēp*, im Boden zwecks Verrichtung der Notdurft. Beischlaf ist an Bord verboten.

Proviant: Im *barong* hat auch der Kapitän den Proviant bei sich, nur die Kokosnüsse sind im *bul*-Raum oder *basebas barong*; sie dürfen nicht angetastet werden. Der *pallü* ißt immer zuerst, dann die Besatzung *rōliva*. Niemand fragt um Essen; alles wartet, bis er ißt, dann bekommen die übrigen ihre Teile zugewiesen. Das Essen ist immer sehr knapp. Auch *mar* nehmen sie mit, der sehr gut zu *tak*-Belone schmeckt.

[1] So hörte ich. Sopi hatte den Vorieng (s. Bd. 6 I S. 278) im Mastspurfuß, Urupo hatte ihn im Fuß des Mastes.

Lehre: Ähnlich wie auf Pollap. Treibende Boote in Regen und Wind erkennen die Richtung der Drift aus der großen NO-Dünung *lōláblab*, auch aus der SO- und NW-Dünung, die das Boot an den betreffenden Punkten hebt und senkt.

Fehlfahrten: Trotz der guten Kenntnisse der Dünungen und Sterne (s. u.), kommen Fehl- und Irrfahrten nicht so selten vor, namentlich wenn durch Stürme die Dünungen verändert sind und der Himmel bedeckt ist. So wurde erzählt, 1 Jahr vor unserer Anwesenheit seien zwei Boote nach Faiau zum Schildkrötenfangen gefahren, die verschollen seien. 6 Monate vorher war ein Boot nach Oleai und Faroilap gefahren, das nicht ankam. Ferner waren als verloren bekannt: Uleisap mit Boot Falegarórong, 2 Boote von Ifaluk, 1 von Oleai[1].

Fahrten: nach Oleai und Ifaluk Ende November *(bale aremoi* s. S. 133); zurück Juli—September; nach Guam fuhr man zunächst nach Pikelot, dann 3—4 Kurs NNO—N, dann NNW; dann sieht man schon viele Vögel, denen nachfahrend man bald die Marianen sichtet.

Chamisso hörte von Kadu, nachdem er von einigen Fehlfahrten gesprochen hatte (s. auch S. 125) (s. Kotzebue III S. 94): »Die Karoliner kommen jährlich zahlreicher gegen Guajan. Ihr Geschwader in Booten aus Ulea und umliegenden Gruppen, aus Lamureck und Setoan bestehend, versammelt sich in Lamureck. Die Reise wird von da aus im Monat April unternommen; man zählt bis nach Fayo, der wüsten Insel, auf welcher man sich ein paar Tage verweilt, zwei Tage Überfahrt, von Fayo nach Gajan drei Tage. Die Rückreise geschieht ebenfalls über Fayo und Lamureck. Ihre Zeit ist im Mai, spätestens im Juni, bevor die Westmonsoon, die zu fürchten ist, eintreten kann«.

Weiter unten heißt es: »Es war auch in diesem Jahr (1807) oder in dem folgenden, daß ein Boot aus der östlichen Insel Tuch (Truk) auf Guajan verschlagen ward. Es hatte fünfzehn Menschen an Bord, der Pilot hieß Kulingan. Die Fremden wurden gut empfangen, aber eine Prozession, die in diesen Tagen stattfand und Artilleriesalven veranlaßte, verbreitete Furcht und Schrecken unter ihnen. Sie verbargen sich in dem Walde und gingen in derselben Nacht, von allem Vorrat entblößt, wieder in See. — Zu ihrem Glück begegneten sie auf dieser Flucht der anlangenden Flottille aus Lamureck, die sie mit Lebensmitteln versorgte und ihnen die zu ihrer Heimkehr nötigen Unterweisungen gab. Das Geschwader war im Jahre 1814 achtzehn Segel stark. Die Karoliner tauschen in Guajan Eisen, Glaskörner, Tücher usw. gegen Boote, Muscheln und Seltenheiten ein; der Trepang kann zu einem wichtigen Zweig ihres Handels werden."

[1] S. auch Sopi und Meireg, Haus 24b.

Hambruch erfuhr auf Elato folgende Richtungssterne, die angesteuert werden für Reisen nach:

Faraũlip	*mŏl*	Vega
Ifalũk	*ũliũl*	Gürtel d. Orion
Uleai	zwischen *ũliũl* u. *mâ i lŏp*	Gürtel d. Orion u. Altair
Auripik	*ʒare u ŏl*	Corvus
Sorol	*ũl* u. *mãrgaregĭr* von Uleai aus	Aldebaran u. Plejaden
Fais	*tagãl e mâ lãp a ie fãń* von Sorol aus	β ursi minoris (Aufgang)
Mogemog	*tubũl e mâlŏp a ie fãń*	β ursi minoris (Untergang)
	tubul e uelẽgo von Sorol aus	Ursus major (Untergang)
Yap	*tubul e ʒare u ŏl*	Corvus (Untergang)
Ngulu[1]	*tubul bũp*	Kreuz d. Südens (Untergang)
Palau	*ʒare u ŏl* von Ngulu aus	Corvus.
Yap—Soröl	*tagãl i tumul*	Antares (Aufgang)
Mogemog—Fais	*tagãl i ũliũl*	Gürtel d. Orion (Aufga g)
Fais—Uleai	*tagal i tumul*	Antares (Aufgang) n
Fais—Faraulip	zwischen *tag[illegible]zare uol* u. *ũliũl*	zwischen Corvus (Aufgang) u. Gürtel d. Orion
Faraulip—Uleai	*tubul [illegible]up* u. *meta riu* (Auge zwei)	Südl. Kreuz (Untergang) u. Skorpion
Faraulip—Ifaluk	*ũliũl* u. *matšumẽĭt*	Gürtel d. Orion u. (Mitte d. Himmels) Sdl. Kreuz, S.-Spitze
Lamũtrek-Satoan	*mâ i lŏp, ũliũl*	Altair, Gürtel d. Orion
Lamutrek—Poluat	*mâ i lŏp*	Altair
Lamutrek—Truk	*mâ i lŏp.*	Altair
Lamutrek—Sŏg	*tubul bũp*	Südl. Kreuz (Untergang).

Soweit Hambruch.

Über den Handel s. oben S. 82.

Bekannt sind folgende Inseln: (Pollap Bd. 6 I S. 273); auch werden zahlreiche „Steine" angegeben:

ostwärts *tuas*:	Póloat[5]
Sĕtoval[2]	Sŏg
Pikĕlo[3] *(lŏ* Ankerwasser) (NO)	Tametam
Pik („kleine Insel")[4]	Pol'lap

[1] Von Yap aus i Centauri.
[2] östlich Oraisãu, Sũat, Póloat. nördlich Uraitũefu, Gaitag (östlich von Pikĕlo (2).
[3] Auch Pikelot angeblich nach dem Fisch *lol.*
[4] westlich Bãbã (nahe bei Gaitag), nördlich Sapan, Móul, östlich Olipig, Fauriap, Onóun.
[5] südlich Rúral, Sog.

Olóul oder Volóul (Onóun Bd. 6 I S. 191).
Mágur
Úlalu
Piserar
Fáiau[1] („Stein")
Lámoil
Rua
Murílo
Rŭg oder Djug (Truk S. 19)
Lémma (Nama)
Lámolu (Námoluk)
Lukulór (Lukunor)
Lukuór (Nukuor)
Pĭkeram (Kapingamarangi)
Ingadjig (Ngatik)
Fálepei (Ponape)
Maki (Mokil)
Pingelap
Gajau (Kusae Truk S. 53)
Ebon in Ralik
Salevis (Djalŭt)
Laur

Norden:
Mariales (= Marianen span.)
Faiau (hoch) und südlich davon Ralugoísong. (Vorolegeisam)

Westen:
Oléa
Faróilep
Ifaluk[2]
Aúrupig
Sorol
Feis („steinig")
Ulŭtíu oder Ulutíu (Mókemok)
Eap
Ngólu
Bán'noe (Palau I S. 184)
Sóngorol
Bul
Merir
a Tógobei (Tobi)

Über die Ralik- und Ratakinseln erzählt A. v. Chamisso (4. Seite), daß sie einem Eingeborenen von Lamureck bekannt waren, den sie auf Guajan antrafen. Auf Arno (s. d.) in den Ratak lebten 5 verschlagene Leute aus Lamureck.

Die Meeresteile heißen

zwischen Lámotrek und Sĕtoval = Oireg[3]
zwischen Lámotrek und Olimarau = Goisa
zwischen Lámotrek und Elat = Mĕtol
zwischen Lámotrek und Ifaluk = *a* Pilĕrup
zwischen Lámotrek und Fariolep = *a* Pilimetau.

Was davon von Lamotrek beansprucht wurde s. bei Handel S. 82.

Nautische Berichte.

Die Inselkenntnis wird durch folgendes ergänzt: Nach Espinosa II S. 15 gelangten am 26. Mai 1787 am Cap Oroto nach Guam 13 Eingeborene von der Insel Lamursek (Lamotrek), die zu 26 Inseln eines Archipels gehört, nach den

[1] *faiau ail* bei Pikeradj nach Onóun; *eradj* = *airedj*; Faiau soll hoch sein.
[2] Soll »auf dem Ausguck« heißen; NO davon Fás, nördlich davon Sumarivari *bukut*, westlich von Olimarau.
[3] Bd. 6 II S. 105 Woirá; aber nicht erwähnt, daß auf Sátoval Lamotrek mit Lamóireg bezeichnet werden soll.

Angaben des Kapitän Umal-Luyto. Bei Kotzebue III S. 93 steht: Luito ein Seefahrer, der im Süden von Guajan gelegenen Inseln, dessen Ruhm unter seinen Landsleuten fortlebt, fand im Jahre 1788 mit 2 Booten den Weg von Waghal oder Guajan wieder, wovon ein altes Lied aus alter Zeit die Kunde aufbewahrt zu haben scheint. Er kam, durch den Erfolg der ersten Reise, und den Empfang, den er gefunden, ermutigt im Jahr 1789 mit vier Booten wieder, und begehrte vom Gouverneur Urlaub, jährlich wieder zu kommen. Die vier Fährmänner, als sie zur Rückreise sich anschickten, entzweiten sich über den Rumb, den sie steuern sollten, — sie trennten sich. Die See gab keinen ihrer seinem Vaterlande zurück. Darauf ward der begonnene Verkehr unterbrochen. Forts. s. Oleai. Espinosa erhielt diese Nachricht vom Gouverneur Don Josef Azlegui unter Mitgabe einer Karte, auf der alle die Inseln mit ihren Bewohnern verzeichnet standen, von denen der Kapitän viele kannte. Folgende sind die Inseln:

1. Carao
2. Falopi
3. Ingerig
4. Orizolua
5. Etat
6. Lamuluc
7. Luosap
8. Ohala, 1000 Bewohner
9. Olcul, 200 Bewohner
10. Ponlap, 100 Bewohner
11. Poloac, 600 Bewohner
12. Sove, 500 Bewohner
13. Pig
14. Piguela
15. Satavan, 400 Bewohner
16. Lamursee, 1400 Bewohner
17. Falive, 1000 Bewohner
18. Fayao
19. Farroilap, 100 Bewohner
20. Olic, 1000 Bewohner
21. Fais
22. Falalap
23. Mugemuge
24. Jap
25. Ngulue
26. Palao

Im Londoner Nautical Magazine von 1862 steht die bekannte Arbeit von Rev. L. H. Gulick über Micronesien (S. 174 Ulie-Wolea), und im Jahrgang 1866 (ein Jahr vorher beginnend) ist ein Bericht des Kapitäns D. Eugenio Sanchez y Zayas der Korvette Narwaez (Viaje de la corbeta de guerra Narwaez desde Manila a dichas islas), des ersten Dampfschiffs, das draußen gesehen wurde. Er berichtet darin auch über die Ansiedlung der Karolinier, deren frühere Landungen schon oben S. 123 erwähnt wurden; sie bildeten in Garapan auf Saipan eine Kolonie von 415 Köpfen (im Januar 1864 wurden 433 gezählt). Gerade als der Kapitän mit seinem Schiff in Tinian war, kamen Karolinier von Elato-Lamotrek an, die zu ihm an Bord kamen und über das Gesehene höchlichst erstaunt waren. Sie waren sehr muskulös, geölt am ganzen Körper und fast nackt, trugen in den Ohren Schmuck von Muscheln. In Saipan, wo der Kapitän dann die Kolonie in Garapan besuchte, hörte er dann viel über die Seefahrt dieser

mutigen Menschen. Die ersten waren nach Agaña gekommen, auf der Suche nach neuem Land, weil ihres durch den Taifun zerstört worden war. Denn alle ihre Inseln seien, außer Ilap, sehr niedrig. Arumiat galt als ihr bester Navigator, der alle Sterne kannte, der wußte daß der Polarstern seinen Platz nicht wechselt, und daß der Aufgang und Untergang des Oriongürtels Ost und West anzeigt. Den Kompaß lehnte er, als für die Navigation entbehrlich, ab. Für die Sterne im Zenit wird ein aufgehängtes Bambusrohr, mit Wasser gefüllt, benützt[1].

In Garapan war auch eine Bootswerft, wo die Karolinier Schiffbau lernten; dabei war eine Schule für karolinische Navigation, und wer selbständig ein Boot führen wollte, mußte vorher ein Examen vor einem Rat von Piloten ablegen. Dabei war eine große Seilerei; da hängten sie das zu drehende Seil hoch an eine Palme und drehten die Kardeele, deren jedes 4—5 Zoll im Umfang hatte. Seile bis zu 100 Faden Länge wurden hergestellt.

Es gibt keine Anker. Wenn festmachen nötig, springt ein Mann über Bord und belegt das Ende an einem Felsen; ebenso geschieht das Losmachen; um Tiefen und Haie kümmern sie sich nicht.

Gebaute Boote waren im Kiel 30 Fuß lang, 4 Fuß breit und 6½—7 Fuß tief vom Deck zum Kiel, Tiefgang vorn und hinten 2⅓ Fuß. Vorsteven und Achtersteven fallen[2] gleich, Bug und Heck sind in Form gleich. Kein Nagel gebraucht; die Planken werden mit starkem Kokosgarn zusammengebunden, die Löcher werden mit Kitt verstopft. Die Spanten-Planken sind weniger als einen halben Zoll dick und ohne Rippen. Die ganze Arbeit ist gesichert und gestärkt durch eine starke Bordeinfassung (Dollbord gunwale) von beträchtlicher Größe, und diese sind untereinander verbunden durch quere Sitze, die alle in gleicher Höhe sind. Beide Seiten sind nicht in Form ähnlich, da eine schöner wie die andere ist. Man kreuzt nicht mit ihnen; die Seite welche in Luv ist, ist voller und mehr gerundet als die Leeseite, beinahe im Verhältnis 3:5, und an dieser Wetterseite ist der Ausleger, auf den Philippinen *batangas*, der ein starker Baumstrunk ist, am Ende zwei Querstangen tragend, die 8—10 Fuß außerhalb des Bootes sind. An der Leeseite ist eine Plattform außerhalb der Bordleiste, aus langen Stangen gebildet, auf der eine Kabine aus Rohr plaziert ist, einem großen Korbe ähnelnd, in dem man Proviant, Ladung und selbst Passagiere verstaut. Die Mannschaft ist meist im Schiffsraum zusammengedrängt. Der Mast, der gewöhnlich 22 bis 24 Fuß lang ist, ist nicht auf dem Kiel, sondern auf dem Luv-Dollbord (gunwale) eingesetzt. Er wird durch Stage in seiner Stellung erhalten, mit denen man ihn gemäß der Stärke des Windes senken kann. Das Segel, aus sehr feinen Matten bestehend und beinahe dreieckig, ist zwischen zwei Bambusrohren ausgebreitet und wird durch Leinen an jeder Ecke gehandhabt, Fall[3], Hals und Schot[4].

[1] Vgl. Samoa, wo man sich in den Schiffsraum ganz nach unten legt, um 3 Sterne zu beobachten.
[2] engl. strake Plankengang. [3] haulyard = halliard Fall. [4] tack and sheet.

Das Ruder ist nicht hinten[1], sondern an der Leeseite und hat die Gestalt einer Paddel, das nach den Aussagen der Karolinier dazu dient, neben der Steuerung des Schiffes, es aufrecht zu halten, worin die Kunst des Steuermanns besteht, die keine geringe Geschicklichkeit erfordert. Obwohl es für den Seemann schwer ist, sich das klar zu machen, muß man doch den Karoliniern glauben[2].

Es ist nicht unwahrscheinlich, daß ihre Absicht ist, in den Wind anzuluven, wenn er auffrischt, so daß der seitliche Druck auf das Segel dadurch vermindert wird; aber jedenfalls ist viel Erfahrung nötig und vor allem die größtmögliche Sorge, damit das Boot nicht kentert oder über die Leereeling Wasser übernimmt. Zehn oder zwölf Personen können an Bord sein, von denen die meisten im Schiffsraum verstaut sind. Sie füllen den Korb mit Kokosnüssen, und wenn sie einen Passagier haben, der nicht Karolinier ist, wird er auch in den Korb gesetzt. Sie werfen die Ankertaue los, setzen Segel und stechen in See. Die Schot wird nirgends belegt: der Steuermann muß sie während der ganzen Reise, Tag und Nacht, halten, so lange es sein mag. Einige Steuerleute haben Helfer bei langen Reisen. Wenn er die Schot losläßt und das Boot kentert, muß die Besatzung schwimmen wie der Korb mit den Vorräten. Der Steuermann richtet dann ohne Hilfe das Schiff; wenn das Gleichgewicht in Luv verringert ist, richtet sich das Boot mit geringer Hilfe von selbst wieder, dank seiner Form. Ist es gerichtet, geht die Mannschaft wieder an Bord, fängt den Korb auf, und die Reise geht weiter.

So geht die Fahrt über den weiten Pazifik. Sie nehmen den Kurs nach der Sonne, den Sternen, der Windrichtung und der der Seen. Wenn das Wetter schlecht ist, der Himmel für einige Tage wolkig, dann legen sie bei wegen des kommenden Sturmes; ist er vorüber, brauchen sie 3 Tage, um ostwärts das wieder einzuholen, was verloren gegangen ist. Dann machen sie ihre Beobachtungen: sie füllen ein Rohr und beobachten die Sterne im Zenit und berechnen daraus die Position des Schiffes. Danach fahren sie. Viele gehen natürlich verloren. Nach einer Versammlung von Piloten, die Arrumiat präsidierte, setzte der Kapitän die Striche ihres Kompasses fest. Auf dem Kabinentisch wurde mit Bohnen eine Figur ausgelegt und vom Kapitän auf Papier kopiert, so gut es ging. »Als ich glaubte, ich hätte eine falsche Figur gemacht durch Setzung der Punkte und sie mehr zu einem perfekten Quadranten verbessern wollte, wurde es mir nicht erlaubt. Als ich wiederholt die Ecken der rechteckigen Figur rundete, wurde ich genötigt, sie so zu lassen, wie sie war, und deshalb muß sie so, wie sie ist, genommen werden.«

Sie teilen den Horizont in 4 Viertel oder vielleicht besser in 2 Halbkreise: den

---

[1] Gemeint ganz hinten, wie unser eingesetztes Steuerruder.

[2] Wenn das Segel voll steht und der Wind böig ist, kann das Ruder durch einen starken Seitendruck das Schiff vor dem Kentern bewahren oder wenigstens verursachen, daß es zu stark nach Lee überholt, namentlich wenn der Schwimmer über dem Wasser schwebt.

östlichen und westlichen. Uebuel[1] ist der Name des Polarsterns und Mailab[2] der des Gürtels des Orion. Die 3 Punkte, mit denen sie Ost und West vorstellen, nannten sie alle Mailab und Tubule mailap. Keiner der dreien hat einen besonderen Namen; sondern der Name ist zusammenfassend. Es ist bemerkenswert, daß kein Name für O z. N oder W z. N vorhanden ist. In ihrer Rose sind die Punkte entsprechend N z. O, NO z. N und NO z. O, aber es fehlt O z. N; der Platz bleibt frei. Dasselbe geschieht im 4. Quadranten, obwohl die Punkte dieser Winkel unsern gleich zu sein scheinen. Ihr 3. Quadrant ist dem 4. ähnlich, aber der 2. ist weder dem 1. noch einem der andern gleich. Ihr 1. Quadrant ist in 8 Teile geschieden, denn Tagale mol entspricht dem NO; aber von diesen acht sind nur sieben markiert und haben Namen. Die übrigen sind nicht gleich geteilt, sondern sind wie in der Figur dargestellt. Ich konnte keinen Grund für diese Eigenart finden.

Abb. 66. Kompaßpunkte der Karolinier nach Sanchez.

Kompaß-Punkte der Karolinier, Sanchez 1866, Abb. 66.	Aufnahmen von Krämer 1909[3].	Ebenso die von Ikeram auf Pollap mit Zahl der Steinchen.
1. Mailab Ueleuel	1. *volevol iefang* N.	1. *volevol*, Stern *fümakel* • von Sog nach Póloat

[1] Hambruch Elato 44fdd. [2] Hambruch dörö, Altair und ι Sip.

[3] Es ist ein gutes Zeichen für die Überlieferung, daß meine Aufnahmen 40—50 Jahre später so gut mit denen von Sanchez übereinstimmen. Mein Gewährsmann legte Steine aus, wie Ikeram auf Pollap (Bd. 6 I Abb. 116 S. 273. Dort nicht gebraucht).

2. Tagale mailes pelevant	2. *mailap ăle fang* 15° (β kleiner Bär)	2. *mailăpălafang* ••
3. Tagale olego	3. *voldgo* 30° Großer Bär	3.
4. Tagale iguelie	4. *ăgulăg* 36° Cassiopeia (I. Pikêlo)	4. *ugulăk* ••
5. Tagale mol.	5. *măl* 51° Vega	5. *măl* ••
6. Tagale magariguec	6. *magarigar* 63° Plejaden	6. *moirigar* ⁘ nach Pôloat, Tâmatam
7. Tagale ul.	7. *tagalul* 73½° Aldebaran (I. Goteu)	7. *ăn* •⁘
8. Maitab	8. *mailap* 81° (Sêtoval, Pôloat, Djug, Rálug, Falepei, Gadjau)	8. *dăl mailap* ⁘ Fahrt nach Botelês (Ku.), von dort nach Truk mit *un*
9. Tagale eliel	9. *tangali ălăel* 88° Orion-Gürtel	9. *a liel* ⁘
	Zwischen 8. u. 9. Atair 99° *sarabol* Raben 68°	
10. Tagale lumur	10. *tumur* 64° Antares (zurück Farollap) *metaru* (2 Augen) 52° Skorpion	10. *tumur* ⁘ Fahrt nach Pôloat, zurück mit *măl* *arebol* ⁘ *mareg* ⁘ *galu* ⁘
11. Tagale liup	11. *tagal lup* 27° (Pikeram von Sog aus, zurück 3.) *medje meiet (medj* dazwischen)	
12. Mailab delub	12. *volevol ăaur* S. *medjemeitol*	12. *volevol* • nach Sog *galu* *mareg* *arebol*

24. Olelup = S.		

Abb. 67. Inselkarte.

Die Sternnamen von den unbekannten Punkten im unteren Teil sind dem Berichterstatter entfallen. Es war eine Analogie mit den oberen Punkten vorhanden. Der 14. Februar wurde in Garapan unter den guten Karoliniern verbracht, die einen Tanz machten. Sie waren gelb bemalt und geölt, und die Haare, die geschmückt waren, mit Federn und Tierhörnern, waren in einen Knoten geschlungen. Alle Männer trugen sechs bis sieben Fuß lange Stäbe, die an einem Ende abgeplattet waren. Tanz in 2 Gruppen, die herummarschierten und verschiedene Evolutionen machten, begleitet von einem einförmigen Gesang, dann kam der Stabtanz. Die Gruppen vereinten sich und standen in 2 Reihen, wobei sie sprangen und Figuren machten, zeitweise die Stäbe zusammenschlagend.

Sie arbeiteten mit großer Geschicklichkeit, ein Ende des Stabes und dann das andere gegen den Stab des nächsten schlagend, zu gleicher Zeit die Hände wechselnd, sich drehend und Gruppen bildend, was hübsch aussah. Es war ein Kriegstanz. Während die Männer tanzten und sangen, erschienen die Frauen einzeln oder zu zweien gegenüber den Viereckgruppen und bildeten auch Haufen. Dies gab den Männertänzen frische Belebung: es wurde kühner gesungen, lebhafter getanzt und die Figuren wurden vielfältiger. Die Frauen waren auch gelb bemalt, geschmückt mit Armringen und Halsketten, das Haar lose auf die Schultern hängend. Alle waren nackt, obgleich bei einigen das Hüfttuch bis zu den Knieen herabhing und andre dafür Palmblätter angelegt hatten[1]; dies waren die jüngsten, und sicher konnte ihre Kleidung nicht phantastischer sein. Eine von den mehr als hundert Frauen kam als Europäerin gekleidet mit einem alten schmutzigen dunkeln Kleid ohne Unterzeug, schlecht um die Hüften befestigt mit langer Schleppe, ohne Schuhe und Strümpfe, auf dem Kopf einen schokoladebraunen Hut mit einem grünen Schleier, wie bei den Engländerinnen garniert, der lang auswehte. Sie sammelten sich in zwei Gruppen in der Mitte des Vierecks und jede Gruppe sang abwechselnd. Eine von der Gruppe sang vor, die anderen machten den Chor; es schien als ob der Gesang der einen Gruppe sich gegen die andere richtete. In der Absicht die Männer zum Tanz anzufeuern, stritten beide Gruppen, welche Gruppe von ihnen die meisten schönen Männer habe. Der Erfolg war großartig; denn der Tanz, der schon eine Stunde gedauert hatte, wurde mit doppelter Kraft aufgenommen. Aber plötzlich nahm die Fröhlichkeit eine unerwartete Wendung. Die Frauengruppen kamen sich allmählich näher, und zu allgemeinem Erstaunen sahen die Zuschauer, wie die Frauen wie Furien auf einander losstürzten und sich bissen und kratzten, so daß sie durch die Karoliner und Europäer getrennt werden mußten. Zuletzt wurden sie in ihre Häuser

[1] Daß die Frauen nackt waren, also völlig unbekleidet, ist nicht anzunehmen; die nachfolgende Einschränkung deutet die Übertreibung an.

eingesperrt[1]. Die Ursache des Streites war gewesen, daß eine Gruppe Bemerkungen über die andere gemacht hatte über falschen Schmuck, Häßlichkeit, über ihren Verkehr mit den Matrosen usw., was anfangs mit Gelächter erwidert wurde, aber schließlich zu Tätlichkeiten führte. Die Karolinier entschuldigten das Benehmen ihrer Frauen und klagten, daß sie sich nie auf sie verlassen könnten. So endete das Fest und die Seeleute wurden mit Freundlichkeit auf ihre Schiffe zurückgeleitet.

Die Wiedergabe der Aufzeichnungen von Sanchez bergen viel Vergleichsmaterial.

Die Monate *gédj* (s. S. 145).

Sie sind nach den Sternen benannt, die Mitternachts aufgehen, also früh im Zenit stehen.

Die Monatszeiten sind also danach benannt, wenn die Sterne im Zenith stehen.

A. Kr.		Ham.	Zeit
ul	Aldebaran	*ūl, ūl* (rund)	September
ĕliol	Gürtel des Orion	*ūliūl*	Oktober
māl	Sirius	*mall, māl* (Tier)	November
idj	»Nebel« westl. v. Regulus im Löwen	*itš, itj*	Dezember
sárepol[2]	Corvus	*zāre ūōl*	Januar
áremaus (... moi)	Arcturus	*aremauz*	Februar
tumur	*Antares*	*tumul*	März
mairig	Stern westl. v. Atair	*mai rik*	April
mailap	Atair	*mai i lap*	Mai
seōla	im Pegasus	*zāta (thaūdha)*	Juni
lag[3]	α Pegasus	*laχ*	Juli
gui[4]	in den Pisces	*küi* (Wal)	August

Mondtage (s. Wörterverz. 276—280).

1. *segóuru*	(»wir warten zu sehen«) Neumond
2. *ĕleng*	1. Mond, in den Tropen nicht sichtbar
3. *mesĕleng*	2. Mond »sehen den Mond«
4. *mesál*	sieht den Busch seitlich
5. *mesáfuis*	sieht die Sterne

[1] Bei den einzelnen Naturvölkern kann man beobachten, daß, wie in der Tierwelt, die Männer mehr geschmückt sind als die Weiber, daß also die Schönheitsfrage noch auf Seiten der Männlichkeit steht.

[2] Truk S. 303 Sarebol Orion.

[3] *ping in lag* das Dreieck darin, nach Hausgiebel (ornamentiert *tabau*).

[4] Truk S. 303 *ku* Delphin.

6. *mésoal*	sieht den Busch von oben
7. *mésētiu*	sieht hinab *(tiu* Truk S. 49, 64 unter, hinab)
8. *émetal*	alles klar
9. *épei*	schief, etwas auf der andern Seite vom Meridian.
10. *djúabong*	fertige Nächte (im Westen)
11. *eārobugŭ*	nicht mehr so spitz
12. *ólobuā*	Form *(ol)* anschwellend
13. *olomāi*	Form gut
14. *émadj*	reif
15. *eúr*	Vollmond, Sonne und Mond gleichzeitig in einer Höhe
16. *lótĕu*	*lot* = Scaevola Busch, der ungleich höher ist bei Mondaufgang. *teu* westlich, da der Mond von W auf sie blickte
17. *kil'li*	»anfangen« der dunkeln Nächte
18. *kaloválu*	die letzten Reste des Tages schwinden im W.
19. *sŏparr*	»Meerleuchten«
20. *(ĕ)ĕfálag*	noch schief (vom Meridian)
21. *gosēlág*	etwas weniger schief
22. *gárotaliĕfalag*	nicht mehr schief. Halbmond
23. *sŏparemēlmor*	Meeresleuchten. etwas später
24. *killi*	anfangen der östlichen Nächte
25. *gómala*	der Mond beginnt sich zu verbergen
26. *romáleſal* (s. S. 111)	spitzig *rom*[1] wie die Häuser *ſal* (Giebel)
27. *eāroſui*	Sterne verschwinden
28. *eāŭ*	am Rande der Dämmerung
29. *fēing*	muß weg (vor der Sonne) *(fēing ilog* nimm weg)
30. *ĕrapfi*	fertig.

Die Winde.

aus N *ieſang*	*eſangelaŋ*	aus S *iaur*	*aurulaŋ*
	gailoıl		*aurulēsol*
	ſangileás		*lotoár*
	gotŭáſang	aus W *iletóu*	*lotóelaŋ*
	gotu mei		*lotoáſang*
aus O *gotu(e)*	*gotuór*		*eſángilēsol*
	eorileás		

Es soll aber auch Sternwinde geben, die bei jedem neuen Stern kommen; bei Aufgang meist östliche Winde, bei Untergang westliche.

[1] Wie Widerhaken der Fischhaken.

Sterne (Aufgang *tagăl*, Untergang *tubul* Ham.)			Winde *mor* stark *djigor* sanft
Arcturus	*aremoi* (Truk S. 303 *aromoi* Arcturus)	Oktober, Passat beginnt	*balaremoi* östlich (*ba* aus dem Wasser kommend)
			bai a talearemoi östlich und nordöstlich
	djóu (dróu) (Tr. *djēu)* Corona	Aufgang Dezember	*mor a djou* stark einige Tage aus O
			dji gerē djou etwas schwächer 7 Tage lang
Antares	*tumur* (Tr. *tumur* Großer Bär)	Aufg. Dez.	*mor a tumur* stark aus O, zu stark zum Segeln[1], höchstens im Binnenwasser.
			djigerē tumur schwächer
	metáriu (Tr. S. 302 *mesáru* S.)	Aufg. Jan.	*mor ale metáriu* östlich
		bei Untergang	westliche Winde
Atair	*mailaƥ* (Tr. S. 303 Oststern)	Aufgang	*mor ale meilaƥ* O-NO-N
		Ende Jan. morgens	*djigerali m.* schwächer
in Pegasus	*seōta* (Tr. *sōeda)*	Aufgang	*mor seota* gut O
		Anf. Februar	*djigerali seota* 10 Tage lang.
	tēbbi	—	*mor a tēbbi* nur einige Tage
α Pegasus	*lag*	Anf. März	*mor a lag* harte, stark, unsicher
	gaƥ	Ende März	*moi*[2] *tagale gāƥ* unsicher einige Tage
			mor ale gaƥ stark } etwa 2
			djigeraligaƥ schwach } Woch.

			djigoralig schwach } Wetter
	älimeto Bauch des *ig*		*moi le alimeto* östlich bis 2 Tage dann westlich
Plejaden	*magárigar* (Truk *moériger)*	April	*tafalimagárigar* Abendwind, wenn Plejaden 30° hoch; wenn sie Abends untergehen Kalmen, *moƥele*[3] *magárigar*

[1] Während unserer Zeit wollten Leute von Sētowal am 8. Dezember 1909 von Lamotrek heimfahren, da der Postdampfer Germania sich verspätete, aus Angst vor dem *mor a tumur*.

[2] *moi i tag* brechen bei Aufgang.

[3] *moƥ* ertrinken s. Onóun.

			schönste Zeit für Leinenfischen, ruhig, ohne Strom.
	wenn *mag* östlich aufgeht	im Mai	Wind *kobuádj*, von *uádj* kochen, denn 6—12 Stunden ist starker O, so daß die See kocht, darauf *djigerali mag.*, bis *ul* kommt.
Aldebaran	*ul*	Mitte bis Ende Mai	*djelûl* Wasser rippelig, weil oft kurze Böen aus O u. NO kommen.
Orion	*irir ali ol* (*eliol* Gürtel des Orion, S. 130 Nr. 9)	Juli	westliche Winde 2—3 Tage wenn *aliol* morgens aufgeht, dann 2—3 Tage leichte *rángaliol* aus O.
Sirius	*mal, gongalemál* oder *golongalemál*	Juni früh 10′	westliche Winde 1—2 Tage, unsicher
		Untergang Mitte Juni	*liuaráp*[3] *alemál* Kalmen
Nebel im Löwen	*idj*	Untergang 1.—15. Juli	W. *kalangalidj* ca. 14 Tage, dann östlich *djangaliól*[1]
Regulus	*ililigêk*	Juli-August	*eangalililigek* SW, W, NW, ca. 6 Wochen lang mit Unterbrechung wenn der Schwanz des Canusmajor (Sirius) aufgeht, *eangali faliuk*[3] *alimal* der letzte — östlich
Süd-Kreuz	*bup*	Ende August bis Anf. Sept.	*djep alup* SW stark, im Ganzen klar
	gap	Untergang	12—24 Stunden *êlang*[4] östlich
Canopus	*gap i eaur*	Abends 35° Äquinoktien;	*falaligap* westlich veränderlich, früher od. später kommend;
Arcturus	*áremoi* (s. o.)	bei Untergang bei Untergang	*atangaligap* 1—3 Tage östlich *eang ali aremói* *mopolog ali aremoi*[5]

[1] *djang* aufhängen, wenn *aliol* in gewisser Höhe steht.
[2] Von *rap* bedecken, dicht niederlegen.
[3] *iuk* Schwarz, *mal* s. oben.
[4] *sitang, êlang* das Niederpressen — des *bupi djep* springend.
[5] s. o. *mop* ertrinken.

efang alúl	Aufgang Brotfruchtreife 15 Tage nach *ul* (s. o.)	½ Tag östliche scharfe Winde, die die reife Brotfrucht herabwerfen
póulimal der unterste Stern des Canus major-Schwanzes ser schüttelt das Tier *(mal)* an der Angel	ß	östlich vor *eangalifaliuk* (s. o. Regulus) so schüttelt der Wind die Brotfruchtbäume.

Weitere Sterne *fith* nach Hambruch (S. 166).

Morgenstern, Abendstern	*fiz e tšäl (fōiss e tjall)*
Cassiopeia	*jug e lik* (Schwanz vom Wal)
Pisces	*kui* (Wal)
Milchstraße	*e ál ĕli mâ* (Weg d. Brotfrucht, steht zur Reisezeit über den Karolinen)
Plejaden	*mārgārĕgĭr*
α Capella	*ieſăn el ūl* (nördl. v. Ul)
Regulus	*ĭleligĕk*
Zwillinge	*mŏnŏt i zăp* (Fischhaken-Kasten)
Canopus	*gapi eāur* (hinterer Süden)
Südl. Kreuz	*būp*
Centauri	*ip al būp*
Spica	*gapi zare u ŏl*
α Arietis	*gapi lāχ*
Siriūs (Stern selbst)	*golŏn ĕli māl* (Herz des Tieres)
Fomalhaut	*gapi tūo* hinten, ferne
Polarstern	*uiluil, fithei magit* (Stern unbeweglich).

b) Medizin.

Bei Epidemieen und ansteckenden Krankheiten wird Absonderung in die Bootshäuser vorgenommen.

Von **Krankheiten** *mes* wurden genannt:

Schnupfen *ngutali bodj*

Husten *fágaſag*

Influenza ähnliches *masélepik* (Yapwort) mit Schnupfen, Husten, zähem Auswurf, Schmerzen in der Brust, Rücken, Schultern, Augen; Heiserkeit, gelbe Zunge, Fieber[1], s. Arznei.
Schwindsucht *mësebot*
Lupus *lugeileng*[2]
Lepra *ṗatur*
Geschwür, Framboesie *rup*
Hodenschwellung *morulap*
Ringwurm *kelisebou* selten, von den Oleái-Leuten geheilt.
Vitiligo *boēdj* (»weiße«) mit Gefühlstörungen
Blindheit *matabās*
Dicker Schenkel, Abscess *lōs*
Elephantiasis des Beines *bedjēdjop (berērop)*, wenn noch klein und unsicher *bōbō*, durch Tabūbruch auftretend
Geschwülste (Lipom) *pir*
Anschwellung *berēlal*, s. S. 140
»Dämonen-Wahnsinn« *katok alus* bei Krankheitsfurcht, Leib auch befallen, Hunger.

Arzneien *táfei* und Behandlung.

Die Zauberarzneien im besonderen s. bei Geburt.
Kokosnüsse als Weihgabe s. Abb. 75.
Als Abwehr der bösen Krankheitsgeister wird das Fächern, *gálibă ali kuei* s. Abb. 68, geübt, auch um Krankheiten von der Insel fern zu halten; »Matten zur Abwehr« *gilli tilimes* werden etwa alle 100 Schritte um die Insel herum aufgehängt, damit die Dämonen nicht herein können; es sind die 2teiligen Kokosmatten *tapokóu*. Für die Abwehr des Todes *mās* dient eine Abwehrarznei *tafēi limes*; man nimmt die Rinde der Wurzeln von jungen *kelau, djel, ut, eār, ngō* usw., die man abgeschabt hat, gibt sie zu einer Graswurzel *bugor*, wäscht alles, tut es dann in einen Beutel *tükemöil*[3] oder *tukumöi* (Kr. 464 u. 465 = 3220[II] u. Gesang S. 141). Dieser wird in reines Wasser gesetzt, das sich in einer Holzschüssel befindet; man deckt mit einer Matte zu und läßt stehen. Nach einiger Zeit versucht man mit *tagag*, ob die Arznei gut ist. Ist der Hersteller zufrieden, so trinken alle Hausinsassen von ihr und er spricht:

---

[1] *masélepik* trat nach dem Besuch des Schiffes »Germania« kurz vor unserer Anwesenheit auf. Ende Oktober 1909 es starben in 14 Tagen 13. Auf Tobi war nach dem Besuch der Expedition ein großeres Sterben aufgetreten.

[2] Vgl. den Gott, S. 147, der die Krankheit auf sich nahm, daher sein Name für sie. Syphilis war nicht bekannt.

[3] s. den Zauber *tukumaun*, Bd. 6 I S. 72, Truck S. 226, Beutel S. 308; auf Lamotrek nach Gebrauch in den Häusern aufgehängt, Urupo (Haus) legte einen nach Rückkehr von der Reise unter einen *mog*-Baum hin.

alesī, īē tafé a limes	Besinge sie, die Abwehrarznei
meseveiām	deiner[1] Krankheit,
gēl Mareísepa	du, Mareísepa.

Der Beutel bleibt in dem *tabbi*, der Holzschüssel, und jede Mitternacht wird Wasser zugegossen, das dann getrunken wird.

Fremde trinken nicht davon, nur Angehörige des Hauses.

Eine besondere Arznei ist die für die Influenza *masélepik*. Sie heißt *tafeilialis*

Abb. 68. Fächer zur Abwehr, Elato.

und wurde von Ikelúr mitgeteilt. Wasser von zwei Kokosnüssen gibt man in eine Holzschüssel; darin wird nach Einweichung ausgewrungen ein Beutel *tukemöil* mit Kräutern, ein kleiner Beutel mit gebrannter Kokosnuß[2], nun ein dritter Beutel mit *djig*, *giliau* und *uórŏng*; der Beutel bleibt in der Schüssel.

Dann werden heiße Steine in die Flüssigkeit gegeben. Man bedeckt dann den Kranken mit einer Matte und stellt die Schüssel zu ihm darunter. Der Heilkünstler schwenkt dann zwei *lagat*-Sträuße von Farn (Abb. 63), dann zwei Zweige von *giliau* über den Kranken unter der Matte, schließlich nimmt er auch ein Netz *(djróu)*, um die bösen Geister wegzufangen, die herauskommen. Endlich schwenkt er noch zwei *ear*-Zweige, deren Spitzen er in den Mund steckt, während er sie anspricht, um Hilfe flehend. Nach diesen Verrichtungen wird der Kranke aufgerichtet und trinkt die Arznei in der Schüssel aus. All dies wird dreimal in zwei Tagen wiederholt. Die Beutel mit den Arzneien werden nach dem Gebrauch im Hause aufgehängt.

[1] Man denkt sich den Geist auch krank, es ist der Geist des Sopi von Feis (Haun 241). [2] s. Palau *ulogzor*

Hellwig (s. Zauberanzug Abb. 70) nennt die Hustenkrankheit *mass*, was Tod bedeutet, wohl Influenza.

Erstschwangere erhalten monatlich eine Arznei *tafei i lolomai*[1] s. S. 107.

Abb. 69a, b. Punktierhacke.

Auf Elato, so erfuhr Hambruch, werden bei Krankheit auch vier verschiedene *bángebang*-Arzneien angewendet; hilft keine, so muß der Kranke sterben. Eluelap will es so und deshalb wird angerufen (s. auch Religion S. 144). Aufstecken von Arzneizauber vor dem Krankenhaus s. Zauber.

Geschwüre, Abszesse, *lās*, werden mit der *fidjefidj*-Hacke (Abb. 69) geöffnet. Itflimara (Haus 5), der Vater von Lolit starb daran. Es wurde bei ihm ein Abszess in der Achselhöhle punktiert, und dabei wird wohl die Schlagader geöffnet worden sein. Kelur, Auólimar, Boésu (S. 114) führten die Punktierung 1910 noch aus. Aderlasser *rissériss*.

Auch der Aderlaß wird mit dem *fidjefidj*[2] vorgenommen. Der Kaiserschnitt (s. Truk S. 312) wird nicht gemacht. Lütke erwähnt schon die Akupunktur mit Fischzahn (Schwanz von Apisurus) durch Einschlagen einer Hacke. Für Geschwüre braucht man Blätter von *djával*, einer kleinen Winde.

Noch eine Besprechung für Bauchweh als Beispiel; es wird dazu ein Beutel *fukemöilü táfei* gemacht, wie schon erwähnt (s. auch Zauber). Mit diesem wird bei der Hersagung ein Kreuz gemacht, also eine Bewegung quer und senkrecht, wie auch der Zauberer ein rotes Kreuz[3] auf Stirne und beiden Schultern aufgemalt trägt. Die Worte sind folgende:

1.	*éta, eta*	Nenne, nenne,
	éta málal	nenne das Abschwellen,
	etamakokul	mache es zerbrechen,
	berēlal ēl	diese Geschwulst,
5.	*berēlal euiái*	jene Geschwulst,
	bo igaue	weil früher
	e galegúri lāng	sie berührte den Himmel,

[1] Dazu trägt der Zauberer *pūul i lolomai* die Angel, und die Teufelsaugen (Kr. 477 = 3233II) vgl. Abb. 62.
[2] He. 2110 auch *tissiris* oder *tirriur*, Griffholz *ngii*, angetriebenes Einsteckholz *odjerrádjab*, Stachel der Fischart *igung mung, feka lig*.
[3] s. Zaubergesang S. 154.

	bo igaue	weil früher
	e galegúrilal	sie berührte die Erde
	10. *i mellau i mcláue*	ich will leben, ich will leben wie früher.

7. 1. *éta* zusammenhängend mit »Name«, hier wohl gleich mit »mache, sage, daß es geschehe«.
2. *magálagal* gebrochen = abschwellen, *magalálog* brich es auf; *málal* soll in Sëtowal brechen heißen.
3. *makuk* ein Stück brach, *kamak* zerteilen.
4. —
5. —
6. *bo* weil, s. o. S. 104, 109 *beigaue*
7. —
8. —
9. *lal* unten, Erde (polyn. *i lalo*). Aluelap u. Saulal, die angerufen sind, wirken auch unten.
10. *méllau* Leben, Truk S. 308; *áue* früher Z. 6.

Gesang für Tautup.

Gesungen, wenn früh die ersten Kokosnüsse abgeschält werden.

1.	*go boē gasáralog*	Du sollst abwenden
	tēmai idjimei	Krankheit des Kopfes
	tēmai ûei	Krankheit des Halses
	tēmai lipéi	Krankheit des Armes
5.	*tēmai úbei*	Krankheit der Brust
	tēmai sêgei	Krankheit des Bauches
	tēmai libedjei	Krankheit des Fußes
	ngaivē ngaivō	und so und so
	ē gulag	bis fertig.

Gesang für *tukumōil*, den Arzneibeutel von Ikelur. (S. 138)

1.	Lemagá Lemagá	Lemagá, Lemagá,	Geist s. Fischlieder
	se tangi lōt tafēi	knete (im) Gefäß eine Arznei,	S. 54 usw.
	melemele tafēi uiai	kläre den Weg (für) meine Arznei,	
	ēgalebuitag ngurilāng	sie steigt empor den Himmel zu küssen,	*nguri* Nase mit der Hand reiben
5.	*melemele tafei uiai*	kläre den Weg für meine Arznei,	
	ē age builong ngurilal	wenn sie aufsteigt, küsse unten.	gemeint Saulal, S. 144.

Gesang für Schmerzkranke,
die mit der Hand gestrichen werden. Soll aus Oleai stammen.

1. *Ilevar,* unübersetzt.
ilegába, gába
i gemángul
makō makolabóiel
5. *sirivog sirivog*
i tábei tab
i tabábelog bólegus
male djil
mēlli farále malēla *fáral* Bauch
10. *mēlli farále djovutēlē.*

E. Krämer beobachtete folgenden Fall: Eine Frau hatte Drüsenschwellungen; ihr Mann nahm Blätter und Rinde des Baumes *galāū (giliau?* A. Kr.); er stampfte beides auf einem Brett, füllte das Gestampfte in eine Kokosblatthülle, schnürte sie wie einen Schnuller und befestigte junge Kokosfiedern mit Zauberknoten daran. Dann wurde eine junge Trinknuß geöffnet, der Schnuller in das Wasser der Nuß getaucht, dann herausgehoben und über dem Wasser ausgedrückt, so daß es sich braungrün färbte. Dieses Wasser trank die Frau als Arznei.

Sexualität.

Anfragen wegen Beischlaf, *ramoidjau*, sind üblich. Die Frau drückt ihre Einwilligung dadurch aus, daß sie mit der Hand von oben nach unten übers Gesicht streicht, was *tófi (mat)* heißt.

Von Perversitäten sind bekannt

Onanie	*sir*
Irrumatio	*faigabóng*
Cunnilingus	*móngo*
Sadismus	*lī*

Der Beischlaf heißt *tengi*.

Vorher geschieht aber fast immer bei der Jungfrau *ulul*[1], sobald die Brüste sprossen, das Verlängern der labia minora und das Einbrechen. Ersteres ist besonders von Oleái bekannt. Eine Mutter bestellt einen Mann, den *válevei*, zu diesem Zweck. Die Frau sitzt in einer Veranda *metalim*, der Mann mit dem Mädchen im *gapel im* hinten. Er müht sich 4 Tage lang, die labia minora *fir* herauszuziehen, was eben für die Frauen als durchaus nötig gehalten wird. Die Frauen lachen über ein *dārefir*[2].

Nach 4 Tagen erfolgt das Brechen des Hymen, *ngatangat* genannt; die Vagina wird langsam, erst mit dem 5., dann mit dem 4., 3., 2. und 1. Finger erweitert,

[1] Alle kinderlosen Frauen heißen auch *ulul*, Witwe *lipid*. [2] ohne Verlangerung Truk S. 316.

schließlich mit 2 Fingern auf einmal. Der Mann wird von der Mutter für seine Arbeit bezahlt, aber wohl nicht immer, auch ist es nicht sicher, ob er als erster den Beischlaf vollzieht. Der *valevei* ist jedenfalls für das Mädchen tabū.[1]

Über die Geschichte des Beischlafs erfuhr Hambruch auf Elato:

In alten Zeiten kannten die Menschen den Coitus nicht. Da kam Lūgeilēn und sah Mann und Frau, Te mōńemōn ♂ und Li paráre ♀. Sie war sehr schön. — »Nun, was machst du? Wo ist dein Mann?« — »Der fischt« — »Gut, geh, bade dich. Ich will dir hernach etwas Schönes zeigen.« — »Vorher will ich dich aber um etwas fragen. Magst du dich beschlafen lassen?« — »Ich weiß nicht.« — »Dann gehe in's Haus. Ich werde dir etwas zeigen.« — Dann unterwies er die Frau im Beischlaf. Die Frau freute sich darüber sehr. Lugeilēn sagte ihr Lebewohl. Ob des neu Gelernten vergaß die Frau ganz das Kochen. Sie lief an den Strand und schrie und rief nach ihrem Manne: »Komm! komm! Mach' schnell! Laß das Kanu, laß die Fische. Ich will dir etwas ganz Neues zeigen!« — »Na, was ist los?« — »Komm, komm nur schnell«. Der Mann mußte ins Haus. Die Frau zeigte ihm, wie er sich hinlegen mußte, da er von nichts etwas verstand; als sein Penis nicht steif werden wollte, nahm die Frau ihn in die Hand, rieb ihn tüchtig und nun konnte er sie beschlafen. Das übten sie tage- und wochenlang. Bis sie schließlich ihr ganzes Fleisch eingebüßt hatten. — Da kam Lugeilēn wieder und fragte die beiden: »Was macht ihr denn?« — Sie erzählten es. »O, dann hört auf! Nur einmal in der Woche sollt ihr es tun, sonst sterbt ihr.« Und danach taten sie.

Siehe Hambruch-Faraulip: Liebeslegenden aus der Südsee. Hamburg 1924.

Pīletāk ♂ erzählt *fiōn* Jāt me Jōl, Geschichte von Jāt und Jōl. Für die Bearbeitung ist das Märchen 43 aus Hambruch: Südseemärchen, Jena 1916, S. 180—196 wörtlich zu übernehmen (s. S. 160).

3. Religion.

a) Weltentstehung und Götter.

Bei Kotzebue III steht zu lesen, daß östlich von Mokemok keine Tempel und Opfer vorhanden gewesen sein. Das Faletaipu, S. 17, läßt aber doch den Schluß zu, daß ein Haus zur Gottesverehrung vorhanden war.

Am Anfang war alles dunkel und der Himmel lag auf dem Wasser. Im Wasser war ein großes Riff, Oledjapdjap[2] genannt, das die Mutter von 3 Göttern, *alus*[3], wurde,

[1] zu Boot, *ieuć* Seereise s. S. 159[1] also „Reiseboot", schöner Name für diesen Kunstbau. — Die Sonne Inseln I S. 81 „Kriegsschiff" Name für Priester.

[2] Ham. von *ole* »sehr alt« und *zapzap* »früher, anfangen«, diese Riffmutterangabe hat Hambruch auf Elato bekommen, s. auch Ifaluk, wo Ham. arbeitete. In Faraulip Aufwachsen eines Stabes, den die Frau ins Riff steckte, aus dem Eluelap aufstieg.

[3] s. am Ende von *alu, anus* (Truk S. 318) erscheint in Palau III S. 335 als Possessiv *resul*, aber auch das Wort *galid* = *anuch* Ralik zeigt es.

... (Ham. Zaulala), s. S. 47 u. Bd. 6I S. 274, wohnte in Ilal, der Unterwelt[1]

... Ham. Zauñor) auch Souiaur (s. Truk S. 324)[2]

und Aluelap[3] (Ham. Elüelâp) »Großer Geist« (Yap S. 312 Yälülop).

Saulal ward der Herr des Meeres, der die Fische herbeischafft, Sauaur, der Herr ... der die Brotfrüchte liefert und Aluelap ist Herrscher über das Weltall, ... und höchste, wie Yongelap auf Yap (s. S. 82 u. 151) und auf Palau III ... Elüelap hatte die Frau Limaraûarau[4], wie das große Himmelsgewölbe ..., mit der er im großen Hause Fadjamal[5] wohnte.

Er hatte 3 Töchter[6] (s. die 4. Ham. s. u.).

1. Ligoboub (s. o. Bd. 6I Inseln um Truk S. 112) und unten,
2. Lisarêre (Truk S. 319) Schwester, gelangte nach Makúei (nicht Karolinen), und 3. Legabursal (Legabursal) ale aliali (s. u., wo Legabursal le alual Tochter von 1. s. u. S. 145 Anm. 3), sollte nichts tun; wurde deshalb in ein Bündel verschnürt und am Firstbalken von Fadjamal aufgehängt.

Ferner 5 Söhne (Ham.):

1. Zemerüch hilft den Zimmerleuten bei Haus- und Bootbau (Truk S. 257, *sou im* Zimmermann);
2. Zelang (Truk S. 242, 257 u. 319 Silêlap[7] Bootbauer) S. 91 (Yap 1, S. 207);
3. Zemalgoror (Truk S. 319 Semengôror) s. S. 149;
4. Lugeileng s. u. S. 147, 149 (Yap I S. 307);
5. Ururulang, Wolkenschieber und Bote des Alúelap[8].

Zu den 3 Töchtern nennt Hambruch von Elato noch eine, (4.) Nimegéi, die Mutter von Yap S. 307 als Nimegái »ich bleibe allein übrig« meldet; sie heiratet den Lugeleng (s. Lugeileng oben Nr. 4); S. 311 u. 314 dort ist sie aber seine Tochter (s. Feis)

Mir wurden auf Lámotrek von anderer Seite — außer den obigen dreien Legubupup, Legaburahiálial und Lidjarêrê — noch weitere 6 Geisterfrauen genannt, deren Herkunft als Töchter des Aluelap freilich nicht verbürgt ist.

---

[1] ... unten, daher „Herrscher unten", s. auch Yap S. 308.

[2] ... der Südinsel Aur. Hambruch hörte auf Elato folgendes: Er wohnt auf einer Insel im Süden, wo nur Brotfrüchte gedeihen. Von dort hat er sie den Menschen gebracht. Nach seiner Laune fällt die Ernte der Früchte und die Ernte aus. Ist er mit den Menschen unzufrieden, so tragen die Bäume nicht. s. auch Fes Gesch. 2

[3] Kubary ... III S. 128 steht, der Gott *(tautup)* von Elath und Lamurrec heiße Fuß; näheres über diesen Gott Cantova S. 304 sagt, seine Eltern seien Sabucour und Halmelul (Halmelul = Elalamor? S. 146), Tochter Ligebuud, die Schöpferin, die 3 Kinder hatte.

[4] Nach Cantova hieß die Frau Leteuhieul und stammt von Oleai, da sie nur einen Sohn Lugeileng hatte, adoptierte der den Reschahuleng von Lamotrek, dessen Mutter hier lebte.

[5] Truk S. 320 Fadjam. Ham. Fatsumán, Yap I S. 310 Fatsalomán, S. 312 Mogemog Fatsomal s. S. 167.

[6] Die Abkunft von dem Ehepaar ist strittig. [7] Bd. 6 I S. 235 Zelang oder Zelêlap, s. Bootbauer S. 95.

[8] Ham. nennt die 3 Gleichen von Elato, aber Eluelap, der bekannte Anulap (Truk S. 319) ist bei ihm als zweiter aufgeführt, während er mir auf Lamotrek als dritter genannt wurde. Bei Truk sind 5 Bruder und 5 Schwestern genannt, wobei obige 2 Bruder fehlen.

Sie heißen

5. Litáfeo bekam die Lebensfäden (s. S. 150)
6. Ilégúio dient zur Aufsicht von 5. und achtet, daß die Fäden sich nicht verwirren. Muß sie einen abschneiden, so stirbt dessen Besitzer.
7. Ilaitiu kommt vom Himmel herab, um zu sehen, was vorgeht, bringt gute Nachrichten nach oben, da Alúelap nichts schlechtes hören will.
8. Ledjóumes unterstützt Nr. 7 in den guten Dingen, da im Hause Fadjamal nicht schlechtes berichtet werden soll.
9. Legédjigedj brachte die Kokosnuß herab (s. S. 44)
10. Aliuëláng, Name für den Monat *gédj* (S. 133, 145),

weshalb der *gedj* = Fisch *(gudj?)* tabū war und nicht gefangen werden durfte; ja nicht einmal sein Name sollte wegen Ligédjëgedj (9.) ausgesprochen werden. Aliuëláng wollte, daß die Menschen wie die Götter untergehen und wieder erstehen; aber Ligédjegedj meinte, sie stürben besser endgültig, was Aluelap gut hieß, damit die Menschen nicht den Himmel ausspionierten, kurzum alles den Göttern nachmachten (s. S. 147).

Diese Sage ist bei Cantova S. 305 vermerkt, wo Erigiregers, der böse Geist, den Menschen den Tod verschafft, die früher nicht starben, sondern nur vom letzten Mond bis zur ersten neuen Sichel schliefen. Die bösen Geister heißen dort Elus Melabut, während die guten Elus Melafirs heißen. Ein Geist Morogrog gilt als Feuerbringer (s. Olifat S. 148).

Eluelap schläft im Hause Fadjamal stets am Boden *(nisang* Ham.) und wecken sie ihn, so ziehen sie ihm die Augenlider hoch (s. S. 161). Das Firmament *aidjal*[1] ist das Mittel für seine Sprache; die Erde heißt *sälop*.

Auf Elato wird die Schöpfung so dargestellt: Olezapzap, die Götterurmutter (S. 143), pflanzte einen Stab mitten im Weltall und der wuchs als Baum[2] in die

---

[1] Götterbote ist Audjal. Auf Elato: Der Vogel *baz* unterrichtet ihn über alle Vorgänge der Erde, ob die Menschen gut oder böse sind (s. S. 150 u. 163). Die bösen läßt er sterben; sie kommen ins Feuer, worin sie verbleiben, die Guten kommen ins Haus Fatsumān und leben herrlich mit den Göttern.

[2] Wohl eine Kokospalme, aber noch ohne Früchte, s. S. 44. Die Erschaffung von Elato ist so: Ham. Es gab in alten Zeiten einen Stein aus dem ein Baum *ulelux* wuchs, ein breitblättriger Farn. Das war das erste von der Welt. Ein Vogel *garégar* kam und ließ seinen Kot auf den Stein fallen, darin war ein Tropfen Blut, aus dem entstand die Frau Legobu (s. o. S. 146 Ligóboub); die bekam bald zwei Kinder Lot i falu „ und Lot u pi „Großer Platz" und „Großer Sand". Lot i falu brachte den Stoff zusammen aus dem die Inseln gemacht werden, und Lot u pi half seiner Schwester. Beide waren Geister, aber ihre Kinder waren Menschen. Eine Tochter Ligabu e alhalu (s. oben S. 144, 147), andere Schreibweise Lu[illegible] [illegible] (Fliegen [Plural] [illegible] [illegible] Fliegen hin und her), machte die Insel fertig, für die sie angefangen hatten, sie wollte nur schlafen, trinken, träumen und wünschen; so wünschte sie sich, daß alle die Plätze, die sie gemacht hatte, von Menschen besiedelt wurden. Sie schnitt sich in die Hand, bis Blut herausfloß und bildete nun Menschen, Männer und Frauen. Sie verbreiteten sich über die Inseln. Auf Lamotrek hörte ich noch eine Mythe, die hierher gehört. Als der Himmel oben war (s. S. 147), saß ein Mann Namens Pehalu auf einem Baum in Sātoal aitō (Satoalérek nach der See *terek*, Satoal aitō nach der Insel Tā auf Sātoal (Karte I S. 22); siehe auch Dō Südinsel von Pollap usw., das Wort Sātoal soll stammen von *sat* Meer, und *toal* Busch, man sagt z. B. im Busch: *leiai* dort, *nisal* hier) und fing

Höhe bis an den Himmel hinan, der noch nahe über der Erde lag; darauf hieß sie ihren Sohn Eluelap und dessen Tochter Ligóboub (s. o.) Sand nehmen und die Erde formen. „Sie nahmen Kokosschalen, füllten sie mit Sand, stiegen an dem Baum in die Höhe und bildeten die Erde. Eluelap stieg noch höher, hob den Himmel, *lang*, und breitete ihn über dem Baum aus und darüber wölbte er die große blaue Decke *limarāūarau*. — Er brachte den Himmel an seinen heutigen Platz *ueneng* (Gott Fūs = „Stern", s. S. 166).

Auf Lamotrek lautete der Schöpfungsbericht weiter:

Elúelap ist also der Schöpfer und hat eine Tochter Leboupboup (Ligóubub oben Nr. 1), oder Legóupup Bd. 6 I S. 280), welche Legaburs al le aluál[1] gebar (die Fliegerin s. o. Schwester Nr. 3). Als sie vom Himmel nach unten kam, fand sie nirgends Land. Sie flog deshalb herum, sammelte Sand und Steine und schuf so den ersten festen Boden (Truk S. 320). Dann mit einer Hand voll Sand alle die übrigen Inseln. Sie schuf dann auch Pflanzen und Tiere, die Vögel in der Luft, und alles übrige. Aber niemand war da, es zu bewundern. Darauf schnitt sie sich in die Fingerspitze der rechten Hand[2] und ließ das Blut zur Erde tropfen. Alsbald entstand eine Frau Yat und dann ein Mann Yól, die nun zusammen lebten und viele Kinder bekamen.

Yat und Yol (s. Gesch. 1 S. 160) hatten unter anderen folgende Kinder; drei Mädchen

1. Lataaisean ♀
2. Lemaugarertra ♀
3. Elamalór ♀, auch Elamalaur sich anhörend (Ham. Elato Ilamelúl, Ilamulul Gesch. 1) S. 281.

und einen Sohn Oralvers.

---

gurugūb = Seeschwalben. Als er eine eingeholt hatte, offenbarte sie sich plötzlich als ein Geist *(alu)*, denn sie zog den Mann mit seinem Netz in den Himmel hinauf. So kam er nach Fadjumal, und sah dort alle Geister der Krankheiten auf sich zukommen mit der Absicht, ihn zu vernichten. Denn sie hatten von den Wegehütern Ileitfu und Lidjómas schon von seinem Kommen gehört. Im Hause aber hing eine Tasche vom Firstbalken herab. Ligabur ale aluál war aber im Hause, sie, die Gewalt über alle auf der Erde hatte. Als nun die Krankheiten über den Mann herfallen wollten, gab sie dem Vogel den Befehl, den Mann wieder an den Haaren zu fassen und auf die Erde zurück zu bringen. So erfuhren die im Himmel durch Peialu von dem Vorhandensein der Menschen auf der Erde. Peliahu gilt deshalb als Helfer*in* *alu*. (In Bd. IV von Palau S. 124 ist das Wort *olsóbōl* schützen, helfen, mit der Endsilbe *bōl* offenbar gleichstammig mit Peli).

[1] S. 144 wurde sie schon als Schwester von »Legóupup« genannt; diese machte ja auf Geheiß Aluelap's die Erde und hernach sandte er seinen Boten Eidjal (s. o. Aidjal das Firmament als Mittel für seine Sprache) als Wind, damit er in die Nase der Ligoubub eindringe. Dies tat dieser auch und drang dann bis in ihren Bauch vor, wo er sich als Atem und als das Wesen des Aluelap festsetzte, so daß diese schwanger wurde und 2 Kinder gebar, einen Knaben und ein Mädchen. Eidjal ging darauf in den Himmel zurück, um dem Aluelap die Nachricht zu bringen, dieser sandte ihn wieder hinab, um den Kindern Namen zu geben und zwar dem Knaben Tipalálailog oder kurz Tip (von *tipei* mein Wille, Gedanke) und dem Mädchen Ilalálailog, kurz Il (= bedächtig, nicht ungerecht). Die beiden Kinder wurden so die Ursache der guten Gedanken allüberall (s. S. 11).

[2] So schuf Truk S. 348 auch Aluelap die Ligóubub.

Alle lebten sorglos dahin, sie kannten keinen Tod. Legaburs al le alual führte sie zu weit aufs Meer hinaus, über das sie hinlaufen konnten. Dadurch wurden aber die übrigen Geister neidig und zornig, so daß Ligoubub in den Himmel zurückkehrte und die Menschen für sich selbst sorgen ließ, so daß Hunger, Krankheit und Tod über sie kam.

Auch hatte Alúelap deshalb den Himmel von der Erde getrennt, damit die Menschen nicht allzuviel erfuhren, den Lisarérë hatte den Frauen Arbeit gelehrt, besonders die der Weberei, und zwar durch ihre Tochter, die Spinne Likesoburára, deren Spinnweb das Beispiel abgab. Aber auch Flechten und die Stoffherstellung wurde ihnen gezeigt.

Die dritte Schwester Ligabur ale aliali aber tat nichts, sondern pflanzte den Geist des Neides in die Menschheit. Sie flog töricht und faul herum, s. oben S. 145.

Lugeileng[1], der Sohn des Eluelap (o. Nr. 4), kam eines Tages vom Himmel und sah auf Erden einen Leprösen, mit dem er wegen seiner Entstellung so Mitleid hatte, daß er mit ihm die Haut wechselte, nur sein Zahnfleisch gab er ihm nicht. Mit der kranken Haut kam Lugeileng zu Yol. Die Frauen und dessen Haus wollten aber dem Kranken kein Essen geben, bis sich die Tochter Elamalor erbarmte und ihm Essen und Wasser reichte. Dies gefiel dem Lugeileng; auch fand er so Gefallen an ihr, daß er sie mit sich nahm, nachdem er sich in einen schönen Jüngling verwandelt hatte.

Elamalor war es, die ihm dann einen Sohn, den bekannten Olifat gebar[2].

Der Eingeborene Urupo sagte dazu, Elamalaur sei von Lugeileng fortgeschickt worden, um eine Muschel zu holen; als sie sie gebracht hatte, schlitzte er ihr damit den Scheitel auf, worauf Olifat herauskam (so auch in Gesch. 1). Dieser rannte sofort herum und reinigte sich selbst von den Geburtsrückständen an seinem Körper. Dann blickte er nach oben, und als er seinen Vater Lugeileng im Himmel sah, stieg er zu ihm hinauf. Olifat sah eines Tages im Himmel Kinder mit einem Hai spielen[3]; sie hatten ihn an eine Leine gebunden und ließen ihn hin und her schwimmen. Er sagte: »Gebt mir die Leine und laßt mich etwas spielen«. Aber alle lehnten es ab, bis auf einen, der denn auch von den Bissen des Haies verschont blieb.

Andere Kinder spielten mit einem *márafas*-Fisch, den sie auch angebunden hatten; auch hier wollte Olifat sich am Spiel beteiligen, aber alle lehnten ihn ab, bis auf einen, dessen Arme in der Folge vom Fisch nicht zerschnitten wurden.

---

[1] Truk S. 319 Sohn von Anulap, s. o. Nr. 4, adoptiert Gesch. 1, ebenso auf Ku. s. Bd. 6[1] S. 111. Ham. schrieb an anderer Stelle, sein Vater sei Mezelang e gotu (S. 166) gewesen, und Eluelap habe ihn adoptiert und sehr lieb gewonnen, s. Gesch. 1. — Nach Cantova S. 306 hatte L. eine himmlische Frau, die ihm 2 Söhne gebar, Carror und Melilhau, die andere irdische Frau von Falalu (s. Tarisso Bd. 6[1] S. 189), gebar ihm den Olefat (s. u.).

[2] Auf Fananu war es die Tarisso von dort, die als Mutter gepriesen wurde, s. Bd. 6 I S. 189. Viel ist über ihn geschrieben, besonders schon von Freycinet (s. Olear). — Nach Naut. Magazine 1866 Sohn: Anulap, Lungalen Essenspender s. Olofat.

[3] Das Hai-Spiel des Palau-Olifat, des Medegelpelau, in Palau IV S. 231.

Wieder andere Kinder unterhielten sich mit Spielbooten, und als er mitmachen wollte, ging es ihm hier ebenso; der eine, der ihm gewogen war, behielt darauf sein Boot, während die der andern von dannen segelten. Endlich sah Olifat wie die Männer Kokoswedel zur Hausbedachung abschlugen. Da bekam er Lust auch an der Arbeit sich zu beteiligen, aber keiner gab ihm sein Messer, bis es schließlich einer tat, dem er es dann auch zurückgab, während alle die übrigen ihrer Messer verlustig gingen; überdies kam nur allein sein Gönner von der Palme wieder herunter, die andern klebten oben fest und kamen nicht mehr herab. Als diese sehr klagten, jammerte ihn ihrer und er beauftragte den Kalung (*?kulung* S. 148), sie zu befreien. Ihre Unfreundlichkeit hatte aber auch seine Folgen, denn als die Himmelsleute eine Menge Kokosnüsse als Lohn für die Arbeit des Wedelschlagens verteilten, erhielt Olifat nichts, zumal da sie ihn auch nicht kannten, denn nur sein Vater Lugeileng kannte ihn. Weil sie ihn nicht kannten, verlachten sie ihn auch, und als diese ein Haus bauen wollten und die Pfostenlöcher gegraben hatten, setzten sie ihn in eines dieser Löcher hinein, und stießen dann den Pfosten auf ihn, damit er sterbe[1]. Olifat verwandelte sich aber rasch in eine Ameise, kroch nach oben und setzte sich, nach dem er sich in die menschliche Gestalt zurückverwandelt hatte, auf den Ramenbalken des Hauses. Da erkannten sie ihn. Als Alúelap ihn rief, ging er zu ihm und beklagte sich über das schlechte Benehmen der Leute. Dann verwandelte sich Olifat in Luft. Die Schwester des Lugeileng, (Lisarērē S. 147), wurde weiterhin schwanger und gebar eine Kokosnuß, die vor das Haus Fadjamal hingelegt wurde. Sie trieb in einer Nacht zu einer Palme empor, die Früchte ansetzte, die sich in Unzahl vermehrten. Aber Aluelap mochte sie tabū, weil sie von Lugeilengs Schwester stammten. Als einer seiner Brüder eine Nuß stahl, wurde Lugeileng böse und jagte ihn aus dem Himmel, weil er das Auge der Götter essen wollte[2]. Er kam nach Gádjau[3] und wurde verrückt und wollte alle Leute töten, die von der Ligóubub auf Geheiß Alúelap's geschaffen worden waren (S. 146). Er schlug 4 Palmen um, teilte sie, damit er Speere aus dem Holze fertigen konnte. Aber der Häuptling beobachtete im Großen Haus alles und erkannte seine Schliche. So setzte er alle seine Leute auf ein *gabábel*-Treibholz, ließ es auf die See hinaustreiben und so gelangten sie nach Truk, später nach Poloat usw.

Durch die Uneinigkeit der Brüder kam so der Krieg auf die Welt, besonders auf die hohen Inseln, wo so viel Streit ist. Lamotrek denkt, daß er von Gadjau stammt.

Über Olifat erzählte man noch auf Elato, daß er den Menschen das Feuer *ilf* gebracht und das Kochen gelehrt habe.

---

[1] Bekannte Geschichte s. Truk S. 321, und Palau IV S. 40 u. 234.

[2] s. die Gesch. vom Kokosaffe. Auch der Taro kam durch Diebstahl auf die Erde, in dem bei der Vertretung im Himmel ein Geist eine Rube stahl, mit ihr davon rannte, wobei er so stark fiel, daß er den Himmelsboden durchbrach und auf die Erde fiel. Er starb, aber der Taro fiel in den Sumpf und wuchs.

[3] Gadjau s. Truk S. 333, auch S. 350ff. Adjau = Kusae.

Über Lugeileng (vgl. Ugélianged, das gleiche Wort in Palau III S. 187, 334 u. a.) ist noch von Elato zu berichten, daß er als Bringer des Bootes gilt (vgl. Yap I S. 315). Sein Werkmeister ist der Zelang (s. o. S. 144)[1], der als Patron der Zimmerleute gilt, aber im Himmel kein Ansehen genießt. Alúelap selbst zeigte ihm den Bau der Boote bis in die kleinsten Einzelheiten. Der Bootaufsatz, die Gabelschwanzgallion, heißt daher auch *mónu* Zelang (Ham.) (s. Truk S. 227). (S. 95). Beim Bootbau war schon vom Zimmermann die Rede. Er heißt auf Lamotrek[2] Sẽlạng und gilt als Erfinder der Gallion, ihr Gestalten, und ist einer der 5 Helfer des Lugeileng und der Zimmerleute; die übrigen 4 sind:

2. Semälegóror (s. S. 144) Überwacher der Form, des Auslegers, der Planken, zeichnet, macht die Linien, sorgt für Eile, vielleicht gleich mit Semágor, dem Bruder des Mórva Feis Gesch. 2 und S. 56. Mórva s. auch „Die Malanggane von Tombara" S. 43.

2a. Semadjek sieht nach den Sitzen, nach *ebẽp*, *fáraf* (s. Truk S. 230); hilft dabei.

3. Ligadjälap oder Ligédjülab der Maler sorgt für Farbe *(lap* S. 97), für Leine und Kalk.

4. Simälegodjúat der »Umdreher«, von *godjúat* »umwenden«, der rohe Bearbeiter des Stammes im Busch; er sieht wie das Holz am besten auskommt.

5. Mes[1] seit der Verbesserer von Sẽlang's Arbeit, mit feinem Auge *(mes)*.

Ham. nennt auch noch den Alülemez, der den Leuten beim Kalfatern hilft, damit es kein Wasser mache; überhaupt sorgt er für die Sicherheit des Bootes, schützt es vor dem Zerbrechen und hilft beim Ausbessern.

Über allen steht Lugeileng; er schwebt über den Bauplatz und seine Leute führen die Arbeit aus; sein Haus Falesidj[3] ist im Himmel.

Für die Seefahrt selbst ist Palúelap wichtig, denn er ist der »große *pallu*« (Truk S. 244), der besonders bei Pollap erwähnt ist, wo er (nach Ham.) die Frau Ilagaiidjor heiratet, von der er alles über die Seefahrt erfuhr, weshalb Pollap in der Seefahrkunst voransteht (s. Pollap Gesch. 1. von Lẽofas Bd. 61 S. 276).

Hambruchhörte auf Elato: Die Kinder von Paliulãp und Illsagórũ sind folgende:

Farouũ ♂	der Wettermacher, der vor Schlechtwetter warnt.
Alului ♂	s. u.
Rongerik ♂	leitet die Boote heim; s. Pollap S. 284.
Xaligi ♂	sorgt für die Boote und ihren Bau an Land..
Rongelap ♂	führt die Boote auf die See; s. Pollap S. 284.

[1] Vgl. Tangaloa und Zimmermann s. A. Kr. Die Samoainseln Bd. I, S. 399 Z. 91—94. Yap I S. 309 Sẽlang Hausbau, Bootbau usw.; Feis Solang.

[2] Nach Angaben von Urupo und Ikelur.

[3] *ndj* das Rohr auf Yap angeblich, bei Müller Yap nicht zu finden.
Volkens Yap *nchâll*; Palau *lâld*. Das Haus Yap 310 Yimpo und 311 Difitj.

Zemal ♀

Mangeär ♀ sorgt für Essen, daß den Bootleuten die Speisen geraten.

Ilegafaz ♀ sorgt für das Feuer an Bord.

Über Alulueil[1] ist Truk S. 319 gesagt, daß er als Alûelap der Schiffer sei; auch auf Pollap ist er der Bootskundige. Yap I S. 313 nennt ihn Paloolop, bzw. dessen Vater. Ob also Alului der Sohn von Paluelap, oder er selbst ist, ist von keinem Belang, da er in der Seefahrkunst mit ihm eins ist; er gilt im Besonderen als Gott der Orakel[2]. So gilt er als Gott der Navigation und hat 4 Augen, 2 hinten und 2 vorn (s. S. 156).

Hambruch hörte auf Elato, Alului fahre mit dem Reiseboot und leite es sicher auf den Fahrten. Seinen Platz *paräng* hat er auf dem Ausleger jeden Bootes, auf dem vor der Fahrt Kokosnüsse *bëgi*, Düfte usw. niedergelegt werden. Schwemmt die See die Opfergaben herunter, so hat Alûlui sie geholt. Er hat eine Frau; sein Sohn ist Falus, der dem Vater hilft.

Lugeileng gilt auch als Bote des Alûelap. Hambruch hörte über ihn auf Elato, daß Lugeleng alle Inseln besuche und dem Eluelap über ihren Zustand, über die Menschen und ihren Charakter, ihr Benehmen, ihre Arbeit berichte; sind sie fleißig, hilft er ihnen, sind sie faul, schickt er ihnen einen Taifun. Dabei muß ihm Zaûlälu helfen. Täglich wird Bericht erstattet. Lugeleng brachte den Menschen Tanz und Gesang, und die Heilkunde.

Als eigentlicher Götterbote gilt auf Lámotrek Audjal, auf Elato auch der Ururulang, der S. 145 schon erwähnt wurde (s. u.). Audjal ärgerte sich eines Tages über die Menschen, weil sie nicht gut waren. Er änderte deshalb ihnen zum Schaden die Zahlen um; früher zählte man: 10 *seg*, 9 *tiv*, 8 *väl*, 7 *fis*, 6 *uŏl*, 5 *lim*, 4 *fäng*, 3 *eël*, 2 *rû*, 1 *ëlŏl*, so daß man mit 10 begann, was der sofortige Ertrag der Arbeit war; jetzt fängt man mit 1 an.

Urupo bemerkte dazu: ursprünglich reichte ihr Wissen bis zum Ellbogen, jetzt ist es nur an der kleinen Fingerspitze; bei den Weißen wächst es aber mit jeder Generation ins Unendliche; der liebe Gott habe ihnen vier Finger gegeben, dem Kanaken nur den fünften.

Ururulang, der eben erwähnte Bote, geht als Posten vor dem Himmelshaus Fadjamal (Fatsumel Ham.) auf und ab. Er hört und sieht alles und meldet alles dem Eluelap. So wird keine Seele in den Himmel eingelassen, ehe sie nicht von ihm beurteilt ist. Die guten dürfen sich im Haus Fadjamal niedersetzen, die schlechten aber werden in das Wasserloch *böl ipës* gestoßen, wo sie ewig bleiben müssen. Jeder Mensch besitzt einen Lebensfaden *idjor e melâu*[3]. Geht die Seele in den Himmel, so sagt Ururulang seinen Leuten Kula, sie sollen nach dem

[1] Auf Oleai Wort = *alu lowei* Geist der Reise s. S. 143[3].

[2] *inafwi* oder *bof* (Truk S. 336, Bd. 6[1], S. 110).

[3] *melâu* Leben s. o. S. 105 usw. (Truk S. 308).

Lebensfaden sehen, ob er in Ordnung ist. Können die Leute ihn schnell entwinden, so ist der Mensch gut, geht es aber schwierig und bleibt er in Unordnung, so ist der Mensch schlecht. Oleiguso heißt die Frau, die den Faden abschneidet, Litafidjor (= Frau gerade halten F[illegible]en) die, die ihn dreht und in Ordnung hält und an Eluelap gibt. Wird ein Mensch geboren, ist er »fleischliche auf der Erde, aber der Lebensfaden *idjor e mēlau* ist im Himmel.

Hambruch hörte noch den Namen Yongeläf nennen (s. Yap I S. 324) über den er das gleiche wie auf Faraulip hörte; oben S. 144 ist er schon von Yap erwähnt. Dann hörte er von einem Erdenbewohner Nigēregēr, der sich eines Tages mit dem Mond zankte; dieser sagte schließlich: »Nigereger, du stirbst; wenn ich sterbe, bin ich morgen wieder lebendig; du aber stirbst für immer.«

b) Die Seelen.

Hambruch hörte auf Elato, daß sie auf einer Leiter in den Himmel steigen, und zwar im Westen, wo Himmel und Erde sich berühren.

Die Bestrafung der Menschen erfolgt gemeinsam durch Elúelap, Zaulal und Zauaur (S. 144), die 3 Brüder, und zwar nach dem Grade der Schlechtigkeit.

In Bolipes, dem Aufenthaltsort der Verdammten, braucht keiner die Seelen zu bewachen. Ururulang (S. 144) und seine Diener bringen sie dorthin. Unter der Schlafmatte des Elúelap befindet sich im Himmelshaus Fádjamal ein Loch, durch das sie in das Reich des Zaulal[1] rutschen; s. Lebensfaden oben.

c) Zauber *bolebol* und Orakel.

(Vgl. Tafel 2, 4, 10, 12 und Farb-Tafel 3).

Im wesentlichen nicht von den übrigen Inseln unterschieden. In den Häusern (z. B. Sopo's Haus) befinden sich auch die Hängealtäre (s. Abb. 101 in Bd. 6 I S. 232); der schöne von Udot (Truk S. 341) soll von Lamotrek stammen.

Die *gobai*-Stäbe mit den Augen hier sind neu. Der Zauberer *vāk* (Abb. 70 u. 71) hat meist ein Haus *(im bólebol*[2] s. S. 89), in dem er seine Arzneien bereitet, meist in der Nähe der kranken Person. Einige Zaubergesänge sind schon bei der Medizin wiedergegeben und beim Bootbau, und auch sonst ist schon viel von Zauberhandlungen erwähnt, da solche das ganze Leben durchziehen.

Zauber für Wöchnerinnen s. S. 108. Aufstecken von Arzneizauber Abb. 63.

Auf Eláto fand ich im Hof eines Anwesens als Zauber *kuei* einen Fächer *gáliba* aufgepflanzt, über den näheres S. 139 berichtet ist.

Für Regenzauber sind einige Gesänge (S. 52) gebracht: Zur Beendigung zu vielen Regens wird die Beschwörung mittelst einer Ansprache, dem Tritonshorn

[1] Dieses ist aber in der Tiefsee, nicht unter dem Himmelsboden, wie schon in Gesch. 1 vorkommend.
[2] S. 108, 111.

taui, und mittels einer Regenrute aus der Korallenpflanze ***kaini lidal*** (He. 2238 = 601711) seitens eines kundigen Beschwörers vorgenommen. Bei Hersingung des Gesanges wird die Rute mit dem Horn gegen die Wolken geschwungen, nachdem vorher das Horn mit aller Kraft geblasen wurde.

Abb. 70. Zauberer Ikelur mit Zauberstab (s. Taf. 2[d]).

Abb. 71. Zauberstab *gobai*.

alis ali touber Zaubergesang für Hausreinigung von Ikelur (Haus 3), der niemand dabei haben will außer Faragau (H.1), weil er sonst zu sterben fürchtet.

Der *alus* Róiang (s. Sturmzauber S. 155) wurde von Aluelap ausgesandt, um zu fordern, daß die Häuser von Blut und Geburtsverunreinigung sauber gemacht werden.

1. *ilabéleng ngílengi*	Ich färbe mich für den Himmel,	*i lab* ich färbe
ilabéla lólalo	ich färbe mich für die Unterwelt,	vergl. S. 97
mailéngi mailaló	(das ist) gut für den Himmel, gut für die Unterwelt;	*mamai* gut
ibaméiba	ich speere und speere,	*ib, ub* speeren
5. *ibangalíra*	ich speere mit dem Speer	*ira* Stock, Speer, *ira rŏgal* speer die Leute da
čremesč lengil	Leute im Himmel,	*áramas* Leute Truk S. 266
meroi lengil	(das) Volk im Himmel;	
i bálü	ich speere die Kokos,	
ub aramés	ich speere die Leute,	Stock ins Haar
10. *eübe samól*	ich speere den Häuptling!	Stock in die Erde

Beispiel eines gereinigten Hauses Abb. 72 (nach Aqu. E. K. 31).

Abb. 72. Purifiziertes Haus.

Abb. 73. Kopfaufsatz Geisteraugen.

Anzug: Der Zauberer ist bemalt mit einem roten Kreuz[1] auf der Stirn, dessen senkrechter Strich bis zur Nasenwurzel reicht, außerdem hat er je einen schiefen roten Strich von der Schulterspitze zur Achselhöhle[2] und einen senkrechten vom unteren Ende des Brustbeins bis etwa zum Nabel. Auf dem Kopf trägt er ein Kokosfiederkranz, (s. unten l. *metalöris)*, mit zwei Ringen vorne, den *metál alus* »Geisteraugen«[3]; Abb. 73, solcher Augenpaare hat er auch eine Menge an dem Zauberstab *gobai* (Abb. 71) oder *gobai l touber*; auf Abb. 70 hat ihn Ikelur in beiden Händen; er ist außerdem mit vielen jungen Kokosfiedern behangen. Wird ein Kranker mit dem *gobai* bezaubert, macht der Zauberer erst mit dem Stock einen Kreis ums Gesicht, dann je 2 Kreise um die Nasenspitze, l. Schulter, r. Schulter, r. Schulter, l. Schulter, Nabel, um das Haar (Z. 9) (s. Taf. 2d), dann wird der Stab hinter dem Kranken in die Erde gesteckt (Z. 10).

Über den Anzug bei den Zauberhandlungen ist hier zusammenfassend zu berichten. Bei der *garangâp*-Fischerei, beim Bootbau, bei der Hausreinigung wie beim Sturmzauber, dann bei Heilbehandlungen werden die jungen Kokosfiedern *uvudj* oder *ubudj* (Truk S. 179, 127, 283, 328, 359 *ubud)* angewandt. He. 2203a—e = 5977—8111 hat Belegstücke beigebracht.

a) Knoten doppelt (Knoten *djedjá beddaχ)*, an beiden Knoten mit beiden Händen horizontal gehalten; nähert man die beiden Hände einander, so spreizt sich das doppelte Blatt; durch schnelle Rückbewegung der Hände schlagen die Blattflächen klatschend aneinander. Durch dieses Klatschen wird die Beschwörungsformel stellenweise akzentuiert, es wird also dem Liede dadurch ein Rhythmus gegeben, während z. B. ein Trupp Leute mit dem Zauberer *vâk* an der Spitze den Strand entlang zieht. Es wird also dieser Doppelknoten (s. Abb. 74) wie eine Schlittenpeitsche gebraucht; sie heißt *ubudj vai vei* oder *vei vei l'ubudj* und wurde mir besonders beim Bootbaugesang 2. u. 3. gezeigt. Zum Unterschied vom eben erwähnten *metál*[4] *alus* braucht er nicht aufgesetzt zu werden.

Abb. 74. Knaller.

b) 4 Kokosblätterruten *ōwúte χássĕ (ubudj)* womit durch den Beschwörer die Krankheit von der Insel weggewedelt wird (vgl. d. Fächer S. 138).

---

[1] s. auch das Kreuz bei Bauchwehgesang (Medizin S. 140) und Abb. 78.
[2] die *forol*-Ketten S. 109 Z. 10.
[3] Es sollen eigentlich 4 Augen einen Wirtel bilden.
[4] = »sein Auge«, *alus* Dämon.

c) 2 Stirn- oder Armbänder *owute matalál*, mit 1 Schleife *metalöris* (s. *metál alus)*.

d) 1 Kopfschmuck von gespaltener Kokosfieder.

e) 2 Stirnbänder *marre marre öwüte metalöris*. Die 2 Schleifen sitzen auf der Stirn, die Enden am Hinterkopf entweder zusammengebunden oder mit dem Kamm befestigt (s. oben *metálálus)* Abb. 73; s. auch Feis.

Nadeln zum Zustecken der Schmuckfiedern aus Fiederrippen *loχ, sivel*. Diesen ganzen Beschwörungsanzug fand Hellwig an einem Baum des NW-Strandes

Abb. 75. Hauszauber.

in einsamer Gegend bei einer Hütte, deren Bewohner gegen die Fortnahme nichts einzuwenden hatten. Die Beschwörung war gegen Truk gerichtet, von woher die Krankheit *mass* kam.

Hauszauber mit Cocosnuss s. Abb. 75, auch als Arznei.

Die Sturmzauberstäbe *gosilifei* (s. Truk S. 300).

Den Sturmzauber erfuhr der Geist Roiang (s. S. 152) von dem Geist Tipoeo, der ihn von Alúelap erfuhr. Der Sturmzauber war beim Besuch der Expedition in voller Kraft. Das sahen wir schon an den am Strand von Lámotrek öffentlich ausgestellten Stücken, wie das Lichtbild auf Taf. 4d zeigt. Die Zeichnung Abb. 76 zeigt einen solchen Aushang am Strande noch deutlicher. Man sieht, daß ein Tritonshorn dabei hängt, und eine Weihegabe an der Spitze. Ein anderes Stück, das mir Ikelur gab, ist im Linden Museum zu Stuttgart Nr. 77830, s. Taf. 7, viele Kokosfiedern sind daran geknüpft.

4: Krämer OR21 Woleai

Wie z. B. die Zulu in Südafrika auf einem Hügel sich versammeln und bei nahendem Sturm gegen diesen anbrüllen, damit der Sturmgott sich abwende, so kämpfen die zentralkarolinischen Zauberer, *vāk*, mit den Rochenstacheln an ihrem Zauberstab, die im Kampfe sehr gefürchtet sind und eins mit dem Gotte Saulal (s. S. 144) erachtet werden, gegen den Sturmwind.

Abb. 76. Sturmzauber am Strand.

Das Holz ist gleich dem Gotte Alúelap, und der Kalk verbindet beide. Die Stacheln werden gelegentlich gegen den Beter selbst gewendet, um die Erfüllung zu erzwingen. Der Januskopf stellt Palúelap und Alúluei dar (vgl. S. 148), die nach allen Seiten blicken sollen. Deshalb macht man schon beim Beginn einer Seereise, wenn der Mast aufgerichtet wird, das *fore alus* für Alúluei. Oben S. 150 wurde aber auch schon ausgeführt, daß er mit Alúelap oder Palúelap eins erscheine; deshalb heißt es auch, daß der Januskopf = Aluluei sei und 2 Augen vorne und 2 hinten habe (S. 290). Es gibt solche Zauberfiguren für Boote und solche für das Land (s. Idole Abb. 77. 78).

Letztere sind der Ligóubub (s. S. 146) geweiht, und heißen *ēpil alu; ēpil* meint das untere, z. B. Wurzel eines Baumes oder Boden einer Schüssel. Die

Abb. 77. Sturmzauberfigur.

Abb. 78. Idol mit Stirnkreuz (vgl. Abb. 70).

Wurzel der Pflanze *ēlau* wird abgeschabt, und das Schabsel mit Cocoswasser übergossen und getrunken, gegen Krankheit oder Wind; daher in den Wohnhäusern aufbewahrt, sonst den andern gleich. Der *kuling* (s. S. 148) soll die Zauberfiguren angegeben haben. Sinn der Rochenstacheln *ohét* unbekannt.

Sturmzauber-Gesänge.

Ein Gebet für Boot (und Land) bei Sturm.

1. *ĩ leilei e ánga lăbĕlăb*	Ich bin der Vater des großen Windes,	*lei* mein Kind; Sprecher fühlt sich als Vater.
i leilei e anga lemāsue-sńe	ich bin der Vater der sanften Brise,	
mas eáng	stirb Wind,	
mas e lau	sterbt ihr Brecher,	
5. *mas e gorón*	stirb Regen	
mās alus i leng	stirb Geist des Himmels	der Verursacher

Auf Feis hörte ich einen Sang von Sēpi (H. 3 S. 20), der so lautet:

séboai gegádjua log	Macht alles gut gegen mich	
áromet langileng	Leute, daß kein großer Regen gegen euch komme,	*langileng maūvoi*
sausóu tipelielis	hoffet auf Güte der Götter	*alus* Gott; *tipei* in meinem Herzen.
maūvoi le valeuai	für mein Boot.	*mauvoi* Z. 2., s. *valevei* S. 159, 202.

Erster Sturmzaubergesang von Urupo (Taf. I a), bei dem der Zauberer *vāk* rechts das Tritonshorn *taui* links die Janusfigur *gosílifei* hält (Taf. 4c).

1. *sūsū mei a, sūsū mei a*	Stehe weg, Stehe weg	vom Regen, *siu siu* aufstehen.
rērē mei a, rērē mei a	schneide weg, schneide weg,	
mē golugē tíu, mē goulugē tag	halte es zum Westen, halte es zum Osten,	*aitol* W.-Teil, *aiet* O.Teil, *mokúe*[1] N.
lugilímel	außerhalb des Hauses	der Regen.
5. *mē gopi ia, go masē*	zerschneide, bis er tot ist,	*gopi* schneiden, *mas* tot.
alus irīar i alus irīar	Geist des Regenbogens,	*lauliar* Regenbogen, wurde beim Streit aus dem Himmel geworfen und kam an die Himmelsseite mit kurzem Leben.
alus iri	Geist	
ebāsurērē ebasu rērē	der Wasserhose,	*ētibaso* hohe Wasserhose von oben. *saularērē* niedriger Wasserwirbel unten.
gopóru, gopóru, gopóru rúei	nimm sie, nimm sie, nimm sie weit weg,	
10. *gotóru, gotóru, gótóru rutóg*	bringt nicht hierher,	*falu* das Boot in See.
gōlā isiu gōlā fēlei	renne fort von meinem Boot,	
goleisiu ō	geh weg!	
isiugó o! o!	weg!	

[1] *mokulog* »von Norden« aus gesehen, denn niemand geht nach dem Süden.

Zweiter Sturmzaubergesang von Ikelūr (Taf. 2d).

itou meséi lengīl	Ich steche das Auge des Himmels,	*mes* = *metal* sein A.
igamāl meséi lengīl	es klärt das Auge des Himmels,	*gamál* = *málamal* aufklären
ngasaboi lengīl	die Enden des Himmels,	*sab* das Ende (Sētowal), *tabol* Ende Lam.
ngasaboi lengīl e fūfū	die Enden des Himmels klar,	*fuselog* aufgeklärt
ngasaboi lengīl e toto	die Enden des Himmels, kommt herab,	*dōdō* herunterkommen.
ngasaboi lengīl ēa	die Enden des Himmels, geht weg,	*ēa* = *áia*
mara galāngīe	presse aus hinauf in den Himmel,	Wasser
tara galāngīe	presse hinab vom Himmel	
ngē bogativāto	und lasse (es) zurück hinter mir.	*gativáteu* von einer Menge etwas zurücklegen.
fatul ei sēila	die Pagaie vom Boote da.	d. h. eine gute Brise.
ngēgadja borobóro	Werft hin	*ei* Genitiv, *seí* = *va*[1] *gēsebórobor* etwas mit Gewalt fortwerfen.
alāng gadjēpadjep	mit Begeisterung zu besänftigen den Himmel	

Über das Losorakel (Bd. 6 I S. 110) konnte hier nichts besonderes in Erfahrung gebracht werden; über die 16 Dämonen war nichts bekannt; und doch spielt ein Teil der Gesch. 75 in Yap II S. 616 auf Lamotrek. Dieser ganze Mythus ist bei Feis erwähnt und scheint den Westkarolinen anzugehören, da östlich von Feis nichts davon erwähnt wurde.

Das Knotenorakel wird schon bei Cantova S. 311 für die Westkarolinen erwähnt.

4. Geschichten und Gesänge (*alis, rong*).

Gesch. 1) von Jat und Jol[1].

Dieses »Märchen« ist in Hambruchs Südseemärchen S. 180—196 Anm. S. 343 ausführlich wiedergegeben, weshalb hier nur im Auszug darüber berichtet wird:

Jat und Jol hatten als Kinder zwei Mädchen, die, groß geworden, heirateten, zu gleicher Zeit schwanger wurden und ein Kind gebaren. Jede grub dazu im Frauenhaus ein Wasserloch, setzte einen Stab hinein, auf dem die Geburt vor sich ging; beide Kinder waren Knaben. Die Stäbe aber grünten und bekamen rote Blumen. Eines Tags ging die ältere Mutter ins Tarofeld, um Nahrung zu holen; als sie lange ausblieb, schrie ihr Knabe. Vergeblich suchte sie ihn zu beruhigen. Da kam ihre jüngere Schwester und half ihr dadurch, daß sie heimlich zu dem Wasserloch ihrer älteren ging, eine rote Blume abbrach und sie dem schreienden Kinde brachte, worauf es sofort still wurde. Als aber dann die ältere, um Wasser zu holen, zu ihrem Loche ging und das Fehlen einer Blume bemerkte, kehrte sie alsbald zurück und schalt ihre jüngere heftig. Trotz der Aufklärung gab es einen heftigen Streit, der erst durch die Eltern Jat und Jol beschwichtigt werden konnte.

Die jüngere war eine fleißige Weberin[2], die unermüdlich arbeitete. Eines Tags kam zu ihr Nitor, die Schwester des Königs Remesielangegotu[3], der im Osten des Himmels ein großes Reich beherrschte. Sie fand an der Frau Gefallen, und deshalb nahm sie sie mit ihrem Kinde in den Himmel hinauf. Ihrem Bruder gegenüber pries sie die Frau so sehr, daß der König sie zu heiraten beschloß. So wurde sie Königin. Der Knabe war inzwischen herangewachsen und verstand vortrefflich zu tanzen. Als gerade Remesielangegotu anwesend war, forderte die Mutter ihren Sohn auf, den Kreuztanz Gapagag zu tanzen, der dem König so gefiel, daß er das Schneckenhorn blies, damit auch das übrige Himmelsvolk herankäme, um des Anblicks teilhaftig zu werden. Zur Belohnung holte er hundert feingewebte rote Matten aus seinen Kisten und bedeckte mit ihnen die Erde, damit der Junge diese nicht berühre. Die Zuschauer aber wurden so von Tanzlust ergriffen, daß sie mit bis zum Morgen tanzten. Am folgenden Abend wiederholte sich dies alles; der Zuschauer waren noch mehr geworden.

---

[1] s. o. S. 146, s. auch Ende von Gesch. 5.
[2] s. o. S. 147.
[3] s. S. 147 Anm. [1] = Mezelang e gotu, *mez* oder *mes* = Auge, *lang* Himmel, *gotu*?

Als Eluelap davon vernahm, wollte er einen Boten an den Vater des Tänzers senden, aber alles war weggelaufen. Nur einen seiner Söhne fand er schließlich, der aber nicht wieder kam. So ging Eluelap selbst und wurde auch von dem Anblick ergriffen. Als er zurückkam, fand er seinen Sohn Morakero, den er nach dem ausgesandten Sohn sandte; dieser stand in der Zuschauermenge, starr, mit aufgerissenen Augen. Da warf Morakero ihm Sand hinein, ließ ihn zurück und kehrte zu seinem Vater zurück. Der wollte nun den Tänzer einmal aus der Nähe ansehen, und sandte deshalb den Ururulang[1] mit 50 schönen Matten als Geschenk an Remesielangegotu, der sie empfing und hundert rote Matten dafür wiedergab. Darauf sandte Eluelap seinerseits auch 100 besonders schöne Matten mit schwarzen und roten Mustern an Remes und lud ihn ein, mit seinem Sohne zu ihm zu kommen. Remes sandte nun seinerseits auch 100 schöne Matten und ließ sie vor dem Haus Fadjamal ausbreiten. Als er dann selbst mit seinem wohlgeschmückten Sohne bei Eluelap eintraf, befahl dieser seinen Dienern Ulülemes und Tibur[2], sein Auge zu öffnen, damit er den Tänzer ordentlich sehen könne; es ging dies aber nicht leicht: die Hände der Diener versagten, auch Bootspaddeln halfen nichts; erst als diese mit Sand eingerieben waren, ging das Auge auf. Eluelap war so befriedigt von dem Anblick, daß er die Hand des Knaben nahm und sich auf die Stirn legte, wodurch er in den Besitz des Gottes überging. Remesielangegotu schrie darüber vor Schmerz laut auf. Da der Knabe noch keinen Namen hatte, rief Eluelap alle seine Diener, die Sterne des Morgens, Adler, Plejaden, Orion, großer Bär usw. herbei, damit sie ihm einen recht schönen Namen vorschlügen. Sie dachten lange nach, aber sie fanden nichts rechtes, und Eluelap mißbilligte ihre Vorschläge. Der Morgenstern rief darauf wütend: »Nennt ihn doch Pagaral, den Scheißer!« AberAtair entgegnete: Nein, das ist nicht gut. Er heiße Lugeileng, »Mitte des Himmels«[3]! Dieser Name gefiel dem Eluelap, und er gab dafür dem Atair den höchsten Platz am Himmel, damit er alles sehen könne, dem Morgenstern aber er trug auf, daß er nur Morgens oder als Abendstern scheine, und dem Lugeileng leuchte, wenn er am Strand sein Geschäft verrichte.

Als Lugeileng herangewachsen war, gab ihm Eluelap Ilamulul[4], die Tüchtige im Spiel, zur Frau. Sie bekam einen Sohn, der hieß Geo. Die 2. Schwangerschaft führte aber zu nichts, und auch das dritte mal konnte sie nicht gebären. Da fürchtete Eluelap, daß ein Ungetüm zur Welt kommen könnte, das dem Geo zu schaden vermöchte. Die Mutter suchte deshalb nach einem sicheren Platze und wählte einen Ort unter der Schlafmatte des Eluelap, zu dem man nur gelangen konnte, wenn man die Matte emporhob. Als dann die vierte Schwangerschaft eintrat und Ilamulul schließlich nicht niederkommen konnte und große Schmerzen hatte, hieß er die Hebamme eine Perlschale aus dem Meere holen und mit ihr

[1] s. S. 144. [2] s. S. 145. [3] s. S. 147. [4] s. S. 146.

der Frau den Kopf aufschneiden. Es geschah so und ein Kind sprang heraus, das den Namen **Ólufat**[1] erhielt. Er konnte alsbald sprechen und wie Erwachsene handeln. Er schnitt sich selbst die Nabelschnur ab, und als er fortrannte, färbte der Wundstumpf die Kokospalmen rot, wovon sie diese Farbe haben. Dann rannte er in den Busch und verübte viele Streiche. Als er einmal Frauen Blumenkränze winden sah, suchte er sie zu berücken, aber sie lehnten ihn ab und neckten ihn, weil er häßlich war. Sie sprachen, Geo sei »schön«, und für diesen und Eluelap seien die Kränze.

Da wurde er verstimmt und suchte überall nach Geo, aber niemand sagte ihm, wo er sei. Da sah er vor der Türe von Fadjamal 2 Fische hängen, die er noch nie gesehen hatte. Auf seine Frage sagte man ihm, Lugeileng habe sie gefangen; aber sie stammten aus dem Lande des Geo. Er hörte dies aber auch. Da ihm niemand verriet, wo das Land war, setzte er sich an den Weg vor Fadjamal, um nachzuspüren und zu warten. Er verwandelte sich bald in eine Eidechse[2], und lief dann in dieser Gestalt ins Haus zurück, wo er sich unter der Schlafmatte[3] versteckte. Alsbald fand er den Eingang in das Land des Geo, in das er hinabstieg, in seine Gestalt zurückverwandelt. Als er aber dem Badeplatz des Geo sich nahte, verwandelte er sich in einen Kranich; dorthin flog er, wo 100 Wächter waren, 50 Diener, zehn Köche und 5 Frauen. Als Geo zum Baden ging, erblickte er den Kranich, über den er sich sehr wunderte, denn er hatte noch keinen gesehen, da es in seinem Lande gar keine Vögel gab. Daraufhin flog der Kranich wieder davon, verwandelte sich wieder in eine Eidechse, kroch dann wieder unter die Schlafmatte des Eluelap und von dort ins Freie, wo er sich in Olufats Gestalt zurückverwandelte. So betrat er wieder Fadjamal und bat um ein Beil, unter Vorgabe seinen Busch roden zu wollen. Als er es erhalten hatte, versteckte er es unter der Matte des Eluelap.

Am andern Tag verwandelte er sich wieder in eine Eidechse, kroch unter die Matte, nahm das Beil und machte sich nun in Olufats Gestalt auf den Weg zu Geo's Haus. Unterwegs hatte er einen Stein aufgehoben, durch Zauberformeln besprochen und mitgenommen; den warf er zuerst auf das Hausdach, so daß er durchschlug und in den Raum fiel, in dem viele Leute saßen, die sehr erschraken. Da fiel dem Geo plötzlich der Vogel ein, und ehe er seine Leute danach fragen konnte, kam es ihm bei, daß Olufat der Vogel gewesen war, daß er den Stein geworfen hatte, und nun alle töten wolle. So kam es auch. Olufat tötete erst das ganze Hausgesinde, und schlug dann dem Geo den Kopf ab. Diesen nahm er mit und versteckte ihn bei der Rückkehr hinter einem Wandbalken des Hauses Fadjamal. Als die Leute ihn nach seinem Verbleib frugen, erwiderte er, er habe viel Busch gerodet. Seine Mutter Ilamulul ahnte aber, was vorgefallen war und

[1] s. S. 147. [2] Vgl. die Wichtigkeit der Eidechse in Indonesien.
[3] Vgl. das bei den Seelen, S. 151, gesagte.

sprach ihre Vermutung aus, worauf die Leute in Olufat drangen, seine Tat zu bekennen; er holte dann auch den Kopf hervor und zeigte ihn der Versammlung, die entsetzt war und ihm schwere Vorwürfe machte. Er aber erwiderte, daß sie ihm ja verschwiegen hätten, daß Geo sein Bruder sei. Große Trauer herrschte in Fadjamal. Lugeileng begrub den Kopf seines Sohnes vor dem Hause. Bald wuchs ein Liliengewächs aus dem Grabe auf, das zwei prächtige Blüten trieb, und aus diesen wurden zwei wunderschöne Mädchen, die Eluelap als seine Töchter annahm. Die Leute aber waren auf Olufat so ergrimmt, daß sie ihn töten wollten. Doch die Mutter legte sich ins Mittel und sprach: »Nein, es ist genug, daß mein eines Kind tot ist; soll nun auch das andere sterben?« Aber seine Verbannung wurde doch beschlossen, und so wurde es aus dem Himmel gejagt.

Olufat wanderte darauf nach dem Lande Pelit, wo ein Mann gleichen Namens wohnte, der beständig Palmwein schnitt und trank. Olufat half ihm eine Zeitlang, dann wanderte er weiter bis ans Ende der Welt, nach Tabolifalu. Dort lag ein Stück Bambus, das hob er auf und nahm es mit, als er zu Pelit zurückkehrte. Der saß gerade auf einer Palme bei seiner Arbeit. Olufat schlug den Bambus an den Stamm der Palme, was solch einen Lärm machte, daß Pelit erschrak, herabsprang und davoneilte. Dabei nahm er aber Messer und Trinkschale mit, so daß Olufat nun die Blütenstränke nicht abschneiden konnte, sondern dies mit seinen Zähnen ausführen mußte. Als er aber einmal hoch oben in einer Palme saß, erblickte er in der Ferne ein anderes Land. Alsbald ging er zum Strand, teilte mit einem Stab das Wasser, so daß er trockenen Fußes zu dem andern Land gelangen konnte. Dort lebte ein Fischer Goschuberig und seine Frau; Olufat gewahrte sie gerade im Tarofeld, und so verwandelte er sich in einen Säugling und fing mächtig zu schreien an. Als die Frau dies hörte, eilte sie herbei und freute sich über den Fund sehr, da sie kinderlos war. Sie päppelte das Kind mit einer jungen Kokosnuß und so gedieh dies, worüber auch der Mann sich sehr freute. Als eines Tags Goschuberig beim Fischen und die Frau im Tarofeld war, wollte Olufat Palmwein schneiden gehen und griff deshalb nach den Kokosschalen am Hausdach. Da gewahrte er zwei Säcke, die dort hingen. Goschuberig hatte in ihnen früher Menschen gesammelt; in einem waren die guten, im andern die bösen, kranken und lasterhaften[1]. Obwohl es ihm verboten war, verschlossenes zu öffnen, schnitt er doch die Säcke ab, die mit einem großen Geräusch auf den Boden fielen; der ganze Himmel erbebte und zitterte. Als die beiden Alten herbeieilten, nahm der Junge die beiden Säcke auf den Rücken und lief davon. Da wußten sie, daß der Junge Olufat sei. Er rannte zurück nach Pelit, und Goschubering verfolgte ihn. Als die Säcke zu schwer wurden, ließ der Räuber einen fallen, den der Verfolger ergriff, um mit ihm zurückzukehren. Aber als er ihm zu schwer wurde, ließ er ihn fallen; er durchschlug den Himmelsboden und fiel hinab auf

[1] s. diese Gegenüberstellung S. 164[1]

die Insel Feis. Den andern Sack brachte Olufat nach Pelit, wo er ihn öffnete, aber zu seinem Schrecken die schlechten Menschen vorfand; so schlug er alle tot, und kehrte dann nach Fadjamal zurück. Der auf Feis von den Bewohnern gefundene Sack, der Land und See hatte erzittern lassen, wurde geöffnet, und es kamen aus ihm so viel schöne Frauen heraus, daß jeder der dortigen Männer eine davon bekam. Den leeren Sack warf man achtlos an den Strand. Nur einer der Feisuaner war leer ausgegangen, Apischur nämlich, der mitten auf der Insel wohnte und bei der Öffnung nicht zugegen war. Als er von dem Sack hörte, beschloß er, diesen einmal anzusehen. Er legte wie beim Bootaufholen einige Palmfiederstengel am Strande aus und holte über sie den Sack nach oben; er war aber arg schmutzig, weil die Frauen in ihm ihre Notdurft verrichtet hatten. Dabei fand er noch eine vergessene Frau, die er Ilusumar benannte, weil er sie zwischen dem Schmutz[1] gefunden hatte. Er wusch sie ab und er fand die reine Frau als ein Wunder der Schönheit. Als der Oberhäuptling davon erfuhr, suchte er die Frau an sich zu bringen und sandte deshalb den Aschipur nach der Insel Faiju[2], damit er ihm Vogelfedern für Festschmuck hole.

Aschipur führte auch denAuftrag aus, fuhr aber so schnell, daß er am selben Abend wieder zurück war. Als dem Häuptling so sein Plan mißglückt war, sandte er den Aschipur nach Yap, um dort Gelbwurzpulver zu holen. Aber auch da war der Abgesandte am selben Abend schon wieder da.

Da beschloß der Häuptling, den Apischur nach dem großen Land des Ostens zu senden, damit er schöne Tücher hole. Dieses Land liegt sehr weit ab. Ehe aber Apischur abfuhr, brachte er seine Frau in Sicherheit, dadurch, daß er einen Zauber machte, wodurch sich die Klippen von Feis aus dem Meere hoben; hinter diesen verbarg er seine Frau. Dann fuhr er davon und war in fünf Tagen mit den 50 Tüchern wieder zurück. Da sah der Häuptling, wie schwer es für ihn war, die Frau zu bekommen und wollte es aufgeben; aber die Liebe ließ ihm keine Ruhe. So trug er dem Apischur etwas recht gefährliches auf, nämlich ins Land der Kraniche, nach Falueluegarar zu fahren. Als Ilusumar hörte, daß ihr Mann schon wieder reisen wolle, und nicht bei ihr bliebe, frug sie ihn nach der Ursache. Er erzählte es ihr alles, und daß er diesmal nach Falueluegarar[3] fahren müsse. Da wurde sie freudig bewegt, denn dieses Land, sagte sie, sei ihre Heimat, denn dort sei sie geboren. Sie hieß ihn darüber schweigen und sagte: »Geh nicht in diesem und im nächsten Monat; die Früchte sind noch nicht reif; das Land ist sehr weit von hier und du kannst nicht genügend zu essen mitnehmen. Bleibe noch und brenne dir Kalk, denn unterwegs wirst du viele böse Geister treffen; die kannst du alsdann damit bannen und verscheuchen." Apischur tat also und fuhr nach 2 Monaten mit 4 Leuten fort. Als er einen Monat unterwegs gewesen war, sah

[1] Kot *gaf*. [3] s. Bd. 6 I S. 163.
[2] Das Wort klingt ostmikronesisch — polynesisch.

er von fern zwei steile hohe Felsen im Meer[1], zwischen denen der Weg hindurchführte. Seine Begleiter hielten es für das gesuchte Land, aber Apischur sagte, das Land sei noch viel weiter im Osten; diese Felsen seien von bösen Geistern bewohnt. Wie richtig dies war, zeigte sich alsbald, als sie hindurchfuhren und sie von den Geistern angegriffen wurden. Apischur wehrte sie einfach durch Kalkstreuen ab.

Nach einem weiteren Monat begegneten sie einem großen Walfisch, den die Besatzung für das gesuchte Land hielt. »O nein«, sagte Apischur »wir müssen noch viel, viel weiter fahren. Aber kommt, laßt uns den Wal hinaufklettern, er soll fortan unser Boot sein und uns nach Falueluegarar bringen.« Da zerschlugen sie ihr Boot, warfen Mast und Segel in die See und kletterten auf den Rücken des Wales. Apischur sprach: »Ich bin der Führer und sitze auf dem Rücken; ihr übrigen verteilt euch auf die Flossen und zwei setzen sich auf den Schwanz«. So fuhren sie weiter. Als es aber den Leuten auf ihren Plätzen nicht mehr gefiel, machte Apischur einen großen Zauber, und so gelangten sie alle auf die Wirbelsäule des Fisches. So kamen sie wohlbehalten nach Falueluegarar, denn nach einem Monat strandete der Wal dort. Da kamen die Kraniche und fraßen das Fleisch des gestrandeten Tieres; als dann das Knochengerüst in der Sonne trocknete und auseinanderbarst, kroch Apischur mit seinen Leuten heraus. Sie gingen ins Land hinein und kamen an ein Haus, das der Frau Alizelap gehörte. Sie war eine schlimme Zauberin, halb Geist, halb Mensch. Als sie die Ankömmlinge sah, ging sie ihnen entgegen und sagte: »Leider habe ich kein Essen, euch zu speisen, ich will aber meine Leute rufen, die es bereiten sollen.« Sie zündete eine Menge Feuer an, damit die Fremdlinge herbeikämen. Denn sie wohnte ganz allein auf der Insel. Neben dem Hause stand eine Kokospalme, die der Ilusumar gehörte; daneben waren zwei Wasserlöcher. Apischur wußte dies von seiner Frau. Das Wasser, des einen Loches war klar, der Brunnen war schön gepflegt, die Korallensteine schön aufgesetzt; aber wer in ihm badete, wurde zwar schön und stark, aber er wurde auch krank und starb. Dies erhoffte Aliselap, denn sie wollte die Fremdlinge auffressen. Dagegen war das andere Loch unsauber, mit Schmutz umgeben und hatte trübes Wasser; aber es war ungefährlich. Als die Leute des Apischur nun in dem schönen Wasserloch baden wollten, warnte er sie; er hieß sie auch 5 Nüsse von der Palme holen, und den Schmutz wegräumen. Als sie dies getan hatten, fanden sie einen flachen Stein zum öffnen der Nüsse und unter ihm die von Ilusumar dort niedergelegten Trinkschalen. Alle badeten nun und erfrischten und sättigten sich dann von den Nüssen. Dann machten sie sich daran, den Auftrag der Feis-Häuptlings zu erfüllen. Sie verteilten sich über die Insel und jeder sammelte eine Kiste voll Kranichfedern. So wurde die Abreise auf den folgenden Morgen festgesetzt. Als sie nachts im Hause der Aliselap schliefen,

[1] s. Matángrengós, Palau IV S. 9 = Kusae, daß der Weg zwischen beiden führt, stimmt freilich nicht.

legte Apischur seinen Leuten und sich Kokoskernstreifen auf die geschlossenen Augenlider, damit die bösen Geister glaubten, daß sie wachten.

Da Apischur kein Boot mehr hatte, hieß er am folgenden Morgen seine Leute den Stein des Wasserloches wegräumen. Als sie es getan hatten, fanden sie den Eingang zu einer Höhle. Apischur sagte, es sei der unterirdische Weg nach Feis, den sie nun, jeder mit seiner Kiste, wanderten. Endlich kamen sie wieder an einen Stein, und als sie ihn entfernt hatten und hinaufstiegen, gelangten sie in das Haus der Ilusumar, die über die glückliche Heimkehr des Apischur sehr erfreut war. Nachdem die Ermüdeten lange geschlafen und sich gestärkt hatten, brachten sie die Kisten dem Oberhäuptling, der nun sah, daß er dem Apischur nichts anhaben könne, und so Ilusumar zufrieden ließ. Die beiden lebten nun glücklich zusammen und bekamen viele Kinder.

Als diese einmal spielten, hatte der Älteste das Unglück, ein anderes Feiskind zu erschlagen. Da wollte niemand mehr mit den Kindern der Ilusumar spielen, weshalb diese von Feis fort wollten. Der Älteste wollte ins Land der Mutter, nach Falueluegarar, denn hinter der Kranichinsel der Aliselap war noch eine schöne größere, wo viele Leute wohnten. Als Ilusumar sah, daß der Junge durchaus wollte, sagte sie ihm die Zauberformeln zum Schutz gegen die Gefahren, die schon ihrem Gatten gedroht hatten. Sie salbte auch dem Jungen seine Füße mit Öl, besprach sie, so daß er über die See wandern konnte. Als er nach langer Zeit zu der bewohnten Insel gelangte, wurde er dort freundlich aufgenommen, und als er von seiner Mutter erzählte, weinten die Leute vor Freude, über die totgeglaubte Schwester etwas zu hören. Sie feierten den Sohn und machten ihn zu ihrem Oberhäuptling.

Der zweite Sohn ging heimlich davon und wurde von den bösen Geistern der beiden Felsen gefangen. Aus dieser Haft befreite ihn dann der dritte, der mit Wissen der Mutter fortgereist war. So gelangten beide wohlbehalten zu ihrem Bruder und wurden herzlich aufgenommen. Schließlich wollte auch der vierte Bruder fort und so vereinsamten Apischur und Ilusumar. Sie verließen auch Feis, wanderten nach Falueluegarar, wo sie bis an ihr Ende mit ihren Söhnen glücklich vereint blieben.

2) **Füs** (Hambruch auf Elato[1]) (s. Fußnote S. 144).

(Erzähler Tăréulimĕng, der Priester des Füs.)

Füs ist ein *uopéi*, ein Dämon, wie Yóngelaf in Yap. Er lebte früher auf Olimăuruo[2], wo er heute noch ein Haus hat. Auch auf Elato ist ein Haus von ihm,

[1] Bei diesen Aufnahmen war ein Mann von Mogemog (Lamululsi = Uhlíthi s. Kr.) zugegen, der den Erzählern vieles ins Gedächtnis zurückrief. Es sind also diese Sagen auch auf Mokemok bekannt, oder der Fremde müßte sie früher schon auf Elato gehört haben. Kotzebue S. 57. nennt den Gott von Lamotrek und Elato = Fuß = „Stern".

[2] s. S. 17.

obwohl er noch ein kleines Kind ist. Dieses Haus wurde von Iguar errichtet, der in jüngerer Zeit den Füs nach Elato gebracht hat; er ist schon gestorben. Er hatte es auf Geheiß von Füs getan, der es ihm im Schlaf anbefohlen hatte. Auf Olimarauo, das wie Pik und Pikelot früher stark bevölkert war, hieß das Haus Falimar, und auf Elato Eaurulap[1]. Hier werden Kränze, Matten, Düfte, Nüsse, *mar* usw. von den Seefahrern niedergelegt, sowohl von fremden, als einheimischen. Auf Lamotrek ist aber Füs nicht heimisch; seine eigentliche Heimat ist Olimarauo. Seine Mutter ist Lagalufar, sein Vater Mäzapelăχ. Als Olimarauo von einem starken Sturm heimgesucht wurde, der Insel und Menschen vernichtete, kamen beide zu Iguar, wo Füs geboren wurde. Dieser hat seherische Eigenschaften; so erscheint er z. B. einem Manne im Traume und kündigt das Erscheinen von Schiffen an; auch warnt er vor Krankheit, Unbill und Gefahren und so genießt er göttliche Verehrung, obwohl er nur ein Mensch war, eben nur mit besonderen Eigenschaften.

Füs hat übrigens auch im Himmel ein Haus mit einem runden Pfeiler und ein Schirmdach darüber. In diesem Hause schläft er und sieht alles, was Elato betrifft, Krankheiten, Reiseboote usw. Bei Krankheiten werden zur Abwehr Matten, *kini*, rund um die Insel gehängt. Kommt die Krankheit trotzdem, so müssen Arzneien helfen. Füs wird dann in Gebeten angerufen.

3) Eine Himmelslegende (Hambruch).

Es war einmal ein König im Himmel. Der hatte ein Kind, das war ein Mädchen. Auch gab es im Himmel einen Ort, der war tabū; kein weibliches Wesen durfte ihn betreten. Eines Tages ging das Mädchen ans Wasser und tötete mit einer Keule Fische. Als es wieder aus dem Wasser kam, ging es an einem Wasserloch vorüber. Dort fand es auf den Kopf gestellt eine halbe Kokosnuß. Es hob die Nuß auf und trug sie unterm Arm fort, bald unterm Rechten, bald unterm Linken und schrie dabei laut; denn es war auf den Tabūplatz geraten und hatte hier die Nuß weggenommen. Schließlich legte es die Nuß auf die Schulter. Hier wuchs sie sofort mit dem Fleisch zusammen. So gelangte es in das Haus der Eltern. »Nun, was ist mit dir los? Willst du sterben?« Sie salbten das Mädchen mit Öl und Reng und behängten es mit den kostbarsten Sachen. Darauf ging es an das Wasserloch zurück. Dort fiel die Nuß plötzlich von ihm ab und genau auf den Platz, wo es sie fortgenommen hatte. Aus dieser Nuß wurde ein Wesen Ẓubulimāl. Dies Wesen lief im Himmel hin und her und suchte nach einem andern Geiste. Da kam Semālogerāl[2], der Bruder des Ẓelān des Weges und sah die Königstochter dort sitzen. Er warb um sie; sie wurde seine Braut, und er brachte sie zu seinen Eltern. Darüber ergrimmte Ẓubulimāl; denn er bean-

[1] vergl. Truk S. 324 und oben S. 144. [2] s. S. 144.

spruchte das Mädchen für sich. Die Eltern des Zelāū versteckten nun das Mädchen. Zubulimāl war sehr böse und hielt am Wasserloch Wache. Als das Mädchen nicht wiederkam, rief er alle Geister zusammen, die das Mädchen töten sollten. Doch niemand konnte es finden. Da befragten sie das Abzählorakel (*inapin*) und bekamen damit heraus, daß das Mädchen im Hause des Semālogerāl befand. Da versammelten sich die Geister vor den Häusern. Die Insassen hatten große Angst. Semālogerāl sandte aber Botschaften an Butā und Wōrōwōr, ihm zur Hilfe zu kommen. Nach einer Weile erschienen dann Blitz und Donner über dem Hause. Die beiden fielen über die Geister her; der Donner trieb sie auseinander und der Blitz verbrannte sie. Da konnte Semālogerāl das Mädchen heiraten. Und wenn sie nicht gestorben sind, leben sie noch heute.

4) Die Geschichte von Maaûtīk[1]. — Inhalt eines alten Epos. (Hambruch).

In Mōgemōg lebte ein Mann Mōrāp. Der hatte drei Söhne. Die beiden ältesten benahmen sich dem jüngsten gegenüber schlecht. Er bekam kaum Essen und hatte die niedrigsten Dienste zu verrichten. Mōrāp machte häufig nächtliche Ausgänge, und die beiden älteren Brüder wußten nicht wohin der Vater ging. Der Jüngste wollte nun gern wissen, woher der Vater alle die schönen Sachen bekam, die er hatte; er schlich ihm nach. Maaûtīk kam bald dahinter. Er hörte, wie der Vater 1; 2, 3 zählte, dann in die See sprang und nach Fais schwamm. Das lag damals unter Wasser. Maaûtīk ging also dem Vater nach, der dann höchst erstaunt war, ihn in Fais zu finden.

Einmal kam Mōrāp nicht mehr zurück. Er war gestorben. Maaûtīk sah nach ihm, fand ihn in Fais. Doch erzählte er davon nichts den Brüdern. Als er heimkam, fragten ihn die Brüder: »Wo bist du gewesen?« — »Ich habe geangelt.« — »Mach Feuer und arbeite, sonst töten wir dich!« — Hernach sagten sie: »Komm, wir wollen fischen; du sollst im Kanu das Wasser ausschöpfen.« — »Bitte gebt mir auch einen Haken, ich will einen großen Fisch fangen.« — Bald kamen sie in das Riff, wo sie sonst ihre Fische fingen. Die Brüder gaben dem Jüngsten ein Stückchen Kokosschale als Haken und ein wenig Kokosfasern zur Leine. »Was soll ich damit?« — »Knote es nur zusammen, für dich ist es gut genug.« Bald hatte Maaûtīk Haken und Leine über Bord. Schon biß es an. Er zog und zog. Da wollten die andern ihm helfen. »Geht weg, haltet lieber das Kanu klar.« Bald kamen die Wedel von Palmen, dann Felsen zum Vorschein. Das Kanu war nahe dem Untergang. Da schoß endlich mit einem Male eine Insel aus dem Wasser empor. »Seht, ich bin der Jüngste und Schwächste und kann doch Fische fangen!«[2] — Nun fingen sie an zu streiten wem das Land gehören sollte. Der älteste Bruder beanspruchte es, der zweite auch; Maaûtīk sagte: »Mir gehört

[1] Durch Vermittlung von Lewis erhalten. [2] s. Palau IV Gesch. 14.

die Insel.« Aber wir wollen nicht streiten. »Laßt uns zum Vater gehen. Der wird es wissen und entscheiden.« — Da rief Mörŏp von unten herauf: »Du bist klein und doch groß; du sollst groß bleiben.« Da erschraken die älteren Brüder und ließen von Maaŭtlk ab. — »Du bist klein, aber du bist groß. Du bist ein tüchtiger, guter Mensch. Dir und deinen Erben soll die Insel gehören.« So wurde Fais aus dem Wasser gezogen[1].

5) Vom Regenbogen, *Lăŭliăr* (Hambruch).

In alten Zeiten waren die Winde sehr stark und kräftig. Immer stürmte es. Da sandten die Menschen eine Botschaft zum Himmel und baten, die Winde sollten doch aufhören so stark zu wehen, denn auf Erden hätte man nichts mehr zu essen. Da sagte ein Mann Sŏńŏr: »Ich will sterben, wenn ich euch damit helfen kann.« Sie setzten ihm seinen Tanzstab auf die Brust. Da starb er. Wegen seiner guten Tat nahm Eluelăp ihn zu sich. Aber er wurde im Himmel bald übermütig; belästigte und ärgerte alle Leute, so daß man seiner schließlich überdrüssig wurde; sie wandten sich an Olufăt. Olufăt nahm ihn freundschaftlich beiseite. Und Sŏńŏr fragte den Olufăt: »Woher kommt es, daß auf Erden immer Sturm ist? Woher kommen die Winde?« — »O ja, daß weiß ich.« — Sie schliefen nun und begaben sich dann nach dem Hause der Winde. Das war ein Pfeiler ohne Dach. Die Winde hatten das Dach fortgenommen. In dem Pfeiler war ein großes Loch. Da fuhren die Winde stets heraus. Die beiden konnten nicht an dieses Loch herankommen, denn der Winddruck war zu stark und warf sie immer wieder zurück. Olufăt kehrte deshalb um. Sŏńŏr sprang jedoch auf das kahle, abgedeckte Dachgerüst. Da fragten ihn die Bewohner

Atibajur	Wasserhose	Lăŭliăr	Regenbogen
Tjur	Nebel	Pugilitălk	kleiner Windstrudel

was er wollte. Er sagte es ihnen. Er wolle die Winde sehen. Dann gingen sie hier fischen. Als sie heimkamen, wollte Pugilitălk das Segel ins Haus bringen. Das ging nicht, denn Sŏńŏr schob das Segel immer wieder zurück. Schließlich verlor Pugilitălk die Geduld. Er rief seine Brüder herbei. Sie versuchten nun zu vieren das Segel in's Haus zu bringen. Vergebens. Da glaubten sie, daß Olufăt ihnen einen Streich spielte. Schließlich brachten sie das Kanu mitsamt den Fischen vor das Haus. Da bemerkten sie den Sŏńŏr. »Na, ihr habt wohl tüchtig gefischt? Und habt Glück gehabt?« — »Wer bist du denn?« — »Ich bin Sŏńŏr.« — »Dann komme herunter vom Dachgerüst, wir wollen kochen und essen.« Nach dem Essen schlug Sŏńŏr vor: »Wir wollen spielen.« Sie fingen an zu ringen.

---

[1] Vgl. Mogomog wo statt Mŏrŏp ♂ eine Frau Lŏrŏp ♀ die gleiche Rolle spielt.
Lewis machte auf Polyn. Society 04/05 aufmerksam, wo die Erschaffung von Hău-a-iki erzählt wird. In der Lŏrŏp-Sage: Maŭ kĕh bzw. Maŭe tik. — Fakarafa = Tahiti.

Sŏńŏr besiegte den Pugilitšlk und darauf seine drei Brüder. Nur beim Lafuliär gelang es ihm nicht ganz. Sŏńŏr sagte da zu ihm: »Du sollst fortan ein Zeichen am Himmel sein für Sturm, reichen Fischfang und Tod.« — Darauf holte Sŏńŏr sich einen kräftigen Knüppel, schob ihn in das Loch der Winde und besiegte so auch diese.

Er heißt auch Péiroilap[1]; daß ist ein Ehrentitel und bedeutete soviel als die segnende schützende Hand.

Füs lebte vor Ankunft der Weißen. Sein Vater zeigte den Eingeborenen den Weg nach Guam, um dort Eisen und Tabak zu holen. Füs steht als Sonnenstrahl vorn im Boot und weist dem Boote den Weg. Um ihn gut zu stimmen wird ihm von jedermann nach Belieben geopfert. Diese Opfergaben werden stets dem Füs inspiriert; ist er befriedigt, so bringt er reiche Fischzüge.

6) Gesang von *alusúlŭl* »Geist der See« (s. S. 42).

Flehen um Erlassen der Strafe bei Bruch von Fischertabŭ, wobei mit *edr*-Zweigen geschlagen wird. Der Gesang soll sehr alt sein, schon bei der Entstehung der Insel entstanden. Er ist von einem Oleái-Mann, dem Baura von Falális berichtet, den ich auf Lamotrek antraf[2].

1. *ilémetiu, i lémeta*	Ich winke hinab, ich winke hinauf,	
mála gatára lángila	erflehe Hilfe vom Himmel,	*gatardi* aufstören z. B. die See.
malagatára satílŭ	erflehe Hilfe von unten,	
igo saŏă riă	du treibe weg die Strafe,	*ría* von selbst kommend wegen Hoheitsverletzung.
5. *igo saoă mas*	du treibe weg den Tod,	
meteă mélĕba	treibe weg....!	dabei Schlag mit *kiop* (Crinum) Blatt.
rigeri kŏŏiog	Renne fort in Fäden,	*idio* in Fäden, in Haufen.

[1] = Arm breit, groß; s. oben *wopŏi*.

[2] Es handelt sich um eine angebliche 1904 ereignete Geschichte: der Geist *alus*, der *alus ŭrŭ*, verliebte sich in ein schönes Mädchen von Falális, heiratete sie, blieb aber nur während der Nächte bei seiner Frau, und verschwand jeden Morgen mit Hahnenschrei. Dafür legte er aber vormittags die herrlichsten Fische neben dem Hause der Frau nieder. Dies dauerte ungefähr einen Mond lang. Als aber Wachen ausgestellt wurden, um den Bringer der Fische zu beobachten und zu fangen, flogen auf diese Steine von unbekannter Hand. Die Essenslieferungen hörten aber auf als die Schöne eines Tages ihrem Manne untreu wurde; auch brannte das Haus eines Mittags ab, ohne daß ein Mensch in der Nähe war. Die brennenden Hölzer flogen nach allen Seiten, das Wasserloch dabei versiegte, als man löschen wollte. Der Jüngling, der mit ihr sich einließ, starb nach 3 Tagen. Sie verzog darauf nach Saipan, wo sie 1910 noch lebte.

melemal e ɓiog	reinige in Fäden,	
tamól i tát	Herr der See!	*tát* das Meer s. o.
galang a perém	hebe dein Bein	
boẽ tafal	und kehre heim,	
boẽ ti vól	wolle gehen hinauf,	
boẽ rikefál	wolle rennen hinab,	
boẽ kamátaiól	wolle dein Gesicht abwenden,	*kamát* ausblicken, das Gesicht zurückwenden, *aiól* sanft.
kamátaitát	wende dein Gesicht zum Meer,	
kamát ale palegia	blicke zurück zur Bohrmuschel,	*palegi* Lithodomus
ẽ djúa	geh' fort,	*dju, djrú* gehen.
iléli matafára	schwimm weg mit dem Übel innen,	*il* schwimmen, *fára* das Innere; bezieht sich auf den ersten Biß des *alus* im Wasser; *fai* der Stein, der bezaubert in der Hand gehalten und besprochen wird: er soll fortnehmen.
fai le matafára	den Stein fort mit dem Übel innen.	
govolésóu	Lege ab	mit dem Boot
govolẽ i vas e tát	und fahre aufs Meer,	*vés* = gehen
váselok lémetau	fahre auf den Ozean.	
valevole tábotap	Segne das Heilige,	*valevol* wohl gleich *bolebol* (S. 151) „bedecken" mit Segen.
go tálɓia	Du geh' irgend wohin,	*tal* gehen.
go tal ẽ temaka	Du geh großer (Täuscher),	oder Spitzbube, unausgesprochen.
iẽ tárage perémo tát	ich habe gehoben die Füße, Tat,	Tat = *alusitát.*
mol lugu togorol	und warf ihn hinter meinen Rücken.	den Stein.
go volél vas	Du schnell gehe,	
i vaséllau lémetau	fahre nach dem Ozean.	Z. 22.
ifa alús ifai aromat	Wo ist der Geist, wo der Mann,	

i lúlur néi tatav	ich nehme weg und treibe weg,	den schlechten Einfluß, *lul'lur* zusammenschrumpfen.
tarai evó lêt	treibe es über die See;	
lap esió mê	einen roten senkrechten (Strich)	*lap* ockerrot[1]; gegen Schnupfen und Verwünschung wird ein senkrechter Strich über Stirn und Nase gemacht.
siusiu	(mache ich mir) einen stehenden,	*siu* stehen, *siu siu* stetig stehend; *kasíu* stelle auf.
êlir a lê ê sigatíei	(gegen) alle die mich hassen,	*alir* alle, *sigatíei* Haß gegen mich.
35. *lê farualis síei*	die Zauber machen gegen mich	
mê vôli fáliuei Falalis	auf dem Platz Falàlis.	auf Oleái.
bágou êli boêtiu	Hai der Tiefe,	
sêrau êli boêdji	Sarau der Nähe,	Fisch s. Index.
39. *karótê metáralog*	verschlinge sie völlig	sie, die Feinde.

Hier hält der Sprecher Kokosblätterbündel in den Händen und rudert damit, *meseli pálü*.

Einen dem eben gebrachten Oleáigesang ähnlichen bringe ich nur im Lamotrektext ohne Übersetzung in folgendem, wobei die Zeilenangaben, auf dem vorhergehenden Gesang hinweisen. Er wurde gesprochen gegen einen Tabubruch der Frau Levólimar gegen den *alusitet*.

Auch hierbei wurden Crinumblätter gebraucht, mit denen die Schultern des Kranken zweimal geschlagen wurden, dann einmal beide Blätterbüschel oben zusammen, dann schließlich beide zusammen auf den Boden gelegt.

rikiriki ôlo	s. Z. 7

7) Gesang (E. Krämer).

ganat varūch — Es geht das Boot,
rēnnū göppi sjiē giuia — der Tag, da geht das Boot ins Wasser,
sjāumauennivalūjasch — und wenn es fortgeht,
gij gāune marau ulach — bin ich traurig hinter dem Boot;
ējēuvalāch mē latipasch — mein Herz ist umgedreht!
majange ma atirigurujaf — Majange und Atirigurujaf — Mädchen Namen; *majange* junger Farntrieb, *at*.... Blüte vom *eare*-Baum;
ji le uai i gaitirang — nicht mehr wollen sie auflegen *reng* — Gelbwurzfarbe.
ma gulejoi nalūjasch — oder irgendeine Blume tragen,
lē giti laggo pilimoare — kein *moere* mehr machen,
boatai mellē aboiila — wenn sie nicht mehr sehen
ngaji buēri garaijasch — und hören den Liebsten
tiu ēuni jē ji gilimallū — zwischen den hübschen Vögeln — d. h. Knaben.
allē allē laggo mētalūbas — sie möchten....,
buogara melē ji taimaj — wenn sie keine Arbeit hätten,
ngaji bāafitī bēroijīf — gehen in den Schaum der See,

syi rik mē ūēl būrailo	dem Branden der See,	
ta buē ē aūt pūngū toch	sie möchten mit dem Strom hinausschwimmen,	*ēut* Strömung hart, sonst *fongosch*, Fritz *fangosch*.
yi būnge boajibui ē re falago	ihrem Liebsten das Gesicht abzuwischen,	
tamuruno ē tai mosch	das Salz fällt auf ihr Gesicht,	
20. *mā sjērēlō li uēijei*	und die Kälte des Bootes;	
ē tēganaue ē fatujonge	sie haben Mitleid mit	
mē pā jegili gē faiyage	ihren Geliebten, daß sie so mitgenommen werden.	

8) Weiterer Sang (unübersetzt).
Eigener Versuch.

pūngepūnge mē nūgūg	Es donnert die See, (s. S. 114, Z. 10)	*ilukun* draußen Truk
pūngepūnge mē lalo	Es donnert die See unten,	
arajojo manēji, tru	.....	

9) Gesang (unübersetzt)

sinilipē uruwēja[	*mariēgatjoligu*
va jē patjūgū majei	*fai ē sati goalaoch*
ira melle ū mellat	*anni fērra mou gamoar*
ga jū pōepōe i tēua	*ite nou gatjei garar*
na m merri ē ri gamoa	*uollejēja drolagar*
siē vagate fērigarat	*ēta muerre ja oupagā*
uari lōt a gū fellat	*nga tjō gemen ngijilak.*

5. Musik.

Nichts besonderes ermittelt.
He. 2170 = 594311 eine Flöte *a tigetig* aus Yap-Bambus *sit.*

6. Plastik, Ornamente.

An Plastischen Holzarbeiten seien nur die Vögel genannt, von denen einer an der Traufe des Boothauses (Farbtafel 2) hängt. Die Truhe mit den Figuren (Abb. 31) ist wie erwähnt, eine fremde Arbeit.

Eine besondere Kunstübung liegt nicht vor. Lamotrek schmückt aber seine Boothäuser, seine Wohnhäuser, seine Matten und Webstühle am schönsten. Auch die Tatauierung und die Bambusbüchsen zeigen eine Menge Muster auf, deren wichtigste hierunter zusammengestellt seien.

Die Liste folgender Ornamente stammt meist aus der Tatauierung; aber auch aus dem Kerbschnitt sind einige hinzugefügt. Die Aufzeichnungen der Bezeichnungen stammen von verschiedenen Aufnehmern, woher sich die Verschiedenheit erklärt Abb. 79:

Abb. 79. Ornamente.

1. *idrfüs* von *idj* Messer, *füs* Stern (?), wohl gleich Nr. 37 *idjefidj* die Hacke Abb. 69; gleich der Fingertatauierung Truk S. 113, a.
2. *ngi kavisevis* Zahn *ngi* von *füs* Stern = Strahlen; s. Nr. 40, Abb. 10c.
3. *ngi le gälj (gedj)* Zahn der Ratte; vgl. Truk 113, n. s. Abb. 10d links.
4. *kuludjelle* unerkärt; Muster ähnlich Nr. 3, Abb. 11a rechts.
5. *kuriegars* unerklärt, ähnlich Nr. 3.
6. *ngirigers* Zahn der Ratte gedj wie Nr. 3.
7. *ngi shi meie* Zahn von ...
8. *ngi li tag* Zahn des Hornhecht.
9. *ngi le paggo* Haizähne s. Nr. 43, s. Abb. 9a und b oben, und 10d rechts.
10. *irēriēüde* unerklärt, wie Nr. 8.
11. *noriaidjinnē* oder *radjib* wie 10, sägenförmig.
12. *ngi sum* Tridacnazähne (Truk *sim*).
13. *ngoüissum* offenbar die alternirenden Tridacna *(sum)* Zähne beider Seiten.
14. *gaulimadj* ein Winkel, wie die Legangel Palau III S. 77 (s. o. S. 50) Bd 6 I S. 222 *ōr*; s. Abb. 9a.
15. *oródrib* Zikzaklinien.
16. *parük* ebensolche, senkrecht stehend.
17. *lebalörres* Zikzakfigur, vogelähnlich.
18. *bagergari (fagegari)* oder *kogotjieb* (s. 19) Rautenreihe, 2 Zikzak sich treffend, Abb. 11a links (= Truk S. 149r').
19. wie 18. Zwei Rauten, durch Stab getrennt.
20. *agapörripuragäre* stehende Rauten gereiht, zwischen zwei Linien. Truk 113, d rechts. Weiß auf schwarzem Grunde, Abb. 11b unten.
21. *ajüjü rüferre* (djüdjü Raa mit der *mop*-Verschnürung) zwischen zwei Linien schiefe Verbindungsstriche, Abb. 11b.
22. *radjelle djinne* auf einer Linie stehende Dreiecke, Spitze nach unten (wie am Fächer *pērrät* He. 2118) s. Nr. 43, s. Abb. 11b links.
23. *pup* einzelne Raute mit Gabelverlängerung (s. Truk S. 150x). Fisch Balistes, Abb. 10c.
24. *ig a djep* »Fisch Caranx« gereihte Schwänze. Abb. 12 u. 13 rechts.
25. *ig* »Fisch«, liegendes Dreieck.
26. *küe, ku* »Delphine«, einfach und doppelt. Abb. 10b u. c, und 11 (Truk S. 113i).
27. *metál ig* »Fischauge« Vierecke in Reihe (vgl. Truk S. 149q).
28. *djünipar* »Knochen des *par*«, stehende Winkel zwischen 2 Linien. (Truk S. 148i).
29. *djünipari* »Knochen des *par*«, Zikzaklinien übereinander, Spitzen durch Stäbe verbunden. Abb. 11a unten.
30. *kurugago* Dreieck mit Schürhakengabel. Schwanz der *gurugak* = Seeschwalbe (Anous). S. 146. Abb. 11a.

31. *nadjigo* ein Vogel, Muster ähnlich. Abb. 10a u. b und 57.
32. *kor'ror* der Reiher. Vgl. die Fregatvögel, Abb. 57.
33. *valitog* Bögen unter einer Linie, eine Muschel. He 4654.
34. *epēp* Dreieck nach unten hängend, an der Spitze ein Viereck. Lepas. Abb. 9b.

Oleáí-Gruppe.

(Karte 4)

Position: mitten etwa 7° 21′ N.-Br., 143° 55′ O.-L. genau: Nordspitze von Raur 7° 21′ 39″ N.-Br., 143° 57′ 30″ O.-L.

I. Entdeckung und Erschließung, Allgemeines.

1. Segelhandbücher.

S.-H. S. 36: Oleáí-Inseln (Oleei, Uleai, Wolea, Ulie, Anangai) liegen etwa 130 Sm westlich von den Elato-Inseln. Die Gruppe besteht aus zwei Atollen, die eine Westlagune und eine Ostlagune umgeben; erstere ist ausgedehnter, aber die größeren Inseln liegen um die Ostlagune. Die Hauptinsel Flalap, an der Nordseite der Ostlagune, verbindet sich durch eine Sanddüne allmählich mit der westwärts folgenden Insel Marijong (Mariom), außerdem aber auch mit dem südöstlich gelegenen Paliau, und dieses wieder mit dem südwärts sich anschließenden Raur. Die Gruppe wird von 19 teils größeren teils kleineren Inseln gebildet, von denen nur die 8 größten bewohnt, alle aber üppig mit Kokospalmen und hochragenden Brotfruchtbäumen bestanden sind. Die Namen der bewohnten Inseln sind: Raur, Flalap (Oleái), Marijong, Tagaulap, Saliap, Utagal und Falalis. Die Inseln liegen in der Form von zwei Halbkreisen, die bei der Insel Tagaulap zusammenstoßen, derart angeordnet, daß eine arabische »3« durch sie gebildet wird. Die Öffnung dieser 3 ist nach Süden. Diese große Rifflücke setzt die Lagune frei dem Südwestmonsun[1] aus, so daß, wenn er weht, schwere See im Hafen steht. Dieser ist zudem von vielen Riffbänken durchsetzt. Eine besonders gefährliche Bank liegt nordöstlich von der Insel Motegosu (Motagu) und 0,7 Sm westlich von Paliau. Dort steht bei stürmischem Winde, wie er zur Zeit des Nordostmonsuns oft herrscht, sehr hohe, ineinanderlaufende, von allen Richtungen kommende See mit gewaltigen Brechern.

Eingeborene. Die Wohnstätten der Eingeborenen liegen an den der Innenlagune zugekehrten Seiten der Inseln. Sie ziehen sich längs des ganzen Sandstreifens hin, ohne daß merkbare Grenzen zwischen einzelnen Ortschaften beständen. Solche bestehen indes, jede Insel hat zwei bis drei unter verschiedenen Häuptlingen stehende kleine Dörfer. Das Oberhaupt ist der Häuptling in Gatschbar auf Jap. Die Oleáíleute unternehmen Handelsfahrten, die sie bis nach Truk führen, wo sie »Reng«, das Wurzelpulver der Gelbwurz, das Oleáígold, holen im

[1] s. das über den Monsun bei Lamotrek S. 1 Anm. 1 gesagte.

Karte 4.

Eintausch gegen gewebte Matten, Schmucksachen und Kanus. Die Oleáíleute gehören nach Körperbau, Kleidung, Sprache und Sitten zu den Central-Karoliniern und stehen mit den Einwohnern von Truk, Ululssi, Lámutrik, Sátuwal, Sorol und andern Inseln in engem Verwandtschaftsverhältnis. Die Einwohnerzahl betrug 1904: 661. Als Hauptgrund für die Abnahme der Volkszahl wird Dysenterie infolge des Genusses von saurem Toddy, ferner Elefantiasis und Paralyse angegeben.[1] Da der schwere Taifun vom 28. März 1907 die östlichen Inseln der Gruppe verwüstet und 200 Menschen das Leben gekostet hat, wird die Einwohnerzahl wohl auf wenig über 450 gesunken sein.

Boote: Hervorragendes leisten die Oleáíleute im Bau von Segelkanus, von denen es zwei Arten gibt: kleine Kanus, die dem Verkehr in der Lagune dienen und die großen Ozeankanus, mit denen sie die Hochseefischerei betreiben und ihre weiten Fahrten bis nach Truk unternehmen.

Fischfang bildet die Hauptbeschäftigung der Männer neben dem Haus- und Kanubau; er wird innerhalb der Lagune wie auf hoher See ausgeübt und zwar mit Speeren, Angeln, Reusen und Netzen auf Fischbänken.

Frischwasser: Gutes Frischwasser ist auf der unbewohnten Insel Paliau zu haben.

Durchfahrten der Oleáí-Gruppe sind der Nord-Kanal zwischen Jalangigereil und Fareiles, der West-Kanal und der Raur-Kanal östlich von Motegosu; letzterer ist etwa ½ Sm breit und hat in der Mitte 16 bis 46 m Wassertiefe. Durchfahrt für Kanus und Boote benutzbar, liegt zwischen Tagaulap und Marijong. Neben ihr, nach Tagaulap zu, findet man auch bei ruhigem Wetter hohe Brecher. Ziemlich genau an den Scheitelpunkten der Halbkreise ist beim Nordostmonsun die Brandung am stärksten.

Verschwundene Inseln. Die Inseln Pial, Komol und Falulap sind nach Bericht S. M. S. Cormoran vom März 1912 weggespült.

Ankerplatz. Westlich von Raur können große Schiffe in 24 bis 36 m Wassertiefe ankern; sie liegen dort geschützt, man achte aber auf die in der D. Adm.-Krt. 93 (Tit. XI. 403) angegebenen Untiefen innerhalb der Ost-Lagune.

Flalap (Wolea, Ulie), die nördlichste und größte der Oleáí-Inseln, hat dreieckige Gestalt und ist etwa 1 Sm lang. Das Küstenriff der Südseite steigt steil an, es hat gute Landungsstellen. Flalap ist gut mit Bäumen bestanden; Fußwege führen nach verschiedenen Richtungen über die Insel.

Tagaulap. Vor etwa 15—20 Jahren zur Zeit des Südwestmonsuns hat eine Sturmflut die ganze Südspitze der Insel Tagaulap weggerissen mit allen Häusern, Kokospalmen und Brotfruchtbäumen, doch ohne Verlust an Menschenleben. Heute ist die Spitze völlig versandet, und nur die nackten Gerippe der abgestorbenen Bäume ragen aus dem lockeren Sande heraus.

[1] s. Born's Bericht.

Raur ist während des Taifuns Ende März 1907 durch eine Flutwelle vernichtet worden; nur zwei Personen konnten sich retten. Die frühere Insel ist jetzt ein mit einer Sandbank bedecktes Riff. Der Regierungsschuner »Ponape« lag während des Taifuns 1907 südlich von Flalap vor Anker. Bei nordöstlich bis ostnordöstlichen Winden verlor er dort beide Anker und trieb jedenfalls mit der Flutwelle, die Raur vernichtete, südwestlich frei über die Riffe nach See.

P. J. P. S. 501: „Die Woleai oder Anangai[1] Inseln liegen ungefähr 60 Meilen nordöstlich von den Eauripik-Inseln. Das Atoll, dessen Südseite größtenteils untergetaucht ist, ist in 2 Lagunen geteilt, durch einen Kamm von Riffen südostwärts streichend von der Insel Tagaulap (Br. 7° 22′ N, Br. 143° 53′ O.). Die Westlagune ist weit und im allgemeinen tief, aber mit zerstreuten Untiefen; da der Eingang zu ihr flach ist, können größere Schiffe nicht hineingelangen. Beide Lagunen sind offen nach Süden hin, und während des Südwestmonsun setzt eine Dünung herein. Ein Sandkai liegt auf dem Riff an der südlichen Atollseite ungefähr 1½ Meilen von Tagaulap.

Alle Inseln sind mit Cokospalmen und andern Bäumen bedeckt. Die Insel Motogosu an der südwestlichen Seite der Ostlagune und beinahe eine Meile westlich der südlichen Spitze von Raur, die südöstlichste Insel der Gruppe, ist niedrig und aus Sand und Kies gebildet.

Zwei weiße Häuser sind an der südwestlichen Seite von Woleai, der nordöstlichsten Insel der Gruppe, aber sie sind nicht deutlich. Zwei hölzerne Landungsbrücken sind in der Mitte der Südseite der Insel Mariaon, ungefähr 4 Kabellängen westlich von Woleai gelegen; die nördliche Pier ist schwach. Es ist auch eine Pier am südlichsten Ende der Insel. 1930 waren 539 Bewohner in der Gruppe.

Einige wenige Hühner sind erhältlich, Fische sind reichlich. Brotfrucht, Taro, Bananen etc. wachsen auf den Inseln.

Eingangskanäle. Der Raur-Kanal, der in das südliche Ende der Ostlagune führt, ist ungefähr 2¼ Kabellängen weit zwischen Riffen, die sich südwestlich vom südlichen Ende von Raur ausdehnen und die die Insel Motogozu umgeben; er hat Tiefen von 10 bis 25 Faden (18,3—45,7 m) auf der guten Fahrbahn, aber die Tiefen mögen bei der Annäherung kleiner sein. Der Westkanal, an der südwestlichen Seite der Westlagune, nahebei südöstlich von der Insel Falulap, hat mitten im Weg einen Stein mit 3½ Faden (6,4 m) Wasser. Der Nordkanal an der nordöstlichen Seite der Westlagune zwischen den Inseln Faraules und Jalangigereil, südöstlich von dieser, ist ungefähr eine Kabellänge breit zwischen den Riffen beiderseits, und hat Tiefen von 3 bis 7 Faden (5,5—12,8 m).

Es ist noch eine Passage zwischen den Riffen, die sich vom östlichen Ende von Tagaulap und dem südlichen Ende von Mariaon ausdehnen, aber sie ist eng und

[1] s. S. 202.

die Gezeitenströme in ihr sind stark, so daß sie nur für kleine Fahrzeuge brauchbar sind (Marion-Einfahrt).

Untiefen: In der Westlagune sind viele, wie man auf der Karte sehen kann. In der Ostlagune ist ein Untiefenkamm mit Tiefen von 1—6 Faden (1,8—11 m), ungefähr 8 Kabellängen südöstlich von Mariaon-Insel gelegen. Ein 2 Faden (3,7 m) tiefer Stein liegt ungefähr $2^3/_4$ Kabellängen südwestlich von dem südwestlichen äußersten Ende des Kammes, und ein anderer von 2 Faden (3,7 m) liegt $3^1/_4$ Kabellängen nördlich des südlichen Endes von Raur.

Ankerplätze. Große Schiffe können in der Ostlagune ankern, in Tiefen von 15 bis 20 Faden (27,4—36,6 m), feiner Sand, mit gutem Schutz ungefähr 4½ Kabellängen westlich von dem nördlichen Teil der Raur-Insel.

Kleine Schiffe können während des SW-Monsun gegenüber der südöstlichen Seite von Mariaon-Insel, und auch gegenüber der nördlichen Seite der Insel Tagaulap (Br. 7° 22′ N, L. 143° 53′ O.) ankern".

Dazu Karte 772.[1]

Diese bringt gegenüber den früheren Karten (s. u. S. 193ff.), der russischen und deutschen, die im wesentlichen übereinstimmen, vor allen Dingen eine bessere Auslotung der Westlagune, namentlich im Nordteil, und dann die bis jetzt fehlende Feststellung und Ausdehnung der Südbarre des Atolls. Die russische Lotungslinie von Tagaulap nach Südsüdwesten hatte schon ostnordöstlich von Falalis, der südlichsten der Inseln, die Barre angezeigt, da die Lagunentiefen von ca. 40 m hier nur noch ca. 10 m waren. Die neue englische Karte Nr. 772 zeigt nun von Falális ausgehend einen nach ONO streichenden Sockel von ca. 2 km Länge, zwischen dessen östlichem submarinen Ende und dem isolierten Sand Cay Riff eine Vertiefung ist, die ich Falális-Canal nenne, und die Tiefen von 5,3—16 Faden (9,5—31m) zeigt.

Neu ist das eben erwähnte Sand Cay-Riff (auf der deutschen Karte ist es nur klein angedeutet), auf dem sich, genau südlich von der Westspitze von Tagaulap und 2½ km ab, eine Sandinsel befindet[2], ebenso wie auf dem ostwärts folgenden isolierten Riff die Insel Motogosóu; zwischen beiden liegt auch eine Einfahrt mit etwa 7 Faden (13 m) Tiefe, die ich Mittelkanal nenne, da durch ihn auch große Schiffe in die West und in die Ostlagune einfahren können, besser gesagt könnten, wenn die Ränder der Einzelriffe alle durch Baken sichtbar gemacht wären. Zur Einfahrt in die Ostlagune diente ja bis jetzt stets der oben genannte Raur-Canal, den auch unser Expeditionsschiff benutzte, da er und die Ostlagune

[1] s. Karte 4 S. 184.

[2] Diese Sandinsel zwischen Falalis und Motogosu ist nach dem Taifun 1907 neu entstanden; im Jahrbuch der Dt. Kolonialzeitung 1908 S. 28 ist die Vermutung ausgesprochen, daß sie durch Vulkanismus entstanden sei; wieviel näherliegend ist die Aufschüttung durch Wassergewalt.

eben trefflich ausgelotet sind. Hier liegt eben die größte und wichtigste Insel der Gruppe Oleai, die ihr den Namen gegeben hat. Die Westlagune ist eben nur 2—3 mal größer als die Ostlagune und ist weniger durch Untiefen eingeengt. Das mittlere Becken ist 20—27 Faden (36,5—49,5 m) tief; Untiefen sind nur randwärts: 2 SO (bei Sand Cayriff) mit 4,1 Faden, (7,5 m), NO 1 mit 5,3 Faden (9,5 m) und einige kleinere, ebenso im NO und SO. Merkwürdig ist, daß von der Zerstörung von Raur (s. S. 196) gar nichts erwähnt ist, wie auch die Karte Raur und Paliau vor 1907 zeigt.

Außenlotungen: im S. von Raur ca. 1 Seemeile ab 216 Faden (389 m), ebenso von Motogosu ca. 2 km südlich 347 Faden (625 m), ca. 400 m vor dem Ausgang des Westkanals 168 Faden (300 m), aber 500 m weiter südlich nur 20 Faden (36 m).

Durch die neue englische Karte ist die wahre Gestalt des Atoll erst bekannt geworden.

189

2. Entdeckungsgeschichte.

Der Name Vóleai erscheint zuerst (s. Palau I S. 178) 1697 in Pater Clains Brief als Valayay, 1706 als Ulier[1], 1710 als Olie, 1721 nach Cantova Ulee, 1804 nach Torres dem ersten Besucher Guliai und Ulea, 1817 Chamisso Ulea, 1828 Lütke Ouleyai, 1908 Kolonialatlas Oleai, Uleai, Woleai, 1909 H. S. E. Atoll Oleai und Insel Voléa.

Die Spanier scheinen die Atolle Lamotrek und Oleai vor 1700 nicht gesichtet zu haben, erst James Wilson auf der Duff 1797, dessen Bericht von Lamotrek oben S. 6 begann, und seine Fortsetzung über Oleai hier hat. Wenn aber Oleai auch erst so spät gesichtet wurde, so erfuhren die Fremden auf Guam doch schon früh von dem Vorhandensein verschiedener Atollgruppen im zentralen Teil. 1722 hat Cantova dort Nachrichten über Ulea u. Lamotrek gesammelt, die in seinen Briefen veröffentlicht sind (s. Kotzebue S. 85).

Über den eigentlichen Entdecker von Oleai, James Wilson, folgt hier die Fortsetzung der Geschichte von Lamotrek S. 9:

»Bei der Entfernung von einer Meile peilten wir die beiden Enden in NW ½ W bis W z. N ½ O, wonach ihre Ausdehnung geschätzt werden können. Die Breite des südlichen Teiles von ihnen ist 7° 16′ und 144° 30′ O. Ungefähr 60 Boote kamen zuerst heraus, und später zählten unsere Leute 150 in Sicht, von denen jedes durchschnittlich sieben Mann enthielt, was 1050 ist; und wenn wir halb so viel, die an Land zurückgelassen wurden, hinzufügen, und die doppelte Zahl für Weiber und Kinder, so steigt die Bevölkerung dieser Gruppe allein auf 3150 Seelen, die, nach der Erscheinung der Inseln, oft von Hunger gequält werden müssen. Hier bekamen wir zum ersten Mal ihre Weiber zu sehen, die in der Zahl von ein Dutzend oder mehr, in 3 Booten herauskamen; in zwei waren sie von Männern begleitet, das dritte war nur von jungen Frauen besetzt. Eine beträchtliche Zeit blieben sie in Luv, während ihre Männer sie mit Aufmerksamkeit zu beobachten schienen; aber als sie bemerkten, daß wir sie nicht mit besonderer Aufmerksamkeit betrachteten, erlaubte man ihnen bis auf einige Ellen ans Schiff heranzukommen, das sie, wie auch uns, mit Vergnügen zu mustern schienen. Einige von ihnen hatten ein hübsches Gesicht, hatten weder sehr dicke Lippen noch breite Gesichter, obwohl sie zu beidem hinneigten. Ihr Haar ist schwarz und lang. In der Farbe unterscheiden sie sich von den Männern durch eine kränkliche

[1] Auf Clain's Karte (Palau I S. 17) stehen die Inselnamen: Parivu (Paliau), Raor (Raur), Ulier (Volea), Marioc (Máriong), Tacaylap (Tagúlap), Alingaray (Vótagai) und Farilies (Falalis). Vgl. Lamotrek S. 5).

Art von Weiße, die mit dem natürlichen Oliv gemischt ist. Da wir sie beinahe nackend sahen, so war ihr größter Schmuck und höchster Preis die Schamhaftigkeit und Bescheidenheit ihres Betragens. Die größere Zahl der Männer war auch nackt; andere fügten einen schmuckhaften Gürtel rings um ihren Leib, nahe dem Nabel: diese Gürtel sind ungefähr einen Zoll breit, zusammengesetzt aus Stückchen von schwarzen und weißen Schalen, durchbohrt und aufgezogen in der Art von Perlen. Einige von ihnen trugen einen breiten konischen Hut, in der Gestalt nicht sehr ungleich dem der Chinesen. Diese Inseln schienen in jeder Hinsicht gleich, keine einen größeren Vorteil vor den andern gewährend, ausgenommen wo die Gruppen Vergnügungen von der Nachbarschaft herleiten; und vielleicht bieten ausgedehntere Untiefen und glattes Wasser einen Schutz, wo die Fische Schutz vor den Stürmen haben. Da mögen sie hier größere Hilfsquellen als auf den einsamen Inseln finden. Jedoch nach den Tauschmitteln zu schließen hatten sie den gleichen Besitz; ihre Vorräte waren Kokosseil, wovon wir dreißig Faden für ein 6 Zoll langes Stück eines alten Eisenreifen kaufen konnten; dieses Seil ist gewöhnlich einen Zoll dick und unsern hanfenen Seilen gleich oder überlegen. Da sie überall ihre große Gier nach Eisen bekundeten, würden wir zu obrigem Preis, wenn wir einige Stunden bei jeder Insel gelegen hätten, das Schiff damit beinahe anfüllen können, und wir würden es zweifellos getan haben, wenn wir gewußt hätten, was wir seitdem erfahren haben, daß es häufig einen guten Preis in China erzielen kann. Ihr Fischgerät unterscheidet sich wenig von dem, was wir auf den östlichen Inseln gesehen haben; aber ihre Matten waren auffallend und fein, gewoben und gemacht in der Form einer spanischen Schärpe, mit einer phantastischen Borte an jedem Ende, mit schwarzen Fäden eingearbeitet. Die natürliche Farbe dieser Schärpen ist weiß; aber viele von ihnen sind schön gelb mit Curcuma gefärbt. Es ist unmöglich, diese hübsch gearbeiteten Schärpen und die rohen Anfertiger zugleich zu sehen, ohne sich zu wundern und wissen zu wollen, wie sie zu dieser Kunst gekommen sind. Es ist nicht unwahrscheinlich, daß sie von den Jesuiten-Missionaren belehrt worden sind, von denen zwei durch die spanische Regierung in Manilla im Jahre 1710 ausgesandt worden sind; aber da das Schiff, das sie dorthin nahm, durch Ströme vertrieben wurde, sind die Jesuiten verschollen[1]; jedoch es wurden andere gesandt, die einige Jahre ihre Anstrengungen fortsetzten, bis sie sich von der allgemeinen Armut der Inseln unterrichtet hatten, und daß sie sicher der spanischen Monarchie von keinem Nutzen sein konnten; so verließen sie sie, und seit jener Zeit (um 1720) sind sie vollständig vernachlässigt worden. Dies macht es so mehr bemerkenswert, daß während einer so langen Zeit diese nützliche Kunst erhalten worden ist; und weil es Lob auf die ursprünglichen Lehrer wirft, so ist es auch unseren Missionaren eine Anfeurung,

[1] s. Palau I S. 32 ff.

alles was in ihrer Macht steht zu versuchen, um die mechanischen Künste einzuführen und es zeigt sich, daß ihre Anstrengung nicht vergebens ist[1].

Schildkröten sind unter den Gegenständen ihres Lebensunterhaltes, da wir eine von ungefähr 20 Pfund kauften für ein Stück Eisenreifen von 2 Fuß Länge.

Sie lenken ihre Boote mit großer Geschicklichkeit, und gehen offenkundig ohne Furcht von Insel zu Insel. Daraus schlossen wir, daß sie nur wenig Kriege haben, wegen dieses freien Verkehrs untereinander, und da sie keine Waffen haben, ausgenommen eine Schleuder. Ihre Sprache unterscheidet sich von allen, die wir bisher gehört hatten; und ausgenommen einige wenige Worte als *lulu* (Eisen), capitaine etc. verstanden wir nur wenig von dem, was sie sprachen.

Ihre Zahlworte sind wie folgend:

Karolinen	Palau	Palau II S. 331
1. *iota*	*tong*	*tang*
2. *rua*	*oru*	*oring*
3. *tolu*	*othey*	*odêi*
4. *tia*	*oang*	*oáng*
5. *lima*	*aim*	*oim*
6. *honu*	*malong*	*malong*
7. *fizu*	*oweth*	*uid*
8. *warrow*	*tei*	*iai*
9. *hivo*	*etew*	*itiu*
10. *segga*	*mackoth*	*magod*

Nach diesen 13 Inseln, die zweifellos Oleai sind, sah Wilson keine der kleinen Inseln mehr und fuhr direkt nach Palau, was Palau I S. 128 erwähnt ist.

Nach der Entdeckung seitens Wilson war — soweit bekannt[2] — Don Luis de Torres, der im Trukband S. 5, 7 und 20 schon erwähnt wurde, der erste, der Oleai besuchte und genauere Nachrichten darüber gab. Kotzebue III S. 93 berichtet, daß 1804 das Schiff »Maria« aus Boston, Kpt. Samuel W. Boll, Supercargo Thomas Bormann, von Guajan aus, auf Entdeckung fuhr, und um Trepang auf den Karolinen-Inseln zu suchen. Don Luis de Torres war an Bord um die Insulaner, die nach Guam verschlagen waren (S. Luito) und die er liebgewonnen hatte, wieder zu sehen, ihnen Gutes zu erzeigen und zu erfahren, warum sie Guajan zu besuchen unterlassen, und sie zur Wiederkehr zu bewegen. Nach dem Tagebuch des Don Luis wurden auf der Fahrt bestimmt: eine Untiefe von 24 Faden in 8° 20′ N. Br. und 149° O. L.[3], die wüste Insel Piguelao, nach Kadu

[1] Diese Annahme ist natürlich irrig.

[2] s. die Liste der Walschiffe usw. in Truk S. 3. Anm. 2.

[3] Nach Karte 97 liegt in 8° 10′ und 148° 43′ die Gray Feather Bank mit 9 m Wasser, in 7° 50′ und 149° 40′ die Hitchfield-Bank mit 20 m Wasser; sonst nichts in der Gegend.

Bigellé, in 8° 6′ und 147° 17′[1], die Untiefe Oraitilipu von 12 Faden unter gleicher Breite[2] nach der wüsten Insel Fallao, nach Torres Fahueu, Cantova Fayo in 8° 5′ und 146° 45′[3], Farruelap[4], Torre Faroilep, Cantova Fatoilep in 8° 3′ und 144° 30′, Guliai, Torres Ulee, Cantova Ulea, Kadu Olä 7° und 144°.

Seine Karte s. Kotzebue III S. 85.

Von der Maria blieb ein englischer Passagier D. Luis Juan auf Oleai zurück. Kadu kannte ihn als Lisol mit Ehefrau und Kind. Er soll dort gestorben sein. Don Luis ließ Rinder und Schweine zurück, die aber wieder ausgerottet wurden.

Torres ist vortrefflich durch A. v. Chamisso bekannt geworden, der so viel von Ulea berichtet, obwohl sein Schiff Rurik unter Kapitän v. Kotzebue das Atoll nicht besucht hat. Er erfuhr so viel eben durch Don Luis de Torres, vor allem aber durch den bekannten Kadu, über den er schreibt (Über unsere Kenntnis der ersten Provinz usw.):

»Wir hatten zu Anfang 1817 im äußersten Osten dieser Provinz auf der Gruppe Otdia und Kaben der Inselkette Radack mit dem lieblichen Volke, welches sie bewohnt, Bekanntschaft gemacht und Freundschaft geschlossen. Als wir darauf in die Gruppe Aur derselben Inselgruppe einfuhren, die Eingeborenen auf ihren Booten uns entgegenkamen und, sobald wir Anker geworfen, an unser Bord stiegen, trat aus deren Mitte ein Mann hervor, der sich in manchen Dingen vor ihnen auszeichnete. Er war nicht regelmäßig tatauiert wie die Radacker, sondern trug undeutliche Figuren von Fischen und Vögeln, einzeln und in Reihen um die Knie, an den Armen und auf den Schultern. Er war gedrungenern Wuchses, hellerer Farbe, krauseren Haares als sie. Er redete uns in einer Sprache an, die, von der radackischen verschieden, uns völlig fremd klang, und wir versuchten gleich vergeblich, die Sprache der Sandwich-Inseln mit ihm zu reden. Er machte uns begreiflich, er sei gesonnen, auf unserem Schiffe zu bleiben, und uns auf unseren ferneren Reisen zu begleiten. Sein Gesuch ward ihm gern gestattet.... Kadu, ein Eingeborener der Inselgruppe Ulea, im Süden von Guajan, von nicht edler Geburt, aber ein Vertrauter seines Königs Toua, der seine Aufträge auf andern Inseln durch ihn besorgen ließ, hatte auf früheren Reisen die Kette der Inseln, mit denen Ulea verkehrt, im Westen bis zu den Pelewinseln, im Osten bis auf Setoan kennen gelernt.« Seine Verschlagung nach Ratak s. unten bei Navigation S. 275f. Kadus Mitteilungen an Chamisso sind weiterhin im Text verwertet.

Der nächste und wichtigste Besucher Oleai's war 1828 Lütke, der schon im Bd. 6 I S. 7ff. eingehend gewürdigt wurde. Er kam am 25. 3. nach Namourrek,

[1] Karte 97 Pikelot in 8° 9′ und 147° 42′.

[2] Auf Karte 97 in 8° 6′ und 147° 15′ eine Untiefe dieses Namens mit 22 Meter, mit Fragezeichen, angegeben.

[3] Das sog. West-Faiëu; Ost-Faiëu S. 164 und bei Námoin Bd. 6 I S. 163. Bedeutung »Stein einer« s. Truk S. 42 Stein = *fau*, auf Lamotrek *fai*, daher auch Fais »steinig«; Karte 97 8° 5′ und 146° 52′.

[4] Karte 97 Faraulip.

von dem er eine fliegende Aufnahme durchführte (s. Karte S. 2), die die Grundlage für die Karte des Reichsmarineamtes bildete. Kittlitz II S. 148 erzählt, daß früh am 26. mehrere Boote herauskamen, deren Insassen durch eine besonders elegante, den ganzen Körper mit Ausnahme des Kopfes bedeckende Tatauierung ausgezeichnet waren (s. Tatauierung S. 226). Sie brachten keine Fische, sondern wollten nur zu essen haben. Was man ihnen reichte, verschlangen sie gierig, so daß man eine Hungersnot an Land annehmen mußte, die auch nach Floyd's Angaben auf den Koralleninseln fast jedes Jahr im Herbste 1—2 Monate lang auftritt S. 199. Dann nähren sie sich fast nur von Brotfruchtteig (Kr. *mar*). Einige der Leute fuhren mit nach Elato, wo sie ein Boot an Land nahm. Viel Verkehr besteht hier mit Guaham (Guam). Auch sollen häufig spanische Schiffe wegen Trepang hierherkommen. In Guam traf Lütke den Häuptling Orolitau von Elato, der den Verkehr in den Marianen für den Gouverneur besorgte. Von ihm hörte ich viel über die Karolineninseln. Er soll 3 Frauen gehabt haben: Letaururu, Laguol und Lamõarup; sein Gehilfe Sepa nannte Mairuk und Mesauro, ein zweiter Gehilfe Orotak nur eine: Namõarimet. An der Westseite fand Lütke keine Einfahrt. An Land sah Kittlitz von Sträuchern Scaevola.

Am 28. März war Lütke schon vor Faroĭlap, wo ein Tamol fließend spanisch sprach (s. Duff S. 6) und sich Alberto nannte, wohl von den Marianen her. Auch hier war Lebensmittelmangel. In den folgenden Tagen, 1. April, wurde auch nach Suchen Olimirao gesichtet und aufgenommen; es kam ein Fahrzeug mit 3 Männern heraus, von denen einer sehr hungrig war. Am 3. April kam er nach Ifaluk, und Abends noch nach Uleai, das durch »Kadu« den Leuten des Rurik schon bekannt war. Aber niemand kannte bei Nachfrage den Namen Kadú, den Chamisso Kadu schrieb (ohne Akzent!). Es war also ein später angenommener Name oder — falsch ausgesprochen! Am 4. April glückte es, in der Ost-Lagune zu ankern. Viele Fische wurden hier zum Kauf angeboten. Die Inseln hießen im O. Ra-ur, Palliau, die nördlichste Ulea oder Uleai, ein Dreieck mit eingedrückten Seiten. Am nördlichen Rande der Untiefe lag die Insel Marion, zwischen ihr und Ulea ein halb im Wasser verborgenes Riff, ähnlich wie zwischen Funoar[1] und Lukunór, das aber länger ist. Kanäle im Osten z. B. zwischen Raur und Paliau leicht zu durchwaten. Alle Inseln mit sehr hohen Bäumen, zwischen den Häusern auf Rasenplätzen.

Prachtvolle Calophyllum-Bäume, ferner Hernandia ovigera, um die zahlreiche weiße Seeschwalben flogen, Gygis candida; ihre quarrenden Lockstimmen hörte man stets, aber nur beim Fliegen. Von Strandvögeln sehr häufig Strepsilas collaris, Numenius tenuirostris, den Brachvogel, einzeln. Im Busch Sylvia syrinx und die Lamprothornis von Lukunor, von dem auf Kusae durch den schwefel-

[1] In Bd. 6 I S. 20 nicht genannt; es muß schon Piafa sein, obwohl nach der deutschen Karte dieses von Lukunór 1570 m entfernt ist, dagegen Mariong von Uleai nur 470 m.

gelb-weißen Unterleib mit schwarzen Längsstrichen unterschieden. Keine Hühner und Tauben, auch kein Flederhund Pteropus. Einmal 1 Kuckuck. An Pflanzen hier auf Raur viel Tacca pinnatifida. Kokosnüsse mußten teuer bezahlt werden, was wohl auf die oben S. 193 erwähnten kargen Verhältnisse hinweist. Dies war auf Lukunor besser, wo die Bevölkerung überhaupt freundlicher war, was wohl daher kommt, daß sie mehr abgeschlossen lebt. Häuser in Bauart und Einrichtung wie dort, aber auf Oleai besser gebaut und reinlicher. Man war erstaunt über die oft recht großen Bohlen und Bretter, welch letztere aus den geschickt benutzten Ausläufern der Brotfruchtbäume gewonnen werden.

Frauen wurden durch den Ruf *farak*[1] zum Verschwinden aufgefordert, waren daher nicht sichtbar. Kleine Häuser meist ganz verschlossen. Erst am 4. Tage stellten die Männer sie zwecks Beschenkung mit Schmucksachen vor; war dies erfolgt, ertönte wieder der Ruf *farak*. Am 8. April kam ein Boot mit Frauen angefüllt zum Schiff, umkreiste es aber nur. Die Frauen hatten einen gewebten Rock (Matten) an, die Mädchen einen Ringschurz von frischem Laubwerk.

Im Westteil des Atoll liegen Ulemarai und Seliap nebst anderen kleinen Inseln. Ulemarai war die Heimat des Kadu; er selber war, wie erwähnt, nicht bekannt, aber sein König Touá[2] lebte noch und kam trotz seines Alters an Bord.

An Fische bekam Kittlitz die brennend roten Serranus-Arten (S. punctulatus und urodelus), ferner eine neue Myripristis-Art mit weißen Randstreifen der Brust- und Afterflosse, eine neues Genus Odax (Axodon Cuvier) mit breiten schaufelförmigen stark nach vorwärts geneigten Schneidezähnen[3].

Die purpurrote Julis Gaymardi kam einzeln vor; goldgelbe Julis-Art mit hellgrünem Unterleib und halbmondförmiger Schwanzflosse, Helichoeres, Labrus Sparus insidiator und zonephorus, Labrus fasciatus, Scarus ocillatus, Grammistes punctatus, dunkelbrauner Acanthurus pyroferus (armiger) usw. vervollständigten das bunte Bild (s. Fische).

Die Fischkörbe gleich denen auf Lugunor, aber nicht das Instrument (Taf. 6 I S. 55), das man sich zum heraufziehen bedient; hier geschah es durch Taucher. Als solche sind die Eingeborenen sehr geschickt. Ein 15jähriger Knabe fing alles, was man ins Wasser warf im Tauchen auf. Alles fing er, wenn man es ihm nur vorher gezeigt hatte.

Kapitän Lütke kaufte von Tapeligar (s. S. 194 u. 215), dem Oberhäuptling der Insel Ulea, für 3 Beile ein vollständiges Segelboot.

Am 9. April ging das Schiff wieder unter Segel, fuhr westwärts an der Südseite des Riffkranzes hin, zwecks Aufnahme. Das wenige Land hier, in Lee, fiel auf; das Riff selbst lag unter Wasser und war nur durch die grünliche Farbe des Wassers zu erkennen.

---

[1] Fritz *fáreg* gehen, marschieren; also »geh«!

[2] Torres sagte Roua, ebenso Ruch statt Tuch (Truk).

[3] Genauere Beschreibung S. 178 ff.

Die Fahrt ging nach Eurupyk. — — — — —

Andrew **Cheyne,** der die Gruppe Ullieye im September 1844 besuchte, spricht von 13 Inseln, von denen 9 von 1500 Eingeborenen bewohnt seien. Es bestehe Handel mit den umgebenden Inseln und Guam. Leute schlau und verräterisch, Waffen Keulen, Schleudern, Steine.

Der Schuner Rupak, Kapitän **Gall,** der in Palau I S. 152 schon erwähnt ist, hat, wie Robertson berichtet (s. dort Anm. 5), am 28. März 1875 auch Ulleai besucht und dort einen Händler Williams angetroffen, der erzählte, es sei eben ein spanisches Schiff dagewesen, dessen Besatzung fast alle Brotfruchtbäume umgeschlagen habe, so daß eine Hungersnot die Folge gewesen sei, an der 5—6 Leute täglich stürben. Die englische Flagge sei niedergeholt, und dafür die spanische gesetzt worden, die nach der Abfahrt des Schiffes von dem Engländer wieder heruntergeholt worden sei.

L. H. **Gulik** (Truk S. 37) spricht im Nautical-Magazine 1862 von Wolea — Ulie; ein Eingeborener sei 1788 nach dem 600 Seemeilen entfernten Guam gefahren und sei gut angekommen.

Er spricht von 600 Bewohnern (s. Bevölkerung S. 201). Der Oberhäuptling habe dann 1807 Saipan (Seypan) besucht und sei so gut aufgenommen worden, daß in der Folge eine ganze Kolonie von Eingeborenen sich dort niedergelassen habe, die jedes Jahr einmal ihre alte Heimat besuchten. Sie besorgen den Handel mit den Spaniern bis Truk hin. Ihre Sprache sei verschieden von der auf Eap und Truk.

Alfred **Tetens,** den ich in Palau I S. 163 des längeren erwähnt habe, besuchte mit seinem Schiffe Vesta, wie die meisten Handelschuner, auch Oleai zwischen 1865—68 sicher des öfteren. In seinem Büchlein S. 347 erwähnt er einiges sehr interessante:

Die Bewohner der Uliei-Inseln zeigten sich friedfertiger als die der anderen Gruppen; die Männer waren schön und muskulös, und sind am ganzen Körper sehr geschmackvoll tatauiert. Ohren und Hals sind mit vielen Verzierungen versehen und in dem »wolligen« Haar prangt ein Büschel emporstrebender Federn. Unter den jungen Frauen und Mädchen erblickt man viele von großer Schönheit, nur wird diese durch die häßlichen Tatauierfiguren auf der Brust, meist Fisch- und Vogelköpfe, beeinträchtigt.

Beim Besuch des Königs Jogelock benahm sich dieser sehr manierlich, nur waren die Frauen seiner Umgebung durch ihre Neugier lästig. Die Uliei-Insulaner gelten als die Schiffahrtkundigsten in den ganzen Karolinen, besuchen z. B. die Marianen.

Das Süßwasser ist schlecht und ungenießbar, deßhalb bildet die Kokosnuß und der Palmwein Ersatz.

Kleidung ähnlich der von Mokemok, Häuser sinnreich erbaut und reinlich. Für Aufnahme der europäischen Kultur scheinen sie besonders geeignet.

Besuch spanischer Schiffe sind nicht bekannt.

S. M. S. »Albatroß« war am 30. Sept. 1885 in Uleai (Kubary's Benennung); er ankerte bei Raur, wo man für jeden Schluck brackigen Wassers Geld verlangte.

Während der Deutschen Kolonialzeit wurde Oleai öfter aufgesucht, namentlich seit die »Germania« alle 4 Monate das Inselgebiet durchfuhr.

Auch Regierungsschiffe und Copraschoner liefen die Lagune nicht allzu selten an. So besuchte der Bezirksamtmann auf Yap während der oben S. 9 erwähnten Reise auch, am 10. Nov. 1905, Oleei, wie er schrieb. Die Palmen standen normal, die Rattenplage war mäßig; Toddy-Trinken ebenso. Es hatte aber der Tod eines Händlers Verdacht erregt, und durch Zeugenaufnahme kam es schließlich heraus, daß er erwürgt und durch Hammerschläge getötet worden war, von einem Sonserol-Eingeborenen, der aber schon im Westen war. Ein Polizist wurde deshalb auf Oleai zurückgelassen. 1902 sollen alle Händler ermordet worden sein.

Wichtig für die Inselgruppe sind zwei Besuche des Regierungsarztes Dr. Born 1903 und 1907. Den ersten beschrieb er ethnographisch in den Mitteilungen aus den deutschen Schutzgebieten 1904 S. 175—191; der zweite ist von ganz besonderer Bedeutung, weil Born diesmal den Karfreitags-Taifun 1907 durchmachte, so daß dadurch eine einwandfreie Beobachtung eines solchen großen Wirbelwindes auf einer Koralleninsel vorliegt; er berichtet im Kolonialblatt 1907 S. 567ff. nachstehendes, im Auszug wiedergegeben:

3. Taifun.

Taifun 1907, in den Westkarolinen.

Die Verwüstung der Oleai-Inselgruppe (mit Karte)[1].

Am 27. März traf der Regierungsschoner »Ponape« in Oleai von einer Reise nach Ifaluk wieder ein[2], wohin er am Sonntag, den 24. abgefahren war, das Wetter war wochenlang schön gewesen; jetzt traten widrige Winde mit Gewitterböen auf, so daß die 35 Seemeilen erst in 42 Stunden gemacht werden konnten. Die schwierige Einfahrt nach Ifaluk gelang; früher ankerten die Schiffe außerhalb in 9—16 Faden Wasser. Rückfahrt in 5½ Stunden (27. 3.). Weiterfahrt nach Yap war für den folgenden Tag festgesetzt. Ärztliche Fürsorge Nachmittags an Land. Abends windstill, herrlicher Mondschein (1 Tag vor Voll). Früh am 28. mehrere starke Gewitter aus O u. N, starke Regenböen unterbrochen von Windstillen. Auffällige Brandung aus O u. S, die sich immer verstärkte. In der Frühe zahlreiche Fregattvögel, die sonst selten sind, über dem Atoll schwebend, ziellos. Mittags in der Lagune starke Brandung am Sandstrand. Barometer stark fallend, so daß »Ponape« nicht abfuhr. Kapitän wollte den drohenden Taifun im Binnenwasser abreiten. Born wurde aufgefordert, an Bord zu bleiben, aber er konnte

[1] s. die Bilder dazu in Krämer 1927: Die Entstehung und Besiedelung der Koralleninseln Taf. IV.

[2] Angeblich wegen Ausschreitungen fremder Matrosen gegen Eingeborene.

sein Gepäck nicht mehr durch die Brandung bringen; 2½ Uhr nachmittags Brandung am Außenriff und im Binnenwasser außergewöhnlich hoch. Ponape verlegt den Ankerplatz. Bei Born's Fahrt an Land plötzliche Bö aus NNO, so daß Fahrzeug voll schlug. Mit Mühe an Land gekommen, wo Born's Haus schon geräumt war, weil, eine mächtige See über die 80—100 m lange Düne bis zum Haus vorgedrungen war. In den nächsten 2½ Stunden wurde diese Düne an der Ostspitze (SO) völlig weggewaschen, so daß zwischen der Hauptinsel Flalap und Paliau eine breite Passage entstand (vorher eng), durch die aus O große Seen in die Lagune stürzten, wo sie mit der Brandung aus SW zusammentrafen, so daß das Wasser turmhoch aufspritzte.

5 Uhr neue große See bei schwachem Wind ans Haus gelangend, wo der schreibende Born durch die Verandasprossen mehrere Schritte weit fortgeschleudert wurde; heftige Quetschung des linken Oberschenkels war die Folge.

5¼ Uhr sandte Born ein Schreiben an den Kapitän der »Ponape« mit dem Rat eines anwesenden Spaniers Villaçon, den Ankerplatz des Schiffes unter den Schutz der NW-Spitze beim Dorf Ifang zu verlegen. Die Antwort war, das Barometer stünde, es sei ein Abflauen des Windes zu erwarten, aber die Brandung würde noch zunehmen.

Kurz vor 6 Uhr mußte Born die bereits eingestürzte Station verlassen; er zog sich in das angrenzende Dorf Leuleperik zurück, wo er in einem neuen Eingeborenen-Haus Quartier nahm, etwa 800—1000 m vom NO-Strand entfernt.

Spät am Abend wurde der NO-Wind noch stärker; so daß Äste von den Bäumen brachen. Dies wurde von Nachts 1 Uhr ab so stark, daß sich der Lärm wie Kleingewehrfeuer anhörte, unterbrochen vom Geschützdonner der knackenden Baumstämme. Beides war kaum hörbar beim Sausen des Windes und dem Donner der Brandung. Die Häuser hielten aber während der Nacht noch Stand.

Morgens 5 Uhr kam Nachricht, das Wasser komme schon ins nahe Dorf und stehe auch schon ums Haus, in dem Born und Villaçon waren. Das Wasser stieg so schnell, daß es kaum möglich war, das Nötigste zu bergen und nach der Japan-Station im Dorfe Jaur, wo die Insel am breitesten ist, zu bringen. Der Weg war nur mit Not passierbar. Es gelang ohne Unfall. Von dort sieht man auf die Lagune, wo aber die «Ponape« nicht mehr sichtbar war. Am Horizont im W starkes Wetterleuchten. Die Brandung in der Lagune schlug bis an die Häuser des Dorfes. Da der Aufenthalt auf der Station gefährlich schien, verzog sich alles nach dem westlichen Bootshaus, wo sich auch schon die Eingeborenen der Insel versammelt hatten. Sie waren rat- und kopflos und glaubten an eine alte Weissagung, daß ihre Insel einstmals weggewaschen würde. Die Zeit schien ihnen gekommen. Alsbald kamen auch die Japaner von ihrer Station an, weil sie von einer See weggewaschen war. Aber auch der jetzige Platz wurde unsicher und alles begab sich nach der NW-Spitze bei Ifang. Dies war die letzte Zuflucht. Hier

stand auf einer kleinen Anhöhe ein Haus, wo eine Menge schreiender und weinender Eingeborener Zuflucht gesucht hatte. Die Klagen verstärkten sich, als ein Mann meldete, daß das Wasser nun auch aus NNO käme. Born stieg auf eine Palme und sah; wie die Seen gleich weißen Katzen durchs Gehölz sprangen; als er herunterkam, reichte ihm das Wasser bis zu den Hüften. Alles versah sich mit Planken und Seilen und zog zum Lagunenstrand. Glücklicherweise stieg das Wasser nur langsam und der Wind ließ nach. Da gewahrte Born einen riesigen Brotfruchtbaum, der entwurzelt war und dessen Wurzelwerk mehrere Meter hoch emporragte. Alsbald kletterte er hinauf. Kaum war er mit andern oben, als der Taifun aus OSO zu wehen begann, und zwar mit unbeschreiblicher Eile. Es war als ob 1000 Schnellzüge vorbeirasten. Dies war 9 Uhr vormittags und dauerte bis 3 Uhr nachmittags. Dabei war die Luft so voll von Wasser und Sand, daß man nur wenig Schritte weit sehen konnte. Dann wurde es ein wenig stiller; der Sonnenschein drang sogar auf Augenblicke durch und man sah, wo man war: ziemlich dicht am Lagunenstrand in der NW-Ecke der Insel.

Das Wasser war ein wenig gefallen und so sah man die Verwüstung; meterhoch lagen die Bäume übereinander, von Häusern und Menschen nichts zu sehen, nur Reste von den großen Bootshäusern sah man noch am Strande. Als Born sich, bis zur Hüfte im Wasser, dem Dorf Jaur nahte, erblickte er zwei rot bemalte Jünglinge, die ein Schwein inlands trugen. Ihnen folgend gelangte er zum Mittelpunkt der Insel, wo ein Teil der Eingeborenen sich gesammelt hatte, und wo alle die erste Nacht verbrachten. Von der Oleai-Insel war anscheinend niemand umgekommen, aber bald trafen schlimme Nachrichten vom SO ein.

Am Sonnabend 30. März früh hatte der Wind sehr nachgelassen, aber in der Lagune wirbelte und kochte die See noch wild durcheinander; von der »Ponape« war nichts zu sehen. Eingeborene sagten, sie hätten die Lichter am 29. früh noch bemerkt; sie galt als verloren. Ein Gang am Strand zeigte die grauenhafte Verwüstung; von der Insel Raur sah man nur noch eine Sandbank mit einzelnen Palmen darauf. Am Strande von Leuleperik wurde die Leiche eines 5jährigen Knaben gefunden. Bald wurde bekannt, daß von der Raur-Bevölkerung nur noch zwei Menschen am Leben waren, ein Mann und eine Frau; 130 galten also als umgekommen. Nur 9 waren auf andern Inseln gewesen. Auf Paliau waren von 90 etwa 50 umgekommen. Auf Tagaulap war eine Frau durch ein einstürzendes Haus erschlagen worden. Von Saliap waren 4 Frauen auf Raur gewesen, von Utagal 10 Leute, von Falalis 5, so daß der Gesammtverlust etwa 200 sein mußte. Den zahlreichen Verletzten konnte vom Arzt nur wenig geholfen werden, da Medikamente und Instrumente fortgeschwemmt waren. Im Laufe des Sonnabend und Sonntag wurden eine Menge Leichen an Land gespült, meist greulich verstümmelt. Wunderbare Rettungen kamen auch vor; so wurden von Paliau mehrere Eingeborene nach Saliap vertrieben, vier von Raur nach Utagal, und

zwei Kinder, ein Knabe von 5 und ein Mädchen von 8 Jahren landeten wohlbehalten auf Marijong. —

Die von Paliau und Raur stammenden Geretteten berichteten folgendes: Schon am Abend des 28. März schlossen erfahrene Leute aus dem besonderen Tosen der Brandung, daß eine Flutwelle im Anzug sei. So wurden Vorbereitungen getroffen, in dem man z. B. zahlreiche Frauen und Kinder auf die Brotfruchtbäume brachte und dort festband. In der folgenden Nacht stieg das auf die Insel geströmte Wasser bis zu 1½ m Höhe. Aber erst am folgenden Morgen des 29. März kam etwa 8 Uhr die Flutwelle, die man über den Gipfeln der höchsten Brotfruchtbäume, also gegen 40 m hoch, erscheinen sah, und die mit schrecklichem Sausen als dunkle Wolke mitten über der Insel zusammenbrach, wie ein gigantischer Wasserstrahl. Alles hatte aber noch Stand gehalten, bis alsbald schon eine zweite noch höhere Flutwelle erschien, die alles, Bäume, Häuser und Menschen wegspülte. Die Lagune wurde so ein wirbelnder Kessel, in dem die treibenden Bäume und Balken alles zermalmten. — — —

Während so die ganze 1700 m lange Insel Raur weggewaschen wurde, entstand zwischen Falális und Motogosóu im Süden eine neue Insel, die früher schon einmal vorhanden gewesen zu sein scheint und Met hieß (s. o. Karte 4). Auch wurde der schmale und seichte Durchlaß zwischen Paliau und der Hauptinsel (Abb. 80)

Abb. 80. Bootkanal zwischen Volea und Paliau 1906, vor dem Taifun.

sehr erweitert und vertieft. Die Riffplatte zwischen beiden Inseln war zersprungen wie eine Marmorplatte. Auch sah der Boden von Paliau und Raur wie zerplatzt aus[2]. Am Außenriff von Raur, wo die Flutwelle hereingebrochen war, zeigten sich drei längliche Korallenschuttaufhäufungen, kleinen Eilanden gleich. Der ganze Sockel war glatt wie eine Tischplatte, auf der nur einiger Korallenkies ausgestreut war. Die Flutwelle kam wohl von ONO.

Da der Postdampfer erst um den 25. Mai erwartet wurde, war große Sorge wegen einer Hungersnot[1]. Die Kokosnüsse wurden deshalb gesammelt, und der Taro aus den Feldern, in denen 2—3 m Wasser stand, durch Taucher herausgeholt. Die Häuptlinge besorgten die Verteilung der Lebensmittel vortrefflich.

Die Handelstation von O'Keefe-Yap wurde zu bergen versucht. Der ein-

[1] Wie ich hörte, werden die Taifune deshalb auch Lángeta »keine Nahrung« genannt. A. Kr.
[2] mði Riffbruch Wörterverz. S. 402.

zementiert gewesene Wassertank von 3½ Kubikmeter Inhalt war 100 m weit fortgetragen. Die ausgestreuten Waren und Lebensmittel konnten zu einem guten Teil geborgen werden. Das meiste davon wurde vom Regierungsarzt auf Kosten der Regierung an die Eingeborenen verteilt.

Eine große Trockenheit trat ein, so daß am 11. April die »Germania« als Retter in der Not eintraf. Der Dampfer brachte auch die Nachricht, daß die Ponape am 4. April wohlbehalten in Saipan eingetroffen war.

Der Kapitän Martens berichtete, daß Freitag 29. März von ½8 Uhr Abends an voller Taifun wehte. Eine Bö jagte die andere. Vom Land war trotz Vollmond nichts mehr zu sehen. Es wurden möglichst alle Ketten gestreckt. Etwa ½9 Uhr begann das Schiff zu treiben, nachdem durch eine Sturzsee alle Boote weggeschlagen waren und was an Deck erreichbar war. Die Besatzung saß mit Korkjacken in der Kajüte, auf alles gefaßt. An Deck konnte niemand mehr sein.

Am folgenden Tag um 10 Uhr begann das Barometer zu steigen, aber der Wind wehte weiter. Die Segel wurden in den Zeisingen zerfetzt, nur das Schunersegel blieb ganz. Das Schiff war um diese Zeit schon auf offener See, war also über den Atollring weg hinausgetrieben. Das Schiff schlingerte bis zu 45° und hatte viel Wasser. Um 4 Uhr nachmittags stand das Barometer auf 29.10. Der Taifun wehte weiter. Erst am Sonnabend 30. 3. war es zwar böig, aber etwas handiger. Da der Strom arg nach NW setzte, konnte nicht daran gedacht werden, nach Yap zu fahren. So wurde nach Guam oder Saipan gestrebt, das am 4. April erreicht wurde.

Die Zerstörung durch den Taifun war eine so empfindliche, als auf Betreiben der deutschen Regierung eine Menge Kokospalmen angepflanzt worden waren, und zwar auf Volea 1000, Máriong 500, Tagaulap 500, Vótagai 500, Falális 1500; auf Raur, das jetzt Daruélimog gehört, waren sogar 4000 angepflanzt und auf Paliau 2000; nach dem Taifun nahm SS. Natuna viele Leute fort, so von Volea 100, von Mariong 7, Tagulap 8, Soluap 1, Falális 110; etwa 200 wurden nach Saipan verbracht.

Der Soldat und Aufseher Goru (Phot. 307) — er konnte nur seinen Namen schreiben — gab mir folgende Nachricht an die Regierung in Yap mit, er wolle auf Voléa bleiben. Agupelior sandte zugleich 20 Webmatten als Geschenk mit der Nachricht, daß auf Oleai jetzt viel Essen vorhanden sei, und daß deshalb die fortgenommenen Landsleute zurückkommen könnten. Goru sorgte, daß nach dem Taifun 20000 neue Kokospalmen angepflanzt wurden. Die Brotfruchtbäume trugen lange nicht, und die Tarosümpfe waren versalzt.

Das Hamburger Expeditionsschiff »Peiho« kam am 5. Nov. 1909 von Ifaluk nach Oleai, wo es bis zum 17. Nov. vor Máriong zu Anker lag. A. und E. Kr. nahmen die Arbeit an Land auf, die durch eine große Mückenplage sehr erschwert wurde. Hellwig sammelte auf Voléa, Mariong, Tagaulap usw.

(E. d. S. Bd. I S. 249—258).

4. Anthropologie.

Bei Lütke Bd. III S. 144 (Observations) heißt es: Bewohner der niedrigen Inseln eher mager als dick, eher groß als klein; Haar ist dicht, schwarzbraun, in Knoten; Nase vorstehend aber breit und groß, Mund groß, Lippen dick usw. Dies trifft im allgemeinen zu.

Bei der Betrachtung der Bevölkerung von Oleai muß berücksichtigt werden, daß sie durch Zuzug von den umgebenden Inseln reichlich durchmischt ist, wie die Siedlungstabellen zeigen, daß also von einer Ortsform kaum gesprochen werden darf. Im allgemeinen muß man aberdoch hervorheben, daß die Uleenser, als anmutig gelten dürfen, was ja frühere Besucher schon hervorgehoben haben, namentlich hinsichtlich der Frauen. Die Bilder zeigen das zur Genüge. Ein englisches Halbblut (Taf. 18c) zeigt, wie auf Lamotrek, stark die britische Dominanz

Hambruch hat 12 Eingeborene gemessen, 4 Frauen und 8 Männer, erstere um 150 cm groß (3), 1 hat 162,8. Die Männer 158—167, Durchschnitt 163.

Die Dolichocephalie tritt nicht mehr hervor, je unter 170 ist kein Längen-Breiten-Index mehr vorhanden; 2 sind brachykephal 81,1 u. 85,5, 7 sind mesokephal 73,6—77,7 und der 3 haben 70—71,5. Die Karolinenhand (Truk S. 23) fand sich bei 3 Männern. Die Haare bei den Frauen schlicht bis weitwellig, bei den Männern fast alle gekräuselt, bei einem dicht kraus; s. die Tafeln. Cantova berichtet ja auch von den Leuten von Faroilap, die nach Oleai wollten und nach Guam verschlagen worden waren, daß sie krauses Haar hatten. Körperfarbe das Braun der Zentralkarolinier. Über die sonstigen Beobachtungen s. den Gesamtbericht.

5. Bevölkerung, Demographie.

Wie bei Lamotrek, so ist in der Oleaigruppe ein starker Rückgang der Bevölkerung eingetreten. Um 1800 sollen, nach Freycinet, S. 101, 3000 Einwohner auf Guliay gewesen sein; dabei stehen neben der Hauptinsel noch folgende Inseln der Gruppe: Raor (Raur) mit 110 Einwohner, Paliao (Paliau) 125, Mariog (Mariong) 90, Fagounlap (Tagaulap) 86, Solïap (Soluap) 70, Fallougla (Votagai?) 50, Harradies (Falälis) 50, Falouelap (Falulap) 36, Hanarisaray (Eangaligarail) 32 Einwohner. Daß die letzte auch besiedelt war, ist neu; dagegen fehlt der alte Hauptplatz Votagai. Ob diese Zahlen bei den 3000 der Guliay-Insel einbegriffen sind, oder noch besonders berechnet werden müssen, ist nicht klar. Jedenfalls wäre 3000 allein für eine Koralleninsel eine viel zu hohe Zahl, da Volea oder Falälap, diese Hauptinsel von Oleai, kaum 1 qkm Land hat. Von 1 qkm tropischen Landes können bei sehr günstigen Bedingungen 1000 Menschen ihren Unterhalt beziehen, aber 3000 keinesfalls. Also ist die Zahl entweder falsch oder sie bezieht sich auf das ganze Atoll mit allen Inseln.

Ich hörte am Orte, Falalis habe wie Volea ehemals 300 gehabt (vergl. oben 3000!), Falalis habe aber 1909 nur noch 30 gehabt, Tagaulap 60, Mariong 50, Raur vor Taifun 200, Paliau 60. Also wird man für Volea und Votagai in früherer Zeit je 300 annehmen dürfen. Gulick hat im Nautical Magazine 1862 S. 174, ungefähr 600 Bewohner angegeben. Wie oben erwähnt waren es 1904 = 661, 1930 waren es 539.

Der Charakter Ulienser scheint früher recht harsch gewesen zu sein: ich hörte auf Lamotrek, daß etwa um 1894 ein Ire Harry Chisholm von 4 Eingeborenen ermordet worden sei. Sie schossen ihn von hinten an und warfen ihn dann in die Passage von Paliau. Wahrscheinlich handelt es sich aber hier wie bei dem letzten Mordfall auf Oleai, der S. 196 erwähnt ist, um Fremde. Denn im allgemeinen gelten die Oleai-Leute seit alters als freundlich und versöhnlich, wie wir es persönlich erfahren haben, und wie es auch Tetens (S. 195) schildert.

6. Name.

Oben S. 183 sind die Frühbenennungen schon aufgezählt. Das S.-H. führt als Namen Oleaï, Uleai, Wolea, Ulie, Anangai[1]. Meinicke nennt schon Ulie, Ulea, Uleei, nach Guliek eigentlich Wolea. In der neuen spanischen Enciclopedia universal illustrada von 1929 steht Uli, Ulea, Uleay, Ulie, Woleai, Oleai. Diese verschiedenartigen Namen kommen natürlich von den Berichten der Besucher; Palau I S. 178 gibt an: Clain 1697 Valayay, 1706 Ulier, 1710 Olie, Cantova Ulee[2], Torres Guliai, Chamisso Ulea, Lütke Ouleyai, Kolonialatlas 1908 Oleai, H. S. E.: Voleai, Japankarte Woleai. Oleai ist in deutscher Aussprache am richtigsten, wie die genaue Aufnahme ergeben hat; das W davor findet seine Begründung im Band 6 I., wo verschiedene Orte mit und ohne W erscheinen, so Onoun (S. 196), das auch in der Bedeutung von »rund« Volóul gesprochen wird. Ferner wird Olimarau (S. 17) häufig auch Volimarau gesprochen, und auch auf Pollap gibt es mehrere Beispiele, z. B. Vórieng Geist und Binnenwasser (S. 278); und Volebuku erscheint in Gesch. 5 usw. Völepeg (*peg* wie *pik* sich anhörend) werden gemeinhin die »kleinen Plätze« der Umgebung genannt als Aurepik, Sorol usw. Besonders die Hauptinsel Falálap »das große Land«, die ja die größte von allen ist, wird meist Voléa[3] genannt, was also eine gute Unterscheidung gegen das Oleai der ganzen Gruppe abgibt. In dem Sturmzauberlied S. 158 heißt Valeŏái »auf mein Boot« (*wa, oá* Boot).

7. Sprache (s. Verzeichnis am Schluß).

Als erstes wurde über die Sprache von Oleai das Vokabular in Kotzebue Bd. III S. 55—67 bekannt, das im ganzen wohl mit den neuen Aufnahmen übereinstimmt,

[1] So Oleai auf Yap genannt, wie ich hörte und bei W. Müller Yap öfter bestätigt wird.
[2] Ich hörte auf Mokemok, wo Cantova war, für Oleai deutlich Óleë.
[3] s. Ges. 1 Bootbau S. 264 Z 7, *vol* im Erinnerungstrauergesang S. 292, Z 3 „sein Duft".

was ganz natürlich ist, wenn man gute Hörer und Schreiber voraussetzt. Ein Teil der Wörter ist zum Vergleich in das Verzeichnis eingefügt, wobei sich herausstellt, daß die meisten sich mehr an Feis angleichen, so daß es scheint, daß bei der Aufnahme der Mitteilende ein auf Oleai lebender Feisuner war. Hinsichtlich des bei Truk S. 20 schon erwähnten *dj* ist noch zu erwähnen, daß daneben noch ein sehr weiches *j* vorkommt, aber gelegentlich verhärtet sich das *dj* auch zu einem *ts*-Laut wie z. B. in Fátsumal.

l und *n* sind auch hier wechselnd, wie auf Lamotrek, wenn auch dort das L vielfach das Übergewicht hat.

Für Regenbogen *loiliar*, sagte Agupelior deutlich *noiniar*;
bei H 1 S. 209 hieß es Nei und Lei;
bei H 13 S. 212 usw. Lag und Nag usw.
Vor Namen häufig Ne... statt Le...

Die Possessivsufixe werden gelegentlich ersetzt durch vorgesetzte Eigentumsbezeichnung z. B.

mein, dein, sein Kochhaus *eai mulum, eau malum, ealá malum* (s. Feis).
allmählich kommen die Leute *fasót ĕr vulog ĕromat*
ich gebe ihnen Tabak *i vongaler tamako.*

S. Lamotrek.

Taifune s. oben S. 196.

Erdbeben sollen nicht allzu selten sein. Lütke berichtet, daß auf Wolea große Riffspalten, von Erdbeben herrührend, vorhanden gewesen seien.

S. auch Taifun oben.

8. Mission.

Weißer Missionar nicht vorhanden.

Auf Oleai hörte ich über den Missionar Snelling, über den in Truk S. 51 Fußnote 1 berichtet ist, näheres nach seiner Ausweisung. Er fuhr nach Onoun und Póloat, verfehlte aber beide bei der Heimkehr, und trieb im Eingeborenenboot nach 3 Monaten in Aurepik an, wo ihn eine Bootsbesatzung aus Oleai sah. Er war fast zum Skelett abgemagert. Das Oleaiboot brachte die Nachricht heim, worauf der Oberhäuptling Agupelióor auszog ihn zu holen. Er brachte ihn auch wirklich nach Oleai und schaffte ihn auf einer Bahre, weil er zum gehen zu schwach war, nach Vósavo in sein Haus, wo er aber nach kurzer Zeit starb. Agupelióor hatte ihm versprochen, ihn nach Truk zu bringen, sobald seine Frau niedergekommen sei. Die Japaner schienen sich in unangenehmer Weise eingemischt zu haben.

204

II. Landesbeschreibung

(s. Karte 4).

1. Inseln und Siedlungen.

Das Oleai-Atoll zeichnet sich vor den andern Gruppen durch seine Sanduhrform aus; ostwestlich gerichtet ist der Inselkranz 5,6 Sm lang, und im W (Falalís—Votagái) 3 Sm breit, im O (Raur Südspitze—Voléa Nordkap) 2,1 Sm. Die Einschnürung ist etwa 1 Sm breit; von dem neuen Sand-Cay bis Tagaulap wären es 1½ Sm.

Durch die Einschnürung wird das Binnenwasser in zwei Lagunen geteilt, die durch Einzelriffe im nördlichen Teil der Enge von einander getrennt sind; nur südwärts führt ein 2 Kabellängen[1] breiter Verbindungskanal von O nach W, innerhalb des Kranzes mit genügend Wasser für größere Schiffe (mindestens 15 m). Die Tiefe im O ist meist 7—9 Faden, im S ungefähr doppelt so viel; dort ist auch die meist gebrauchte S-Einfahrt, der Raur-Kanal; die große W-Lagune hat meist über 20 Faden, mitten 27 Faden, und hat im Süden auch eine große Einfahrt mit einer Untiefe von 5,3 Faden, die Falális-Einfahrt. Zwischen beiden Einlässen dem Raur- und Falális-Kanal liegt noch eine kleinere mit 7 Faden Tiefe, zwischen dem Sandy-Cay und der kleinen Insel Motogosóu; sie führt auf den Verbindungskanal zu, in dem man nach O oder W direkt in die Lagunen gelangen kann. Alle diese 3 Südeinfahrten haben also genügend Tiefwasser (mindestens 15 m) und auch genügend Breite (mindestens 300 m), aber ihre Ränder sind unter Wasser, denn der Riffsockel auf dem Raur liegt, springt über 700 m weit nach W vor (bis an den Raur-Kanal), und das Riff von Falális ca. 1500 m nach O. So bleiben im Süden als Grenzen nur noch 2 submarine isolierte Riffe, auf denen im O die kleine Insel Motogosóu, im W das schon erwähnte Sand-Cay liegt, das erst im Taifun 1907 neu entstanden ist. Nach dem Bericht der Eingeborenen ist eine alte Sage vorhanden, nach der in alter Zeit an gleicher Stelle eine Insel war, die durch einen Taifun zerstört wurde, wie Raur 1907 (s. S. 198); der gleiche Taifun hat an alter Stelle die Sandanschwemmung, das Sand-Cay geschaffen. Der Sonderplan der Karte 93 des Reichsmarineamtes von 1903 verzeichnet an der Südseite westlich des Motogosóu-Riffes nur ganz klein den Kern des Sand-Cay-Riffes[2] und westlich davon eine Lotungslinie von SW—NO mit

[1] eine = 10 Faden = 185 m.

[2] Offenbar nach der englischen Karte von 1876 bei Miguel.

Tiefen 9.1, 9.1, 26, 11, 9.6, 9.6, 11, dann 40 als Lagunentiefe. Erst durch die japanische Karte wurde die offene Südseite (wie bei Onoun) verständlich gemacht, obwohl nur eine fliegende Vermessung vorliegt.

Die deutsche Karte verzeichnet noch einen Westkanal zwischen Falalis und Falulap, der aber an der Einfahrt Untiefen von 4—6 m hat, die auch die Japan-Karte zeigt. Sie ist nur für Boote geeignet, ebenso die zwei Einfahrten im Norden. der Nordkanal zwischen Jalangigereil und Fareiles, der in die Westlagune führt (10 m tief und 180 m breit) und den Tagaulap-Kanal zwischen dieser Insel und Marijong (mit einer Untiefe von 3,6 m bei kaum 100 m Breite), der direkt in die O-Lagune mündet.

Voléa ist die größte unter den Inseln mit nahezu 1 □-km Fläche, dann kommt Votagái im W mit über ½ □-km, das ja früher auch die Vorherrschaft in der Gruppe gehabt haben soll, wie Kadu versicherte, dann kommt Votagai, Soliap, Falális, Tagaulap. Mariong, Eangaligarail, Faralíes usw.

7. Raur †	Davokulong	
	Logop, Lúgalapraur	Daruélior †
	Kuoi	
8. Paliau †	—	Erurlíëlit

2. Voléa oder Falálap[1].

Von den einzelnen Eilande ist die Hauptinsel Voléa, oder auch Falálap, das »große Land« genannt, die wichtigste. Sie hat ein Horn gegen die NO-Passat-See vorgeschoben und hat deshalb eine dreieckige Gestalt, welche die Karte von 1903 zeigt. Dabei war der SW-Schenkel sanft, wie eine Bucht, gebogen. Von hier

15. II. 09 **Brackwasser-Lagune im NO-Teil der Insel Woleai**

Karte 5.

bis zur Spitze war fast 1 km. Dieser großen und breiten Aufschüttung verdanken auch die Bewohner ihre Rettung im Taifun 1907 (s. S. 198). Nach der Japan-Karte wäre die Breite nach NO hin durch den Taifun noch um etwa 200 m gewachsen; dafür wären aber die beiden Nordseiten des Dreiecks im O und W etwas nach innen, landwärts gekrümmt worden, so daß aus einem gleichseitigen Dreieck mehr eine Mützenform entstand, wie Karte 5 zeigt. Leider habe ich der

[1] Wie die Insel des Mogemog Archipels.

gedrängten Zeit halber nicht selbst eine Aufnahme gemacht, aber ich habe den 11. Offizier Gollert gebeten, diese zu machen und so sehen wir wenigstens, wie die Nordspitze 2½ Jahre nach dem Taifun aussah (Karte 5). In dem groben Geröll sind noch einige Brackwasserseen, da wo früher Tarosümpfe waren, wovon S. 200 die Rede war.

Plan 6.

Der Siedlungsplan (Plan 6) von Voléa zeigt längs des ganzen Südstrandes einen breiten Weg, der auf Geheiß der Regierung angelegt wurde; er beginnt am SO-Kap Matónnap und endet am Westkap. Der Plan zeigt alles nähere.

Von den Inseln Paliau und Raur im Osten ist nur zu erwähnen, daß Paliau schwer mitgenommen wurde, aber in der Hauptsache seine Gestalt behielt (Durchlaß zwischen Paliau und Voléa s. S. 199), daß aber die Insel Raur als Aufschüttung vom Riffsockel vollständig heruntergewischt wurde.

Siedlungsaufnahme (s. Plan 6) 1909
auf Wolea in den Dorfteilen Lúgulap, Vósavo, Jaur und Lolepéleg.
(H. = Haus, Si. = Sippe, Lam. = Lámotrek.)

Es waren und sind noch folgende Männerhäuser *falap* vorhanden: Lamalúel, Gatala, Ungalél, Falelát (Leabal), Galengelífés.

10. Karten.

Die erste Karte kam durch die Vermessungen unter Lütke 1828[1]; sie ist erst durch die neue englische Karte von 1927 wesentlich verbessert worden, die sich wohl auch in der Hauptsache auf japanische Arbeiten stützt. Was sie neues bringt, darüber alles nähere oben S. 204.

Miguel erwähnt die alte englische Karte von 1876, die er in seinem Atlas Hoja IV bringt.

---

[1] s. Bd. 6 I S. 7 und 8. Die neue Karte von 1927 s. S. 184.

221

III. Stoffliche Kultur.

1. Tracht.

a) Kleidung.

Nach Lütke lieben die Frauen, die Ringe von den Saugnäpfen der Octopus-Tintenfische, die beim Genickabbeißen[1] (Samoa) entstehen; ihre Tinte dient zum Färben der Halsringe.

Man steht früh auf. Die Männer waschen sich am Strand, baden, spülen den Mund aus, mit Salzwasser; die Frauen gehen zu einem andern Teil des Strandes, Kinder können bei beiden sein (Lütke).

Nach Kotzebue III S. 87 sind die Einwohner von Ulea den Ratakern im Wohlstand, und auch sonst noch in manchen Dingen überlegen. Aber diese Angaben des überheblichen Kadu treffen nicht zu.

Kinder gehen meist nackt. Mädchen tragen nach der Menstruation den Grasschurz *sivisif*, Born *siwesiw* (s. S. 268), He. 1431 aus Kokosfiedern, He. 1537 aus Hibiscusfasern. Herrschend sind hier wie sonst für die Frauen die Webmatten (s. Weberei) *gabálabal (gabalei, ...om, gaban)* (Born: *gapalepal*, Ko.: *gapellepel*). Die Arbeitsmatte ist grob (He. 1866 = 566011 *gābe)* aus Bananen und Hibiscusfasern; oft mit schwarzen *(lugurāl)* und roten *(ligotrā* Europ.) Streifen (s. u. *bülo)*. Die Männer tragen die Schambinde (He. 1775 = 557611 *garrogiss)* und einen Regenmantel *negaū (nego)* aus Hibiscusbaststreifen, He. 1536 = 5385. Die Schambinde (He. 1863 = 565711 *karīri, genurs, gelurs*) ist aus Bananenfaser gewebt; Born Männermatte *tor*. Die Unerwachsenen haben Blätterbüschel, die oft niedlich zurechtgemacht wie Abb. 81 des Mädchens zeigt; er heißt *erünnu* oder *tivetio*, He. 1537 = 538611 *jongjong vaifil* aus Hibiscusbast; Blätterketten über den Damm *chatiletach* (Born). Ein Knabenhüftschurz mit rot und schwarz gefärbten Hibiscusfasern (und Bananen) heißt *bülo* (He. 1839 = 563711); so nennt aber auch He. 1867 eine grobe Frauenmatte.

Abb. 81. Mädchen mit Blätterschurz.

Hut *bárong* (He. 1681 *párong* aus *solivars*-Pandanus. Rand *narréte* (S. 238[2].) Spitze *ungale*, Spitzenring *ferigeli*, Kinnband *gali*, Nähte *dēdi)* (s. Feis). Über den Zauberanzug s. S. 152.

[1] A. Kr. Die Samoainseln Bd. II S. 407 *fe'e*.

Duft. Kr. 401 eine Parinariumfruchthülle gefüllt als Duft: *uongas* (vergl. Truk S. 424 *vangu)*. He. 1403 eine wohlriechende Nuß ähnlich Muskat *éssid*, Falálap, s. unten.

b) Schmuck.

(vgl. Tafel 16 und 18.)

Lütke beobachtete 1828 Hals-, Arm- und Fußbänder aus Muscheln und Perlmutter. Im Tausch wurden Glasperlen verlangt. Die Gürtel aus Kokosschale waren zwei Finger breit; auch weiße Muscheln daran; sie waren zu teuer im Tausch; s. auch bei Tatauierung.

An Schmuck wird kein Luxus getrieben. Meist ist er spärlich oder fehlt ganz. Halsketten von roten Scheibchen und von *tia* (Mangle) wie auf Truk kommen natürlich vor, auch ein Fischzahnhalsband fand Gollert, aber besonderes zeigte sich nicht. Nur eine einzelne Perle, durchlocht und auf einen Faden gezogen, bekam ich (Kr. 408), aber es war nur eine dichte Tridacnakugel. Taf. 14d u. 16 zeigt auch eine reichere Schmückung: auf dem Kopf ein Kranz von Crinumblüten (vgl. auch Phot. 334), Schnurrbart und kurzer Kinnbart vorhanden, Ohrläppchen mit Ringen (wie kleine Pattarmringe) und sonstigem, Hals- und Brustkette, aber alles bescheiden bei den Stutzern. Der Häuptling Rogiol von Tagaulap trug neben einem Kamm einen Kopfkranz aus aufgereihten Röhrenblüten, wenig im Ohr und ein Stück Schnur als Halsband, Taf. 16d; aus seinen Kopfhaaren hatten Knaben sich einen Kopfschmuck für Spiel und Tanz hergestellt (Kr. 378 = 31351I) Das *lima* = Stirnband, das S.-K. S. 383 erwähnt, gehört nach Ku. (Bd. 61 S. 32), ist jedenfalls auf Oleai nicht bodenständig; auch für die übrigen Schmucksachen ist die Herkunft unsicher.

Kamm *ráua* (Yap) s. die Tafeln.

Haaröl, Born *loi*; Haar kurz geschnitten oder Schopf hinten; Mädchen Locken.

He. 1881 Kopfkränze *úlevars* getroknet, im Haus aufgehangen als Andenken (Ko.: *kabulipeu)*.

Spitzhut Born *tscholiſadj*.

Düfte sind beliebt, nur mangelnd; eine angetriebene alte Parinariumnuß wurde geschabt und zum Einreiben benützt, zu erotischen Zwecken. *eis*, *eais* und *vóngas* (s. Truk S. 424 *vangu)*.

Als Epilator für Haare, He. 1890 *kom*, aus Muschel Lioconcha castrensis L., in eigner Sammlung *kagugú* die hübsche Cytherea puroglyphica Conrad, mit einer Schmuckschnecke Natica mamilla Lk. Bestimmung von Herrn H. Wägele Stuttgart; ebenso Palau (s.S.37).

Kämme s. oben. Ohrschmuck s. S. 35.

Halsketten, *márremar*, bekannter Form (Ko.: *maremar)* Kr. 314—17 = 3096—9811, Ketten *kamojd* (Born *chamotsch)* aus roten Muschelscheibchen *ſēpar* (Born *ſeipar* und *gau)* (He. *vaipar)*; Kr. 353 *kamodj a djolipoi*. Abb. 82 Hals-

band, *gomalath* genannt (Born *chamelath*) aus weißen Muschelringen und Kokosscheibchen *(sagach*, Born *tagag)* (Kr. 318 = 30991I). Eine Kette aus Kokosscheibchen *sagách üle maremar* zeigt Abb. 83 (Kr. 320); solche aus Kokos und Konusscheiben He. 4646 *marremarre dágag ma vul (mat)*; eine solche He. 1593 = 54271I Abb. 84 hieß auf Mariam *m. billigarú*[1]; die Konusscheiben hatten weiße senkrechte Streifen *ladjére vul.*

Abb. 82. Halsband. Weite 47 cm.

Abb. 83. Halskette aus Kokosscheibchen. Weite 36 cm.

Zum Schleifen größerer Ringe werden die viereckigen Schalenstücke *dagag dibedib* mit Löchern *vúrarow* auf ein Holz (He. *ira igēk dagag)* gesteckt, Abb. 85 (He. 4647 = 821311), und geschliffen[2].

Eine Kette mit Fischzähnen zeigt Abb. 86 (Kr. 353a *maramar ni le gai).*

Brustketten: Aus den größeren Ringen fertigt man die darmähnlichen Brustketten (Truk S. 94 Abb. 30), die aber höchstens bei Festen getragen werden (He. 1442). Große Pattscheibenringe *bodjaü* vorhanden (Truk S. 95 Abb. 36).

Ohr: An dem meist nicht sehr erweiterten Ohrläppchen ist fast immer Schmuck vorhanden, wie die Bilder zeigen. Stärkere Erweiterung s. Taf. 16. Taf. 14d zeigt Crinum eingesteckt (r.), und (l.) den *tebau*-Ohrschmuck von Palau III S. 21 Abb. 12, der hier gar nicht so selten ist (s. auch Lam. Taf. 2a). Aus Tridacna geschliffene Kugeln (Perlen) zieren sie, oder sind auch frei im Schmuck vorhanden.

[1] He. 1831 Halsband aus 6 Reihen Kokosperlen *billigórru*, von einem alten Mann in einer Stunde völlig neu aufgefädelt; s. Lam.

[2] s. Bd. 61 S. 37 u. 220 Abb. 92.

Gehänge *suasua* wie Lamotrek, auch Dreiecke aus rotem *faubar*. Beliebt waren zu unserer Zeit die etwa talergroßen Räder, aus hellem Schildpatt gefertigt, *puodj*[1] *a dju dju* oder *ale falu* genannt (s. Truk S. 107), von deren Formenreichtum nur zwei hier abgebildet sind (Abb. 87) (vergl. Bd. 6 II S. 36 u. 37).

Abb. 84. Halskette aus Kokosscheibchen, Länge 68 cm.

Abb. 85. Kokosringe zum Schleifen.

Abb. 86. Fischzahnhalsband, Länge 35 cm.

Abb. 87. 2 Testrädchen.

Abb. 88. Ohrring aus Mark.

Abb. 89. Testhaken.

Abb. 90. Testscheibe.

He. 1555 ist ein gekrümmtes Stück Mark von einem Strauch *varálihil*; wurde von einem Mädchen im Ohr getragen Abb. 88.

He. 1543 ein Ring von einer *rubung*-Steinnuß aus Truk.

Zu den Hängern an den Ohren oder an der Brustkette gehören auch die Zeremonialfischhaken He. 1623 = 5454II Abb. 89, die aus einer Pattscheibe,

[1] Ko.: Ohrenschmuck *wot.*

Abb. 90 (5½ cm He 1735), herausgeschnitten werden. He. nennt sie *gaũ bodj*; soll der Hacken gebraucht werden, muß man den Steg entfernen, damit Spitze und Einfahrt frei wird. Ihre Bedeutung s. bei Feis Abb. 197.

Erwähnenswert sind auch noch die Hänger von roten Dreiecken (Truk S. 103 *lanubodj)*, die hier als *faliúrupeg* (Feis *faliúrepeg)* als »Steine von Aurepik« erscheinen, da die roten Muscheln dort häutpsächlich gefunden werden (vgl. Lukunór). Diese roten Schalen heißen *fóudja* (von *dja* Blut), Schildpattscheibenringe *bõs* (s. Taf. 16a).

Armbänder aus Schildpatt *puodj a lagállag* (Kr. 335), gerieft *daridavi*, breit und flach (He. 1630) *woróil*; He. 1676 *lagámu*, *lakelake*. He. 1629 ein Armring *djágeag* der Trochusschnecke Yap, He. 1727 *lagelag*. Aus Patt werden auch Fingerringe (He. 1713 *galágalag a li got)* geschnitten. He. 1821 ist ein Armband aus Haar mit *tigere*-Muschel. Alles ähnlich Truk, auch eine Manschette mit *faubar*, und roh aus Kokosschale (He. 1369) und Trochus (He. 1364 = Palau).

Aus Haaren macht man aber gerne Gürtel, wie sie im Bd. 6 I S. 256 schon erwähnt wurden; und S. 32a bei Lámotrek, oft dreistrangig. Kr. 328ff. *djiem e dēdē* Haar, ca. 35 Stränge zopfartig geflochten; He. 1573 *datár e djim* Haargürtel (Born *tschiim)*. Kr. 333 E. Kr. *tagach u pöch* Kokosgürtel für Frauen. *méang* weiße Spangen. Daneben fehlen nicht die früher schon beschriebenen Gürtel aus Kokos und Muschelscheibchen, wie sie Taf. 14a zeigt (Born *tartar* zusammengehalten durch weiße Muschel *maijal*. Die Prachtgürtel *táral*[1] sind schon S. 32a erwähnt; sie sind von Aurepik, Sorol, Ngulu und Feis eingeführt. Ihre Kostbarkeit erfuhr schon Lütke (s. oben).

c) Tatauierung *māk* (Ko.: *mõck)*.

S.-K. S. 380 sagt, wohl nach Kubary: »Die meisten Männer sind über den ganzen Körper geschmackvoll tätowiert, mit vielen Verzierungen in den Ohren und um den Hals, und Federn im Haar geschmückt«. Zu unserer Zeit waren es nur wenige.

Auf Oleai erschien mir, von Osten kommend, zuerst die zentralkarolinische Strahlentatauierung. Wahrscheinlich war sie früher bis nach Kusae hin verbreitet, worauf Lütke's Abbildung (s. Bd. 6 I S. 42) hinweist. Sie ist seitdem nur durch Kubary bekannt geworden, der sie 1895 auf Taf. XI von einem Sonserol-Mann vorn, hinten und von der Seite wiedergibt, etwas klein und unscheinbar, aber doch unverkennbar deutlich[2]. Joest S. 82 hat nur einen Yap-Mann von hinten abgebildet, der aber so viel mehr schwarze Flächen zeigt, daß

[1] Nach Senfft Glob. Bd. 87 S. 78 auf Oleai *kil* (auf Ululsi *bül)*, Born *djil mit* Stegen *pak e le djil*.

[2] Im Journ. Mus. God. Heft II Taf. IV ist ein Yapmann mit senkrechten Strängen am Leib, oben am Hals von Querstäben überlagert, ganz wie ein Gartenzaun.

Tatauierung eines Häuptlings.
Abb. 91a—c.

E Kr.

Abb. 92. Tatauierung

sein Zusammenhang zweifelhaft erscheinen könnte. Aber Müller Yap I S. 43 u. 45 zeigt doch deutlichst, daß diese Strahlentatauierung, auch auf Yap, wo ich sie selbst nicht sah, vorkommt, während sie auf Palau andersgeartet ist. Ich habe sie an Mogemog-Männern auf der Fahrt nach Yap studiert, und Feis zeigt die zweifelsfreie Verbreitung, so daß sie also auf den westlichen Karolinen mit Ausnahme von Lamotrek und Palau (auf Yap scheint sie nur von Mokemok her eingeführt) heute noch vorkommt.

Strahlentatauierung nenne ich sie wegen der strahlenartigen Gebilde, die auf der Brust und an den Seiten nach oben streben, wie Finger von Händen; Müller nennt sie *yōl*, neben den eigentlich yapischen Beinmustern.

Die Abb. 91, 92, 93 zeigen, wie schön sie auf Oleai bei den Männern vorkommt; bei den Frauen sind meist nur kleine Ornamente an den Oberschenkeln vorhanden, die von den Matten bedeckt werden. Dies kann auch bei Männern der Fall sein, da die große Rumpftatauierung natürlich schmerzvoll, mühsam und teuer ist. Die Erklärung der Strahlentatauierung siehe bei Feis. Hier nur noch einiges zur Ausführung auf Oleai.

Der Tatauierer *idlemak* wird geholt, wenn sich jemand beschlagen lassen will; ist das nötige besprochen, so gibt man ihm am Tage vor Beginn ein großes Essen und macht ihm auch als Vorausbezahlung viele Geschenke, für ihn und seine Familie. Für eine große Tatauierung sind es oft 150 Stück an Flecht- und Webmatten, Gürtel, Schüsseln, Deckelkisten, Äxte, Messer, ja ein Boot kann dabei sein, denn der ganze große

Schmuck ist mühsam, erfordert viel Arbeit und Geschicklichkeit. Ein berühmter Künstler läßt sich dementsprechend bezahlen. Er zeichnet mit einer Kokosfiederrippe *(log)*, die er wie einen Pinsel in die schwarze Farbe (Ruß von Calophyllumnüssen mit Wasser angemacht) taucht, die Muster *gaar* in 5—10 Tagen fertig. Hat das Schlagen begonnen, so schläft der Geschlagene

Abb. 93. Frauentatauierungen.

immer auf der beschlagenen Stelle, damit das Sekret abfließen kann. Ist nach vielen Tagen alles zum glücklichen Ende gebracht, so marschiert der Geschmückte auf dem großen Weg durch das Dorf, damit alle Leute ihn sehen und bewundern können. Er hat eine Matte mit sich, auf die er sich zuweilen niedersetzt und erhält von allen Seiten Erfrischungen.

Im ganzen gilt er als tabu, d. h. er darf z. B. mit Frauen nicht zusammen essen und verkehren; dann tritt er wieder ins Alltagsleben ein.

Die Tatauierhacken *gálēt* sind wie Aderlasser vorhanden (Kr. 256—259). Schneide aus Fregattvogelknochen; die Hämmer *olo* oder *vao* sind oft recht lang, fünfeckig, wie der auf Abb. 94, (Kr. 264 = 304911), der 45 cm lang ist; ihre

Abb. 94. Tatauierhammer.

Abb. 95. Tatauierhammer.

Form ist als Vogel unverkennbar. Das Holz soll vom *gōngi*-Baum stammen (s. Feis), der aber auf Oleai ausgestorben sein soll. Einen einfacheren Hammer zeigt Abb. 95, He. 1609c *daiō* oder *daijo* aus *ira*-Holz; man schlägt mit dem verjüngten Ende.

Das Baumharz *rumaio* (Kr. 405) oder *rau* (He. 1774) dient zur Rußbereitung *bollāt* (He. 1609).

Bemalung mit Gelbwurzpulver *reng* (Ko.: *rahn*).

2. Ernährungs-Wirtschaft.

a) Pflanzenprodukte.

Wichtigste Nahrungsmittel und Geräte:

lu Kokosnuß (Born *nu*, *djan'nelú* Kokoswasser, *djal* Wasser, *bōr* Flasche; zum Abnehmen der Kokosnüsse gibt es einen Sitzstock bzw. Kletterfußsessel Abb. 96, He. 1937 u. 5727 Abb. 96 s. S. 232. Ko.: Kokos *ni*, abhülsen *pajōl*,

Abb. 96. Kletterstock.

udt Edeltaro (Ko.: *eoth*)
pūlag[1] Großtaro (Ko.: *wulach*)
fillē Großtaro (Ko.: *villa*)
uidj Bananen (Aberglaube S. 284) (Ko. *ul*)
mei Brotfrucht (Ko. *md*)
e mamis Gurkenart
uōu Zuckerrohr
faliap Eugenia malaccensis; beliebt bei Kindern
gadji Palmsaft (Born *gatschi mem*, sauer *faloba*) erst 14 Tage nach Schnitt Ertrag gut.)

[1] Born *bulak*, nach geschlechtsloser Nacht gestochen. Tagaulap hat kein Feld.

nach Born Papaya *galoruk* und Crataeva *jabatsch*; v. Kittlitz S. 155 gibt an, daß Tacca pinnatifida *(mókamok* Truk S. 420) sehr viel auf der Insel Raur vorkomme (Ko.: *mogemug*).

b) Gerichte:

djél gestampfter Taro oder Brotfruchtteig mit *gadji* oder Preßmilch gemischt. Born: *djarong* Cocos mit *bulak*-Stücken.

limelim: Tarostiele enthäutet und mit Preßmilch oder *gadji* gekocht, ebenso *mar*.

Das Klären des Busches geschieht durch die Männer; so werden Rodungen *ídravol* erzielt. Die Erde *mádjor* wird mit einem ruderähnlichen Grabstock *goldívol*[1] (Abb. 97 Kr. 263) umgebrochen. Die Frau pflanzt den Taro; gelegentlich auch Männer, wenn sie es verstehen. Blätterdüngung *rál*.

Abb. 97. Holzspaten.

c) Kochen.

Arbeit der Frau, die auch im Kochhaus webt (Lütke). Es gibt eine Art Kochschulen.

d) Küchengeräte.

Kokosschale (zum Trinken) *tagag e lául*, Wasserflasche *baradjal*

Löffel *ólil*[2], Abb. 98;

Eßspatel He. 1678 *gátik* (Fischschwanz *perál*), *átak* aus Test-Knochen Abb. 99, Kr. 253 = 303811, 29 cm lang, zum Kokosnuß aufschlagen, ausschaben und essen; s. auch Linden-Museum Nr. 41258 Taf. 7.

Abb. 98. Teelöffel aus Palau.

Stössel *fál*, Abb. 100, Stampfer für Taro, Brotfrucht usw. He. 1852 und 565011 und Kr. 282 = 306611, Höhe ca. 18 cm; auch aus »Steine« *faisúss* He. 1679 Stoßbrett *al'líf*, stampfen *sugu* (Ko.: *lovis*)

Kokosraspel *wégin* Abb. 101, He. 1627 = 545711 von Máriam, Holz *félé*, Muschel *pílig*

---

[1] He 1857 *ottiwdri* oder He. 1943 *udi* aus Kokosholz.

[2] Auch Schildpattlöffel von Palau fanden wir hier vor (He. 1697), und He. 1658 Trinkröhrchen.

Bambusmesser *gig* (Yap) (He. 1785) zum Sägen von Schildpatt gebraucht (Ko.: schneiden *kulovi*)

Taroschaber, große Becherkoralle, Kr. 407.

Abb. 99. Spatel.

Abb. 101. Raspel.

Abb. 100. Sitzbrett.

Taroschaber aus Perlschale He. 4649 *sár*

Feuer *sáf*, -Hobel *weelit*; neuerdings Stahl und Stein in Täschchen He. 1558 *kaigéra*, 4643 *sigeréra*; s. auch die Feuerholzbüchsen bei den Gefäßen S. 242; Zunderholz *gabát*

Herd *fálang*, Feuerfächer *gálipo*, Brunnen *djálal*.

Kokoshüllenspalter He. 1860 *gátubirra* Wurzelknotenholz; He. 1885 = 56761 Kletterfußfessel aus Bast *laviteg*; He. 1937 Sitzstock, Sitzholz *valevaib* zum Palmen besteigen, Abb. 96, zwecks Reinigung, Nüssepflücken und Palmwein schneiden. Hacke aus Testknochen (vgl. Ku. Bd. 61 S. 50), breite Schneide, Nil ähnlich Palau.

Turdus columbinus für Männer tabū, weil sie sonst von den Kokospalmen fallen.

e) Tierische Nahrung.

Hauptsächlich Fisch *ig* (Born *ik*).

Cantova S. 316 erzählt vom Walfang (Delphin?) nach dem Bericht eines Eingeborenen von Oleai: Wenn ein Wal in die Lagune kommt, fahren Boote sofort zum Einlaß und versuchen das erschrockene Tier ins Flachwasser zu treiben. Sie springen dann ins Wasser und speeren den Fisch, andere werfen ihm Leinen um, die an Land festgemacht sind. Dann wird er an Land gezogen. Ein großes Fest folgt.

Lütke S. 176 schildert eine Art der Fischkonservierung (vgl. Palau III S. 98): In einem Erdloch macht man Feuer und legt Korallensteine hinein. Sind

sie glühend, bedeckt man sie mit Blättern, legt die Fische darauf, bedeckt diese auch mit Blättern und gibt heiße Steine darauf. Dann wird das Loch mit Sand zugedeckt. Dann sollen die Fische eine Woche gut bleiben.

Grüner Scarus wird roh mit Brotfruchtteig *mar* gegessen.

Nach Lütke Octopus 48 Stunden nach Kochen gegessen.

Turdus columbinus für Männer tabū, weil sie sonst von den Kokospalmen fallen.

3. Fischerei.

a) Allgemeines.

Die Leine *djál* wird aus Fasern von *dromá* gedreht; Rinde von der Epidermis befreit, der Bast mit Muschel geschabt und in der Sonne getrocknet.

Born: Fischfang *seloch*, mit Speer *koboi*, Angel *bau*, Haken *cho*, Reuse *buiau*, Netz *jadeng*, Fischbank *kassutsch*, Fiederfischfang *tülimingar* (s. o. *dulima* . . .).

Abb. 102a—d. Fischhaken.

An Haken *bā* wurden gesammelt: (Angelstock He. *tigo* 1826 *wai*, Angel *wau lü vül*). (Ko.: *gau*) (Zeremonialhaken s. oben Abb. 89, He. 1347 offen von Falális).

Kr. 379 *bā lietam*.

Kr. 381 *bā ligátaf* aus schwarzer Perlmutter *djar* für Fisch *djep*.

Kr. 383 *bā ligataf faibar* aus rotem Spondylus für Fisch *gali*.

Kr. 399 *bā levil* für Bonito *karangāp*; Testhaken Berlin VI 10661 vgl. Feis.
He. 1797 *pā faipar* von Vótagai Abb. 102a für *kalli, mol, detettivars.*
He. 1619 = 5450 *pā fai*, Abb. b, von Mariam, mit Widerhaken außen.
He. 1625 und 1705 (5455 und 5524II) *pa ssār*[1], Abb. c, d, für große *ilam* (s. S. 49).
He. 1795 *fai wai* Blänker schwarze Perlschale *waū*, für *matak'trd, moil, ilam, gali.*
Kr. 397 Testhaken *gō* für alle Fische s. S. 225 (Lam. *gobodj*), *matalipā* Haken für *balug*-Fische vom Boot aus, *baligat'taf*[2] für Innenriff *illang*. Die Behälter für die Haken s. bei Gefäße.
He. 1912 Kokosbüchse mit Fischhaken *wai teri pér.*

Nach Lütke 3 Arten Haken: 1. klein bogenförmig, aus Holz daumengroß, Muscheln, Kofferfischteil, Köder Gerres (Tinga). 2. Perlmutter bei Mond für Serranus, Bodianus, Labrus, Balistes usw. 3. größere für Bonito, geschleppt vom Boot, mit Kokosfiedern.

He. 1552 Fischdrachen aus Brotfruchtbaumblatt *srōu*[3] *e gataug* (Lam. *gedjeg*). Abb. 103 mit Köder aus Haifischhaut *gēli boggo* oder *hoilūl li boggo* (s. S. 48). Länge 70 cm, Breite 35 cm; s. Feis.
Haifang *lemalibóggo* mit Köder *tag*, s. Feis.
Aalschlinge fehlt.

Abb. 103. Fischdrachen.

b) Fischspeere:

He. 1694 *tau* aus Kokosholz; Lütke *hattan* spitzige Stange.
He. 1828 *gōbai* aus Arecaholz von Yap.
He. 1903 kleine *to lik* aus *song* Holz, Zacken *rumūl*, Spitze *meldl; dulimat* mit Fackel auf dem Riff fischen *(dul* Fackel), *dulemangar* auf Flederfische (s. u.).

c) Fischkörbe und -netze s. S. 237 Lütke.

Treibholz fischen *gabeibei i rēl* s. Feis. Am 6. Nov. 1909 wurde ein großer Baumstamm an der Nordseite von Wolea gemeldet, den wir mit Agupelior besahen. Die Fischer fuhren über die Brandung der Riffkante hinaus und befestigten

[1] He. 1787 *ba garangap e ssēr* aus Perlschale.
[2] von *gat'taf* hin und her bewegen.
[3] s. Lam. Blatt *reau.*

die Körbe an den Flanken. Die Leute von Mariong fingen über 100 graue kleine Brassen.

Schon in Bd. 61 Taf. 5 ist ein Stück von Oleai abgebildet. Eingang überdacht, Kammer mit kuppelförmiger Erhöhung; diese Art heißt *ulebam*, He. 1900 = 568911 *ūlepam*, Dach *rūg*, 2 Kammern neben Eingang *peg*. Horizontaler Reifstock im Eingang *pōgepōg*, äußerer Boden *bássebazs*, Kuppel *ung*, Hinterwand *kab*, Steifgabel innen *ula roi*, innere Seitensteifstäbe *sūre*, Ringe *talling lū ū le pam*.

ulebíou sieht aus wie eine längliche Kiste.

ulemorōual (...morōuel) ist keulenförmig, auf einer Seite verdickt.

He. 1899 *ū le gārér* Kippreuse. Wird mit der offenen Seite nach unten ins Wasser gehalten. Schwimmen Fische hinein, so wird der Korb rasch nach oben gedreht. Die starken Längsreifen *olōl* sind aus Wurzelholz *wogarulle giriau*, die dünnen aus *wogarolle lū*; Quergeflecht *gobór*, Griff und Ramen *ū*. He. 1948 gleich, aber mit Handstock; Reuse *tangag*, Holz des Geflechtes *jaro*.

util ist länglich walzenförmig und wird zwischen zwei Booten gehalten.

util wurde aber auch ein Netz mit Ramen genannt (Kr. 266 = 305111). (Ko.: *ueh*) das als Modell mitgebracht wurde (s. Taf. 19a.).

Kr. 265 *gajab* Filetnadel, *uápes* Schwimmer, Senker *fáorem* s. S. 246.

Handnetz für fliegende Fische *sōu*; He. 1645 *srōu*, Namen *atūrtrōu*, Griff *fouwo*. *ūeng* Hochseenetz.

Nach Lütke Frauenarbeit *boschebok*: sie machen im Binnenwasser einen Halbkreis gegen den Strand, die Netze dicht aneinander; die Männer stehen mit Speeren am Strand und jagen die Fische hinein.

Nach Born bringen schwimmende Knaben ein Netz in einen Halbkreis; Enden an Land gezogen, Boote am Rand, viel Geschrei, aber selten viel gefangen. Einmal bei Paliau bei einem Zug einige 1000 lachsartige *skibijak*.

Bei Ankunft eines Fischerbootes rennt alles vom Strand in den Busch, dann Fische ins Haus. Wenn am Feuer, Zeigefinger hineingehalten, dann an Zunge. Dann Verteilung.

Die Fischer *fita, tōfita, tōsAlog, liap* müssen nach Seefahrten (s. S. 271) immer 5 Monate im *fallap* bleiben, sonst werden sie von Haien gefressen, oder die Haie fressen ihre Fische, und ihr Weib wird gestohlen.

d) Bootsgesänge.

1. Bootgesang für Fischer.

Der Sänger will viele Fische haben; er klappt mit den Kokosfiedern *ubut* wie mit Schlittenriemen (s. Lam. Abb. 74); mitgeteilt von Uolegar von Vótagai.

1. *igolō igolō vorāu vorá*	Viele, viele Essensgeschenke,	*vorāu* = *volevu* 1. Bootbaugesang S. 264.
eangeangnlei	schnell, mein Sohn,	*eang* Wind

ma eangeangalipei	komm schnell auf meine Hand	d. h. zu mir
eangeang iligána roro	schnell die Speise reiche,	*gan* Speise (Palau *kál*)
5. *ülö urára*	wie der Regen, im Überfluß.	

2. Gesang für *ba*-Fische (*ba* S. 233).

1. *diribö diribö*	Komm schnell, komm schnell,	
darabö darabö	komm herauf, komm herauf,	
daraböbo, dágadjak gö	komm herauf, komm in die Höhe	*metá gö* Was ist das?
garangäp ale foiüle	Bonito, an dem Riff da	*/ai* Stein, kleines Riff.
5. *iöiö mälü*	sind viele Fische zusammen;	
vujevuj gárang	verrückt der Bonito	*gárang* = *garangäp* = *eás* s. u.

3. *alus i le garangäp*, Bonitolied (vergl. S. 54).

meibung, meibung	Er stößt, er stößt;	der Fischer in den Schwarm
sinetog eás /aleöti	komm zurück, Bonito, unter mein Boot,	*eas* s. o. */an* unter
välei ia	heute, jetzt.	der Fisch schwimmt vom Boot fort, wird aber durch den Geist zurückgebracht.

Bei Kotzebue III S. 125 (Truk S. 451) heißt es über die Delfin Jagd: »Es kommen drei Arten Delphine mit weißen, roten, schwarzen Bäuchen in diesem Meerstriche vor. Wenn die von Ulea diese Tiere gewahr werden, so gehen kleine Boote, gegen 80 an der Zahl, in die See, umzingeln die Heerde, treiben selbige gegen das Land, und wenn sie sich dem hinreichend genähert, belästigen sie die Tiere mit Steinwürfen, bis sie sich auf den Strand werfen. So wird man ihrer in großer Anzahl habhaft. Ihr Fleisch wird gern gegessen. Bei dem Zerschneiden sind kunstgerechte Schnitte zu beobachten. Ein falscher Schnitt entfernt die Tiere auf eine gewisse Zeit von der Insel. Zu Svilick[1], wo der Riff nur einen schmalen

[1] Wo?

Eingang hat, werden die Tiere in die Laguna getrieben, und es wird keines getötet, bis sie sich in gehöriger Anzahl (gegen ein halbes Hundert) eingefangen haben. Auf den zu Ulea gehörigen Inseln wird diese Treibjagd mit besonderem Erfolg ausgeübt. Man versteht auf anderen die Kunst nicht so gut.«

Hierzu vgl. Die Samoainseln Bd. I S. 354 Gesch. 13.

Bei Kotzebue S. 132 wird hinzugefügt, daß Kinder mit einem häufig gefangenen kleinen Fisch (wohl die Sardine *sennif* Truk) belehrt werden: »Geschehe es, daß wer einen dieser Fische bei dem Schwanz anfasse und aufhöbe, so daß der Kopf nach unten hinge, würden bei dem nächsten Fischfange, alle Fische ebenso mit dem Kopf nach unten die Tiefe suchen und es könnte keiner gefangen werden.«

Nach Lütke S. 166 ist im Okt. und Nov. Mangel an Fischen und Früchten. Ersatz Seevögel. Fang 2—4 Uhr früh und 8—9. Vorher Beischlaf tabū. Auslegen der Fischkörbe (aus Volkameria-Zweigen), Mündung gegen den Gezeitenstrom; alle 2 Tage nachsehen, weshalb jeder 2 Körbe hat, wenn nicht mehr; für Frauen kleine *unaḍaba* mit Krebsköder, ohne solchen bei großen *ouh* in kleinen und großen Tiefen, mit beschwertem Hakensenker gehoben; dabei Öl (gekauten Kern) aufs Wasser, um besser sehen zu können. Fang mit Handnetz in der Sonne oder Nachts mit Fackeln aus 3 Kokoswedeln in der Linken. Nachtfang *eddoll*.

4. Handwerk, Geräte, Waffen.

a) Holzbearbeitung.

Erzeugnisse: Holzschüsseln
Kopfbank (Hausrat)
Haus und Boot.
(Ko.: behauen *falla*).

b) Geräte.

(Ko.: Eisen *parang*, Meißel *tété*, Axt *moil*, Messer *sar*, Schleifstein *fasitte)*, Drillbohrer Kr. 291 = 30751I, He. 1874 *wūruwur manupok*, Eisen *parang*[1], Eisenaxt *bosogul*, Handbohrer *vuruvur* Kr. 292 und He. 1722 = 55381I, aus Haizahn oder Fregattvogelknochen.

He. 1669, 1921 Muschel zum Patt-Raspeln *pelig*, *falá trig*, dafür auch Rochenhaut.

Kr. 294—301 Tridacnaklingen (s. S. 62) für Axt *atilagi* Abb. 104 Länge 29 und Abb. 105 = 13,3 cm, Dexel *gasuéla*.

Kr. 302 Äxte mit Klingen.

[1] He. 1789 ist ein Kombinationsbohrer *ni li baggo ma parang* aus Haizahn und Eisen, zugleich Messer und Säge. Eisen ist seit 100 etwa Jahren vorhanden, durch eine Strandung (s. Truk S. 13). s. auch Kotzebue III S. 124.

Kr. 304 Hohlklinge aus Mitra-Schnecke, He. 1365 aus einem Stück der Cassis-Schnecke.

He. 1567, 1680 Beilklinge *dallę barâ*[1] aus Tridacna *sûm* (s. S. 62).

He. 1595, 1665 Beilklinge *dallē* aus großer Tridacnaart *gi*.

He. 1647 Hohle Beilklinge *dallē koroilimang* aus Muschel *maidjal (maial)*.

He. 4648 aus Konus *kórror*; jetzt als Schaber gebraucht, früher Hohlbeil.

Abb. 104. Dechselklinge. Abb. 105.

He. 1893 = 5682II Muschelbeil Hohlklinge *dallē*, Schaberform von *Sêtowal*.

Pfriemen s. Webnadeln.

Schleifsteine wurden ehemals von Yap geholt, He. 1701 ein leichtes Lavastück.

Die Holzarten sind Kokos, Brotfruchtbaum *mqi; nga; ut* (He. 1699 Schüssel); *ira* (S. 230); *gálliu, kalu* (Cordia subcordata); für Schüsseln auch Calophyllum *ragits;* Eugenia; *kadrió* (He. 1811) seit Taifun nicht mehr da; *mareill* Hibiscus *(gulivâ)*.

Harz vom Brotfruchtbaum *bilis*, (Kr. 404 war 1933 entsetzlich stinkend); ein Harz *rumâio* war angeschwemmt, auch Paraffinstücke.

c) Gefäße.

Die Holzschüsseln, *tabbi* (Ko. *tapi)* schließen sich in der Form denen von den östlichen Inseln an[2]. Die Bodenfläche innen ist meist gefalzt, geht also nicht mählich in die Seitenwand über. Nasen oft sehr lang, durchlocht für Schnur. Man unterscheidet:

Holzschüsseln Abb. 106a—r.

Schüsseln ohne Füße.

a) Kr. 280 = 30641I Abb. a länglich, Enden abgerundet; Länge 22 cm, Breite 9,2 cm, Höhe 6 cm, s. Durchmesser a'.
Kr. 279 u. 272 breiter als lang 15:14 u. 41:38 cm.

b) He. 1888 = 56781I Abb. b von Vótagai, Bootform; Länge 31,5 cm, Breite 12,2 cm, Höhe 6,8 cm, Boden flach, für Yapfarbe *ē ngap*. Vgl. Vogelform Abb. c. Durchmesser b'.

c) Berlin VI 25365 Abb. c, rote Farbschale in Fregattvogelform, Länge 35 cm, Breite 11,5, s. Lam. Schwanz hinten abgesetzt; (s. u. Kr. 492).

[1] He. 1834 *parâ*, Stil *érat*, Ellbogen (Nacken S. 62) *gapûl*, Klingenlager *kor u lal*, Verschnürung *vóval*.

[2] He. 1674 *tapi, tapi, tâpi*, Griffe *metatapi* (Spitze, Auge), oberer Rand *narret tepi* (s. S. 221), Nasen *bôati tepi*, Füße *peréri tepi*; ich notierte folgende Teile: außen *luge tébbi*, innen *lane tébbi*, Griffplatte *metatébbi*, Nase *bodjiltébbi*, Längsrand *ngasel* t., unten *tobel* t., Fuß *bedjal* t.,

Abb. 106a—i. Holzschalen.

d) Kr. 276 = 3061II *eadjal* Schöpfschale mit Griff *ejal*, Abb. d rund, Diam. 23 cm, Höhe 7 cm.

Schüsseln mit Längsfüßen (2 Längsleisten am Boden):
(He. 1915 = 5706II *perrĕt tépi* kleine Schüssel mit 2 Füßen).

Abb. 106 k—r. Holzschalen.

e) Kr. 273 = 3058II Abb. e, Griffplatte oben; Länge 44 cm, Breite 27 cm, Höhe 16 cm, Fuß halb so hoch. Boden platt, Brotfruchtbaum-Holz: ebenso Kr. 270 Calophyllum-Holz. Durchmesser e'.

f) He. 1696 = 5517II Abb. f, Rand sanft geschwungen; Länge 31 cm, Breite 23,5 cm, Höhe 10 cm. Nase lang, Griffplatte nach oben gewölbt. 2 Längsfüße, nur wenig hoch.

g) Kr. 279 = 30631I Abb. g, Rand stark geschwungen; Länge 14 cm, Breite 15 cm, Höhe 6 cm, Durchschnitt g' schüsselförmig, Füße kurz.

h) He. 1700 = 55191I Abb. h, breiter als lang, querelliptisch (Palau III S. 121); Länge 30,5 cm, Breite 37 cm, Höhe 9,5 cm. Füße sehr klein auf dem flachen Boden. Brotfruchtholz. Durchmesser h'.

Schüsseln mit Querfüßen.

i) He. 1915 = 37061I Abb. i, Längsschüssel mit durchlochten hohen Nasen und Henkel. Länge 23,5 cm, Breite 19,5 cm, Höhe 9,3 cm. Füße 2—3 cm hoch. Durchmesser i'.

k) He. 1674 = 54961I Abb. k ähnlich wie vorige, Rand mehr geschwungen; Länge 40 cm, Breite 24 cm, Höhe 10,5 cm, Calophyllum-Holz.

Schüsseln mit 4 Füßen.

l) Kr. 274 = 30591I Abb. l, mit gehobenem Sattel über Nase; Länge 38 cm, Breite 27 cm, Höhe 13—15 cm; Walzige Füße etwa 7 cm hoch.

m) Kr. 281 = 30651I *tabbi en'nap*[1] (für Farbe) Abb. m, trogartig; Länge 32 cm, Breite 10,5 cm, Höhe 7,5 cm. Wände mit je 4 viereckigen Vertiefungen; Füße stummelförmig. Durchmesser m', Nase m".

Deckelkasten *sap*[2].

n) Kr. 398 = 31561I Angelhakenbehälter, 2teilig Abb. n; Länge 16 cm, Breite 8,5 cm, Höhe 6,4 cm, mit Falz, viereckig.

o) Kr. 400 = 31571I Abb. o, Behälter für *ba levil*; Länge 26 cm, Breite 9 cm, Höhe 8 cm, viereckig. Deckel oben mit Griff, keine an den Enden. Durchmesser o' und o".

p) He. 1864 = 56581I *sáp* Abb. p, längsoval mit Knöpfen; Länge 32 cm, Breite 7,6 cm, Höhe 8 cm, Holz *gálliu (kalu)*.

q) He. 1847 = 56451I Abb. q, viereckig; Länge 26,8 cm, Breite 10 cm, Höhe 8,8 cm.

r) He. 1717 = 5534 Abb. r, viereckig, nach unten kleiner werdend. Länge 14 cm, Breite 5,2 cm, Höhe 5 cm.
He. 1907 Enden schiefer, He. 1877 Enden sehr schief mit Zapfen, ohne Obengriff.
He. 1341 (Falálap) Voléa, Griffplatte wie *lios en mingau* Truk S. 150d'.

[1] He. 1887 rote Yapfarbe *i ngap*.
[2] He. 1802 Deckeldose (2teilig) *dkidiu*.

Bambusbüchsen[1].

He. *gulugul*, Deckel *sése*, Falz *autél* nach indonesischer Art ornamentiert. Leipzig Mi. 1793 u. 99 zeigen Büchsen, die noch von der Godeffroy-Sammlung stammen.

Abb. 107a.
Bambusbüchse.

Abb. 107b.
Bambusbüchse mit Abwicklung.

Abb. 108.
Bambusbüchse.

[1] He. 1643, ...73. Kokosbüchse *ware* für Tabak, Deckel *pdlepal (pilipildl)* aus Brotfruchtholz, s. S. 245.

s) Hamburg: He. 1719 = 553511 Abb. 107a mit Abwicklung b; Länge 32 cm.
t) He. 1761 = 556811 Abb. 108; Länge 35 cm.
u) He. 1920 = 571211 Abb. 109a mit Abwicklung b; Länge 21 cm.
v) He. 4654 = 821811 Abb. 110; Länge 50 cm, Durchmesser 4,2 cm.

Dazu wurde noch gesammelt:

Kr. 491 = 324511 Fischeßbrett *rólig*.
Kr. 492 Schüssel mit 2 Fregattvogelköpfen.
Kr. 493. Schüssel als sitzender Fregattvogel.
He. 1878 = 566811 *ságeag*, eine Seepocke als Farbbehälter Abb. 111.

Abb. 109a. Bambusbüchse.

Abb. 109b. Bambusbüchse mit Abwicklung.

Abb. 110. Feuerholzbüchse.

Abb. 111. Seepocke als Farbtopf.

Ornamentik.

s. Lamotrek S. 88 und 175.

Eine Menge Muster zeigen sich auf den eben erwähnten Bambusgefäßen, wie auch die der Strahlen-Tatauierung, deren eine große Menge Abb. 79 von Lámotrek zeigt, die Ornamente Abb. 107b—109b, nicht wesentlich verschieden sind. Wie bei Lamotrek zeigen auch hier die Häuser Giebelschmuck (s. u.).

d) Waffen.

gibt es wenige, wie auf Lámotrek. Ich fand an Keulen nur eine alte von Truk (Kr. 409) und zwar auf Vótagai, wo sie als Stange für ein Mückennetz Verwendung fand.

An Angriffswaffen sind nur Reißringe mit Haizähnen oder Fischdornen vorhanden.

Abb. 112a. Haizähne Reißring.

Abb. 112b. Nasenstacheln.

He. 1835 = 563511 Abb. 112 *rajerás* mit Haizähnen (a).
He. 1692 mit zwei Naseus-Stacheln *baráli ge váleval* (b).
He. 1693 mit Haizähnen *ni li bago*.
Kotzebue III S. 61 nennt Speer, Schleuder; s. Krieg.

e) Geld, Maaße; nicht besonders ermittelt. Zählschnur Abb. 133.

f) Flechterei.

(vgl. Tafel 19).

(Ko.: nähen *thigi.)*

Zum Flechten dienen wie üblich Kokoswedel und Pandanusblätter; letztere werden welk *mang* (s. Bd. 61 S. 178) am Feuer, nicht in der Sonne getrocknet, in eine Rolle *sābil* gewickelt. Diese Rolle *sabil lü mang* wird bis zum Gebrauch aufbewahrt.

Zum Schaben der Blätter bzw. der Streifen dienen Perlschalen, zum Flechten das Holz *wā sigerára* (He. 1830).

Matten.

Kotzebue III S. 62 Matte von Pandanusblättern *mang*, Schlafmatte *sagi*, Zeug aus Bananenfaser *kou*.

He. 1443 = 529511 Schlafmatte.

He. 1642 ist eine kleine Pandanusmatte *géagi*, die in einer Kinderwiege lag (s. S. 113).

He. 1832 = 563111 gibt ein Bild der Matte Abb. 113a und die Flechtart b aus dem Hamburger Museum. Geflecht *faije pé*, Mittelflechtansatz *fōlu*; ohne Flechtnadel gearbeitet.

He. 1850 *vaijepek* (vgl. oben *faijepé)*, Streifen *géagi*.

a b

Abb. 113. Flechtart einer Schlafmatte.

Taschen.

He. 1571 ein quadratisches Täschchen *sigerára* aus Pandanusblättern mit Deckel *pilipilál*[1], wie auf Taf. 5 m zu sehen. Herstellung mit Hilfe des Holzes *wāisigerára* s. o.

Auch hier die *gaigérs* Taschen (s. S. 67); oft für Feuerstahl usw. gebraucht, aus Pandanusblättern.

He. 1924 ein Täschchen aus Kokosblättern *déibe*.

Körbe ohne Henkel.

Kr. 308 *tjuk i le monga* »Eßkorb« für rohe Feldfrüchte, Abb. 19 g schnell aus zwei halben Wedeln gefertigt, am Boden innen Zopf.

Sonst heißt man nach He. 1598 diese Art Kokoskörbe *tūg watálu*, gemeinhin *watau* (s. S. 69), breite Seiten *golongal watau*, oberer Rand *jawále*, Außenboden *verélle*, Inneres *lánne*, schmale Seiten *tawole*, Knoten *vúgevug*, grüne Kokosblätter *bálnu*, trockene *épal*. Auch ein Frauenhandkörbchen He. 1556 wird *wóatau* genannt, ein Männerkorb He. 1570 *ware wotau*.

He. 1779 *watálu* mit je einer Öse an den Ecken, gebunden mit Armband aus Menschenhaar *tim* und Muschel *tigere* (s. Taf. 5 h).

Auch der runde Webekorb (Truk S. 169 *abeas*) erscheint hier:

He. 1540 *gabéts*, He. 1829 *gabédj*, unten der Boden viereckig.

He. 1541 *ka'caul* ein runder hoher Korb mit viereckigem Boden.

Körbe mit Henkel.

Kr. 306 = 308911 *gat* für Aufbewahrung von Speisen. Taf. 19 b.

Kr. 307 *gappare*, Henkel innen von Kokos *gappari*; Abb. Taf. 19 c, He. 1539 *kapoló*,

[1] s. S. 242, Anm. 1.

kato, 1554 *kaporó*, He. 1755 = 55641I *kaporo*, *kād*, Abb. Taf. 19c, langer Henkel in der Mitte.

He. 1642 = 54711I *tug e sari* Kinderwiege Abb. Taf. 19h.

Kr. 305 = 30881I *tuk ĕ sari* Korb für ein Neugeborenes, Abb. Taf. 19f, Flechtart *faoagell*. 2 Henkel, auf jeder Seite einer; bei h geflochten, bei f aus Schnur (Mariam) umgreifend gefertigt. Vergleiche die Wiegen auf Lamotrek.

Fächer

für Feuer, Wind, Mücken.

Kr. 309 = 30921I Feuerfächer *galipo*, Flechtart *tarasjill* über 1. Taf. 19i.

Kr. 310 Feuerfächer *galipo*, Flechtart *tarauál* über 2. Taf. 19k.

He. 1559 Fächer *saipe*.

Flechtmuster

Das Truk'sche Windrad kommt vor; s. Lamotrek.

g) Zwirnarbeiten.

Seildreherei s. S. 72

ist vorhanden; Schnur *gologól*, Knäuel *gassegül lü g*. He. 1853. Gestell *méil* wie in Lam. Abb. 44.

Kotzebue III S. 62: Seil *tal*, Schnur *kologol*.

Schnurkörbe.

Kr. 406 = 31631I ein Schnurkorb *uotáudjo* (s. o. S. 245 *wátau)*.

He. 1628 *watáu sóu*, wird nicht mehr angefertigt, während sie früher sehr verbreitet waren.

He. 1646 = 5477 dreieckige *srótur*-Tasche aus Schnur mit Befestigungsringen *talling*.

He. 1695 kleine dreieckige Stricktasche *djóu* für Frauen.

He. 1698 *komän* oder *komádle* Kokosbastklopfer.

Netzarbeit.

He. 1718 Netzgabel *kasäb*, s. Fischerei S. 235 *gajab*, offene Enden *ĕwäli*.

He. 1823 Netzstrickholz *jäf*.

Knoten *búgäbug*, Maschen *métal*, fertiges Senknetz *ading*; ins Wasser fadenweis ausgeben *kalligilögi*, obere Schwimmerleine *tantiabess*, Schwimmer *úabess* aus Actocarpus Holz, Korallensteinsenker *válurem* (s. *fáorem* S. 235).

h) Weberei.

(vgl. Tafel 17 und 20).

Abb. 114 die Zeichnung einer webenden Frau nach Phot. 387.

Taf. 20 zeigt die Gleichheit der Matte mit Lamotrek. Es gibt also auch hier dreistreifige mit Querbändern, und vielstreifige. Die Ornamente sind natürlich örtlich verschieden; die Herstellung der Muster geschieht während des Webens mit Webenadeln *dji dāb* aus Knochen *dji* der Schildkröte oder sonstigen Fischen. Abb. 115 a—c zeigt 3 Nadeln.

a) He. 1858 = 5654[II] *čii i dāδb* »Knochenmuster«, Fischknochen *daχo rare*, Länge 17 cm.

b) He. 1677 = 5499[II] *druiitob*, Kopf *sēmēl*, Spitze *tawól*, Holz *kaini*, 27 cm lang.

c) He. 1734 = 5537[II] *čii dāb*, Testknochen *čii le wong*.

Kr. 254 Webnadel *sútop* aus angetriebenem Holz, s. oben Webekorb.

Born: Webrahmen *pap*, Spanngürtel *talletoi*, Schwert *gopop* aus *jengi*-Holz.

Kr. 355 *mür* schwarzer Bimstein zum Färben von Garn.

He. 1701 Bimstein, mit dem alte Eisenteile abgerieben werden; der Rost wird mit gestampften *kid*-Blättern in Salzwasser aufbewahrt. In dieser Lauge werden Bananen- und Hibiscusfasern schwarz gefärbt.

Abb. 115a—c. Webnadeln.

Bündel Hibiscusfaser *dallivörsik gulivā* (He. 1883).

Moskitovorhang *márup* (He. 4625).

Männermatten für T-Binden, *karir*, *genurs* (He. 1863) s. E. K. *kenuj*).

schwarze Streifen	*ligoróe*
helle Streifen	*ligawassa*
Fransen	*matē rēlle*.

Die Art der Matten erhellt am besten aus E. Krämers Katalogaufzeichnungen:

vielstreifige, s. Taf. 20.

Kr. 366 = 312311 *kenuj* siebenstreifige Bananenmatte rot und grün (import.), Webart *ligos*, Leinenbindung.

Kr. 367 *kenuj ligadja* ebenso, mit 7 roten Streifen; Webart *ligos*.

He. 1904 Streifen rot berandet.

Kr. 368 *kenuj* ebenso, schwarz und weiß, Webart *gasúitip*, Dreifachbildung.

He. 1581 1.—4. und 7 Streifen grün; Salkante rot.

Kr. 369 *kenuj* ebenso, aber feiner, mit *sūk* Fransenborte; *materel*-Zöpfe an Stelle der losen Fäden.

Abb. 114. Beim Weben.

Kr. 376 = 313311 *gilifoi* siebenstreifige »Hibiscus-matte« für Frauen typisch; Webart *gasuitip*, Dreifach, mit schmückenden Bananenfäden, schwer zu bekommen, alt.

Kr. 377 = 313411 ebenso, nur in Webart *goilipat*, Vierfach, s. Taf. 20, Breite 49 cm, Länge 197 cm.

He. 4627 *karir, genús*, schön siebenstreifig, schwarz weiß.

He. 4636 siebenstreifig, gesprenkelt bräunlich mit 6—7 feinen weißen Streifchen.

Dreistreifige Matten.

Kr. 370 = 312711 *balüelúf*, dreistreifige Bananenmatte, weiß und grün *(bugo-garau)*, Webart *nigos* (Leinenbindung).

Kr. 371 *balüelúf etáp* ebenso, mit *tap* Durchflechtmuster; Muster *ngisum* Tridacnazahn, *pub* Fisch; Webart *nigos*.

Kr. 372 *peig*[1] dreistreifige Bananenmatte, Streifen von roten Streifen unterbrochen, Durchflechtmuster *tap*, Webart *gasuitip*, Dreifach (s. S. 76).

Kr. 373 *peig* ebenso, aber feiner; mit 3 Mustern: 1. *bailimal* Vogelklaue, 2. *ngisum* Tridacnazahn, 3. *failimat* Augenlid.

Kr. 374 = 313111 *peig ugo tal* ebenso, auch die Muster 1. *ngisum* △, 2. *fallimat* ⊏, 3. *ballimal* ⊔, Mittelstreifen in 3 aufgelöst, Webart *gasuinp* s. Taf. 20k; Breite 48 cm, Länge 203 cm.

Kr. 375 *maletilil, ngarevutelil* dreistreifig aus Hibiscus mit schmückenden Bananenfäden, Webart *goilipat*, mit Vierfach; schwer zu bekommen. Ist vom Hamburger dem Rostocker Museum überwiesen worden.

Kr. 377 Taf. 20h, 197 cm lang, 49 cm breit.

Kr. 946 = 365811 *peig* feine Frauenmatte, Webart *gasuitieb*, Dreifach, Taf. 20i, Breite 47½ cm, Länge 207 cm.

Kr. 947 = 952 ähnlich.

Kr. 953 = 366111 Webart *galút*, Vierfach, s. Taf. 20d, Länge 193 cm, Breite 50½ cm.

Kr. 954—55 ähnlich.

Kr. 956 Webart *gasuitieb*, Dreifach.

Kr. 957 = 366311 sehr fein nach Ifalukart, Länge 210 cm, Breite 52 cm, Taf. 20e.

Auf der Tafel sind noch folgende von Hellwig:

a) He. 1776 = 557711 *kab, gab*, Breite 61 cm, Länge 260 cm; grob, Taf. 20a.

b) He. 1851 = 564911 *kab*, Bananenfasern, Breite 66 cm, Länge 252 cm. Wótagai. Taf. 20b.

c) He. 1778 = 557911 *kab*, Breite 56½ cm, Länge 237 cm, grob. Wótagai.

f) He. 1640 = 546911 *durr, torr, pak*[2], Breite 45½ cm, Länge 187 cm, Mariam, Taf. 20f.

[1] s. S. 70. [2] s. S. 77.

g) He. 1584 = 542011 Breite 47½ cm, Länge 214 cm. Wolea. Taf. 20g.
l) He. 4631 = 819411 *palüe līidj*, Breite 48 cm, Länge 178 cm, grob. Wolea. Taf. 20l.

Für eine ziemlich gleiche wie He. 1640 gab Hellwig folgende Namen an:

breite schwarze Längsstreifen	*nugurále*
schmale Längsstreifen (rot)	*nigotrá*
äußerer Randstreifen	*narēlól*
innerer Randstreifen	*neriwór*
Querstreifen	*dāōbō* (s. o. *tap*)

Muster:

a *bosurúe*

b  *sebassairiwiri* schwarz *erutrále* s. S. 77 Nr. 3
rot *ertrá*

c *fairimát* s. S. 78 Nr. 7

d *dorruwāli*

e *rau nugeripár*

f *gutterilange*

g *garáp* s. S. 78 Nr. 11

h *pairimél* s. S. 79 Nr. 14.

5. Handel.

Eisen Truk S. 13; Ko.: *parang*, Meißel = *eis*, Nagel *téld*.

Oleai-Boote gingen meist nur nach Feis; gelegentlich aber auch nach Mokemok (Ululsi) und Yap. In Feis blieben sie 1—2 Monate (s. Navigation und segelten wieder mit gutem Wind zurück.

Von einem Tribut nach Yap war nicht die Rede (s. o. Lam.). Die Zwischenhändler können die Sachen für sich behalten und bezahlen dann mit ihrem Besitz. Ein Zwang ist nicht vorhanden. Verkauft Oleai Land, kann es beliebig viel an Inefel geben. Früher wurde erzählt, daß ihm Oleai gehöre.

Born sagt, jetzt fährt nur noch Mogemog nach Yap, wo die *gau*-Scheibchen, das Yapgold sehr beliebt sind, ebenso wie *rang*, das besonders von Truk geholt wurde, als Oleaigold galt. Handelsware war sonst: Matten *dōr (lor)* und Harz *bilis* (S. 95). Eisen

und Boote[1] seitens Oleai, während die einzelnen Inseln von Oleai bestimmte Absatzpunkte hatten. Raur fuhr nach Faterai (Ululsi). Paliau, Lolepéleg und Vósavo auf Ost-Volea, dann die Insel Máriong, fuhren nach Falálap (Ululsi). Tagáulap, Soluap und von West-Volea Iefang usw. fuhren nach Meiángeang und Falálap (Ululsi). Falális und Dorf Bigol auf Votagai endlich brachten ihre Waren zu Tulei auf Feis.

Im allgemeinen galten für die Oleai-Inseln folgende Empfänger auf Yap (s. Feis) Inefel für Raur, Vótagai außer Bigoldorf, für das Fetal galt, Meiu für Páliau, Lolepéleg (Voléa) und Máriong. Fetal in Oneán für Vósavo Volea und Bigol (s. o.). Fólávu für Jefang (Volea). Bógilrou für Tagáulap und Soluap. Tárangau und Galipevai für Falális.

6. Haus.

Dorf *fálü*. (vgl. Tafel 13, 14, 15, 17).

a) Hausarten:

fal'lap (fan'nap)	Junggesellenhaus
faldoã	Boothaus (Born kleiner Canusschuppen *thapal* s. Yap)
fal connap	s. Tagaulap
im	Wohnhaus *(imai, ...om, ..al, ..adj.)* (Born *im molut*, Plankenhaus *im pap)*
malum	Kochhaus (Born *malam)*
im alipel	Gebärhaus (auch *imateing)* (Born *im mallipel)*
im ali gogobong	Zehnnächtehaus s. S. 268
im ali fám	Geburtshaus nach *fam* Geburt
im meljagobung	Bluthaus (Born)

Abb. 116. Schlafhaus auf Pfählen.

imoõ	Schlafhaus auf Pfählen (Abb. 116) nach dem Fußboden *bõ*
imapõ, fannõ	Vorratshaus (früher viele, jetzt wenig)
im motucko	Kokosspeicher (Born).

[1] Kotzebue S. 127: «Die von Feis, Eap und Mogemug holen Boote in Ulea gegen Cocosmagalver. Die von den östlicheren Inseln haben den Brotfruchtbaum im Überfluß und bauen alle ihre Boote selbst, die von Nugor und Tuch holen in Ulia Eisen gegen Zeuge. Die von Ulea fahren auch gegen Tuch und Nugor, die von Sawasinomuch (Lukunór) wurden auf diesen Reisen besucht, ohne selbst andere Inseln zu besuchen.

Die Wohnhäuser im Oleai-Bezirk sind fast durchweg sechseckig, wie die von Yap, nur ohne Steinunterbau, wie sie übrigens auf Yap auch vorkommen, wovon Christian S. 258 auf einer Tafel ein Zeugnis gibt. Den Grundstock bildet hier, wie auch schon weiter ostwärts, das Ramenhaus mit Holzwänden, also eine viereckige Cella, an die giebelseitig dreieckige Vorbaue, Veranden *faleping* genannt, sich anlehnen. Da das Dach deshalb, die Firstspitze, stark vor-

Abb. 117. Sechseckhaus, Veranda offen.

Abb. 118. Sechseckhaus, Gerüst.

springen muß, wird diese gern durch eine oft 4 m lange Säule *sirung* unterstützt, die Abb. 117 u. 118 an einem Vorratshause zeigt, uns Taf. 17b (Phot. 299); hier steht sie aber schief; hiervon weiter unten. Zuerst sei noch bemerkt, daß meist aber diese Säule fehlt; das Walmdach der Giebelseite lagert dann auf dem dreieckigen Vorbau, wenn die Cella an der Giebelseite offen und unmittelbar mit dem Raum des Vorbaues verbunden ist, wie Abb. 119 des H. 1. Sangi, und (Phot. 287) H. 3 (Taf. 15a) zeigt, während z. B. das Innere des H. 8 Fálel (S. 211) innen rechteckig ist, ähnlich wie es Abb. 117 zeigt. Hier ist die Veranda ein besonderer Raum, vorn und hinten (Born *im mal paloi*).

Ist der dreieckige Vorbau aus Planken nicht da, so baut man ein dreieckiges Dachgerüst, das durch den Firstspitzenpfeiler *sirung* gestützt wird, wie die Phot. 299 Taf. 17b zeigt, oder es bleibt dieser fort, und man nimmt nur 1—2 Stützpfosten für die Traufe (Abb. 120). Dann wird das Dreieck mehr abgerundet, und,

Abb. 119. Inneres des Haus 1 Sangi.

Abb. 120. Verandadachart.

wie beim vorigen wird eine hutkrempenähnliche Traufe aus 3—4 Stangen gebildet. Diese Randpfetten sind bei Abb. 120 aus einem Stück außen herumgebogen und es lagern auf ihnen in beiden Fällen noch kurze sparrenähnliche Stäbe.

Das H. 8 Fálel hat also eine abgeschlossene viereckige Celle und ein solch rundliches Verandadach vorn und hinten. Aber nicht allein der Pfeiler, sondern auch die einzelnen Stützpfosten können fehlen; man stützt dann das Vordach durch horizontale Stäbe, die hauslängs hervorschießen, auf dem oberen Rahmen der Giebelseite lagernd, wie es Abb. 84 u. 85 im Bd. 6 I. S. 180 u. 181 zeigt; unterstützend wirkt hier höchstens ein Joch, wie es von Truk S. 220 Abb. 174 usw. bekannt ist, vom Schlappdach des Boothauses. Ein solches Haus mit gebogener Randpfette vor den Stäben sah ich auf Vótagai, wo, wie auf Tagaûlap noch viele alte schöne Häuser vorhanden waren, da ja diese Inseln vom Taifun 1907 nicht so zerstört wurden.

Vielfach vorhanden sind, wie erwähnt, auch die Häuser ohne die dreieckigen Giebelvorbauten, also einfach rechteckig, aus Werkholz, das einfache Ramenhaus.

In einem Fall, beim H. 1 Gabengatîl auf Tagaûlap, war die Giebelwand der Cella mit ihren Wandfüllungen und der Tür in der Mitte, nicht so hoch wie der obere Ramenbalken, so daß also hier noch einer darunter saß, wie beim *bai* auf Palau, so daß ein Fenster vorhanden war, aber nur an den Giebelseiten; Vorbaue fehlten hier.

Bei dem Haus mit dem Firstspitzenpfeiler *surung* auf Vótagai waren am giebelseitigen Dachrand Planken, wie die äußeren Giebelramen der Palau-Bai, durch die die Pfettenenden stoßen; sie heißen *eáolim*; sie ruhen auf den ungefähr 1 m lang vorspringenden oberen Längsramenbalken *gapilivei*, die wiederum durch einen Pfosten *sur tavol gapilivei* gestützt sind, der auf dem vorspringenden unteren Längsrahmenbalken, *gogodj levilipeg*, und zwar auf dessen Ende *tavol* ruht. Der untere Querrahmenbalken der Cella heißt *gogodj votap*, der obere *gabilibing* Abb. 118.

Neben den Werkholzhäusern gibt es auch einfache Trukhütten ähnliche wie Abb. 121 zeigt, die ähnlich den Vorratshäusern wirtschaftlichen Zwecken dienen. Das zeigt auch die Unterbringung von Holzschüsseln unter Tischen, wie Abb. 122 zeigt.

Steinunterbauten waren auf Oleai zu unserer Zeit nicht vorhanden, wie sie auch auf Lámotrek fehlten (s. S. 83). Aber wie wir auf Aurepik solche von 2 m Höhe antrafen (s. Bd. I S. 245), so mögen sie auch hier früher vorhanden gewesen sein. Eine Mitteilung sagt: Gamelai, der Vater von Metag in Aurepik (hier Eaurupeg) baute mit seinem Sohne Feker die großen Sockel in Aurepik unter die Häuser. Dies geschah nach einem Taifun, durch den die Bevölkerung bis auf 4 umgekommen war. Der Yaper Goru mit dem Bezirksamtmann um 1905

Abb. 121. Einfache Hütte.

Abb. 122. Einfaches Haus mit Tischen.

Abb. 123. Kopfbank.

nach Aurepik kam, lebte Gamelai noch, aber sehr betagt (wohl 90 Jahre). Er hatte sein Yapisch, das er früher gekonnt hatte, ganz vergessen. Es sind also die Steinunterbauten von Aurepik nur auf lokalen Einfällen beruhend, die natürlich überall vorkommen können. Aber sie haben sich nicht durchsetzen können.

Der Taifun von Aurepik scheint um 1830 auch Oleai heimgesucht zu haben; s. im übrigen die Steinwerften der *faʻlap*-Häuser.

Dach	*fátafat*
Holztüre	*gâtam* (aus *rijeng*-Holz)
Treppe	*eál*
Wand	*tipāp*
Herd	*fálang*
Zaun	*óror, bēi* um Grab (im Haus Nachahmung)
Schlafstelle	*lélliei, masúr*
Kopfbank, Kopfstütze	*eēlungei, ūlūl* Abb. 123 (Kr. 286).
Schlafmatte	*giégi* (poss. *giei*)
Kehrichthaufen	*ūálū beibei*
(Unkraut) jäten	*uīuī, fēngi*
fegen	*bōbō*
Brunnen	*djálūl*
Waschwasser	*djalutūtū*
taulomónu	Mückennetz aus gewebten Matten (Pollap)

He. 1882 Haken *tauung* zum Aufhängen von Eßkörben, nach Born auch aus Haifischwirbeln.

Von öffentlichen, großen Häusern waren auf Oleai die Boothäuser *faleoā*, Taf. 13a, b, c, die ja dem ganzen Gebiet angehören, zum Tagesaufenthalt der Männer; es waren auf jeder Insel 3—4, auf Tagaulap und Mariong 1; die Traufen reichen fast zur Erde, Giebelfläche fehlt.

Daneben gab es noch Junggesellenhäuser, kurzweg *faʻlap* »großes Haus« genannt, nach Born *falepai*. Ich sah sie noch 1907, als ich Oleai auf dem Wege nach Truk passierte; 4 Monate später bei der Rückkehr nach Palau waren sie durch den Taifun zerstört, also nicht mehr vorhanden und sind auch nicht mehr aufgebaut worden. Hätte meine Frau beim ersten Besuch nicht ein kleines Aquarell von der Südspitze von Paliau und der Nordspitze von Raur gemacht, Abb. 80, wo auf beiden Spitzen je ein *faʻlap* stand, so würden diese Zeugen westlicher Gesellschaftsausbildung[1] spurlos von der Erde verschwunden sein.

[1] Ich hörte auf Kapingamarangi, daß angetriebene Leute aus Oleai dort ein Junggesellenhaus gebaut hätten; es war zu unserer Zeit nicht mehr da. Sie sollen auch die Brotfrucht gebracht haben.

Diese Häuser standen vorgerückt auf Steinwerften (Born) am offenen Innenstrand weshalb der Taifun sie auch so vollständig zu zerstören vermochte. Das Bild zeigt bei dem Paliauhaus die Umzäunung mit einer Mauer und die vielen Türen, Am Vordergiebel 2 und an der Längsseite 3. Bei dem Expeditionsbesuch 1909 ließ ich mir durch den Häuptling Agupelior ein Modell eines solchen *falʻlap* anfertigen, dessen Längsseite Abb. 124 zeigt. Born sagt; es sei auf jeder Insel 1 *falepoi* gewesen, auf Falalis 2.

Zunächst fiel auf, daß das Hausgerüst nicht auf hölzernen Pfosten *sur* lagerte, sondern daß nur 4 steinerne Pfeiler *sur*, vorhanden waren, auf denen die beiden

Abb. 124. Junggesellenhaus *falʻlap*.

Längsramenbalken *tanelap* ruhten, ganz wie es auf Feis der Fall ist. Auf den Längsbalken lagern die Querramenbalken *gōusam*, auf denen die Stuhlsäulen *bōt* stehen. Die 2 Stuhlsäulen tragen den Firstbalken *ung*, der die Größe des inneren Giebelhauses bestimmt. Über ihm liegt der zweite obere Firstbalken *ungaseg* oder *ungngáseg*, der die Größe des eigentlichen Daches hat. Über diesem kommt endlich eine dritte lange Firststange *sógoram (sogoramár)* zu liegen, die die Firstspitze des vorspringenden Giebeldaches. Auf Abb. 125 sieht man von vorne die 3 Firstbalken;

es lagert also der erste *ung* auf den Stuhlsäulen bzw. dem ornamentierten Mittelsparren des Giebels.

der zweite *ung ngaseg* wird von den starken Sparren *vōi* getragen,

der dritte *sógoram* von den dünneren Außensparren *gat*.

Auf den *vōi*-Sparren lagern die dicken Pfetten *gápangag*, deren unterste Randpfette *gapilivoi* heißt. Die kleinen runden Pfetten heißen *i fag*, die kleinen Sparren und die langen Pfetten der Dachtraufe *bailimélug*, die langen Sparren und kleinen Pfetten am Giebel werden *langolimetálias* genannt (Abb. 124 u. 125).

Abb. 125. Giebel eines *fal'lap*.

Der Giebelschmuck *tēbáu* ist wie auf Lamotrek dem von Yap I Taf. 48 und Palau V Taf. XI gleich;

die 2 Seitenramen *eáo* zeigen Haizähne *ngi le boggo*,

der unter Querramen *gapileping* ein Dreieckmuster *ngi sum* »Tridacnazähne«, die auf Palau V Taf. 31q, 32v, 33 Bai 21 usw. als *klivuk* sehr beliebt sind, nur in anderer Anordnung.

Die Mittelplanke hat schwarze Dreiecke *basal e vulegálei* (*basal* = *bedjél* sein Fuß oder Schwanz des *bulegálei* Acanthurusfisches),

die weißen Rauten mit dem Punkt mitten werden *pup* genannt, sind also die rautigen Balistesfische (Truk S. 150x).

Der Giebelschmuck steht also im Zeichen der Fische.

Wie der Giebel, so wird auch der Innenraum des Hauses in 2 Hälften geschieden;

die Seehälfte *jétab fal matalifal* ist für die Häuptlinge *támol*,

die Landhälfte *jetab fal apélifal* für die Leute *e áramat*;

das innere heißt *nifal (nim)*,

das äußere *lugilifal (lugilīm)*.

b) Bau.

Soll ein *fal'lap* gebaut werden, bringen alle Männer von den verschiedenen Inseln Kokosgarn; sie setzen sich mit ihrer Gabe am Strande hin und werden mit Kokosnüssen entlonnt.

Die Frauen kommen geschmückt, mit Essen, vor das Versammlungshaus und machen einen Tanz *ur*.

Die Frauen des Platzes, wo gebaut wird, sitzen im Hause und lassen die Fremden nicht herein, obwohl diese von allen Seiten einzudringen suchen. Sie setzen sich dann mit ihrem Oberhaupt außen hin, während der Ortshäuptling innen mit den Frauen sitzt, denen er Kokosnüsse gibt.

Wenn der Bau fertig ist, wird ein großes Kokostabû *ē vāü* gemacht.

Eine Unmasse von Kokosnüssen werden gebracht und um den Bau herum aufgehäuft. Ist die Sammlung beendet, lädt der Bauherr alles zu einem bestimmten Tag ein, da das Haus eingeweiht werden soll.

An dem bestimmten Tage strömen die Gäste herbei. Die Frauen aller Plätze kommen schön geschmückt und tanzen um das Haus herum. Zum Schluß geben sie ihre Halsketten usw. den scheidenden Männern, wenn diese ihre Kokos-

Abb. 126. Geisterhaus auf Tagaulap.

anteile erhalten haben. Sie haben sich alle niedergesetzt und der Bauherr hält eine Rede, in der er ihnen die Bazahlung mit Kokosnüssen ankündigt; er wünsche sie sollen ihnen keine üble Nachrede machen und gesund bleiben. Ist das Fest auf Voléa, so erhält Falális 1000 Nüsse, Vótagai 3000, Tagaulap 1000, Máriong 500, Páliau 500, Raur 500. Dann zerstreut sich die Festversammlung.

Steinpfosten: Merkwürdig ist, daß das Geisterhaus auf Tagaûlap (s. S. 279) Steinpfosten hat, wie die Wohnhäuser auf Feis (Abb. 126). Da bei der Religion ausgeführt, daß fremder Einfluß hier am Werk war, so ist dieser zweifellos daran Schuld. Die Steinplatten als Hauspfosten gehören völlig Feis zu.

Hausrat gering. Haken aus Holz zum Aufhängen von Körben beobachtet. Kopfbank *ûlûl* (von Falális Kr. I 86) s. Abb. 123. Schlafmatten S. 244.

7. Boot *oā*.

(vgl. Tafel 15 und 17.)

Wörter von Kotzebue III S. 62: Boot *oa*, Mast *gkeus*, Segel *üi*, Floß *tham*, Hinterboot *muril*, *mol*, steuern *ekailioth*, rudern *fathel*, treiben *sasol*, drehen *thou*, lavieren *tattagul*, scheitern *eckail*.

Erfindung des Bootes s. Gesch. des Palúelap S. 285.

Die Boote von Oleai waren sehr geschätzt (s. S. 250).

Neben dem großen Segelboot gibt es ein kleines (Born *wa mar)*, dann Lagunenboote mit der gleichen Gabelschwanzgallion (Born *rassim)*, nur der Ausleger und die Leeplattform ist viel einfacher. In Luv ist auf der *baraf*-Planke,

Abb. 127. Lagunenboot.

da wo der Ausleger beginnt, ein umzäunter Behälter zur Aufnahme von Sachen, Abb. 127. Ein Boot zum Fischen heißt *máluvil* (Born: Ruderboot klein *tschosmal*, größer (10—12 ♂) *wa fetul)*; Frauen gute Ruderer.

Kr. 403 = 31601I *bilis* Brotfruchtharz zum Kalfatern; hatte nach 25 Jahren einen Höllengestank angenommen. Kitt nach Born aus Brotfruchtmilch, Kalk, Asche von Kokosschale und Wurzelsaft von Pandanus.

a) Bootbau (s. S. 92)

vom *sel'lap* Robgial.

Will jemand ein neues Boot haben, wendet er sich an einen Zimmermann *sel'lap*. Er bestimmt einen Brotfruchtbaum, der geschlagen wird; der Baum hat oder erhält einen Namen, der dann aufs Boot übergeht; dann frägt er: »Wie lang soll das Boot werden?« Der Bauherr: »Fünf Faden«. Der *sel'lap*: »Gut, laßt uns 4 Faden schlagen«. Der Stamm *bul* wird dann von allen Männern ins Bootshaus am Strand gezogne, wo das Boot geschlagen werden soll; dafür erhalten sie Essen an Fisch, Taro, Kokos usw, das *bai lúrúr oā*. Der Zimmermann erhält in der Folge während der Arbeit täglich 3 Schüsseln mit Speisen, alle 10 Tage 50 Schüsseln für seine Gehilfen und seine Familie, das *bai le fálěfal* oder *bai le oā*.

Mit der Breithacke, dem Dechsel *gasuéla* (Eisen s. oben S. 250) schlägt man den Stamm *bul ēli oā* zurecht (s. Lam. S. 92), dann den Steven *māt* oder *bādj*[1], dann die *bab* Planken, dann die Auslegerstangen *kio*[2], nach deren Fertigstellung

[1] Über die Gallion von Oleai ꝑ bei Lam. S. 93.

[2] Diese, die Luvseite heißt *palietam*, die Außenseite *theta*, *fale* unter, daher der Raum darunter mit seinen 3 Teilen: 1. *fale báraf (báraf* s. u.), 2. *fale fang (fang* Gräting) auch *falest* und 3. *o nidusap*.

der *sel'laṗ* kleine Geschenke an Matten und *ſaibar* erhält, das *gaköul le vá*. Es folgt die gewölbte Luvplanke *ſáramoi*, die Leereling *galigasá* und die Reling *mesáṗ*, die *ſaramoi* mit *badj* verbindet. Alles wird aufeinander gelegt, aber nicht gebunden, dann auseinander genommen. Bei der endgültigen Zusammensetzung der Planken wird Brotfruchtharz *bilis* auf die Stoßflächen geschmiert und Kokoshüllenfasern werden dazu gegeben. Vor dem Aufeinanderlegen werden die Flächen noch kurz übers Feuer gehalten. Das Harz wird bereitet, indem man die aus Stammwunden ausfließende Milch in Kokosschalen sammelt und über heißen Steinen kocht. In Wasser wird dann das Harz herausgenommen, in Kokosblattscheiden gewickelt und aufbewahrt. Die Kalfaterung (s. S. 271) erfolgt erst vor dem Stapellauf.

Jetzt fertigt man auch schon die Bänke *dó*.

1. *do le ſateſat* (s. Truk S. 229) außen.
2. *mátongor*
3. *tivětiſ*
4. *doialü*
5. *sasakio*.

Es folgt die *baraſ*-Planke, die Luvplattform *(libaraṗ)* (Truk S. 230 Abb. 188 *ſaraſ)* und das *ülingal*[1] *ma lĕ masur* = »seine Kopfbank zum schlafen«.

Die Diagonalversteifung[2] *matáraſang* (Truk S. 230 *teléam)*, die Gräting *ſang* einschließend. Die Gräting außerhalb, weiter luvwärts heißt *djodjo liĕlau* oder *lélial a Luluei* (s. Gesch. S. 288) »Schlafplatz des Gottes.«

Abb. 128. Ausleger.

Für die Befestigung der *ſang* am *kio*-Balken sind 2 große Bindungen *eágatiu le baráſ* vorhanden.

Jetzt kommt auch die Innenseite des Bootes *niva* daran, wobei man Schotten *gábung* stehen läßt, und das Loch *lógolog* an den Ansätzen des *matáraſang* zwischen diesen und dem *ülingal* (s. o.).

Es folgen die 4 *eám* Gabelpflöcke, Abb. 128, mit ihrer starken Verschnürung *ſoſóllam*, darüber der Querstab *vasoso* (Truk S. 230 *vaiso)* und das Joch *valeángalaṗ* zum Belegen des Luvstags *ĕ ángalaṗ* (vgl. Palau III S. 180). Taf. 15b u. c.

---

[1] Kopfbank *ülül*, Abb. 123.

[2] Auf Phot. 294, 290, 288 ist die Außenfläche die ganze Länge mit Buchstaben und ähnlichen Zeichen bedeckt (Taf. 15d).

Dazu kommen 4 *djē* krumme Auslegerbalken mit 3 Querstäben, außen *gabidjē*, innen (von den Pflöcken) *dariedjē* und oben am kio *eōpasa*.

Die Leeplattform *ēbep* (Taf. 15b u. c) ruht auf 2 *sūa*, die unter den *suilap* am *kio* gesteckt werden. Eine quere Ramenplanke *vólivalēbép*, auf der die zwei Aufbaubänke *folag*, Querbank *folag iēs*, ruhen. Zwei längs der *sua* laufenden Ramenlatten *paliēbép* und eine quere äußere *valiēbép*. Die Stäbe des Bodens der Plattform heißen *taragaliebép*, die äußerste Gräting *fang ali ēbép*, und das Loch darin *ti eli ēbép*.

Abb. 129. Pagaie mit Singknopf.

Born gibt an: Großes Boot *wa luwē*
Lehnbänke *falak*
Auslegerverschläge *geimeru* für Schutz vor Wind.

Takelung Tau *sós* (s. S. 288).
Mast *gois*, Fall für das Segel *urur*.

mārugoru gōlāg	er entschwindet ergebnislos.	*marugoru* sich auflösen wie Rauch, *langilaƥ* vergeblicher Fang

Wenn man zu Ende gesungen hat, soll ein Fisch gebissen haben.

267

IV. Geistige Kultur.

1. Gesellschaft.

a) Familie.

Kotzebue III S. 59 Nasengruß *feissong*.

Mertens (s. Truk S. 451) sagt, daß die Frauen viel Freiheit hatten, auch selbständig wie auf Feis an Bord kamen, ohne sich mit den Männern einzulassen. Sie kamen gelegentlich allein im Boot längsseit und riefen die Namen ihrer Freunde. Bei ihrer Zustimmung wird alles getan. Andererseits haben die Männer ihrem Gaste im Haus beim Übernachten ihre Frau angeboten.

In Versammlungen und bei Fremdenbesuch schweigt die Frau.

Nach Lütke sind viele Worte in ihrer Gegenwart tabû *(pennant)*. Bei Lässigkeit wurde sie mit Verbannung bedroht.

Frau nach der Conception 3 Monate lang ohne Beischlaf, dann erlaubt bis zur Niederkunft.

Kotzebue III S. 135: »Die Männer wohnen ihren Weibern auch bei, wenn sie gesegneten Leibes sind, nicht aber wenn sie ein Kind an der Brust haben«. »Wenn der Freund die Gastfreundschaft seines Freundes anspricht, so tritt ihm dieser auf die Zeit seines Besuches sein Weib ab«.

Geburt.

Die schwangere *(ĕsidl*, Kotz.: *sasiel)* Frau hat wenig tabû-Vorschriften.

Niederkunft im *imalipel*. Die Hebamme *valimelau* sitzt zwischen den Beinen der Gebärenden und empfängt das Kind. Eine Helferin *surĕlifĕtĕl* sitzt hinter dem Rücken der Niederkommenden und unterstützt sie. Geht es langsam, tönen die Rufe *tsóng, tsong* presse, presse!

Ist das Kind da, schneidet die Hebamme die Nabelschnur ab *bus*, meist mit einer Entenmuschel *gilegil* und ohne abzubinden. Kommt die Nachgeburt *bĕi* nicht, so tut man nichts, höchstens den Leib sanft massieren *sŏgi*.

Born: Geburt durch Schrei als Signal verkündet; Stellung knieend, Hände auf Oberschenkel, oder halb liegend im Schoß einer andern Frau. Nabelschnur mit *gilgil*-Muschel abgeschnitten, ohne Abbindung; Kraut gekaut auf Wunde gespuckt. Placenta *pei* vergraben. Zwillinge und mehr nicht selten.

Blutet die Wöchnerin stark, so werden *nat*-Blätter im Feuer gedämpft und sie setzt sich in den Dampf. Ist alles gut, so geht die Entbundene zum Strand und

badet im Salzwasser, wo die Frauen ihr auch noch den Leib massieren. Sie bleibt dann noch im *imalipel* mindestens während der 4 Tage, da die Lochien kommen. Erst nach 10 Tagen kehrt sie ins Wohnhaus zurück. Meist baut ihr der Ehemann beim Wohnhaus ein kleines *imalipel*, wo sie mit dem Kinde bleibt. In diesem weilt auch die erstmenstruierte Tochter 8 Tage lang. Auch das Kind wird alsbald nach der Geburt im Salzwasser am Strande gebadet, wo auch die Nachgeburt vergraben wird. Kinderwiege aus Kokoswedelgeflecht Taf. 19 f u. h.

Die Frau bleibt nach der Geburt 8 Tage bis einen Monat im *imalipel*, in der Ferne oder in der Nähe. Dann geht sie 10 Tage ins *im ali gogobóng* »genug Nächte« (von *sagon* genug) und dann 5 Monate ins *im ali fam*, wohl = »Kostgeben«, also »Kosthaus«.

In diese Häuser bringen die Eltern oder die nächsten Verwandten gute Kost, damit das neugeborene Kind gut heranwachse, damit es blühe und gedeihe; das gute Essen s. S. 93. Das Kind wird gut gepflegt; man hat besondere Wiegen (s. o.) für sie, auch viereckige Ramen mit Schnurnetz, das von einer Pandanusmatte *gégi* bedeckt wird, wie Taf. 7.

He. 1880 *üloid*, Ramen *wa lüloid*, Netz *üloid*, Ringe *taling*.

Stufen der Frau.

tardivel	Mädchen vor der Menstruation
dáurang	Mädchen menstruiert, trägt den Grasschurz *sivisif*.
nikabal	Frauen verheiratet oder ledig mit Matte *gabálabal*.
malióüteg	Ehefrau mit Matte; ferner Worte für Ehefrau *ril, fitial, ésagal, djoelevúgetal, djoele gáneal, ētial, djoele iti telivulemel djal*.
nipes	alte Jungfern oder Wittwen.
esamesoutagel	stot ihr Gatte« Witwer und Witwen. Letztere trauert ein Jahr ungefähr, und ist meist Hetäre.

Die *daurang* bleibt, wie schon erwähnt, bei der ersten Menstruation[1] 8 Tage im *imalipel*. Während dieser Zeit bringen ihr Jünglinge junge Kokosnüsse, aber sie darf sich nicht mit ihnen einlassen.

Nach ihrer Rückkehr fragen sie Eltern und Geschwister, wer ihr Kokosnüsse gebracht hat und sie pflegt alle zu nennen. Sie wird nun ermahnt, einen von diesen als Gatten zu wählen, sich aber nicht auf vage Liebeshändel einzulassen.

Der Freier spricht mit den Eltern, und wenn das Mädchen einverstanden ist, folgt sie ihm in sein Haus. Der Gatte pflegt ihr Matten, Gelbwurz *rang* usw., sogar Land zu schenken, ihr oder auch der Familie, was sehr angenehm bemerkt wird.

[1] Born *pungelog*; grün geschmückt; Essen von ♂ bereitet tabū. Beischlaf vorher verboten. Nachher Zurückhaltung. Es soll Frauen geben, die unberührt heiraten.

Stufen des Mannes.

Knabe	*tharemal*
Jüngling	*taremal*
Mann	*mal*
alter Mann	*tógobei*
Greis	*málelap*

Über die Beschneidung s. Feis.

Namengebung: nach Kadu (Kotzebue III S. 134) »sollen die Häuptlinge ihrem Erstgeborenen den Namen ihres Vaters, dem 2. Sohn den Namen des Vaters ihrer Frau, dem 3. wieder den Namen ihres Vaters und so fort, die Leute aus dem Volke hingegen ihrem Erstgeborenen den Namen des Vaters ihrer Frau und den andern Kindern andere Namen geben«. Es mischt sich also hier Vater- mit Mutterrecht. Es würde also der 1. und 3. Sohn gleich heißen! Nach dem Stammbaum des Agupelior S. 216 stimmt es auch nicht; oder nicht mehr?

Kranke geben sich gerne einen andern Namen (s. 2. Gesang); und auch für Geliebte geschieht es oft.

Beschneidung *sopi*, *masopi*, findet auf Oleai und Feis statt, wenn die Knaben 1 Jahr alt sind, und zwar als Circumcision. Der Ring wird vergraben. Auf die Wunde wird der ausgepreßte Saft junger Kokosnüsse von Wallnußgröße getröpfelt. Nach 4—5 Tagen Heilung.

Sippen *gailang*.

1. *gailang ali* Voléa
2. Sauel (Truk S. 257 Sábélo?)
3. Gófalu
4. Mongaulifadj (Truk S. 260 und 264 Nr. 21), oben S. 114)
5. Saufaládjik (s. Lam. S. 115)
6. Sor (Truk Nr. 10).

Sippenehen können vorkommen, wie Haus 6 zeigt; eine Verwandtenehe zeigt Haus 8.

Von Námoluk (Bd. 6 I S. 86) nennt Hambruch 8. Gatamak; diese Sippe Gadamak soll aus Uönë (= Oleai) stammen (s. Bd. 6 II S. 157 Gadamän).

b) Staat und Recht.

Häuptling *tamol*.

Nach Kotzebue III S. 134 Erbfolge erst auf die Brüder, sodann auf die Söhne des Erstgeborenen.

Krieg.

(Ko.: *maul*, Lanze *tilleg*, werfen *kattevi*, treffen *jel*, fehlen *tavami*, Schleuder *kaul*) war so gut wie unbekannt, wie auch Speere und Keulen (s. o.) und Schleuder fehlten. Schon Kadu beteuert seine Abscheu vor dem Kriege (Kotzebue III S. 90, 134), den er bei den Ratakern kennen lernte, wobei er verwundet wurde. »Da weiß man nichts von Krieg und Kampf, da tötet nicht der Mann den Mann, und wer den Krieg sieht, dem wird das Haar weiß.«

Recht.

Kadu erzählte, daß Verbrecher nicht bestraft, sondern verbannt würden.

Tod.

Wenn ein Häuptling stirbt, wird auf alles tabû gelegt, und nur noch das nötigste zum Essen zurückgestellt. Die Haare werden kurz geschoren. Trauer heißt *drafagôu*. Die Toten werden in Matten gewickelt (ein Stein wird mit eingepackt) und mit Tauwerk tüchtig zugebunden. Das Bündel fährt man auf die hohe See und versenkt es. Sind keine Taue entbehrlich, macht man ein Grab *mâs* und nach der Beerdigung einen Hügel darauf. Über dem Grabhügel *pei* baut man ein Grabhaus *imalipei* und einen Zaun drum herum, und man legt Kokosnüsse hinein. Von den Kokosnüssen macht man gelegentlich ein Geschabsel, das man für die Haare gebraucht, *gâbêt* genannt. Ist nach einigen Monaten durch das Tabû viel Nahrung vorhanden (es kann 10 Monate dauern), so macht man das Totenfest, ein großes Essen *gâgieg* mit Tänzen *ur*, zu denen sich die Frauen waschen und schmücken, während die Männer es unterlassen. Das Essen wird an die Besucher verteilt, die Kokosnüsse ähnlich wie es beim *fat'lap* S. 236 beschrieben wurde. Sonst gibt es noch Taro, Brotfrüchte, Fische usw., aber keine Schweine. Die Besucher nehmen ihren Anteil mit.

c) Feste und Tänze.

(Ko.: *waruk*, besonders Tanz im Kreis *walebong*, anderer *kapangach*), s. Hausbau und Tod oben. Sitztanz Phot. Kr. 327 ♀, Stehtänze Taf. 13a, Phot. Kr. 324, 325, 326.

d) Spiel und Sport.

Ko.: baden und schwimmen *evoloch*, tauchen *eulong*, auftauchen *ewâsach*.
He. 1906 = 36951 eine Kinderpaddel, Länge 90 cm, Abb. 130.

Abb. 134. Kinderpaddel.

Abb. 131. Holzpuppe.

Puppen, kurzweg *lios* (Truk »Bild«) genannt, kommen vor. Die Holzfiguren (s. Abb. 131) haben eine gewisse Ähnlichkeit mit den Sturmzauberzeichen Abb. 132.

He. 4651 = 821611 Windrad *gā* an der Schnauze eines hölzernen Fisches, auf Bambus gebunden.

2. Wissenschaft.

a) Navigation (s. Handel S. 250).

Wenn ein Häuptling reisen will z. B. nach Feis, so sagt er zu seinen Leuten, sie sollen das Boot richten. Er selbst bringt vor der Reise *uōfalū* einen Monat im *falʾlaf* zu, dessen Besuch für Frauen verboten ist. Dort verbringt er auch nach der 1. Rückkehr 5 Monate, nach der zweiten 1 Monat, nach der dritten ½ Monat, nach der vierten 5 Tage. Bei allen weiteren Heimkehren von Reisen fällt die Klausur fort. An fremden Plätzen braucht kein Tabū eingehalten zu werden. Anders bei Fischern (s. S. 50).

Die Herrichtung des Bootes bezieht sich vor allem auf die Kalfaterung *besdiva*, damit es kein Wasser macht. Es geschieht mit *uadj* »Kalk« in folgender Mischung: Kohle aus Kokoshüllen wird mit Kalk zerrieben unter Zusatz von Saft von ausgepreßten jungen Hüllen, so daß der Saft sich mit dem Pulver mischt.

Ferner wird die Bindung neu überprüft; dann werden neu gemacht die Deckshäuser *gaimodu*, die Taue und das Segel, kurzum die ganze Takelung; auch wird der Bootsleib neu bemalt.

Ist alles fertig, wird das Bodt zu Wasser gebracht und es wird, sobald starker Wind aufkommt, eine Versuchsfahrt im Binnenwasser gemacht. Fällt sie gut aus, so gilt das Boot als segelfertig. Der Schiffsführer stellt nun 4—5 Männer als Matrosen *jōliva* an, aber sie müssen freiwillig gehen, dürfen nicht gezwungen werden.

Dann sagt er zu den Frauen sie sollen das Essen für den *falū* und die *jōliva* bereiten, wobei der Brotfruchtteig *mar* als einzige Konserve voransteht.

Abb. 132 a—c. Sturmzauber.

Bei gutem Wind aus Osten *(gōtimei)* wird alles an Bord gebracht, besonders sorgt man auch für junge Trinknüsse und für alte zum Essen, nimmt auch noch 20—30 Kokoswasserflaschen, gefüllt mit Süßwasser, mit und schließlich holt der *pallū* noch den Sturmzauber, über den S. 135 schon einiges beigebracht ist. Er wird am Deckhaus angehängt, wo der *pallū* an Bord wohnt.

Näheres über *gosdlifpi* oben und unten S. 284., s. Abb. 132.

Vorbedingungen für gute Fahrt nach Feis.

gute See *djeger ali ile mōlau.*

guter Wind *djeger ale gūi (gui* Monat August S. 133),

in der guten Zeit *murilisfang*, wie die Passatzeit nahe am Ende des *gui*-Monat heißt. Dann steht der Stern *māl* (Sirius S. 136) am Himmel und nördlich der *ōgelik*.

Wenn *e dlimeio* (s. S. 135) am Morgenhimmel steht, ist guter Wind. (Für die Rückkehr ist es der *gāp* Spica und *eramoi* = *aromoi* Arcturus.) Sind die Sterne nicht sichtbar, nimmt man die Segel weg, läßt treiben und wartet so lange, bis die Sterne wieder sichtbar sind.

Die Fahrt wird in Abschnitte *gōlag* eingeteilt, von denen eine bestimmte Zahl auf einen Kurs gehen; z. B. der 1. *gōlag* wird durch die Zeit bestimmt, die das Boot braucht, um außer Sicht der Insel zu kommen, wenn ein Mann auf den Mast steigt. Der erste Kurs auf den *ōgelik* dauert bis zum 4. *gōlag* (nordwestlich); der zweite Kurs auf den Stern *magōrogor* Plejaden macht nur 1 *gōlag* aus (westlich); der letzte Kurs ist auf den *māl*, dann sind es nur noch 2 *gōlag* (nordwestlich).

Nach Aurupeg (Aurepik) sind es 4 *gatag* auf einem Kurs nach dem *tubutumur* untergehende Antores.

Nach Ifaluk sind es 3 *gōlag* mit Stern *ilicl* Oriongürtel (O) bei gutem Wind in 8—12 Stunden (1. *gōlag* Oleai sichtbar; 2. *gōlag* Hochsee, 3 *gōlag* Ifaluk sichtbar). Ifaluk-Lamotrek Stern *ul* Aldeboran aufgehend, 5 *gōlag*.

Nach Fāraulap sind es 5 *gōlag*, 3 *gōlag* auf *tagal-ōgelik*, 1 auf *tagalemailap* aufgehend Atair in Ost) Aufgang West und 1 auf *tagal e goldgo*.

Nach Kadu gingen die Fahrten von Ulea nach Palau, Sonsoror, Pul, Merir, Rückfahrt über Sorol (Kotzebue III S. 104).

Kotzebue III S. 64: Kurs Norden *puc*, Süden *puilung*, Osten *puitag*, Westen *puilug*; Morgen *nissur*, Mittag *ogwol*, Abend *eppong*.

Die Winde und Sterne hier (vgl. S. 194) sind folgende:

	Wind	Stern
N	*fangilap, sangisfang*	*vōlevol*
S	*edngoaur, aurilap*	*tāgalup* aufgehend
		magemeiat 45°
		volevol kulminierend

		madjemeitol 45°
		tubulup untergehend

Faluéliep
Jévisi
Námofizi

Mores s. S. 280.

Bei der besonderen Seebefahrenheit der Oleenser sind diese Angaben von Wichtigkeit wegen alter Verbindungen der Karolinier mit Melanesien, aber eine Lokalisierung ist trotzdem nur äußerst schwierig. Bei Lukunór-Námoluk (Bd. 6 I S. 106) erscheint auch Nudja wie hier, das höchstwahrscheinlich die bekannte Insel Nusa an der Nordspitze von Tombára ist; es kann auch Numau hier gleich Numul dort sein, Nuól = Nūol usw., so daß diese melanesischen Orte hier ehemals

[1] *dj* ganz weich.

weit bekannt gewesen sein dürften, was den Ausführungen Bd. 6 I S. 131 entspricht.

Verschlagungen (s. auch Stöcklein):

Kotzebue III S. 127: »Die 2 Boote, die Cantova gesehen, waren mit vier andern auf der Reise von Fatoilep (Fároilap) nach Ulea von dem Westwinde ergriffen und zerstreut worden. Die meisten Menschen darinnen waren Eingeborne, beider benannten Gruppen, und wir nehmen an, die Boote selbst seyen von diesen Inseln gewesen. Das erste größere Boot, welches 24 Menschen trug, drei Kajüten hatte, und seiner Merkwürdigkeit halber sorgfältig beschrieben wird, heißt: »Fremd[illegible]Boot wenig von dem der Marianen verschiedene usw.

Durch Chamisso wurde die von Kadu bekannt, der als er nach Osten vertrieb, 8 Monate lang umhertrieb. »Drei Monde reichte ihr kärglich gesparter Vorrat hin; fünf Monate erhielten sie sich, ohne süßes Wasser, blos von den Fischen, die sie fingen. Den Durst zu löschen, holte Kadu, in die Tiefe des Meeres tauchend, kühleres, und ihrer Meinung nach, auch minder salziges Wasser, in einer Kokosschale herauf. Der Nordost-Passat trieb sie endlich auf die Gruppe Aur der Kette Radack, wo sie sich im Westen von Ulea zu befinden wähnten. Kadu hatte von einem Greise auf Eap, Kunde von Radack und Ralik vernommen: Seefahrer aus Eap sollen einst auf Radack, und zwar auf die Gruppe Aur verschlagen worden sein und von da über Nugor (Nukuor Kr.) und Ulea den Rückweg nach Eap gefunden haben. Die Namen Radack und Ralik waren ebenfalls einem Eingeborenen aus Lamureck, den wir auf Guajan antrafen, bekannt. Es werden oft Boote aus Ulea und umliegenden Inseln, auf die östlichen Inselketten verschlagen, und noch leben auf der südlichen Gruppe Arno der Kette Radack, fünf Eingeborene aus Lamureck, die ein gleiches Schicksal auf gleicher Bahn dahin geführt.«

Diese starken Stromversetzungen werden durch den Äquatorialgegenstrom erklärt, der etwa 100 Seemeilen breit nördlich des Gleichers von Westen nach Osten zieht. Äußerlich verschwindet er vor den aus NO kommenden Passatseen, aber innerlich wirkt er unter der Oberfläche mit elementarer Gewalt, besonders wenn Windstillen dem Boote keine Segelfahrt ermöglichen. So können also Boote nördlich der Linie vom äußersten Westen der Karolinen bis zu den Ralik-Ratakinseln vertreiben.

Die Verschlagungen, deren noch viele angeführt werden könnten (s. Palau I S. 14) sind aber nur Ausnahmen, durch unregelmäßige Witterung und falsche Ströme verursacht. Wie bekannt die Karolinier als Seefahrer schon um 1800 waren, zeigt ein Bericht von Mertens (Truk S. 451), der sagt, daß auf Oleai die Schiffsführer den Besuchern Briefe vorgezeigt hätten, die ihnen von weißen Kapitänen übergeben worden seien, damit sie sie gelegentlich dem Gouverneur Don Luis de Torres auf Guam brächten.

Vertreibungen zahlreiche bekannt; s. z. B. Haus 4, 6, 12, 19 usw.

Man sieht ohne weiteres, daß die Namen nicht genau übereinstimmen und etwas verschoben sind, daß aber, wie natürlich, der Mond die Grundlage für die Monate gibt. Da 13—14 Tage nur für eine Füllung des Mondes gebraucht werden, sind die 30 Tage Chamisso's zu viel; aber auch eigentlich die 29 meiner Aufnahme. So erklärt es sich vielleicht, daß für Jahr nur *seikmarsou* angegeben wurde, was 12 bedeutet (s. Nr. 263 Schluß).

Abb. 133. Zählschnur.

Monatsteinteilung s. Lámotrek.

Im Kotzebue III S. 128 steht: »Man zählt auf den Karolinen-Inseln Tage und Monde und theilt das Jahr nach der Wiederkehr und dem Verschwinden der Gestirne in seine Jahreszeiten ein. Niemand aber zählt die Jahre«.

Zählen mit Knoten Abb. 133.

Sturmzauber s. S. 272.

b) Medizin.

Lütke III S. 144ff. beobachtete Linien von Narben (Moxen) auf den Armen, die durch kleine Einschnitte während der Kindheit hervorgerufen werden, durch Behandlung mit der giftigen Milch der Cerbera.

Namenwechsel der Kranken s. S. 269.

Heilkünstler	*tautaſéſ*	Durchfall	*dadjikedj*
Wunde	*gopilag*	Husten	*ſeſ'ſag, ſágaſag*
Vene	*vag*	Schluckauf	*matov*
Eiterbeule klein	*lós*	rülpsen	*gírér*
Phlegmone	*más*	gähnen	*mólegatol*
Hydrocele groß	*mór, mórulap*		

Viel geübt hier Aderlaß und Punktion von Eiterbeulen mit dem Schnepper *fidjefidj i le vâg* oder *i le mör*, je nach der Anwendung.

Erstere zeigt Abb. 134a und b. Kr. 260 mit Haizahn, Kr. 262 = 3047II mit Krebsschere, letztere Abb. c und d. He. 1606 = 5436II und H. 1913 = 5704II aus Bambus *wai* oder Fregattvogelknochen, oder Stachel *faialiik* vom Fisch *felang* mehr als Abszeßöffner benützt, oder für Hydrocele (Kr. 255).

Abb. 134e ist mehr Bohrer (S. 62) mit Haizahn (He. 1722 = 5538II, Länge 35 cm).

Die Punktionswunde wird nicht verbunden.

Abb. 134a—e. Punktiernadeln.

Nach Lütke dienen Acanthurus-Stacheln oder Haizähne zum Aderlaß usw.

Die Hoden, *failimor*, werden bei Schwellung des Hodensacks gerne entfernt: man öffnet mit dem Messer, zieht den Hoden heraus und schneidet ab. Verband mit Blättern. Vadjegëlog hatte sich beide Hoden ausschneiden lassen.

Die Karolinenhand *got ûmel* (Truk S. 310). Ein behafteter Knabe verletzte sich beim Palmweinschneiden das zweite Kleinfingergelenk; als das Blut kam, wurde der Finger wieder gerade.

Perverses: Die labia minora werden auf Oleai bis zu 10 cm verlängert; dadurch Cunnilingus befördert (s. Feis).

3. Religion.

Was bei Lamotrek über Tempel und Opfer gesagt wurde, gilt auch für hier. Zwar fanden wir keine heiligen Häuser mehr, aber das *imaliêlus* »Geisterhaus«

des Eangelaf (Ko. S. 57 Name des Gottes: Engalap) Abb. 126, beim *im* Marúaru auf Tagaûlap zeigt deutlich auf alte Kultstätten, obwohl das Haus fremdem Einfluß zugeschrieben wird, s. S. 259: Raketip kam mit seiner Frau Lētāgo von Faróelap (Fároilap), wo Ûapei als *alus* verehrt wird, nach Tagaûlap, blieb hier und baute das *im ali ēlus*. Nach vielen Jahren kehrten sie nach Faróelap zurück. Eángelaf (Voléa) war aber auch hier Nebengott. Für diesen Gott wurden auch hier am Hausbalken kleine Ölflaschen mit *vut*-Kränzen aufgehängt. Auf Falális galt Iletilimar im Hause Móélifal als *alus*.

Gegenüber Lamotrek war Oleai nicht so ergiebig[1]. Dafür ist noch einiges vor 100 Jahren aufgenommene vorhanden, worüber unten berichtet wird. Hier folgendes: Alúelap wohnt im Haus Fatsomal (*ts* scharf gesprochen) im Himmel, wohin die guten Seelen *ngol* ziehen, während die schlechten nach dem *im aliáf*[2], dem »Haus des Feuers« von ihm geschickt werden. Tempel und Opfer sind hier nicht bekannt (Kotzebue III S. 129). Alúelap, der *alus eoelap*[3], hat Olcai geschaffen. Er sagte zu seinem Bruder Saulal in der Tiefe *i lál*: »Mache ein Riff heraufkommen. Mache einige groß, einige klein«. Auch hieß er ihn, das Meer und die Fische machen. Saulal ist der Gott des Meeres in Gestalt einer Sirene, Menschenleib mit Fischschwanz.

Límagei (S. 110) ist beider Mutter; Litóbeo, ihre Schwester, saß oben im Himmel und riß die Fäden der Menschen ab, so daß sie starben. Die Fäden[4] reichten von oben bis auf die Erde herab zu den Menschen, die durch sie atmeten; erst wenn Litóbeo sie abbrach, hörte das Leben auf.

Alúelap heiratet die Frau Ilámālun. Ihre Kinder waren Lúgeileng[5] *(= lúgelleng)* und Simēlegóror (s. S. 144), der alle Dinge machte: Sonne, Mond, Sterne, Boote, Häuser, Holzschüsseln, Tatauierung usw. Der Name soll »alle Dinge« bedeuten, aber Simē ist wohl = *simes* »Tod«, wie unten bei Simēlegēreger zu sehen.

Ligéreger war eine streitsüchtige Göttin unbekannter Herkunft. Sie stritt einmal mit dem Monde, dem sie zurief:

simē Ligéreger, *simē serēl*!
tot Ligéreger, tot Du! *(simes* tot)

d. h. Wenn ich sterbe, sollen alle sterben!

Der Mond antwortete: Es ist besser, wenn es so ist, wie bei mir;
der junge Mond *(ēlúelang)* ist die Jugend,
der abnehmende alte *(tógovei)* das Alter!

---

[1] Agupelior sagt: All talk before plenty lie! [2] Nicht auf Lamotrek bekannt.
[3] Kotzebue III S. 128: der Gott *(iautup)* von Ulea heißt Engalap; Eóngelap ist Geist von Voléa.
[4] *melowai* mein Lebensfaden, *ēlli melowai* unsere Fäden.
[5] Nach Kotzebue III S. 129: seine Mutter Leteuhieul, aus Ulea gebürtig; S. 56 Gott = *iautup* = Yap Anruf beim Opfern *marsganam guru iautup*; Volk = *iautup*.

Lúgeileng, der erste Sohn des Alúelap, kam nach Vēisálop[1] und heiratete eine Frau, deren Herkunft man nicht wußte[2]; sie gebar den Ólefat. Lugeileng war fortgereist, aber er kehrte, als sie noch schwanger war, zurück. Sie hatte einen großen Bauch, konnte aber nicht niederkommen. Lugeileng erzählte es seinem Vater Aluelap, und dieser sandte ihn nach Veisalop zurück mit der Anweisung, ihr eine *bellik*-Muschel auf den Kopf zu legen, wenn sie Schmerzen und Angst habe. So geschah es, und plötzlich stieg Ólefat durch den Kopf der Frau empor[3]. Das kleine Kind weinte viel. Als die Mutter sich sorgte, was ihm fehle, sagte es: Gieb mir eine Kokosnuß. Die Mutter holte sofort eine her und wollte sie aufschlagen. Der Kleine aber sagte, er wolle nur ein Loch haben. Als die Mutter ihm ein Loch gemacht hatte, saugte Olefat daran, und sah dabei, als er den Kopf zurücklegte, plötzlich seinen Vater Lugeileng im Himmel. Da hieß er seine Mutter ein Feuer machen, und als es qualmte, stieg er in der Rauchsäule nach oben. So kam er zu Lugeileng. Olifat aber war böse; er war mit nichts zufrieden und wechselte immer. Einmal kam er mit einem dicken Bein, dann mit einem dicken Hoden, dann tatauirt, dann untautauirt, dann jung, dann alt, bald schön, bald häßlich, alles wechselnd. Was er eben nahm, warf er bald wieder weg.

Er ging auch nach Mores in Melanesien, wo er Menschen gefressen haben soll.

Zum Schluß wurde Olefat an einem fremden Platz erschlagen. Als Lugeileng dies dem Aluelap erzählte, sagte dieser: »Laß alles heraufkommen, was wertvoll ist; ich will den Platz zerstören«. Als Strafe sandte er die Fliegen, die Stechmücken, die Haifische usw.

Lütke berichtet einiges über die Religion; ob alles von Oleai stammt ist aber unsicher, wie das folgende von Freycinet. Da es für das Gesammtbild nicht unwichtig erscheint, sei es hier aufgeführt: Hanno oder Hannulap kann nur von wenigen gesehen werden, aber sie hören ihn und vermitteln seine Befehle, durch Schamanismus. Auch Kinder können Nachricht bringen. Die Besessenen heulen und bekommen Krämpfe. Schamane geölt, bemalt, mit 2 Lanzen, beim nahen schreiend. Er greift den Kranken an, der sich erhebt und wehrt; sie kämpfen, dann Lanzen weggeworfen und Tanz mit Stäben, tage- oft wochenlang, bis der Zauberer gesiegt hat. So wird der Wille des Anulap bekannt. Jährlich einen Monat lang Feste für Anulap, wobei die Männer oft bis zu zwei Monaten von den Frauen fern bleiben; es darf kein Segel gesetzt werden; während der ersten Woche darf kein Boot in See gehen; Fremde dürfen nicht landen. Vier Tage vor dem Hauptfest Sammeln von Kokosnüssen und Brotfrüchten. Früh am Haupttag Fischzug.

---

[1] Von *sólop* Erde.

[2] Kotzebue III S. 129: Lugeleng hatte zwei Weiber, eine im Himmel und eine auf Erden, Hamulul und Tarisso (= Elamalor S. 146 und Tarisso S. 147, Bd. 61 S. 189). Letztere war an Schönheit und sonstigen Gaben sonder Gleichen; sie gebar Olifat. Schon Cantova schrieb, daß Tarisso von Falalu (Fananu) stamme.

[3] *ni i ili* Olofátás; *mogúlegul* die Fontanelle.

Alles geht dann zum Tempel *led*, der ein gewöhnliches Haus ist; für eine Nacht ist es geschlossen; am Morgen nach Sonnenaufgang tritt der Häuptling vor versammeltem Volk durch nördliche Türe ins Haus, reich geschmückt, mit einem Stock in der Rechten, mit dem er den Weg zu suchen scheint; dabei blickt er vor sich nieder und spricht zu sich; sein Bruder geht kurz vorher an der Südseite an der Spitze von einigen Leuten hinein; sie setzen sich, erheben sich aber, wenn der Häuptling hereinkommt, der sich auf 3 schöne Matten setzt. Dann erst setzten sich die übrigen. Niemand darf sonst herein. Der Bruder naht sich dann den vorhandenen Vorräten und nimmt von jeder der 50 Platten etwas, gibt den größten Fisch und die größte Kokosnuß in einem Korb dem Häuptling und öffnet für ihn 50—60 Nüsse. Dann verteilt er das übrige an die Versammlung, setzt sich dann neben seinen Bruder, um mit ihm zusammen das bereitete Frühstück zu nehmen. Als Lohn erhält er selbst die Nußhüllen, die für Schnurdrehen sehr wertvoll sind (S. 191). In ½ Stunde ist alles fertig. Dann Haus wieder für alle zugänglich. Nur die Asche darf nicht berührt werden. Es bleiben hier meist Kranke, aber nicht allein, aus Furcht vor Anulap.

Freycinet (s. Truk S. 451) bringt im Historischen Teil S. 107ff. einiges über die Religion der Karolinier. Die Aufzeichnungen stammen wie bei Chamisso (s. Palau Bd. I S. 131) von Don Luis de Torres, sind aber bei Freycinet namentlich hinsichtlich der Religion, die wohl von Oleai stammt, ausführlicher. Deshalb seien sie hier angeschlossen.

Die 3 Götter der Karolinier[1] sind Alouhilap = Alúelap, Lougheling = Lugeileng Olifad = Olefat. Ihre Entstehung wird so erklärt: Seit Ewigkeit besteht eine Göttin Ligopoup (s. S. 144), die Schöpferin des Weltalls. Sie schuf Alúelap[2], den Erfinder der Wissenschaften; sein Sohn ist Lugeileng[3], dessen Mutter unbekannt ist (S. 146 Ilamalun); er hatte zwei Frauen die himmlische Ilamoulong (Ilamalun) und die irdische Tariso, letztere von seltener Schönheit (so auch bei Kotzebue S. 129, ebenso das folgende); sie gebar Olefat (S. 147) 4 Tage nach dem Beginn ihrer Schwangerschaft. Er war ganz mit Blut beschmiert, biß seine Nabelschnur selbst ab und begann sofort zu gehen, nach dem er geboren war; aber er wollte sich von niemand berühren lassen, und wenn ihm jemand bei der Reinigung helfen wollte, sagte er, er werde schon selber für sich sorgen, und rieb sich an den Kokosstämmen ab, die deshalb oft so rot sind. Als seine Mutter ihm als erstes eine junge Kokosnuß zum Trinken gab, und er den Kopf hintenüber legte und

[1] So auch Kadu s. Kotzebue III S. 129. Es wurden auch 7 Götter genannt: Ligopoup, Kantal, Alouilap, Litefeo (S. Litobeo), Houlagouf, Lougheling, Olifad.

[2] So auch bei Kotzebue III S. 129: nach Cantova (Freycinet S. 115 Ehulup) Sohn von Sabukur und Hamelul, Schwester Ligobuud. Ehulup heiratet Letöhiöl von Guliai, Sohn Lugheileng «Mitte des Himmels»; dann adoptiert Reschahuileng (wer?), ein Jüngling von Lamotrek. Ligobuud bekam 3 Kinder.

[3] Lügeileng hatte 2 Frauen (Cantova), eine göttliche, die ihm Karrer und Meliliau gebar; die andere stammte von Falalu; gemeint ist Tariaso S. 147 (s. Bd. 61 S. 189).

nach oben blickte (s. o. S. 147 u. 280), sah er seinen Vater Lugeileng, den er sofort ansprach. Er stieg sofort mit seiner Mutter zu ihm hinauf. Als Olifat in den Himmel kam, traf er auf Kinder, die mit einem Haifisch spielten, den sie am Schwanz angebunden hatten[1]. Da der Fisch Lahmheit vortäuschte, um unbeachtet zu bleiben, fürchteten ihn die Kinder[2]. Olefat wollte ihn haben, aber alle wollten ihn nicht hergeben, außer dem Knaben, der den Strang hielt (vgl. S. 147). Dieser gab dem Fremdling den Strang, und so konnte Olefat sich mit dem Tiere vergnügen. Nach einiger Zeit gab er aber dem Knaben den Strang zurück und sagte ihm, er solle vor dem Fisch keine Angst haben, wenn er wild werde; er tue ihm nichts. Olefat machte nämlich einen Zauber, um die übrigen Kinder zu strafen, die ihm seine Bitte abgeschlagen hatten. Daraufhin wuchsen dem Haie große Zähne und mit diesen biß er die Ungefälligen.

So strafte er alle die, die ihm unfreundlich entgegenkamen, und es waren viele, denn sie kannten den Gott ja nicht[3]. So wollte er einmal beim Bau eines großen Hauses von den Bauarbeitern ein Messer zum Abschlagen der Kokoswedel für die Dachdeckung haben. Nur einer kam seiner Bitte nach; da verwandelte er alle übrigen in Statuen.

Lugeileng und Alúelap wußten, daß Olefat sich in den Himmel begab. Als sie von der Verwandlung der Arbeiter erfuhren, frugen sie den, der nicht verwandelt worden war, ob er irgend jemand getroffen hätte; er antwortete, daß er nur einen *kandoura*[4]-Vogel gesehen hätte, (in den sich Olefat verwandelt hatte). Sie befahlen ihm ihn zu rufen; er tat es, aber der Vogel fürchtete die Stimme und entfloh. Lugeileng hieß ihn noch einmal rufen, ohne zu sagen, daß er kommen solle, was er vorher getan hatte, ja er sollte sogar dem Vogel untersagen, zu kommen, weil seine Anwesenheit den Häuptlingen unangenehm sein könnte. Der Arbeiter führte den Befehl aus und verbot dem *kandoura* ins Haus zu kommen und sich auf den Platz der höheren zu setzen; aber der *kandoura* tat das Gegenteil. Als er da saß, ließ Lugeileng durch einen seiner Leute alle die Verwandelten holen. Sie kamen alle, zum großen Erstaunen derer, die anwesend waren. Denn nur Aluelap und Lugeileng wußten, daß das Kind Olefat war.

Der Bau des Hauses wurde fortgesetzt. Als man die Löcher für die Pfosten machen wollte, nahm diese Arbeit Olefat auf sich, was den Arbeitern viel Freude machte, weil sie hofften, ihn so töten zu können, als Rache für das, was er ihnen angetan hatte, und aus Angst, was er ihnen noch antun könnte. Aber er, die

---

[1] Die Geschichte vom Fischspiel s. Palau Bd. IV S. 231 und oben S. 147; bei Kotzebue findet sich die Angabe, daß sie ihn fürchteten und nicht berührten, weil er ihnen aussätzig erschien.

[2] Bei Kotzebue III S. 130 folgt hier: »Er stellte sich, um unerkannt zu bleiben, aussätzig an. Da hielten ihn die Kinder fern von sich und berührten ihn nicht«.

[3] Bei Kotzebue folgt hier: »Da keiner ihn kannte und er zu seinem Vater noch nicht gekommen, der allein ihn erkennen konnte, stellte man seinem Leben nache.

[4] Kotzebue: *candúra*, eine Art Uferläufer.

Absichten erratend, versah sich mit roter Erde, mit Kohle und Kokosblattrippen, die er gut verbarg; darauf machte er die Löcher, aber mit Nischen, damit er in diese hineinschlüpfen konnte. Als alles fertig war, gab er Kunde davon. Alsbald stießen sie auf ihn einen der Pfosten und warfen Erde nach, um ihn zu ersticken. Olefat aber entwischte in die Seitennische, und begann die rote Erde zu kauen, die er nach außen warf. Seine Mörder hielten dies für sein Blut. Darauf, als sie die Kohle herauskommen sahen, die er ebenso gekaut hatte, hielten sie dies für seine Galle, und schlossen daraus, daß er tot war. Indessen durchbohrte Olefat mit einer Kokosblattrippe den Pfosten der Länge nach, und als er durch die Röhre nach oben geschlüpft war, setzte er sich in der Höhe hin, ohne bemerkt zu werden. Seit dieser Zeit haben die Bäume ein Herz. (Dieser Satz fehlt bei Kotzebue.)

Als das Werk vollendet war, versammelten sich die Bauleute, um zu essen. Olefat beauftragte eine Ameise[1], ihm ein kleines Stück Kokosnuß zu bringen. Die Ameise tat, was sie konnte. Olefat verwandelt mit seiner göttlichen Kraft das kleine Stückchen in eine ganze Nuß, und sprach mit lauter Stimme: »Paßt auf, ich will meine Kokosnuß teilen.« Bei diesen Worten drehten sich die Arbeiter um, und waren überrascht von der Tatsache, daß sie ihn gar nicht getötet hatten. Sie erkannte nun, daß er ein *alu*[2] war. Sie gaben daher den Mordplan auf, und sagten ihm, er solle das Essen zum Donner tragen. Olefat ging freudig von dannen, versah sich aber zur Vorsicht mit einem Rohrstock. Als er in das Haus des Donners trat, sagt er: »Halt, ich bin müde vom Herbeitragen der Nahrung für dein schiefes Maul!« Da wollte sich der Donner auf ihn stürzen, aber er schlüpfte in das Rohr und rettete sich so[3]. So erfüllte er seinen Auftrag, ohne daß ihm übles wiederfuhr, zum großen Erstaunen seiner Genossen. Diese sandten ihn von neuem mit einem Fischessen vom botete de espinas[4], wie die Spanier ihn nennen. Olefat ging, nur mit einer Muschel bewaffnet. Als er in die Wohnung des Fisches eingetreten war, bemächtigte sich dieser der Türe und wollte ihn am Hinausgehen verhindern; aber beim Anbruch der Nacht legte er die Muschel dem Fische auf seinen Oberkiefer und schritt über ihn hinweg. Deshalb hat dieser Fisch, nach Angabe der Karolinier, an dieser Stelle eine Vertiefung.

Endlich gab man ihm ein Essen von dem langmauligen Fisch, den man *fela*[5] nennt. Da er diesen nicht zu Hause traf, gab er das Essen denen, die er traf, und ging fort. Diese erzählten es dem *fela*, als er kam und frug, wer es gebracht habe; sie kannten ihn nicht. Da nahm er einen Haken mit einer langen Leine, und

[1] s. Palau Tlbd. 4 S. 234 u. 40. Die Aufgabe der Ameise ist bei Kub. anders, daß sie ihm Essen bringt.
[2] Kotzebue *alus*; sonst alles gleich.
[3] Bei Kotzebue ist hier eingefügt: »Der Donner konnte ihn nicht finden und ließ ab, ihn zu verfolgen«.
[4] *bote* Schlag, *espina* Stachel, wohl Synanceia, der eine Vertiefung für die Stacheln hat. Der Rochen heißt raya; fehlt bei Kotzebue.
[5] Auf Truk u. Palau *ngal*, der Hecht Belone; der mit gekürztem Oberkiefer = Hemiramphus.

warf ihn nach allen Windstrichen. Er bekam so den Olefat im Norden, und tötete ihn.

Als er nicht wieder kam, beglückwünschten sich die Bauleute. Aber als Lugeileng seinen Sohn suchte und ihn ohne Leben und voll von Würmern fand, da weckte er ihn auf und frug ihn, wer ihn getötet habe. Olefat aber sagte, er sei nicht getötet, sondern schlafe nur. Lugeileng ließ den *fela*-Fisch kommen und schlug ihn mit einem Stock auf den Oberkiefer. Daher ist der obere kürzer als der untere Kiefer. So brachten die 3 Götter Gerechtigkeit ins Leben der Menschen.

Sturmzauber (s. S. 155).

i liliti riailengil	Geh weg ungetroffen dieser Regen	*leng*[1] Regen s. Nr. 238
meisálat riailengil	entschwinde ungetroffen,	
vailēfē tēttog	nicht komme er	
voleōái ē oāil	auf mein Boot, das Boot!	*vol* auf, s. S. 202
ē táralog italōia	Geh langsam unten weg	*italō* unten.

Der Regen, der Sturm soll vorbeiziehen. Der Zauberer gebraucht dabei den Zauberstab (s. Lam. S. 152).

Oben S. 272 wurde seine Mitnahme an Bord schon erwähnt, näheres über ihn schon bei Lámotrek. Über die Rochenstacheln hörte ich auf Volea, daß Paluelap auf seiner Reise einen Speer mit Rochenstacheln bei sich führte, mit dem er die Schlechten bestrafte. Gefürchtet waren ja die Rochenstacheln als Kampfmittel.

Der Name Alúluei kommt auch hier von *alus levêi* Geist der Reise.

Man sagt	*i bale vai*	ich reise
	go bale vai	du reisest
	oā levei	das Boot reist, Reise, Hochseeboot.

Ein *gosilifei* von 52 cm Länge mit 4 Rochenstacheln (2 brachen beim Taifun 1907 ab) erhielt ich Mariong im Boothaus Falefō (Kr. 268 = 3053) Abb. 132c. Eine alte Form zeigt Abb. a Kr. 269, bei der an Stelle des Kopfes nur eine Scheibe ist, und der Leib aus zwei Stangen besteht. Ähnlich geformt ist ein altes Stück Abb. b 32174:1 im Hamburger Museum.

Zählen. Zum zählen hatte man eine Schnur mit Knoten, wie z. B. Kadu nach Kotzebue III S. 89 die Monde seines Aufenthalts in Ratak notierte. He. 1948 sammelte ein Stück (Abb. 133), mittels der der Hausbesitzer Géaf seine Palmen zählte (100 = 100).

Aberglauben s. z. B. bei Fischfang Kotzebue III S. 132 sagt: »Es dürfen nicht mehrere Menschen Früchte von derselben Bananentraube genießen. Wer eine der Bananen gegessen hat, nur der darf die andern verzehren.«

[1] *saratailengil* vom Regen getroffen, *riailengil* vom Regen ungetroffen, von *ria* fehlen.

4. Geschichten *fiong*, ehemals *mesūe* und Gesänge.

Die Ausbeute war mager, und es scheint, als ob die Überlieferung und Erzählung hier nicht sehr gepflegt würde.

Ein gewisser Ersatz ist die eine große Geschichte von Palúelap, von der bei Pollap (Bd. 6 I S. 284) schon berichtet wurde.

Da ich sie auf Lámotrek hörte und aufschrieb, deutet auch darauf hin, daß sie mehr aus Osten, aus Bon'nap, stammt.

1. Die Geschichte von den Söhnen des Palúelap, Róngerik, Róngelap, Alúluei und Fárávai.

Palúelap von Pólap[1] hatte 2 Söhne Róngedjīk und Róngelap. Der letztere kümmerte sich wenig um seinen Vater. Hingegen Rongedjik, der Jüngere, gab von seinem Essen, das er bekam, oder von Truk und den übrigen Inseln sich holte, immer seinem Vater ab, wofür dieser ihn liebte und in die Geheimnisse der Seefahrt und Navigation einweihte. Als Rongelap das hörte und sah, ward er zornig und schmipfte und schlug seinen Vater, und als sein Vater frug, warum er so gegen ihn handle, sagte er: »Warum theilst Du mir nicht Deine Kenntnisse mit?« Dann sagte der Alte: »Warum sollte ich dies wohl thun?« Dann antwortete Rongelap: »Du bist doch mein Vater!« »Allerdings«, sagte Palúelap »aber Du sorgtest nicht für mich, wie Dein jüngerer Bruder; deshalb, weil er gut gegen mich war, hat er alles erfahren«. Zu seiner Beruhigung fing er indessen an, auch ihn zu belehren, aber nur unzureichend. Als Rongelap auf die Reise ging, verfehlte er sein Ziel. Er kam zu einer großen Kokospalme mit Nüssen daran, mitten im Meere, und sandte einen Mann hinauf, sie ihm herabzuwerfen in das Boot, das unten wartete. An einer der Nüsse, die herabflogen, saß aber eine große schwarze Eidechse, die faßte den Rongelap und biß ihn entzwei, und er fiel ins Meer.

Als Rongelap nicht wiederkam, sprach Palúelap zu Rongedjik: »Dein Bruder ist nicht mehr zurückgekehrt; sieh nach ihm bei der Palme!« Rongedjik fuhr alsbald hin; er fand die Bootbesatzung des Rongelap und frug: »Wo ist Rongelap?« Sie sagten: »Er liegt im Salzwasser!« und berichteten ihm den Vorgang. Da machte Rongedjik einen Zauber, den er von seinem Vater gelernt hatte, fand so die zwei Stücke seines Bruders und setzte sie zusammen. Als er wieder lebte, frug ihn Rongedjik, was er getan habe, und Rongelap antwortete: »Ich habe geschlafen.«

Rongedjik frug weiter: »Was? Lagst du nicht im Wasser? Warum holtest du die Nüsse?« Rongelap antwortete: »Wir waren hungrig!« Rongedjik holte nun die Nüsse, und sie aßen.

Als sie fertig waren, wollte Róngelap gehen und nahm seinen Kurs auf. Da rief ihm sein Bruder zu: »Wohin willst du denn fahren? Dein Kurs führt nach

[1] Auf Lámotrek, wo die Geschichte erzählt wurde, Bon'nap gesprochen. S. Pollap Gesch. 7 Bd. 6 I S. 284.

keinem Land!« Rongelap kehrte sich nicht daran und fuhr davon. Nach langer Fahrt fand er einen Mann mit Namen Sâuperon, auf einem Riff stehend und fischend. Rongelap bat ihn um Fische, aber er wollte nichts hergeben. Da rief Rongelap wütend: »Wenn du mir keine gibst, schlage ich dich tot!« Da faßte ihn der Fischer und ertränkte ihn. Rongedjik kam nachgefahren, und frug nach seinem Bruder. Man zeigte ihm denselben im Meere treibend. Rongedjik frug die Leiche: »Was machst du?« Sie antwortete: »Ich schlafe«. »Nein« rief der erstere, »du bist tot«. Er machte wieder den Zauber, so daß Rongelap wieder auflebte.

Sie nahmen dann zusammen wieder eine Mahlzeit. Dann wollte Rongelap wieder fort. Sein Bruder warnte ihn: »Du findest kein Land, du kommst nur wieder um!« Aber er ging doch, trotz erneuter Warnung, und Rongedjik folgte ihm, ihn zu beschützen.

Rongelap fand nun unterwegs einen großen Taro, und wollte ihn pflücken. Aber die Pflanze tauchte unter wie ein Fisch. Rongedjik sah es, stürzte sich ins Wasser und holte den Taro herauf, den sie dann zusammen verspeisten.

Danach zog Rongelap wieder weiter. Er kam nun zu der kleinen Insel Piánipalúelap, wo in einem Haus zwei alte Frauen wohnten, die Schwestern seines Vaters Paluelap, für den sie gerade ein Segel flochten. Da Rongelap sein Segel eingebüßt hatte, wollte er das neue haben, aber die zwei Frauen gaben es nicht heraus, trotzdem er mit Totschlag drohte. »Lieber sterben als hergeben« riefen sie. Als er nun seinen Arm zum Todesstreich erhob, wurde dieser plötzlich steif und so fand ihn Rongedjik und frug ihn, was er denn tue. Der Übeltäter erzählte das Begebnis und rief aus: »Siehst du denn nicht, ich kann nicht schlagen!« Rongedjik erwiederte: »Ja, willst du denn die Schwestern des Vaters ermorden?« »Ja«, sagte Rongelap, »sie sind nicht gut!« Nun bat der Jüngere die beiden Alten um das Segel, und sie gaben es ihm bereitwilligst, der es dann seinem Bruder überantwortete.

Der böse Geist des Rongelap war aber immer noch nicht gebrochen. Er fuhr wieder von dannen, der Jüngere hinterdrein. Bald hatten sie kein Essen und kein Wasser mehr. Als Rongelap klagte, rief Rongedjik: »Was, kennst du nicht das Wasser des Palúelap?« Hohe Brecher waren an dem Orte, aber Rongedjik machte seinen Zauber und holte Wasser aus dem Meere, obwohl kein Land da war. Er gab davon seinem Bruder und dieser, endlich mürbe und überwältigt, gab nun nach, und kehrte mit Rongedjik nach Polap zurück, wo er reuig zu seinem Vater trat und fortan gut an ihm zu handeln bestrebt war.

Um jene Zeit war auf Truk[1] ein *kulung*-Vogel, der so viel Menschen fraß, daß fast alle Dörfer ausstarben. Auch alles an Taro, Brotfrucht, Kokosnüssen usw. fraß er auf. Von Truk ging er nach Póloat, wo ers ebenso trieb, dann nach Sog,

[1] s. Truk S. 362.

Sätowan, Námodjek, Ifaluk, Voleai, Aúrūpek, Feis, Mógemog, Sórol, Eáp, Ngólu, Bánnōè. Endlich auf der Rückkehr kam er nach Polap.

Inesávo, die Tochter des Palúelap, hatte von ihrem Vater den Auftrag bekommen, alle von auswärts kommenden Kanu zu empfangen und zum Platz zu bringen. Als der Kulung angeflogen war, sagte sie: »Komm, du kannst Essen haben!« »Was?« rief der Kulung aus; »alle die andern Plätze haben nicht vermocht, meinen Bauch zu füllen, und dieser kleine Fleck sollte mich sättigen? Du hast mich zum Narren!« Inesávo nahm einen Taro, stampfte ihn, gab ihn in eine Kokosschale und goß Preßmilch darauf, dann öffnete sie eine junge Kokosnuß und brachte beides ins Haus, wo der Kulung saß. Der lachte: »Das soll mein Essen sein?« Das Mädchen sprach: »Iß nur, es wird schon genug sein!« Der Kulung aß und trank und wurde nicht fertig; immer wuchs neues Essen aus der Schale nach. Als sein Bauch so dick war, daß er nicht mehr konnte, wollte er nach Truk zurück. Inesávo und Palúelap gaben ihm noch Essen mit, 200 Körbe, ungeheuer groß, voll Taro und 2 riesige Kokosnüsse, was sie ihm alles unter die Flügel und um den Hals banden. Selig flog der Vogel davon. Als er aber über dem offenen Meere war, machte Palúelap einen mächtigen Zauber, so daß der Wind aufhörte und der Kulung ins Meer fiel, wo er von Haifischen aufgefressen wurde.

Die Frau des Palúelap ward schwanger. Er sagte zu seinen zwei Söhnen Rongedjik und Rongelap: »Der Knabe Alúluei im Bauche meiner Frau hört alles; wenn er geboren ist, bleibt er alsbald im Haus sitzen.« So kam es. Aluluei war mit übergewöhnlichen dämonischen Kräften ausgestattet. Wenn Paluelap ein Mahl einnahm, gab er stets seinem jüngsten Sohne davon. Die beiden älteren haßten ihn wegen dieser Bevorzugung, die allenthalben hervortrat. Sie bauten nun ein großes Boot, aber gaben ihm keine Auslegerbalken. Da frug sie ihr Vater: »Warum macht ihr keine Auslegerbalken?« Die beiden antworteten: »Gib uns deine Leute, damit wir die beiden Balken schneiden.« Paluelap wies den kleinen Aluluei an, in den Busch zu gehen und die Hölzer zu schlagen. Rongelap hieß den Jungen erst auf einen *faliap*-Baum steigen, um seinen Auftrag zu verrichten. Während er aber oben arbeitete, warfen die beiden Brüder mit Steinen nach ihm, so daß er herunterfiel. Darauf »zerkratzten« und schlugen sie ihn, daß er starb. Als er tot war, banden sie die Leiche in Kokosblätter ein, beschwerten das Bündel mit Steinen und versenkten es ins Meer. Darauf gingen sie wieder an ihre Arbeit.

Palúelap kam und frug nach seinem Jüngsten; er wußte wohl, was geschehen war. Er ging in den Busch, machte einen Zauber und rief den Aluluei als Geist, für die andern unsichtbar, zurück. Zum Schutz gegen Überfälle besetzte er dann seinen Kopf mit Augen[1], so daß er nach allen Seiten sehen konnte. Sie waren wie die Sterne am Himmelszelt. Paluelap hieß ihn nun in stetem Diebstahl Kokosnüsse, Taro, Weiber, kurzum alles, dessen er habhaft werden konnte, weg-

[1] Daher der Januskopf des Sturmzaubers Abb. 132c.

nehmen, und Aluluei tat, wie ihm geheißen war. Bald kamen Rongedjik und Rongelap zu ihrem Vater und riefen: »Wer stiehlt uns alles? Wer ist das?« Paluelap sprach: »Ich weiß es nicht. Wenn ihr es aber erfahren wollt, wer es ist, so macht ein Boot fertig[1], setzt ein Haus darauf, und bringt das Fahrzeug ins Wasser; dann wird er schon kommen.« Die beiden taten also, und als Paluelap das Boot im Wasser sah, sandte er Leute in den Busch, die riefen: »Wie schön ist das Boot des Rongedjik und Rongelap.« Aluluei hörte es alsbald, ging zum Strand in sichtbarer Gestalt und sah das Boot, das in der Tat herrlich war. Er ging an Bord, besichtigte alles und kehrte darauf in den Busch zurück. Als die beiden Brüder einen Mann an Bord ihres Schiffes gesehen hatten, gingen sie zu Paluelap und erzählten die Begebenheit. Der Alte frug: »Wie viel Deckshäuser sind auf dem Boot?« Sie sagten: »Eines«. »Gut« fuhr dann ihr Vater fort, »dann müßt ihr noch ein zweites bauen«. Sie taten es und als auch das zweite fertig an Deck stand, sandte er wieder Leute in den Busch, die Schönheit des Bootes laut auszurufen. Aluluei vernahm es und dachte: »Das ist gut für mich«. Er rief 40 Ratten zusammen, ging mit ihnen auf das Schiff, während Rongedjik und Rongelap am Strande saßen und staunend sahen, wie das Boot weggepullt und dann Segel gesetzt wurde. Denn sie sahen nur den einen Mann und konnten nicht begreifen wie dieser allein solch schwere Arbeit zu verrichten vermochte. »Das muß unser getöteter Bruder Alúluei sein«, sagten sie. Dieser nun hatte, als er an Bord ging, Sand und Pandanus mitgenommen. Als er auf offener See war, ließ er den Sand fallen, bis eine Insel entstand. Dann nahm er ein Deckshaus mit an Land, um darinnen zu wohnen und pflanzte den Pandanus. Hier, auf seiner Sandinsel Piálalúluei blieb er wohnen, lange lange Zeit und wohnte noch da, als seine beiden älteren Brüder schon gestorben waren.

Inzwischen war aber seinem Vater ein vierter Sohn, **Fáravai** mit Namen, geboren worden. Er lernte auch die Seefahrtkunst, als deren Gott nun Aluluei galt, und zog eines Tages mit 5 Booten aus, um die fremden Inseln zu besuchen. Als er auf Truk sich befand, erhielt er mit seinen vier Begleitern Essensgeschenke. Während nun die viere von ihren Teilen Fisch und Kokosnüsse für Aluluei als Opfergabe beiseite legten, legte Fáravai nur die Haut der Fische und die Kokoshüllen zusammen und bedeckte sie mit Taroblättern, als seinen Tribut an den Gott. Aluluei, der Allessehende, gewahrte es und sagte: »Alle haben mir gute Sachen gegeben, nur Fáravai hat nichts für mich übrig gehabt.«

---

[1] Zum Fertigmachen gehörte auch die Takelung, die ihnen der Vater fertigzustellen auftrug. Er zeigte ihnen die Schot. Als sie nach dem Namen des Taues frugen, sagte er: *mɔdi*, weil dies nämlich »kratzen« heißt, denn sie hatten ja den Alúluei zerkratzt (s. o.). Ähnliche Racheworte waren

für	Fall	*urúr* = wegholen	Ostaß	*gamdi* = unter sich lassen bei Tod
	Stage	*ŋinagaj* =	Segel	*sú* = Hals umschnürt, beim Ertrinken
	Luvstag	*eangalap* = viel fechten	Tau	*sos* = Blut *djo*.

Da waren die beiden so erschrocken, daß sie nicht mehr zu fragen wagten.

Als die 5 Boote heimwärts nach Polap fuhren, kam ein Sturm und zerbrach das Boot des Fáravai. Während die vier andern ihre Heimat erreichten, mußte Fáravai auf den Schiffstrümmern weiterzukommen trachten. Er gelangte nach Pfalalúluei. Als Fáravai an Land kam, saß Aluluei ihm den Rücken zuwendend und sprach: »Ach kommst Du, Fáravai?« Dieser war erstaunt, daß der Fremde ihn ungesehen so ohne weiteres kannte und frug ihn: »Wie heißt Du?« Aluluei antwortete: »Kennst du mich nicht? Wie kannst du mich nicht kennen, da ich dich doch kenne!« Faravai sprach: »Ich kenne dich nicht!« und er: »Wie, du kennst mich nicht? ich bin Alúluei« Und weiter ging Frage und Antwort:

»Was machst Du?«

»Nichts. Woher kommst Du?« Faravai erzählte seine Erlebnisse.

Alulnei sagte darauf: »Gut! komm und drehe mir Tauwerk!«

»Ich bin hungrig.«

»Ich habe nichts zu essen. Sieh meinen Platz an. Aber hier sind jaTaroblätter, darunter Haut von Fischen und Kokoshüllen!«

»Das ist kein gutes Essen.«

»Was, das ist nicht gut, du hast es mir doch gegeben, nun iß es selber.«

»Aber da liegen ja doch Fische und Taro und Brotfrucht!«

»Ja, das ist von deinen vier Begleitern, die es mir gegeben haben, das gehört nicht dir.«

Faravai wurde traurig. Aluluei fuhr fort:

»Da ist eine *bellik*-Muschel mit Wasser; die kannst du austrinken.«

»O, das ist ja gar nichts.«

»Trink nur, trink nur, es wird schon reichen.«

Faravai trank und trank und sein Durst ward gestillt. Darauf klagte er von neuem über Hunger und Aluluei sagte schließlich:

»Gehe hin zum Wasser, dort sind Fische. Fange sie!«

Faravai sah einen *karangáb*-Fisch, er ging hin und fing ihn leicht mit der Hand, brachte ihn an Land und machte Feuer. Dann zerlegte er auf Geheiß von Aluluei den Fisch, um ihn alsbald zu braten. Er schnitt zuerst den Schwanz ab: da verschwand das Fleisch von den Beinen des Aluluei; er schnitt den Bauch des Fisches weg, da verschwand der Leib seines Bruders, und so gings mit den Eingeweiden, dem Kopf, Rücken, den Seiten: sobald er diese Stücke von dem Tiere trennte, verschwanden sie auch von Aluluei, und als Fáravai sich umsah sah er ein Gerippe neben sich sitzen, so daß es ihm kalt wurde vor Schrecken.

»Was hast du?« frug Aluluei.

»Ich sterbe, ich sterbe!«

»Nein, fürchte mich nicht, ich fresse dich nicht.«

»Warum tust du so übles?«

»Du hast nicht gut an mir gehandelt! Mache es in Zukunft so: Der Schwanz gehört mir, ebenso der Bauch mit dem Magen, der Rücken und die Augen des Fisches!«

»Gut, so will ichs halten.«

Als er nun nicht essen wollte, sagte Aluluei:

»Esse nur. Wenn du heimkommst, lege die Stücke stets als mir gehörig beiseite. Erst wenn du das andere gegessen hast, kannst du auch meine Sachen essen.«

»Gut, das ist schön. Ich will nun heimkehren.«

»Gut.«

»Ich habe aber kein Schiff.«

»Lause mich!«

Faravai tat es, erschrak aber, als er im Haar verborgen die Augen erblickte. Er zitterte.

»Was hast du?« frug Aluluei.

»Du hast ja Augen auf dem Kopfe!«

»Das macht nichts, das sind keine Augen, das sind Sterne!«

und er erklärte ihm alle ihre Namen, im Osten, Norden, Westen und Süden. Dann sprach er:

»Nun kannst Du gehen.«

Er zeichnete ihm ein Kanu in den Sand, macht einen Zauberspruch und plötzlich lag ein schönes Boot im Wasser. Faravai machte sich auf die Reise nach Polap, aber sein Kanu zerbrach unterwegs, weil es aus Schattensand war. Ein Hai kam auf ihn zu. Faravai rief: »Bring mich nach Polap«.

Aber der Hai wollte nicht. Da kam ein Delphin.

Er rief: »Bring mich nach Polap.«

Aber der Delphin wollte nicht. Endlich kam die Schildkröte als Retter. Sie nahm ihn auf den Rücken und brachte ihn nach Polap. Auf dem Riff draußen sagte sie: »Gut, steige ab.« Aber er bat, sie möchte ihn noch ein Stückchen weiter bringen. Als sie dem Strande nahe waren, bat sie ihn wiederum abzusteigen, aber er wollte noch ein Stückchen weiter, und selbst, als sie auf dem Strande waren, veranlaßte er sie, ihn bis in sein Haus zu tragen. Hier angekommen, rief er nach seinen Leuten und schrie: »Fangt die Schildkröte«. Da wurde sie eingefangen, totgeschlagen und gekocht.

Faravai hatte 2 Söhne, denen er alles vertraute: Vórieng, der sich mit schlechten, und Fálus, der sich mit guten Frauen verheiratete[1]. Vorieng begehrte die Frau des Fálus. Er sann auf eine List, seinen Bruder zu beseitigen, und so lud er ihn ein, mit ihm nach Truk zu fahren, um Matten, Gelbwurz, rote Muschelscheibchen und Brotfruchtkonserven zu holen. Falus fuhr mit und sie waren glücklich im Erwerb. Da, als das Boot auf der Rückkehr wieder Polap sich nahte,

[1] s. Bd. 6 I S. 278.

4: Kräner OR21 Woleai

stand Vórieng hinten am Steuer, während Fálus die Schot hielt. Vórieng rief seinem Bruder zu, er solle doch nach achtern kommen und das Steuer nehmen. Als er kam, stieß ihn Vorieng an, so daß er in die See fiel. »Rette mich, Vorieng, rette mich!« rief er, aber dieser antwortete: »Nein! Stirb nur!« und ließ ihn zurück. Vorieng kam allein nach Polap zurück und erzählte, Falus sei umgekommen. Er heiratete dann seines Bruders Frau. Falus aber schwamm und fand einen Bambus, in den er hineinkroch, und welcher dann in Polap antrieb. Seine ehemalige Frau kam gerade an den Strand und Falus rief ihr zu: »Kennst du mich nicht?« »Was?« sagte sie, »bist du nicht tot?« Falus erzählte ihr, was sich zugetragen hatte. Die beiden gingen ins Haus und Falus verbarg sich oben auf dem Boden. Vorieng, der im großen Bootshaus war, sagte zu der Frau, sie solle Taro kochen. Man sei schon auf den Fischfang gegangen.

Die Frau kochte eine Menge Taro und nahm ihn ins Wohnhaus. Falus kam vom Boden herab, stieg in eine große trukische Holzschüssel und die Frau deckte ihn mit dem Taro zu, so daß man nichts mehr von ihm sehen konnte. Dann rief sie den Vorieng, der Taro sei fertig, es könne nun gegessen werden. Als die Fische da waren, ließ Vorieng die Schüssel ins Boothaus bringen. Viele Leute kamen zu dem Fischessen. Vorieng griff in die Schüssel, um den Taro auszuteilen; da biß ihn Falus in die Hände. Vorieng sah plötzlich seinen von ihm ermordet geglaubten Bruder und bekam einen solchen Schrecken, daß er alsbald starb. Falus kam nun aus der Schüssel hervor und erzählte den Leuten die Missetat seines Bruders. Darauf teilte er das Essen aus, ohne die Anteile von Aluluei, Paluelap und Vorieng zu vergessen. Dann aßen alle Leute und freuten sich.

Gesänge *alus* (s. Tanz S. 364).

Ges. 1. Liebesgesang *baruch*.

1. *gadiúdju* von Morogólimeng ♀ † in Falálus

Erinnerungstrauergesang für den Sohn des Bruders, hier für Gafelélimar in Yap, schon vor seiner Abreise gedichtet.

1. *magipalálleis*	Er riecht gut wie Parinarium,	*eis* der Baum Truk S. 417. Erinnerungsgeruch
gudjelúngas ali ból	wie Gras wohlriechend im Tarofeld,	*ngas* wohlriechend, *guddul* Truk = Curcumaart hier *gudjel*
e ais i vóvoli	wie Parinarium, mein Geruch,	*voi, vom, vol* mein, dein, sein Geruch; *ais* = *eis*
ólfali iíri mareí	an seinen Duft gemahnt meine Halskette;	*dafatiá, iafatug, ...ti* mein, dein, sein Duft.

5. *eiēsē tangig*	*eis*-Duft strömt heraus,	*gē sē tangi* du nimm es weg!
voi imes i rēngam	sein Geruch ist wie viel Gelbwurz,	*emis* reichlich, *reng* Curcuma (mit Öl angemacht)
meiaur fit ē modj	gefällig gebunden wie fest,	*meiaur* wenn man etwas gern an einem sieht; *fili* binden, *modj* fest
gafili iēsi ngāli	gezeigt gut ihm, (ihm,	*gafali* lehren
a fari mēdju mēlai	mein Auge weilte stets auf	*fari* machen, *m.* mein Blick
10. *laulālē tagil*	schön ist sein Äußeres	*tagi*, ...*im*, ...*il*

10. *tamai aulangés*	sie ist krank, »guter Geruch«	*áingas* guter Geruch
mátamai	und, sie ist krank,	der Kranke gibt sich gern einen andern Namen,
séli matéu	sie will nicht in der Fremde sterben,	*nimetálu* auf hoher See
élamé falússéu	will schnell nach ihrem Platz	
tanúpéi égilaril	nach den vielen Plätzen um...,	gemeint Ifaluk
15. *ngaradju bái séu*	um eine Hand zu drücken.	
gapilimé gatiemém	Kapitän, meine Frau	Anrede des Ifalukmannes mit Händedruck *djubái*
gasilégangi mésó	kann nicht fort, wenn du auch stark redest,	
lofalú elileto	wir wollen nicht an einen anderen Platz.	
vélengabóng imelétud	Die Mondsichel da,	*engabong* Abendmondsichel, *melétó* dort
20. *gapilóur odjág*	mitten in der Einfahrt, doch	
ia vélevelitagi safój	läßt man herab ein	*velivelitag* das Rasseln,
gélégi leú ól	Boot vom Dampfer.	*gélégi* = *vafalú* Boot und Schiff, *ól* Feuer
valegatau rolóng	Das Boot bringt sie an Land,	
i valdiagú melétud	beinahe fertig dort	*voldug* beinahe fertig. *mel.* Z. 19
25. *idj ilgámmoi éség*	der Vertrag, zerrissen mit der Frau.	*idj* = ink Tinte, Vertrag, *samoi* zerrissen.

5. Musik.

Keine Beobachtungen.

6. Kunst (s. S. 175).

Wir fanden ein chinesisches Speckstein stück vor, das mit geometrischen Reihenornamenten verziert war.

295

V. Kulturvergleich s. Feis.

VI. Indices.

1. Fauna (s. S. 178 und Wörterverz. Nr. 110ff).

a) Säuger, Lurche.

Hund *galág*
Katzen *gato, vuth* s. Kotzebue III S. 125; S. 66 *gato*
Schwein *silo*
Ratte *gedj* (Ko.: *gīt*), Falle He. 1702 u. 59 *ūlegedj*, Paddel *faděl*, Korb *ū*, Bügel *adewidj*, Schlinge *lemállüal*, Gabel *fauwol*, Längsstäbe *kaūlod*, Querstäbe *kaūwar*, *tō* Köder Kokosnuß.
Eidechse dunkel *dagurūbái*, sauft den Palmwein (Ko. *purupur*).
Eidechse schwarz *kuel* (s. Truk)
Eidechse klein mit blauem Schwanz *gúmasal*
Geko *usel*

Don Luis de Torres führte Rinder und Schweine ein, die aber wegen Schädigung der Pflanzungen wieder ausgerottet wurden.

b) Vögel (s. S. 179).

Hahn	*malug*, Henne *moál* (Ko.: *mallich* u. *malugofeivil*)
Kuckuck	v. Kittlitz S. 155
Star	*muěli*
Grasmücke	*niterr*
	ligāpelai Gesang ui, ui, ui
Gygis	*giegi*

Nach Kotzebue III S. 66 Vogel *girigagk* (s. S. 178), Fregattvogel *gutaf*.

Lütke erwähnt den Kuckuck (Eudynamis), Sterna alba sehr gemein, auf Bäumen, Sterna stolida und tenuirostris, melanauchen, auf dem Sand nistend.

Libelle *górap* Turdus S. 233.

Nach Kotzebue III S. 99 wurde seit alters Fayo, gemeint West-Faju, besucht, um Schildkröten zu fangen. Da dieses aber 180 Seemeilen ostwärts, 40 Sm N zu O von Lamotrek liegt, dürfte es zu weit abliegen. West-Faju ist ein Atoll mit einer kleinen unbewohnten Insel.

c) Fische (s. v. Kittlitz S. 161).

Lütke S. 307 werden erwähnt: Labride Axodon Cuv. mit großen Vorderzähnen, ähnlich Julis, von denen der schöne J. Gaymardi Quoy vorkommt. Weiter Chaetodon rostratus, Balistes, Holacantus dux und trimaculatus, Acanthurus usw.

Wie in Truk S. 435 erwähnt, hat der Maschinist Kühne mit Farbstiften Fische gezeichnet, besonders auch während der Liegezeit im Binnenwasser von Oleai. Sie sind so gut ausgeführt, daß das Genus ohne weiteres erkannt werden konnte (s. auch Lamotrek).

balug in der See vom Boot aus mit Haken *matálipá* gefangen
bulegálei s. S. 258
boggo Hai (Ko.: *paghu)* anacau (Lütke) Hecht mit langer Schnauze. Feis.
dat s. Lam.
djagulat (Kü. 6 *zaridat)* s. Lam. Upeneus rötlich, mit gelbgrünen Flossen, 2 Bartfäden, ca. 20 cm lang
djep Caranx s. Lam.
djóngong (Kü. 7 *Zongong)* s. Lam. *sogolalo* Upeneus, 23 cm lang.
ĕiam nach He. ein Raubfisch, Lam. Seebarbe.
fadjilimat, klein *nimeliff* Kü. 8, s. Lam. *ealugulúng* Scarus Art; Truk *feisidju* (dort nicht erwähnt).
fai Rochen
felang s. S. 283
fofo Makrele grau, gut!
galegi s. S. 264 Z. 7 = *gu*.
gali, gralli s. Lam. *gali*, Länge 16 cm Epinephelus (Serranus albofuscus).
gu Delphin (Ko.: *gui)*
karangáp Bonito
mangar Flederfisch (Ko.: *mongar)*.
máravat Kü. 19. Acanthurus olivaceus; dunkel, hinter dem Auge blaues Hufeisen, mit orange gefüllt; s. Bd. 61 S. 162.
matior s. Lam. *madjior* Epinephelus urodelus.
modj(ou) Acanthurus mit Dornen s. Palau 9
moschzun (modjou) Kü. 5, s. Lam. *nagei* Acanthurus
natuigal s. Lam. *gasingal* Acanthurus

návut, sauefang, schwarz *vör*, rot gestreift *i láues*, Muränen, nicht gegessen.
nimeliff s. *fadjil*...
pudogalli Kü. 20 Naseus, dunkel, Schnauze, R. u. Schwanz mit gelbem Band, am Schwanzhals 2 rote Flecke. 2. B. rot.
pulochállei (Kü. 4) Lam. *pulogálei* Naseus, schwärzlich, gelbe Br. u. B.-Flosse, am Schwanzhals zwei orange Flecke.
pup (Kü. 12 *puw*) Balistes, massiver Stachel an R. u. B. (Palau *ilamrokl*).
rai = Lam. *vail*
rosoat s. Lam. *malebos*
soetam s. *etam*
mod in Lam. *mot* Acanthurus.
sauefang weiße Muräne, *návut* gescheckt
tag Belone
tát Lutianus-Art (Palau *thothes*)
til kleiner Fisch (Lam.) in großen Mengen gefangen wohl gleich *sennif* Truk s. S. 60
vadjola, Lam. *livadjola*, Zanclus
volá s. Lam. *oolá* Kü. 15. Variola louti? (Serranus) (Palau *bagungór*)
vong Testudo (Ko.: *woal*)
vül nach He. Sammelnamen für *garauap, dagü* und *faſa*
skibijak Born (= *jaringáb*) lachsähnlich.

d) Schalen.

Triton	*daui* (Ko.: *taui*)
Cardium	*bellik*
Tridacna	*sum, gi*
Perlschale	*sër*, schwarz *djär*
Dolium	*ubuil*
Pteroceras	*lëang*
He. Muscheln	*girrigir* (Haken), *bajok, ssare (sër), tigere* (Korb) s. S. 69 *maidjal, wai*
für Haken	*faibar, sáruthol*
Lepas	*gilegil* (s. S. 267)

Kotzebue III S. 66 Seeigel *mugol*;
nach Lütke schlafen die Einsiedlerkrebse auf den Tournefortia-Bäumen (Bd. 6 I S. 253).

2. Flora (s. Wörter Nr. 179ff.).

Die von Don Luis de Torres eingeführte Ananas gedieh anfangs, ging aber später aus wegen vieler Versetzung.

Nutzpflanzen s. S. 230, Hölzer S. 238.

Gefunden wurde eine Seegrasart Halodule (Diplanthera), Fam. Potamogetonacee. ferner:

Asplenium nidus	*i luluk*
sonstige Farne	*gámarak, sisi*
Calophyllum	*ragits, sĕfang*
Cordia subcordata	*kalu (galliu* He.)
Cassytha	*tig, tigieleu*, roh gegessen, auch als Bündel zum Auslutschen
Eugenia malaccensis	*fáliaṗ*
Ficus tinct.	*gáoan, oán*
Fragraea	*ut*
Gramineen (Gras)	*búgor*
Hibiscus	*marevál*, He. *gulivā*, Ko.: *giliveu*
Ixora	*gadjíau*, Ges. 1 Z. 17 S. 292.
Melochia indica	*gorúĕl (gerúal* Feis)
Morinda	*nĕn*
Pandanus	*fadj*, breite Art *bógu* (Ko.: *faht)*
Parinarium	*eis* (1. Gesang S. 291)
Pipturus	*aromĕ* (Ko.: *aromä)*
Rotkraut	*gavalaval*
Scaevola	*nat* S. 267
Stachysähnlich	*gogo*
Trionfettia	*gárak*, Ko.: *karach, kărach*
Wedelia	*văn*
Vignaähnlich	*valimag*
Curcuma	*reng* soll auf Oleai nach Kadu vorkommen, nur nicht so reichlich als auf Yap.

Kotzebue nennt sie *eong*; er gibt noch an:

Bambus	*wowau.*

299

Feis.

Position: Ostkante 9° 46′ N. Br., 140° 35′ O.-L. Japankarte (SO-Spitze): B. 9° 45′ 26″, L. 140° 31′ 07″.

I. Entdeckung und Erschließung.

1. Segelhandbuch.

S. 40: Feis. (Tromelin, Astrolabe), etwa 100 Sm nördlich von den Sorol-Inseln, ist kein Atoll, besitzt nur im Süden ein schmales Riff und erhebt sich zu einer Hochfläche von 18—20 m Meereshöhe[1]. An den nicht vom Riff begleiteten Seiten fällt die Insel steil ab, die Küste zeigt festes, tropfsteinartiges Gestein, das an manchen Stellen durch die Brandung tief ausgehöhlt ist. Landung ist zuweilen schwierig. Feis ist reich an Phosphat. Die Nordosthälfte der Insel ist seit 1911 an die Westkarolinengesellschaft verpachtet. Die Eingeborenen wohnen auf der Südwesthälfte.

Handelsstation im SW.

Eingeborene: Zahl betrug 1904 etwa 300.

Wind und Wetter: Feis hat mäßig feuchtes tropisches Seeklima mit 27,1°[2] im Jahresmittel; Bewölkung 5, mittlere Windstärke 2. Der Nordostpassat setzt Ende November oder Anfang Dezember bei Feis und den benachbarten Inseln ein, er weht am stärksten im Dezember bis Februar, dann abflauend, um im April, manchmal im Mai, aufzuhören. Der Wind dreht dann östlich und längere Windstillen treten ein. Von Ende Juli bis Ende September herrscht der Südwestmonsun, der indessen nicht dauernd weht, sondern meist nur in Böen auftritt. Dann folgen wieder Windstillen, die ebenso wie im Frühjahr die Hauptniederschläge bringen. Die Temperatur ist ziemlich gleichmäßig das ganze Jahr hindurch. Das Thermometer steigt während der Mittagstunden auf 30 bis 34° C und fällt nachts auf 25 bis 22°. Der Barometerdruck bewegt sich sehr gleichmäßig zwischen 750 u. 760 mm. Nur zeitweise treten geringere Drücke auf und sind dann als Vorboten schwerer Stürme zu betrachten.

Taifun hat am 30. März 1907 die Insel heimgesucht und gewaltige Verwüstungen angerichtet.

---

[1] Nach eigener Erhebung etwa 10 m hoch durchschnittlich (s. u. S. 310).
[2] Natürlich Celsius Kr.

Regen. Auf die Monate April, Juni und August kamen von 2812 mm Regen 1434, also über 50%; am wenigsten Regen, 92 mm, empfing der Dezember, am meisten, 408 mm der Januar. Die Jahreshälfte vom April bis September war mit 1677 mm Niederschlag weit regenreicher als die entgegengesetzte mit 1135.

Ankerplätze. S.M.S. Kormoran ankerte 1910 auf 35 m Wassertiefe am Südwestende von Feis; der Ankerplatz bietet aber auch bei Nordostpassat wenig Schutz. An der Südseite von Feis hat der Dampfer Natuna sowie derRegierungs-

Karte 11

schoner Ponape mehrfach geankert. An der Nordostspitze von Feis ankerte 1911 der Regierungsdampfer »Delphin« auf 15 m Wasser.

Bootsdurchfahrt ist in der Nähe des Ankerplatzes südlich von Feis durch das Riff gesprengt worden. Dort ist eine Landungsstelle.

Dazu Karte 93 (Tit. XI Nr. 403) mit Sonderplan. Ostkante Br. 9° 46′ N, L. 140° 35′ O.

P. J. P.: Die Fais-Insel liegt ungefähr 48 Meilen östlich von der Pig-Insel (Br. 9° 47′ N, L. 139° 41′ O), der südlichsten von den Ulithi-Inseln, ist von Riffen

OR21 Woleai

eingerahmt, außer an den nordöstlichen und südwestlichen Enden, die steil sind. Die Mitte der Insel ist bepflanzt und ist 60—65 Fuß (18,3—19,8 m) hoch; der Rest ist mit Kokospalmen bedeckt.

Es ist kein sicherer Ankerplatz bei der Insel und kein guter Landungsplatz ist vorhanden, aber bei Hochwasser kann man gegenüber der Handelstation landen, am südlichen Ende der Insel, gegenüber einem hervortretenden Haus. An der südwestlichen Seite ist am wenigsten Brandung und der Strand ist sandig.

1930 waren 368 Bewohner vorhanden.

Hauptprodukte Kopra und Pilze[1]. Es ist berichtet, daß kleine Lager von Phosphaten auf der Insel seien. Wenige Hühner sind erhältlich.

Karte 772. Plan 1:25000 nach japanischen Aufnahmen von 1925.

[1] Wohl Batate gemeint.

2. Entdeckungsgeschichte.

Meinicke's Angabe, daß Feis im Jahre 1527 entdeckt worden sei, ist unrichtig. Palau I S. 174 ist schon angeführt, daß es Villalobos 1542 war, der Feis zuerst sah. So auch Miguel, der als Entdeckungstag den 23. Januar 1543 angibt.

Was Miguel dann über die Begrüßung »Buenos dias, matalotes« angeschlossen hat, habe ich schon in Palau I S. 7 behandelt.

Dann wurde Feis von dem Fregattenkapitän Legoarant de Tromelin »entdeckt«, weshalb die Insel seinen Namen erhielt, wie im Nautical Magazine 1852 S. 283 zu lesen ist. Im 18. Bd. der Bibliothèque des Voyages S. 389 steht aber: Je traversai les Carolines sans en voir aucune, quoique ma route passe exactement sur la position assignée à diverses îles. Von Guam westwärts fahrend passierte er die Karolinen ein zweites Mal: je ne vis qu'une seule île qui n'est sur aucune de mes cartes (August 1828).

Auf der Karte von Cantova hätte er Feis finden können, freilich ohne Position, aber durch die Höhe erkennbar.

Chamisso erwähnt (Kotzebue III S. 101): Feis, »von der Nassauischen Flotte 1625 gesehen?« Ein Beweis läßt sich nicht dafür erbringen.

Als erstes Schiff in den 1800ern ist der Modesto aus Manila[1], von dem Chamisso berichtet (Kotzebue III S. 95): »Wir hatten Kadu ein Lied von Feis singen gehört, welches sich auf ein Schiff bezog, womit die Insulaner in Ansicht ihrer Insel, ohne daß es sich aufgehalten habe, gehandelt hatten. Er besang die Namen Jose Maria und Salvador. Wir erfuhren auf Guajan, daß im Jahre 1808 oder 1809 der Modesto aus Manila, Kapt. Jose Maria Fernandez, welches Trepang einzusammeln die Pelew-Inseln aufsuchte, dieselben verfehlte und in Ansicht von Feis kam. Als darauf der Modesto die Pelew-Inseln erreichte, fand sich dort einer der Eingeborenen von Feis, mit denen man zur See verkehrt hatte; dieser war, den Handel fortzusetzen, dem Schiffe vorausgeeilt. — Der Gouverneur der Marianen, D. Jose de Medinilla y Pinedo, befand sich an Bord des Modesto.«

Lütke hat Faïs am 20. 12. 1828 kartographisch aufgenommen, nachdem er diese Insel im April vergeblich gesucht hatte[2], was v. Kittlitz S. 163 vermerkt; S. 417 seines Buches berichtet er über den späteren Besuch:

»Erst am 20. Dezember brachten wir den größten Teil des Tages bei der Insel Faïs zu, deren Lage der Kapitain nach den letzten Andeutungen der Bewohner

[1] Erwähnt Palau I S. 132, s. auch oben S. 6, capitaine.
[2] Deshalb fehlte Feis auf der Carte Générale in der Partie Historique.

von Uleai so genau getroffen, daß es gar keines wirklichen Aufsuchens bedurft hatte. — Die Gestalt dieser kleinen Insel ist merkwürdig: — der Korallenfelsen, aus dem sie besteht, erhebt sich auf beinahe 100 Fuß mit senkrechten Wänden über den Wasserspiegel; er ist oben wie gewöhnlich flach, vertieft sich aber nach innen, und zeigt so sehr deutlich die ehemals mit Wasser gefüllte, jetzt emporgehobene Lagune; der hufeisenförmige Rand derselben ist der höchste Teil des Ganzen. Ein außerhalb der Wände wenigstens teilweise umherlaufender schmaler Strand gehört sichtbar zu dem späteren Anbau der Korallen, der noch jetzt als Untiefe die Insel umgibt. — Die Brandung auf dieser Untiefe konnten wir mit unserem Boote nicht durchschiffen, wir wurden deshalb durch Piroguen der Eingeborenen aufgenommen und ans Land gebracht. Bei der Kleinheit der Insel, deren Umfang nach Kapitän Lütke's Schätzung nur 4 Werste, mithin wenig mehr als eine halbe deutsche Meile[1] beträgt, ist die Bevölkerung ungewöhnlich stark[2] wie man auch schon aus den nahe beieinander liegenden Häusern sieht. Diese werden durchweg von zahlreichen Kokospalmen beschattet, an denen es auch auf den emporgehobenen Rändern der ehemaligen Untiefe nicht fehlt; außerdem bauen die Einwohner sehr sorgfältig Taropflanzen und Bananen, doch besitzen sie nur wenig Brotfruchtbäume. Die Menschen und ihre Wohnungen glichen der Hauptsache nach denen von Uleai, doch bemerkten wir, wie früher schon erwähnt, hier nichts von der Absonderung der Frauen. — In der Kleidung des weiblichen Geschlechts fiel uns hier ein Unterschied auf, der allem Anschein nach zwischen verheirateten und ledigen Personen stattfand; erstere trugen die engen gewebten Röcke, welche wir schon auf Lugunor und Uleai gesehen hatten, die jüngeren aber ein ähnliches, aus einer Art langer Frenzen zusammengesetztes Kleidungsstück, welches an die Tracht der Männer von Funopet[3] erinnerte. Dagegen vermißten wir die frischen Laubgeflechte der Mädchen von Uleai.

Die Menge der gefangenen Fische, welche wir hier sahen, war nicht besonders groß; wir kannten die meisten Arten schon von Uleai her; unter den für uns neuen war eine schöne Spezies von Amphiprion, schwarz mit orangegelb und hellblau gezeichnet, sehr ähnlich dem Rüpell'schen Amphiprion bicinctus vom Roten Meere.

Wir fanden hier ziemlich viel Strandvögel, aber nur von den uns schon bekannten Arten. Numenius tenuirostris kam zahlreich in vereinzelten Exemplaren vor; ich schoß eines derselben, sowie zwei von Tringa minuta, die sich in kleinen Gesellschaften am Ufer zeigte. Sonst erhielt ich noch die schwarze Lamprothornis[4] von Lugunor und Uleai; sie war häufig auf den Kokospalmen[5]. — —

[1] Nach meiner Karte ist der Umfang eine ganze deutsche Meile = 7500 m.
[2] Nach Angaben bei Freycinet S. 101 um 1800 ca. 500 Bewohner.
[3] Ponape. [4] Truk S. 429 Nr. 7 und Ku Bd. 6 I S. 132.
[5] Voyage autour du monde S. 39.

Erwähnenswert ist noch, daß Mertens im Bd. III S. 143 des Werkes von all den Inseln gerade Feys besonders genannt hat — ohne Riff und Lagune, mehr als zwölf Klafter hoch; wenig Brotfrucht, viel Bananen usw. —; S. 140, in den Observations sur les habitans des îles Carlines, wird Ouléai und Feiss besonders genannt, ebenso S. 151 in Des Moeurs et usages des..., wo Floyd's Angaben verwertet sind (s. Bd. 6 I S. 7 u. 164).

Viele Schiffe haben vorher und nachher Feis gesehen, wie die Antreibungen S. 275, 370 zeigen, aber man weiß nichts mehr davon.

Im Jahr 1829 kam Dumont d'Urville (Palau I S. 364) auf seiner 2. Astrolabe-Reise 1826—29 vor Feis, das er nach seinem Schiffe benannte (S. 299).

Am 4. April 1904 kam der Beamte Senfft auf seiner Inspektionsreise (D. Kolonialblatt 1905 S. 192) nach Feis, ohne neues zu beobachten; 10 m Höhe des Landes. Er berichtete nur, daß angeblich eine Ansiedlung blonder blauäugiger Menschen hier vorhanden sei. Dann wieder 1905 am 8.—12. Dezember, wobei die Zahl der Bewohner auf 300 festgesetzt wurde, 129 ♂ und 108 ♀, Kinder 39 + 24; das Fehlen der Blauäugigen wurde festgestellt. (D. Kolonialblatt 1906 S. 383).

Vom 21. Sept. 1909 bis 3. Okt. 12.20 Uhr Mittags war die Phosphat-Expedition von der »Natuna« unter Leitung des Südseeforschers Friederici auf der Insel, vornehmlich die Herren Pilz, Schön und Prager, die durch 92 Schürflöcher mehr als 300000 Tonnen 80% phosphorsauren Kalk auf der Insel vorhanden nachwiesen. Als der »Peiho« 1 Uhr nachmittags (s. Bd. 1 S. 227) die Insel in Sicht bekam, sahen wir noch die Rauchwolken der abziehenden Natuna. Die Rauchwolke des »Peiho« grüßte uns am folgenden 17. Oktober in der Morgenfrühe, mich und E. Kr., die wir zwei am 3. Oktober vom Peiho abgesetzt worden waren, wie Bd. I S. 227 und 238—240 nachweist.

Die letzte Zeit war sehr stürmisch gewesen; dabei zeigten sich einige Eingeborene recht wiederwillig und feindlich, was angesichts der zwei längeren eindringlichen Besuche von Weißen unmittelbar hintereinander nicht verwunderlich ist. Da sagte ich ihnen am 17., ich hätte jetzt genug von ihnen, ich ließe mir am folgenden Morgen das Schiff kommen. Im Bewußtsein der Pünktlichkeit und Tüchtigkeit unseres Kapitän Vahsel konnte ich mich ja auf den Termin verlassen. Die Eingeborenen lächelten nur ungläubig. Aber als sie am 18. früh eine Rauchwolke südwärts am Horizont bemerkte, kamen sie zu mir gelaufen und drückten ihr Erstaunen aus über meine Macht. Sie hielten mich wohl für einen großen Zauberer. Ich nützte dies, um noch im letzten Augenblick etwas über den Gott Róngola aus ihnen herauszubekommen. Was es war, ist bei der Religion vermerkt. Um 9½ Uhr kam das Boot mit dem I. Offizier und kenterte in der hohen Brandung. Mühsam wurde unser Gepäck auf das Schiff befördert. Mit dem 3. Boot fuhren wir zwei; eine 2 m hohe Sturzsee deckte uns von vorne zu. Das Boot schlug aber nicht ganz voll, so daß wir zwar naß, aber wohlbehalten an Bord gelangten.

305

3. Anthropologie und Demographie.

Bei Oleai S. 201 wurde über 12 Eingeborene berichtet. Hier liegen von Hambruch nur 6 Messungen vor, und zwar von 6 Männern, die 158—166 cm groß sind. Ihr Schädel ist mesokephal, zwischen 76,9 und 80,2 stehend. Sonst gilt dasselbe für hier, wie es auf Oleai war. Über die Gesichter gilt im allgemeinen das, was bei Lamotrek gesagt wurde, ebenso über die Haare. Die Form ist oft lang und schmal wie z. B. beim Zauberer Moloáedjeg Haus 10 die indonesische Art Abb. 136. Da Hambruch auf Mogemog zahlreiche Messungen gemacht hat, muß bei der nahen Verwandtschaft auch auf dorthin verwiesen werden.

Abb. 136. Zauberer Moloáedjeg Ha. 10.

Albino *djolegáelang*.

Bevölkerung gutartig. Zahl hat gegen früher abgenommen (S. 303[2] und 304).

4. Name.

Der Name Paiz erscheint schon im Brief des Pater Clain 1697 und auf Serrano's Karte (Palau I S. 178). Auf Cantova's Karte 1721 steht Feis und auf der von Torres Fais (Kotzebue II S. 85), so Krusenstern auch Fais, und so wechselt fürderhin Fais und Feis stetig. Am Orte selbst sagt man meist Fais. Das Wort kommt von *fai* »Stein«[1], der felsigen Insel-Gestalt halber. Es wäre also Fais richtiger; aber das Wort wird auswärts meist mehr wie Feis (deutsch Eis) gesprochen und ist so mehr im Gebrauch, weshalb es auch hier als Name angesetzt wurde.

Auf Yap wird Feis auch Vöeêi genannt, also mit *vo* beginnend wie bei Woleai usw. (s. S. 202).

5. Sprache (s. Verzeichnis am Schluß).

Die zentralkarolinische Sprache gilt auch hier.

Possessivsufixe wie üblich, z. B. Boot 1. *oái*, 2. *oám*, 3. *oál*, 4. *oádj*, 5. ?, 6. *oár*; Gatte 1. *rī*, 2. *rim*, 3. *ril*; Mann, Frau *mal*, *fēfel eirei*, *eirom*, *eirel*; Hüfttuch *gabállei*, *gabállom*, *gabal*; Feld *mátei*, *mátom*, *mátāl*, mein Halsband *marei*; meine Tatauierung *makei*. Wem gehört das Feld? *matāl ítei*; das Boot *oál ítēi*? Daneben tritt hier das vorgesetzte Possessiv stärker auf, wovon schon bei Palau II S. 334 die Rede war; mein, dein, sein heißt *leái*, *leám*, *leál*; mein Tau, meine Matte *eai dall*, *eai giegi*; Kokos *eai lu*; mein Hund da *lai béselē*, *lom*, *lol*; Schwein *lei bábui*; Kind *lei aluidj*, *lom*, *lol*.

[1] Ich bilde deshalb (s. Palau II S. 315 *bad*) das Wort Feisu(a)ner für die Eingeborenen.

E. Kr. hat einige Worte notiert, von denen einige in die Wortsammlung aufgenommen sind. Das übrige hier:

Wie heißt das?	*methá melle* (Sachen)	steh auf	*süthach, olloch*
Wie heißest du?	*iffaithóm*	es ist gut	*sailē*

II. Landesbeschreibung und Siedlung.

s. Karte 12. Eigene Aufnahme.

Drei mangelhafte Booteinlässe sind im O an der Luvkante vorhanden: Thaualap. Thauas und Thaualegedj.

Chamisso berichtet nach Kadu (Kotzebue III S. 101): »Feis, obgleich von derselben Bildung als die übrigen niederen Inseln, ist erhöhter und bei weitem fruchtbarer als alle. Drei Inseln oder Gebiete heißen: Litötö, Soso und Vaneo. Der Chef von Litötö ist unabhängiger Fürst von Feis.« Die drei Inseln oder Gebiete sind die 3 Dörfer oder Dorfteile von Feis, nämlich Ledjodjoi, Ilotóu und Falióu, die weiter unten näher beschrieben werden. Sie liegen an der östlichen Südseite.

Karte 12 Feis. A. Kr.

Die Insel, die ungefähr 2½ km lang, von WSW nach ONO[1], ist und ca. 1300 m breit, Umfang etwa 7½ km, hat an beiden Enden eine Steilküste von 10—12 m Höhe. Sowohl an der Nordküste, wie auch im Süden (s. Japankarte 11) ist ein Strandriff. Der Sandstrand beiderseits ist durch ein Felsenklotz in zwei Teile geteilt: An der Nordküste westlich Bĕdjidj und östlich Rĕfel, getrennt durch den Felsen Idjimál; an der Südküste westlich Matár und östlich Rar, getrennt durch den Felsen Tatholóedjidj.

Der südöstliche Luvstrand gleicht der Schilderung in meiner Korallenarbeit (s. Truk S. 42 Anm. 1) S. 12—17, dort auf Taf. II oben ist das Bild vom Südende des mit Steinen stark durchmischten Sandstrandes gebracht, seines Schuttwalles, der steil ansteigt; das Wasser reicht bis an seinen Fuß. Wie breit dieser Strand bei Niedrigwasser ist, macht Abb. 135 klar; Phot. 225 zeigt ihn am Südkap Fatathol. Auf Abb. 135 erscheinen schon die beiden Boothäuser. Blickt man von

[1] Der Strand Matár verläuft ganz im Süden ziemlich west-östlich, biegt dann mehr nach Norden um und hat beim 1. Gehöft wieder einen Knick, so daß er weiterhin N 50° O verläuft (s. Karte 13).

ihnen südwärts, so fallen die Steine im Sande auf; dieses sind Strandsandsteine, die ich in der Korallenarbeit S. 48 beschrieben habe.

Den Leestrand Bēdjidj sieht man auf weiteren Lichtbildern; er zeigt die erwähnten Eigenheiten, sanftes Ansteigen und feiner Sand mit wenig Steinen; sogar kleine Pflanzen gedeihen auf ihm (vgl. Pollap Bd. 61 Taf. 21c). Nordwärts eine Höhle im Fels Idjímál.

Über dem Strande Matár liegen, über den 2 Bootshäusern (Abb. 135), die 3 Dörfer. Denn von diesem Sandstrand, der selbst 2—3 m ansteigt, steigt landwärts steil

Abb. 135 Südoststrand.

auf eine 3—4 m hohe Schotterterrasse, über einen Schuttwall, an, hinter dem die 3 Dörfer eng beisammen liegen. Dies ist ja bei allen Koralleninseln so, die an der Luvseite, — was ja bei Feis der Fall ist — einen 2—3 m hohen Schuttwall haben, hinter dem die Siedlung liegt. Da diese sonst fast immer in Lee liegt, an der Binnenwasserseite der Atolle, so bekommt man diesen Wall meist nicht zu sehen, wenn man nicht gerade nach der Luvseite einen Spaziergang macht, was ja auf Djalut die Gepflogenheit war[1], weil dort ein Weg angelegt ist.

[1] s. A. Kr. Hawaii, Ostw. u. S. S. 237

Am 1. Nachmittag unseres Aufenthaltes, am 4. X. 1909, besuchten wir das Wasserloch am Strande Bēdjidj, das auch Bēdjidj genannt wird; es ist 8 Minuten nördlich vom Dorf Ilotou entfernt und liegt etwa 10 m hoch; wir stiegen nämlich direkt hinter dem Dorf ca. 3 m steil an, und gelangten so auf die Hochfläche, die eben ist und also ziemlich genau 10 m hoch.

Es wurde behauptet (s. S. 303), daß sie tiefer liege als der Rand und somit die ehemalige Lagune eines Atolls sei. Die Ränder sind allerdings an einigen Stellen etwa 2 m höher, doch bestehen sie dann aus anstehendem Kalkfels, so daß es sich hier doch nur um Erosionserscheinungen handeln dürfte[1].

Die Höhe wird in einigen Quellen zu hoch angegeben, zu 18—20 m; ich habe aber so genaue Aufnahmen gemacht, daß ich für meine Angaben eintreten kann. Übrigens hat schon Miguel nach spanischen Messungen auch 12 m angegeben, so daß die nautischen Aufzeichnungen nur Schätzungen vom Schiff aus sein können.

Die Hochebene ist mit Süßkartoffeln reich bepflanzt; Kokospalmen stehen nur einzeln oder in kleinen Gruppen herum. Taro (groß *filla*, klein *eōth*) kommt nur spärlich fort. Ratten waren zahlreich. Das erwähnte Wasserloch liegt in einem 10 m tiefen, stufigen Trichter; es hat ca. 3 m im Durchmesser und ist nur 1 m tief. Zeitweilig wird es ausgeschöpft und gereinigt, nachdem man durch ein Loch unter dem Wasserspiegel für Abfluß gesorgt hat; dieses wird nach der Reinigung mit Steinen wieder verstopft. Trotzdem ist das Wasser bald wieder trüb und grün, wie auf allen Koralleninseln.

Im Norden, im Dorf Falióu, ist übrigens auch ein Wasserloch, Djēlefalióu genannt, in ähnlicher Form.

Vom Wasserloch Bēdjidj oben sieht man schön den hell glänzenden ca. 400 m langen Sandstrand, zwischen dem Felsenkap Ikesóu (W) und Idjimál (O) gelegen; letzterer Fels unterbricht den Gesamtsandstrand völlig, wie auch die Japankarte zeigt. Vom Wasserloch stiegen wir am 6. Oktober in NNW-Richtung zum Strand hinab und wanderten bequem auf dem schönen Strand (Phot. 210c) östlich zum Fels Idjimal, den wir erstiegen, um wieder auf die Hochfläche zu gelangen. Oben stand ein Vorrat- und ein Kochhaus, und dabei waren Anpflanzungen von Taro, Papayabäumen und Terminalien.

Der Felsblock war etwa 200 Schritt breit. Alsbald stiegen wir durch Barringtoniengebüsch wieder zum Sandstrand, zum östlichen Rēfél, hinab. Etwa 1000 m lang dehnt er sich ostwärts aus; seewärts sah man eine schöne Brandung sich auf ihm brechen, da die Seen des NO-Passates ihn treffen; südwärts war er durch ein dichtes Gebüsch von Scaevola, Tournefortia usw. vom Abfall getrennt.

Dieser Strand bildet einen sanften Bogen bis zum Kap Biedjíkedjik hin, mit

[1] Anders auf Nauru A. Kr. Globus 1898 Bd. 74 S. 156.

dem die östliche Steilküste beginnt, deren niedrigeres Nordkap Tétélegéngálu oder Tateleténgau vom Sandstrand aus gerade noch gesehen werden kann.

Wie weit sich die östliche Steilküste ausdehnt, zeigt meine Karte: zwischen dem Cap Biedjíkedjik und dem Nordkap Tétéleténgau liegt die Strecke Ngatalúel; der richtige Ostteil heißt Luguthóol, und der südöstliche an 12 m hohe Teil Djimeleferegóa. Der Weg am Rande der Felsen ist sehr beschwerlich, aber wo man hinabblicken kann, gewahrt man Wunder über Wunder. Wie die Seen hier die zernagten Felsen umwühlen und mit donnerähnlichem Getose der Gischt heraufspritzt, läßt sich mit der Feder nicht schildern. Deshalb wächst auch oben in der Nähe der Kante nichts; erst weiter inlands sind Anpflanzungen von Bataten, Taro und Yams, die auf dem ebenen Phosphatboden trefflich gedeihen. Der Schönheit der Wetterseite gibt übrigens die Westseite nichts nach, die als schroffe Steilküste Raethí oder Vulubagér zwischen dem schon erwähnten Cap Jekesóu und dem SW-Cap Fatathol liegt. Reichen schon die Passatseen hierher um die Ecke herum, so ist das Seebild bei Südwestwind von unbeschreiblicher Schönheit. Gerade während der letzten Tage unseres Aufenthalts, am 13.—16. Oktober, setzten SW-Stürme ein, die unsere Behausung schwer mitnahmen. Dafür schufen sie uns Brandungsbilder von unglaublicher Wucht, die wir oft zu genießen vermochten, da unsere Wohnung nur wenige Minuten von der Steilküste entfernt und diese leichter zugänglich war, als die ferne östliche. Die 10 m hohen Felsen fallen hier senkrecht ab und waren meist hohlkehlenartig unterwaschen, zweifellos die Bildung einer langen ruhigen Zeit, wenn stetige NO-Winde wehen. Kommen aber Weststürme, so suchen die Seen den Überhang zu zertrümmern, wie das Bild auf Taf. 6 S. 214 des Bandes Palau I zeigt, das ich für die dortige Hohlkehlenbildung herangezogen habe; dort S. 212 habe ich einen Durchschnitt durch eine Hohlkehle gegeben, deren Fuß auf dem Bild Taf. 6[1] nur viel weniger abfallend, ja geradezu eben ist, wie ein schöner Spazierweg; die Felsennase am Ende des Weges zeigt noch den Überhang, der über dem Weg, der roten Brandungsgalerie, schon zerstört ist. Das Bild b auf Taf. 21 hier zeigt die gleiche Stelle, nur daß der Weg nun durch eine Brandungssee überschwemmt ist. Auf Taf. 21 a sieht man schön die heranrollenden langen, 3—4 m hohen Westseen, und die noch nicht zertrümmerte Hohlkehlenspitze.

Der anstehende Riffkalk ist stark zerklüftet und durchhöhlt; dafür hat man die Beweise oben, wo an mehreren Stellen 10—20 m von der Kante entfernt aus Spalten Wasserdampf und Luft ausgepreßt wird, sobald eine mächtige See gegen die Felsen andonnert[1]. Im südlichen Teil, östlich vom Cap Fatathol, ist inlands sogar ein großes Loch, der Einbruch der Höhle Ngatátapamag, die 8 m breit und lang ist und 2 m hoch am Steilabfall ausmündet; hier ist die ganze Hochfläche bis

[1] Sprutzloch ogál, Steilküste odáthol.

zum Rande bewachsen. Nördlich davon aber ist die 10 m hohe Fläche inlands von der Kante, etwa 50—100 Schritte weit, fast allen Pflanzenwuchses bar; höchstens sieht man etwas Gras und Unkraut; erst dann beginnen Pandanus- und Scaevola Büsche, und erst in etwa 100 m Entfernung vom Rande beginnen die Batatenfelder und Taropflanzungen, und es erscheinen einzelne Kokospalmen.

Zu erwähnen ist noch der etwa 600 m lange Sandstrand Rar zwischen dem mächtigen SO-Cap Djimeleferegóa und dem Felsblock Tatholoëdjidj. Landwärts stehen hier viele *ngog*-Bäume mit großen weißen Blüten, die auf Yap vorkommen sollen, ferner eine Myrtacee. Am westlichen Teil des Strandes gedeihen aber in Einzelflecken als Rasen auf dem Sande Trionfettia, Vigna lutea und Cassytha; ein Zeichen, daß auch dieser kleine Strand, wie Bëdjidj im NW, in geschützter Lage sich befindet.

1. Siedlung.

Plan 13.

H. = (Haus), Hof W. = Wohnhaus
K. = Kochhaus Bl. = Bluthaus
D. = Dächer

Der längste Sandstrand von ca. 1800 m ist der Matár, über dem im Westen die drei Dörfer liegen, auf der genannten Schotterterrasse, etwa 6 m über dem Meer. Das Riff hat 3 Booteinlässe, die aber nur für Kenner bedingt brauchbar sind: Tau ale gédj, Thauás, Thaualap, s. Plan. Nach der Landung durch den letzten südlichsten sieht man nordwärts das südlichste Boothaus D. Faluiong, Abb. 135.

Die Siedlungsform sind nahe beieinander liegende Gehöfte, nur Nr. 1, 2 u. 3 liegen ostwärts etwas vereinsamt.

Jedes Gehöft *thëvugot* hat 2—7 Dächer; Dorf heißt *sëafaltii*.

Ein Weg *el'lap* führt von Nr. 3 mitten durch die Dorfschaft westwärts (s. Plan).

Dorf. A. Falióu, Häuptling Vëlemog H. 7.

Häuptling Falërang, *fal* (Boothaus) A Faleör und B. Falegáur[2].

Bluthausgruppe Thilesëu.

H. 1. Gehöft Farërep liegt etwa 200 m von Nr. 4 ab. Hausherr war Rag, dessen

[1] Eine großblütige weiße Winde (Ipomoea) kommt auf Pollap vor, dort *pespás* genannt (nachtragen in Bd. 61 S. 087); sie kann nicht gemeint sein. Wahrscheinlicher ist Bikkia Gaudichaudiana (DC) K. Schum., die freilich von Volkens auf Yap nicht nachgewiesen wurde; sie heißt auf Palau *rur* (s. IV S. 323) an den Gogealwänden, im Bismarckarchipel auf Korallenkalk.

[2] *golo gaura fatkalel* = »du siehst suchend«. Wegen der 2 Boothäuser sagte man: »Viele Leute haben viel Schnur« (zum Binden).

Karte (Plan) 13. Die 3 Feindörfer.
Rechthäuser A Fakör, B Fakgaur, C Falegier, D Falubög.

Tod wir in der Frühe des 6. Oktober erfuhren (s. Tod S. 362 u. Taf. 25); 7 Dächer = 4 Wohnhäuser, 1 Kochhaus und 2 Geburtshäuser (Lage s. Plan).

In der Nähe ist am Strande ein *fal*, das aber nicht Bootshaus ist, sondern nur für die Männer zum Schlafen dient, da die beiden zum Dorf gehörigen *fal* A und B 400 m weit abliegen.

H. 2. Farĕrep, Eigner Théluel.
4 W. + 1 Bl. = 5 D., neben H. 1.

H. 3. Pisefo, Eigner Mangíredjag.

H. 34. Elaier, Eigner Ling.

2. Häuptlinge *tamól.*

Es wurde schon erwähnt, daß 3 Häuptlinge vorhanden sind, die den 3 Dörfern vorstehen: Falëráng in Ilotou, Tulei in Ledjódjoi und Vëlemog in Falióu[2]. Da Ledjodjoi das wichtigste Dorf ist, der Hauptort, so ist Tulei auch der Oberhäuptling von Feis. Cantova S. 298[3] schreibt, daß 1722, also ca. 190 Jahre vor uns, Meirang der Herr von Feis war. Der Name fehlt aber in meiner Häuptlingsliste, die folgende Namen als Vorgänger von Tulei aufzeigt: Djï Vater, Malálefel, Milelúl, Lúllă.

Auch die Vorgänger des 2. Häuptlings Vëlemog, die schon erwähnten So und Vaseg klingen nicht an, während der 3. Häuptling Falërang eine gewisse Möglichkeit böte (M statt Fal, ei = ë); aber er ist von Yap und kann vor 190 Jahren nicht gelebt haben.

---

[1] Es hieß *rong* bedeute »groß« wie *lab*, aber das vieldeutige Wort ist schon (Truk S. 256 u. 275) gekennzeichnet.

3. Exogamie.

Früher, als viele Boote nach Feis kamen, wurde viel nach auswärts geheiratet. Jetzt ist Feis fast endogam; ca. 20 Frauen von Feis sind in Mogemog, während auf Oleai wenig sind.

In Lamotrek war Sope's Mutter aus Feis (S. 27) sonst hier und auf Sorol niemand.

In Feis leben wenig fremde Frauen aus Oleai; fast alle stammen aus Feis.

Früher gabs viel Ehebruch, da viel Leute da waren 500—600 ♂, gegen 200 jetzt. Kinder jetzt 2—3, früher 6—10.

4. Karten.

Die erste bekannte Karte stammt von Lütke 1828; sie ist in seinem Atlas Tafel XXIX; verglichen mit dem von mir aufgenommenen Plan fehlt nur die große Steinmasse der Ostspitze, die nur klein an der Südostecke angedeutet ist. Die Richtung der Insel gibt er mit N 51 E an; das Profil des Ganzen gleicht einem Sargdeckel. Die Sonderkarte 1:50000 auf der Karte 93 des Reichsmarineamts 1903 ist eher eine Verschlechterung, da die Form hier rautenförmig ist, der SO-Capstein Tatholóëdjidj fehlt, dazu natürlich ebenso die O-Spitze. Beide sind auf der Japan-Karte von 1925 (Karte 11) nur schwach angedeutet, ebenso die NO-Spitze Tateleténgau, die auf meinem Plan (Karte 12) so deutlich hervortritt. Da die Japankarte auch die Lotungen ringsum bringt, so wurde sie hier wiedergegeben, wobei sich zeigt, daß die Richtung der länglichen Insel, die bei Lütke beinahe westöstlich liegt, fast nordöstlich gerichtet ist, während sie bei mir sich nach ONO neigt.

5. Taifune:

Rong H. 29 hat 5 Taifune in 60 Jahren erlebt. Klima s. S. 299.

III. Stoffliche Kultur.

1. Tracht.

a) Kleidung.

(vgl. Farbtafel 3 und Tafel 22.)

Junge Mädchen, *tarefēvil*, tragen den oft mächtigen *bathül*-Bastrock[1] (Kr. 135 = 29191ı) aus Kokosfiedern (Abb. 138); *bodj* ist der Knabenschurz aus Hibiscus, vorn und hinten an einem Strang, Kr. 150 = 29331ı, Abb. 139. Männer tragen Binde (Taf. 21 d) oder ein ornamentiertes Mattenkleid *(g)uludj* (Kr. 145 u. 203) und ein ornamentiertes Mattenkleid (Kr. 146) *madji* (Kr. 208, 204 mit Zöpfchen); Frauen haben auch hier Matten *gilifei* (Kr. 199 u. 205) als Kleid aus *gilifei* Hibiscus und *udj* Bananenfaser. Auch ein Hüfttuch wird neuerdings getragen: *gabal*.

Abb. 138. Bastrock, Befestigung der Kokosfiedern.

Abb. 139. Knabenschurz.

Die Herstellung des *bathül* Mädchenbastrockes (Abb. 138).

Zu einem solchen Schurz oder Faserrock gehören etwa 10 junge Kokoswedel, von denen die kürzeren Fiedern der Spitze weggelassen werden. Die anderen werden mit dem Daumennagel geschlitzt in feine Streifchen von Millimeterbreite bis nahe an den Ansatz, in der Sonne getrocknet und gebleicht, und darauf die zerfaserten Fiedern von der Wedelrippe abgerissen. Zu 2 und 2 werden sie verarbeitet. Eine Kokosschnur, zwei Armspannen lang, wird in der Mitte mit einer Schlinge versehen, durch die die Flechterin einen großen Zeh steckt und die beiden Enden auf sich zu legt. Zwischen die Schnüre kommen zwei Fiedern

[1] Wie bathél sich anhörend; Mächtigkeit ähnlich Yap; von Mertens (Truk S. 451) schon beobachtet; bis zum Knie reichend.

so gelegt, daß ein kurzes, handspannenlanges Stück nach unten, der übrige, längere Teil nach oben weist (s. Abb. 138 links. Darüber werden die Schnüre zum halben Knoten gekreuzt. Auf den Knotenpunkt kommen zwei neue Fiedern, nachdem die langen Enden umbiegend sich darauf gelegt haben, wobei eine kleine Drehung nach links erfolgt. Wieder halber Knoten, Umbiegen und zwei neue Fiedern, usw.

Zum Kopfschmuck gehören auch die »Geisteraugen« *metál alus* von Lamotrek (S. 152), hier *matál o vuth* »Muränenaugen« genannt, die zum Tanz getragen werden.

b) Schmuck *dji ele uóthel.*

Kopfkränze und Halsketten heißen *máramar* (poss. *marei*). E. Kr. aquarellierte einen leuchtenden gelbroten Kranz auf dem schwarzen Haar eines hübschen Mädchens, Abb. 140, s. auch Taf. 22 c u. d. Halsketten bis zum Bauch herabhängend aus Kokosscheibchen mit rotweißem Zwischenstück; unten ein *faubar*-Stück mit einem Hänger. Stirnschmuck *mare djimal*, Halsschmuck *mare falüel; faubar*-Halsketten heißen auch *lamalug*, lange Brustketten *isés*.

Abb. 140. Mädchen im Schmuck.

Haarfrisur mit Knoten hinten *abē* oder *legúidjamom* (poss.), durch Kamm gehalten oder lose, Abb. 136.

Der Spitzhut, *djólevadj*, wird nur beim Fischen oder auf dem Feld bei der Arbeit getragen.

Die weißen Scheibchen *vûl* werden aus der kleinen weißen Konusschnecke *fasulu vûl* gewonnen; sie werden mit dem Drillbohrer *búrobur* durchbohrt, das *uassülovul*, auf einer Planke *bab* (s. Abb. 141). Ähnlich werden die schwarzen Scheibchen aus der Kokosschale hergestellt, nachdem man die Schale mit dem Messer dünn gemacht hat *(fálafal* abschlagen, auch *etérret*, bohren *djēdjē)*; dann kommt das Abschlagen kleiner Stücke mit der Hacke, *fáladjig*. Zur Rundung legt man die Stückchen auf die Schenkel und dreht sie, wobei man sie mit einem Haizahn, auf ein Stäbchen gesteckt und gebunden, beschneidet. Das Schleifen der einzelnen Scheiben ge-

Abb. 141. Drillbohrer.

schieht, indem man sie in das Ende eines Holzstockes einläßt *(assügüssüg basölle tal* E. Kr.). Dann werden die so fertig gemachten Scheibchen alle auf eine Schnur gereiht und außen mit einem Stein (Yapstein *metakál)* abgeschliffen.

Kr. 175 = 29581I Ohrringe mit Kokos- oder Perlmutterringen oft gezahnt, eingehängt; Form der Pattringe *uodj*, von denen einer eine 1 Durchmesser von 185 mm hat.

Im allgemeinen wird der Stoff zu Ketten, Gürteln, Armbändern usw. von Osten und Westen eingeführt, die Scheibchen und Ringe werden aber meist auf Feis gefertigt, so Fingerringe *lēgēlēg* aus Kokos Kr. 194 = 29771I Abb. 142, Armringe aus Kokosschale *lāgālāg tagag* Kr. 193 = 2976 II Abb. 143, und die breiten *rodjal tagág* Kr. 174 = 29571I, Abb. 144 mit 3 eingeritzten Rillen (vergl. Bd. 6 I S. 39).

Armringe heißen *rsole pāl*, Fußringe *rsole bedjél*, Fingerringe *lāg ele gáthol*. Trochus-Armringe heißen *eētóiog*, aus Trochus *lāg ele pól*. Konus-Armringe nach

Abb. 142. Ring.

Abb. 143. Armring.

Abb. 144. Armring.

Abb. 145. Armring.

Yap-Art. *ileng* (Kr. 160). Die Armringe aus Schildpatt (Kr. 148 u. 168) heißen kurzweg *uod* (poss. *bodjédl*); so heißen auch die Pattscheibenringe Abb. 145 (Kr. 168 = 29511I) Durchmesser 18,5 cm, Loch 6 cm. Eine hatte neben dem Hauptloch auf jeder Seite ein kleines Nebenloch. Sie sind vom ganzen Osten her bekannt.

Ohrschmuck *djí e talengal* sind die erwähnten Pattringe und die bekannten Konusboden *mad* (Kr. 172).

Abb. 145a. Ohrschmuck.

Ohrloch *uiāuí*, wie Nasenloch, mit Fischknochen durchbohrt. Kleine runde schwarze Scheibchen werden auch aus der *sar*-Muschel (Meleagrina) geformt; sie heißen *djüedjü* Kr. 149 = 29321I Abb. 146, wie aber auch Blätterschmuck im Ohr heißt; Kr. 169 heißt *faliú repēg* Muscheldreieck als Hänger, Bd. 6 I Taf. 3a am Hals und Truk S. 104 am Ohr, hier auch Doppelperle Taf. 21d vergl. Palau III Abb. 12, Kr. 187 ist ein Ohrschmuck aus Kokosscheibchen, angeblich aus Oleai stammend.

Auch für die **Gürtel** *dáradar* poss. *darei*, *tarel*, auch kurzweg *vûl* genannt, braucht man die Scheibchen *vûl*, Kr. 195 aus Kokos *tagág ale vûl*, und aus kleinen Konusschnecken *fath ele (fasulu* s. o.*) vûl*. Die Spangen *djébog* sind meist aus Patt.

E. Kr. berichtet über die Gürtel:

Gürtel werden auf Feis fast bei jeder Frau angetroffen und bestehen meist aus 9 Reihen Scheibchen, sowohl der weißen *basölle vûl* aus Konusschnecken, als der schwarzen, feinen Kokosschale, die in bestimmter Reihenfolge aufgezogen sind. Die Herstellung der Gürtel ist Männerarbeit. Die Muschelstückchen werden abgeschlagen[1], wie auf Ngulu beobachtet, dann in einem Holzstock steckend (s. o.) auf beiden Seiten abgeschliffen, mit dem Drillbohrer[2] durchlocht, auf eine Schnur gereiht außen abgeschliffen, damit sie schön rund werden. Die Gürtel gelten als so kostbar, daß sie beim Tribut auf Yap nur besonders verlangt abgegeben werden (s. S. 37).

c) Körper-Bemalung.

Geschieht auch hier mit Gelbwurzpulver *rang* und wird deshalb *saráng̃arang* genannt. Aber auch mit roter oder schwarzer Farbe zum Gebet (s. S. 117).

d) Tatauierung *mak*[3] (Muster).

Die erste Strahlentatauierung[4] wurde durch Lütke bekannt, der sie in seinem Atlas Tafel 28 abbildet; die beiden Männer heißen Nei und Abien, und folgen unmittelbar den 5 Männern Ouaouk, Romfan, Taliour, Orsan und Romomen. Da Taliour schon von Bd. 6 I S. 42 her als Lukunenser bekannt ist, muß man eigentlich Abien und Nei auch als von Ku stammend betrachten, da offenbar dort Zeit zum Zeichnen war. Aber die völlige Übereinstimmung mit den Mustern der Westkarolinen läßt mich doch die beiden der Inseln Feis oder Oleai zuweisen, zumal ihrer Beine wegen, die *karangãp*-Linien zeigen und unten S. 324 erwähnt sind. Es ließe sich vielleicht durch die Postelschen Zeichnungen feststellen (s. Bd. 6 I Vorwort).

Von Kubary's und Müller's Abbildung weiter unten.

Wie auf Oleái S. 226, so kommt hier, und auf Mógemog noch ausgeprägter, die Strahlentatauierung vor, weshalb ich meine Aufnahmen von dort mit heranziehe. Die Feisuner sagen, die Tatauierung von Mógemog stamme von Gadjbar

[1] Die Kokosschale wird, wie auf Ngulu, dünngeschliffen, innen mit Axt und Meißel bearbeitet, dann mit diesen beiden nach dem Augenmaß kleine viereckige Stückchen auf einem Stück Holz herausgeschlagen.

[2] Einspitziger Bohrer, Querstab mit der Linken bewegt, Abb. 141; die Rechte hält das Stückchen auf dem Knie.

[3] *makei* meine, *makem* deine, *makell* seine, *makalt* unsere, *makalá* eure Tatauierung. Das Beschlagen heißt *fálafal*, das Behauen z. B. des Bootes, des Schmuckes, S. 93.

[4] Von mir so benannt nach den Strahlen auf der Brust und auf der Seite.

auf Yap, das es in Maki[1] gelernt habe. Von Gadjbar haben die Mógemogleute die Kunst mitgenommen. Ich hörte, Oloméng von Mogemog habe die Kunst aus Yap geholt[2]. Das ist wenig wahrscheinlich, da die Haupttatauierung von Yap die *fille verdák* (W. M. Yap I S. 34 *dilevotság)* herrschend neben der belanglosen Strahlentatauierung *yol* (W. M.) steht, die lediglich auf Yap als Schmuck gilt. Auch die Namen der Muster, die in Yap I S. 46ff. gebracht werden, sind rein zentralkarolinisch; im besonderen stammen sie von Mogemog und decken sich mit meinen Aufnahmen von dort, in der Hauptsache wenigstens.

Die Farbe *boloth* wird aus den Nüssen des Calophyllum *(fitoi)* bereitet. Man gibt die Kerne auf eine Holzplatte oder in eine Kokosschale, zündet sie an und hält eine Tonschale aus Yap darüber, damit der Ruß sich niederschlägt. Der Ruß wird dann mit Wasser angerieben. Dabei wird kein Zauberspruch hergesagt; erst wenn die Muster aufgezeichnet sind, wird zum Geiste des Vaters des zu Beschlagenden gesprochen.

Abb. 146. Tatauierte Frau.

Die Hacke *galét*, Knochen vom *gátap*, der Hammer *taióu* aus *gângī*-Holz. Der Tatauierer heißt *thelepalemék*, der erst die Aufzeichnung *(gal)* der Muster *(mak)* mit Kokosblattrippe und Farbe vornimmt. Die Arbeit dauert 1—3 Monde je nach dem Ertragungsvermögen des Bearbeiteten. Er dient in der Hauptsache als Schmuck, als einziges Gut, das man ins Grab mitnimmt, wie auch die Ralik-Rataker sagen.

Frauen werden von Frauen tatauiert, am Arm *mak elepāl* und am Bein *mak elepidjél* nach den Streifen des *garangáp*-Fisches, des Bonito (vgl. die Beine von Nei und Abien s. o.); *faleſal* Schamtatauierung nach Fregattvogel *gátap*; *dor* Bänder am Oberschenkel, s. Abb. 146.

Über die *eól*-Tatauierung erhielt ich auf Yap eine Geschichte von Jélafadj (Müller Yap S. 307), und da sie Müller nicht mit verwertet hat, will ich sie hier noch nachtragen:

Jélafadj hatte seine *eól*-Tatauierung nur nachts an, am Tage trug er seinen *ildjebou*-Ringwurm zur Schau, da er morgens früh erstere auszog und in eine Kokosschale legte. Als eines Abends seine Leute bis Mitternacht um ihn versammelt waren und dann erst fortgingen, blieb seine Frau bei ihm allein zurück

[1] Auf Yap hörte ich, Maggi sei der Ort der Tatauierer; Yap S. 50 sagt Mákí in der Landschaft Gagil, westlich von Gadjbar.

[2] Ein Tatauierlied an ihn auf Feis heißt:
faragamalóm Oloméng, *go magamadji váreg al mak alé*.
(Ich) bitte dich Oloméng, du nimm weg den Schmerz von der Tatauierung jetzt!

und frug ihn: »Was machst du nur, Jélafadj, daß du deinen *eól*-Schmuck nicht auch am Tage trägst? Du solltest sie am Tage tragen, damit du den Ringwurm los wirst; der ist so häßlich!« Aber er wollte darauf nicht eingehen. Als Jélafadj darauf beharrte, versuchte sie es mit einer List. Sie bat ihn, ihr einen Bindfaden zu drehen, aber einen recht langen, da sie ihn notwendig brauche. Er frug nicht weiter, sondern fand sich bereit zu der Arbeit. So begann er zu drehen, und wenn er eine gewisse Länge erreicht hatte und aufhören wollte, rief sie: »Länger, noch viel länger!« So fuhr sie fort, und jedesmal wenn er aufhören wollte, rief sie »Länger, länger«. Erst als um 6 Uhr der Tag angebrochen war, sagte sie »Nun ist es gut!« Da sank er ermüdet in tiefen Schlaf, ehe ihm noch möglich gewesen war, seine *eól* auszuziehen. Als er erwachte war es heller Tag und die Leute sahen ihn so und bewunderten ihn. Da behielt er sie am Tage an; seine Frau aber bekam den Ringwurm.

Diese Geschichte erzählt Müller Yap S. 666 sehr unvollkommen; Yelafádj ist aber hier der Lehrer der Tatauierung; sein Sohn der kleine Yelafadj ist Olifat (s. S. 147).

Preis: Maielai, der Rong's Tatauierung ausführte, erhielt dafür Gelbwurzfarbe, Matten, Kaliko, Schnur usw.

Da ich bei Oleai die Ordnung und die Muster nicht aufgeführt habe, will ich dies hier bei Feis tun, da ja dies im Mittelpunkt zwischen Oleai und Mogemog liegt; Mogemog scheint mir ein Zentrum dieser Kunsttätigkeit zu sein; da aber, wie erwähnt, die Muster-Bezeichnungen von W. Müller in Yap I S. 46ff. gebracht worden sind, sehe ich von einer Einschließung von Mogemog ab, um so mehr, als Hambruch's Aufnahmen von dort eine besondere Bearbeitung erfahren.

Ich bringe nur die eigens ermittelten Namen. Zum Vergleich gebrauche ich die gleichen Nummern, die W. Müller gebraucht hat.

[1] W. M. Yap, S. 46, bildet auch andere Ornamente ab, wie auf Yap *asangól* die Libelle, wofür auf Mog. *maram* der Mond. Ich sah auf Feis auch eine Mondfigur *máramalimík* und ähnliches, alles ist im Schwarzen *sauang*, S. 364, oder *djobung* schwarz. [2] s. Yap I S. 48 Nr. 39.

Abb. 147a—c. Tatauierter Häuptling.

Aus all dem geht hervor, daß eine feste Ordnung vorhanden ist, wie ich sie zuerst von Samoa beschrieb.

Hier ist sie folgende:

1. Halskragen *uós* vorne, auf den Schlüsselbeinen lagernd, schmal mit 2 Spitzen, hinten breit, Schulterblätter bedeckend, mit der Doppelspitze im Nacken bis zur Haargrenze reichend. Die Schmuckstreifen darin wechseln, wenn auch einzelne 12., 11. meist vorkommen.

2. Rücken mit 4 festen schwarzen Doppelflügeln, die 2 mittleren enden in einen Schwanz (Vogel, Fisch), die 2 äußeren in ein Huf. Solcher Hufe gibt es noch je 2, je 1 auf der Seite (Hanke), je 1 vorn (Leistengegend); deren Streifen gehen aus nach unten vom Boot des Solang (23); auf diesem stehen die 4 Seitenstrahlen und die Pfeiler für die 4 Strahlen, die an das Papillendreieck stoßen.

Abb. 148a—d. Kreuzähnliches Muster.

3. Die eigentliche Brusttatauierung zeigt je 4 Strahlen, die oben an den Vorderkragen stoßen und auf je einem Pfeile ruhen. Beide sind getrennt durch einen Mast.

4. Armtatauierung mit einer großen Platte auf dem Oberarm und eine auf den Unterarm.

Sonstige Ornamente an Armen, Beinen usw., was nicht in die Ordnung, den »guten Schmuck« *mak mommai* gehört, bezeichnet man mit *dărifall*.

Bemalung nicht beobachtet.

2. Ernährungs-Wirtschaft.

Gegenüber den niedrigen Koralleninseln macht Feis eine gewisse Ausnahme, da der Feldboden ca. 10 m erhöht liegt. Auffallend waren hier Süßkartoffelfelder[1].

Das gute Gedeihen der Pflanzungen wird wohl mit auf den Phosphatgehalt zurückzuführen sein. Schon Chamisso schrieb: »Feis erfreut sich unter allen niedern Inseln des reichsten Bodens und der reichsten Flora. Der seines vielfachen Nutzens wegen aus Eap verpflanzte Bambus ist da gut fortgekommen.«

Kinder essen gern morgens die Hülle apfelgroßer unreifer Kokosnüsse. Es findet täglich ein Gebet beim Essen statt (s. S. 359).

Wenn man aber glaubt, daß Feis keine Nahrungssorgen habe, so trifft das nicht zu. Viel ist früher von Hungersnöten die Rede und erst durch die Einführung der Süßkartoffel *gamuti* durch einen Yapmann Thágofel von Oneán um 1850 ist die Not behoben worden, da diese vortrefflich gediehen. Zahlreiche Süß-

[1] s. Friederici Anthropos 1929 Bd. 24 S. 441—487. S. Bd. 6 I S. 47 u. 221.

kartoffelfelder (s. Taf. 23a) auf der Höhe geben Zeugnis von der Wertschätzung. Etwa 10—20 *gamuti*, je nach Größe, und ½ Kokosnuß verbraucht ein Mann täglich zur Ernährung. Eine Familie hat 3—4 Felder von ca. 10 Faden Länge. Nach 1 Jahr wird ein neues Feld angelegt. Nach Einsetzen der Setzlinge macht man nach 10 Tagen einen Erdhaufen *pälepäl*; nach 3 Monaten Ernte. Die Frau hält die Pflanzung sauber, erntet und kocht. Früher gabs nur Taro und Yams (je 2 Arten), Brot frucht (Bäume durch Taifune sehr geschädigt) und die wilde Morinda *löll* (s. Ralik).

An Fleisch hier auch Fische vorherrschend. Während unserer Anwesenheit waren nur 3 Schweine auf der Insel, die einem Yapmann gehörten. Durch den Taifun 1907 waren viele Hühner umgekommen, so daß auch diese sehr knapp waren. Da Hühner und Schweine als Nahrung sehr beliebt sind, handelt es sich also nur um Lässigkeit. Yap, Oelai und Lamotrek geben ihnen jedenfalls keine ab.

Abb. 149. Gestelle zum Palmweinschneiden.

a) Pflanzenprodukte:

djo Kokosnuß (Hüllenfaser *eologódj*) *lö*, *lu* junge Kokosnuß, geschabt *göregor*, Sahne *ärrong*, Rückstand (Dust) *gudjo*.

Taro *ooth*; Arten *ooth älle jällüg*, *oothopä*.

Großer (Wald)taro *jillé*, aufhäufen von Korallensteinen darum *iretag*, herausgraben *killinge*: Art *moallüg*, *loi*.

kleine, weißliche Früchte *atöll* (kleine Knöllchen von den Wurzelfaserenden)

Bataten *gamuti*; Arten *gamutitjä*, *gamutiuddj*, auf der Hochfläche in zahlreichen Feldern vorhanden[1] s. o.

Papaya *baosi*

Kürbis *kalebás* (Kalebasse)

Gelbwurz *gudjöll* (nur Blatt gebraucht), sonst *mägomog* (s. Stärke); Art *iungedjik* S. 320c.

Stärke *mägomog* (für Fischer und Seefahrer verboten) s. unter Bereitung.

jäten *peggüpéng*.

Brotfrucht *mai* oder *mēi*. Arten: *māifei* (ohne Stein), *maigeradji*, *mailebédjidj* *mailepémadjol*, *tagomeliu*, *sameirão*, *mémadjei*, *soaig*, *mauli*.
Banane *udj*
Winde *djēuall* (S. 312)
Unkrautgemüse *augus* (s. Bd. 6 I S. 48)
gegessen: Ficus *gauall*
Morinda *löll* (s. o.)

b) Wörter zum Feldbau (E. Kr.).

Grabstock (Kokosholz) *lúrog*	Rodung *ēalág* (Männerarbeit)
Feldstück *oāl*	Feld *matēi*
Acker *lipelup* (5—10 Faden lang)	umgraben *attumūl*
Stock dazu *gūth*	Erde anhäufen um Setzling *pólepōl* (s. o.)
Weg *i faellap*	Ernte *ftágil*
Regenmatte *tebogóu*	Spitzhut gegen Sonne *djólevadj*.

Im Sommer, in den Monaten Juni, Juli, *serávol* genannt (S. 370), wird auf Geheiß des Häuptlings (S. 361) *mógemog* (Taccastärkewurzel) gegraben. Man reinigt dann die Wurzel, kratzt die Haut ab, reibt sie auf Korallen oder auf Holz, das mit einer Schnur umwickelt ist, alles in einem kleinen Boot. Der Brei wird dann in einen Mattensack gegeben, mit Wasser übergossen, das in eine Holzschüssel abfließt. Hat sich die Stärke abgesetzt gießt man das Wasser ab und wickelt den Satz naß in trockene *bogú*-Pandanusblätter. In diesen trocknet die Stärke von selbst und kann einige Jahre aufbewahrt werden.

c) Küche.

Frauen kochen; Mann, Frau und Kinder essen zusammen. Kinder essen gern in der Frühe die Hülle von apfelgroßen Kokosnüssen. Hier trifft man auf Töpfe *ip* aus Ton *ath'ip nu áp*, aus Yap; erhandelt sind auch eiserne, vorhanden sind *ráu*; Trinkschalen (Kokos) *berödjél*. Holzschüsseln S. 337.

Sonstige Geräte.

Kokosschaber *orúgorú djo*, *uāigang* oder *uóthungēk* (Abb. 150) in 3 Formen.
Löffel *isisevodj*, umrühren *edro sā*.
Stössel *falefás*, *v(e)all(fāl)*, stampfen *inōssügge*, *sus*; aus *gēngi* Holz (Abb. 151 Kr. 162 = 2945[11] *fal*) 30,5 cm lang, und aus Korallen-*falefás*.
Stampfbrett *eallif (ēlleſ)*, viel für Bataten gebraucht (Abb. 152).
Feuerhobel *alāl*[1], Bahn *ailit (ithil)* (Holzart: *adr*, *gilifei*, *ira)* (Abb. 153 Kr. 166 = 2949[11]); Feuerschlagen *lédjēledj*, Feuerstein *bedjē*, Lunte *lūt* (Brotfrucht-

[1] so „Holz" Ralik

baumholz) in Bambusbüchsen *vóuau* Abb. 154 (Kr. 151 = 2934II) aufbewahrt, 38 cm lang[1] Eisen *ɛ̂áf*.

Feuerfächer *repoi (rêbêi* Kr. 138 = 2922II) Abb. 168.

Hängebrett für Essen *tâkhaf*.

Abb. 150. Schabscheme! in 3 Arten.

Abb. 152. Stampfbrett.

Abb. 151. Holzstössel.

Abb. 154. Bambusbüchse für Feuerzeug.

Abb. 153. Feuerhobel.

Das Unkraut *dûgus* wird sauber gemacht, mit Wasser und etwas *gomuli* dazwischen gekocht; wenn vorhanden wird etwas *adji* Palmwein zugegeben, sonst Preßmilch *ɛ̂árong*.

gôbâl: gomuli geschält, gekocht, gestampft mit *ɛ̂árong* gemischt, umgerührt, gegessen.

fiêfi: Man kocht Morinda *(löll)* Früchte, zerdrückt sie in der Holzschüssel, nimmt die Steine heraus, gibt Preßmilch *ɛ̂árong* dazu, samt dem Dust *gudjo*; umrühren; gegessen.

[1] Ornamente oben Fregattvögel *gûaf*, unten Delfine *gui*.

limelim: Tarowedelstile werden in kleine Stücke geschnitten und in Wasser gekocht; in Holzschüssel geschüttet werden die Stückchen zerfetzt, mit Preßmilch *ĕárong* versetzt und gegessen.

matol: Brotfrucht wird geschält, dann gekocht und zerstampft; dann wird Preßmilch zugegeben und gegessen.

sepédjeg (sopedjik): Brotfrucht ungekocht geschält, in Würfel geschnitten, im Topf mit Wasser unter Zusatz von Preßmilch gekocht.

tapiliot: eoth-Taro wird gekocht, abgeschält, gestampft, mit Preßmilch angerührt, genossen.

thalâli: viererlei zusammen:
z. B. *augus* + *djauel* (Winde) + *po* (Winde)
oder *limelim* (s. o.) + *djo* (Kokos) + *adji* (Palmsaft).

ilâldeth (Lamotrek): Palmsaft mit Kokosgeschabsel zusammengekocht unter stetigem Umrühren, bis es ein Brei ist; der wird in ein Bananenblatt gewickelt und aufbewahrt; hält 3 Monate.

mógemog: Stärke mit Palmsaft und Preßmilch unter Umrühren zu Brei gekocht, gegessen.

lofith (fasäsü): gaual Ficusfrüchte gekocht, gestampft, mit Preßmilch versetzt, dann auf Feuer unter Umrühren gekocht, gegessen.

3. Fischerei (vgl. Tafel 22).

Fischfang mit Gift *sûp*. Wurzel zerstoßen, bei Sonne Nasenreizung.

Fischspeer *tileg* (Yap *thêllak*), *pisîka*; Fackel dazu *thûl*, Bogen *gasik*, Pfeil *galigêsik* sehr einfach.

Haifang mit der Schlinge *djólu bógou*. Die Schlinge *thî* (Abb. 155a Kr. 171 = 2954II) hat einen Mittelstrang zur Anbindung des Köders b (auch als Spiel); dieser besteht meist aus einer Muräne *lávuth*, die meist mit der Aalschlinge *fáro lávuth* gefangen wird; diese wird ebenfalls zum Spiel benutzt (Abb. 155c Kr. 186 = 2969II). Hat der Hai den Köder gefressen, geht er durch die Schlinge. Strang ca. 150 cm lang. Auch Fang des Hai mit dem Haken *gai* wird geübt; jetzt ist er aus Eisen. Der Köder ist ein Fisch.

a Haischlinge b c Aalschlinge

Abb. 155a—c.

Die Herstellung der Fischleine *ao* (Kr. 178 = 29621) ein Bündel Pipturus-Bast *ē ol fithefith êroma).*

Die Haut wird vom Bast des *e êröma*-Strauches abgekrazt, und zwar mittels eines Ringes *ēálogodj*, der aus feinem Kokosgarn ringförmig geknüpft und um Mittel- und Zeigefinger gelegt wird Abb. 156. In die Sonne zum Trocknen gelegt, dann

Schildpatthaken.

Bast abgezogen, mit den Fingern zerteilt und auf Schenkel zu Fischleine *terdlegoi* gedreht; von Hibiscus *(gilifei)* hergestellt heißt sie *edu*; europäische Leinen heißen *eaulibesedj*. Angelstock *udu*, Köder *pálegoi*.

Haken *bá*. Aus Schildpatt mit Perlmutterblänker[1] in Berlin VI 27129. Befestigung s. Abb. 157; zweifellos für Bonitofang (s. Oleai).

Gefangen 8 Fische: *garangâp, tagū, fōfō, eséllei, tépar, tángerr, êrong, tlam.*

Schildpatthaken *govodj* (Abb. 158 Kr. 191 = 29741) zum Fang des roten Fisches *mos* in ca. 10 Faden Tiefe. Ähnlich die heiligen Haken.

Fang der Flederfische *mangar* mit dem Winkelhaken *gólemadj* (Palau III S. 77), der aus Kokosschale gefertigt wird; s. S. 49; mit Netz s. u.

Die Hornhechte *sag* werden vom rudernden Boot aus mit Köder aus den getrockneten Adern der Haifische gefangen, in die sich die Fische verbeißen. Fischfang mit Drachen *gedjég, gadjáig* s. S. 50, Abb. 159.

Abb. 159. Drachenscheibe, Brotfruchtblatt, 71 cm lang.

[1] Kr. 156—158, 3 Perlmutterhaken, von 3 Oleaileuten auf Feis mit dem Messer geschnitten. Ein *bá* wurde in einer Kiste sabe von Oleai aufbewahrt. Auch Ralikähnliche Haken kommen vor.

Netze.

Schwimmer	*úgopēs*
Senker	*úgofās*
für die Hochsee	*ugálei*
für fliegende Fische	*ug ele mangár*
Fackel dazu	*thul ule math*

Handnetz für Riff mit Stil *ūg*, Abb. 160, Masche 6—7 mm. Stil *īb*, Gabel *gapár* oberer Bug *gath* s. Taf. 22b.

Abb. 160 Handnetz.

Reusen *djel, marâuel.*

An Treibholzstamm *gabēibēi* gebunden, wie auf Oleai beobachtet, Fang *rēl* s. S. 61 u. Am 4. X. 1909 sahen wir einen großen Stamm aus SW. nahen. Drei Boote gingen zum Empfang mit je einem Fischkorb durch die Brandung; die Körbe wurden an den Stamm gebunden, und nach kurzer Zeit hatten die Fischer 150 Stück erbeutet.

Reusenformen nach Abb. 161a, s. auch Taf. 24c *ulebiau*. Große Grundreuse s. Abb. 161b. *ulimoróuel*.

uldm kleiner Fischkorb, mit Deckel, aus Streifen von den Wurzelstelzen des Pandanus geflochten, unten mit Kokosblattrippen verschlossen, zwischen Steinen eingebaut (Kr. 183 = 2966) Taf. 26f.

Abb. 161a, b. Fischreusen.

Fischverteilung *ileth*, ein Teil *sēu ileth*.

Jedes Dorf hat seinen Fischausteilplatz, *lingēsáng*. Pelilemog und Folumar sind die Austeiler von Ilotóu. Bei großen gemeinsamen Fischzügen benutzt man den *lingēsáng* bei Gadjabuth (s. Religion S 372), wo Jēlamathāū H. 21 und Máreieg H. 18 verteilen: der ganze Fang wird für die 3 Dörfer in 3 Teile geteilt. Fischt Ledjodjoi allein, so erhält Tulei allein die Hälfte des Fanges, das Volk die andere Hälfte. Faliou aber hat nicht allein 2 Boothäuser, sondern auch zwei Fischausteilplätze. Verteiler Ealusólumar H. 13 und Rangairal.

Beim großen Fischen von Ilotou und Faliou bekommt Tulei aber nur einen großen Fisch, dagegen Falērang und Valēmog je die Hälfte von ihren Dörfern.

Wenn irgend ein Mann der großen Dorfschaft Tabūfische fängt, so gehören sie Tulei, da sie für die andern tabū sind. Solche Fische sind: *tagú* (s. Lam.), *ēál* (Truk S. 439 *eár* Scarus), *thagurár* (Truk S. 436 Schwertfisch), *mám* (Palau IV S. 354 *mámel, mĕm)*. Auf andern Inseln, wo das Tabū nicht gilt, können diese Fische natürlich gegessen werden.

4. Handwerk, Geräte, Waffen.

a) Sachenbemalung.

Außer den Booten sind nur die heiligen Körbe usw. (s. S. 374 u. Farb-Taf. 3) bemalt (Personen s. S. 330).

Die rote Erde *erie* kommt von Yap (s. S. 97), angerührt in Holzschüsseln *tābbi l'lap*[1] Abb. S. 239, c oder in Kokosschalen *lap* (Kr. 124 = 2908), oder in kleinen Doliumschnecken *i thilemei, djageióg* (Kr. 197), Pinsel *galaliu*, Kokoshülle *pēiel*.

Hozkohle *maleséle kamómo* zusammen mit Dolium (Kr. 126 = 2910II) Abb. 162, zur Bemalung für Gebet-Ornamente.

Abb. 162. Holzkohle mit Gefäß.

b) Holzarbeit.

Geräte.

Axt aus Tridacna *tēllē legī* (Kr. 198 = 298III) s. bei Bootbau. Dexel *tēllē*, für Haus und Boot breit (z. B. 17 cm lang, 9 cm breit). Beilstellung *kétham, vodjongēl*. Schleifstein (Yap) *jasitetei*.

Kr. 185 *vúruvur*. Horizontalbohrer, Stäbchen mit Fischzahn (Abb. 134e).

Holzschüsseln *tábbi*.

Vorherrschend sind rundliche Schüsseln, und oblonge. Ein *tabbi bedjēl* war als runder Eßteller geradezu nach einem Palau-Vorbild auf Feis angefertigt (Kr. 142 = 2926) Abb. 163a. Ähnlich ist das *dábbi djidji*.

Eine längliche Schüssel *dabbi le mongai* zeigt Abb. 163b. Ihr Boden ist flach, die Nase ist hier lang und vorstehend; c etwas gedrungener.

Dagegen sind die Truk-ähnlichen Schüsseln mehr in die Breite gehend und bauchig, Abb. 163d.

Die längliche spitz zulaufende Farbschüssel, Abb. 164, *tabbi l'lap*, hat keine Nase, 27 cm lang, 12,6 cm breit und 4,5 cm hoch.

---

[1] Die Farbschüsseln *tabbil'lap* oft in Vogelform = Kr. 134, Regenpfeifer Charadrius *lili*, s. Lamotrek S. 65.

Abb. 163. Holzschüsseln.

Abb. 164. Farbschüssel.

Deckelkasten.

Die Deckelkasten *bār* von Feis zeigen einen hübschen Kantenschmuck, als ob sie mit Borten eingefaßt wären, Abb. 165; (Kr. 154 = 29371I); 57½ cm lang, 16½ cm hoch und 17 cm breit und kann Matten, Curcumafarbe usw. aufnehmen; kleinere Büchsen *tafetef (dābedaf, dāpitep, dēvidēv)* dienen zur Aufbewahrung von Angelhaken. Kr. 155 soll von Oleai stammen.

Abb. 165. Deckelkasten.

Einen schönen rot bemalten Kasten *dapitēp* mit schwarzen Borten, an den Längsseiten stark abgeschrägt, zeigt Abb. 163e (vgl. Lam. Abb. 31). Sie wurden von E. Kr. aquarelliert, denn sie war 81 cm lang, 29 cm breit und 21 cm hoch, und war dem Gott Rongola (S 372) geweiht.

Büchsen *kivār, vār*, für Tabak, ähnlich Lamotrek. Eine Bambusbüchse wurde Abb. 154 schon erwähnt und abgebildet. Sie wurde *vōvau* benannt und hatte Ornamente an der Seite: *gui* Delphine und *gatāf* Fregattvögel.

Aus einer langen dünnen Kokosbüchse gefertigt ist Kr. 159a = 29431I s. Abb. 166. Der Deckel ist hier scheibenförmig und ist mit einer Nute eingelassen, 8,8 cm hoch. Form und Ornamente erinnern an das Vorbild Palau III Taf. 7 Nr. 4, das aber viel schöner ist. Zweck: Tabakaufbewahrung, der in Rollen (Kr. 202) gewickelt in den Handel kommt.

Abb. 166. Deckelbüchse, ornamentiert.

c) Waffen.

fehlen in der Hauptsache. Die Speere *tileg* dienen nur zum Fischen. Die Speerschleuder *lēog* ist von Yap her bekannt, wird aber nicht gebraucht. Die Schleuder *gāl* kennt man von Póloat und Truk, gebraucht sie aber nicht.

d) Flechterei.

Die Matten aus Kokosfiedern, *tápogau*, und die am Hausgiebel, *gili*, werden an und in den Häusern reichlich gebraucht, s. Abb. 178, Taf. 23 u. Farb. Taf. 3. Die Pandanusmatten *fadj* als Schlaf- und Totenmatten *mogós* Abb. 182.

Körbe ohne Henkel.

Kr. 137 = 2921 II *saudi* zum Aufhängen für gekochtes Essen. Taf. 26a. Höhe 26 cm, Breite oben 40 cm, unten 32 cm.

Abb. 167. Körbe.

Abb. 168. Feuerfächer.

Kr. 139 = 2923 *vádj* Schalenkorb, roh aus Kokosfiedern für schnellen Gebrauch. Taf. 26b. Weite 25—27 cm, Höhe 10 cm.

Kr. 141 = 29251I *djúg* Feldkorb für geernteten Taro und Kartoffeln, Abb. 167a.

Kr. 144 = 2929II *botau tangarik* Handkorb. Abb. 167b.
Vgl. den Handkorb des Gottes, Abb. 193, mit den Fransen *feregegél e votáu*, Abb. 167b. Diese Körbe sind oft recht groß, bis zu 1 m lang, wie auf Pollap.

Kr. 140 = 2924II *gabés* Rundkorb für Webgarn. Taf. 26c. Weite 30—34 cm, Höhe 9½ cm.

Korb mit Henkel.

Kr. 177 = 29611I *bēróu (beráu*, E. K. *bäro)* für Früchte. Taf. 26d. Weite 12—23 cm, Höhe 16 cm.

Fächer.

Kr. 137 = 2921II *rébēi* Feuerfächer. Abb. 168.

e) Seilerei.

Junge Kokoshüllen *bēiel* werden drei Monate in Salzwasser gelegt, dann beginnt das Schlagen *süis* (wie *sus* gesprochen); Fasern *eēlegodj*, Abfall *bagalegódj*. Die Fasern in der Sonne getrocknet. Ein Bündel Fasern *táongat eēlegodj*; das Drehen *gólōgol* der Kardeele *mōrr*; zwei Kardeele geben die Schnur *gólōgol*.

Für Tauwerk *dáll* nimmt man 3 Kardeele *mōrr*, für dicke Taue das Drehkreuz *pekepelilido*, Abb. 44; ein Bündel Schnur *súgul ü gólogol* (Kr. 184).

Kr. 136 = 292011 *djou* Kokoszwirnkorb, Höhe 42 cm, größte Breite 90 cm, obere Breite 30 cm, Taf. 26e. An beiden Enden eine Öse.

Kr. 200 = 298311 *dōdjou* ein alter Zwirnkorb, angeblich aus Oleai stammend, s dort S. 246. (Truk S. 185 *boddou*).

f) Weberei (E. Kr.)

Die Weberei von Feis gleicht fast in jeder Weise der von Lámotrek, sowohl Art der Matten wie Herstellung, höchstens zeigt sich Unterschied in der Häufigkeit gewisser Arten. So sah ich als Frauenmatte fast ausschließlich die schon bei Lámotrek beschriebene 7streifige Hibiskusmatte, mit einzelnen Bananenfäden in der Kette als Wirkung, namens *giliſog*, und die 7streifige Bananenmatte in feinster Webart für die Männer. Daneben aber die herrlich gemusterten Männermatten mit Durchflechtarbeit in reichen Mustern.

Der Hibiskusbast wird in der beschriebenen Weise gewonnen; von mittelstarken, saftreichen Zweigen des Hibiskus wird die Rinde abgeschält, 4 Tage mit Steinen beschwert in die See gelegt, dann der Bast von der harten Rinde abgelöst, ausgestrichen und getrocknet. Die dicken Baststücke werden von den Frauen mit dem Nagel ihres zierlichen Daumens in feine Streifen abgespalten, und diese mit einem kunstvollen Knoten an einandergefügt, abgeteilt und die feinen Streifen mit einem kunstvollen Knoten *bugos* immer wieder aneinander gebunden.

Der Knoten *bugos*.

Er besteht aus drei Schlägen über die die gekreuzten Fäden haltenden Daumen und Zeigefinger, Abb. 169a. An der Kreuzung liegt der arbeitende Faden, (der von links oben nach rechts unten verläuft) über dem anderen. Mit seinem unteren Verlauf werden zwei größere lose Schläge und ein kleiner gemacht, der sich fest um die Kreuzungsstelle legt. Auf

Abb. 169a—c. Weberknoten.

ihn und unter die beiden losen Ösen wird nun das Fadenstückchen, das rechts oben heraussteht, zurückgebogen, vom Daumen gehalten und darauf die drei Schlingen langsam festgezogen. Dies erfordert einige Übung und will nicht immer glücken, doch gibt es einen festen, glatten Knoten; solcher Knoten gibt es eine unendliche Menge bis das Garn für eine Matte vor- handen ist. Eine siebenstreifige Frauenmatte besteht aus:

ungefärbtem Hibiskus = *gilifei*
Bananenfaser = *udj*
feinster Bananenfaser, weiß = *badj udj*
schwarz gefärbtem Hibiskus = *daradja* auch *urier*
gröberer, weniger guter Bananenfaser = *battadjik*,
schwarzer, sehr feiner Bananenfaser = *uludj*;
roter Hibiskus, der auch vorkommt, heißt = *ligauol*.

Bananenfaser liefert die hier in Feis wachsende Art, die eßbare Früchte trägt. Man verwendet die Schichten vom Stamm einer jungen, noch nicht blühenden Pflanze. Die Herstellung, das Ausstreichen der fleischigen Massen, Trocknen, Spalten ist wie in Lámotrek

ulugal Bananenschaft,
matara der erste zarte Streifen an der Blattscheidenseite,
chille der mittlere Streifen der Rückseite,
rairek udj das Fleischige herausschaben.

Fast genau wie in Lámotrek (S. 75) geschieht hier das Färben des Garns, sowohl Bananen wie Hibiskus. Terminalienblätter werden auf einem Stein zerstampft, in eine Schüssel getan und Salzwasser darauf gegossen. Hier hinein legt man das Garn, das davon eine helle, grünlich-graue Farbe annimmt. Vor längerer Zeit schon hat man in einem anderen Gefäß ein Stück Eisen in Seewasser rosten lassen. Ein bestimmter harter Stein, angeblich von Yap kommend, wird an dem rostigen Eisenstück so lange gerieben, bis mit dem Rost zusammen etwas von seiner Oberfläche in die Flüssigkeit fällt. Inzwischen wurden die Hüllen von jungen Kokos-Trinknüssen zerstampft, in Seewasser getan und alle diese Flüssigkeiten zusammengegossen. Die Farbe ist fertig. In ihr bleibt das Garn 24 Stunden liegen, um dann im Wasser geschwenkt und getrocknet zu werden.

sügge	zerstampfen	*iou*	Rost
paiel	Kokosnußhülle	*igëg*	reiben
dath	Seewasser	*podj*	fertige Farbe
metakal	Yapstein	*arier*	schwarz färben
rarei	ausstreichen.		

Die sparsam verwendeten roten Fäden werden gefärbt in einer Mischung aus geschabten Morindawurzeln, Kalk und Seewasser, in die der Bast für längere

Zeit gelegt wird. In neuerer Zeit wird auch hier Japanfarbe erhandeit und verwendet.

Worte zur Weberei.

weben	*bossunge*	durchflechten	*vidjividj (ritjioitj* S. 79)

Holznadel mit Öhr für denselben Zweck	*thevali gaſēthak*		

Kette wickeln.

Die Kette, die ich in Feis wickeln sah, beanspruchte nicht 5, sondern nur 4 Pflöcke. Der erste Pflock (für das vordere Spannbrett) wurde rechts von der Weberin eingeschlagen, dann maß sie 5 Handspannen nach links und schlug den

Abb. 170. Kette scheren.

Pflock für das Kreuz (4) ein. Der für das hintere Spannbrett fehlt, dafür werden die beiden Pflöcke für Litzen (2) und Trennstab (3) die zwischen 1 und 4 kommen, stark nach vorn gesetzt und so die Kettefäden klar voneinander gehalten, Abb. 170.

Beim Einklopfen der Pflöcke hielt die Frau namens Gadjigeireng eine kleine Ansprache:

uoro e ällüs
sero totalla
sero lisarērē[1]
kometangatanga djolēai
vosatēiet.

Ferner ein Gesang beim Kettescheren (vergl. S. 364).

1. *i limgó uēlli uērái*
sámalopalú padjách
i savángair éalüs
a pethēlóng messigüj ē
5. *sabái thēréng ēlliéll*
sahatogullúi ēthēg
lēgēussepē mēngudj
dáugesōródjēthú
aútjegóiang le mēirüdj
10. *iualóng messimahoi*

oiangál auērái
kē thingválingi thērei
i sē vassengudj sasiut

Es wird der Faden der fortlaufenden Kette in der üblichen, aus der Zeichnung ersichtlichen Weise bei 1 anfangend hinter 2 und abwechselnd vor und hinter 3 gelegt und bei der Tür hinter 3 ist bei 2 die Litzenschnur eingelegt worden. Rechts von 4 kreuzt der Faden, nachdem er 4 umlaufen hat und kehrt rechts nach 1 zurück.

Die 7-streifige Frauenmatte, deren Kette hier vorbereitet wurde, bestand aus

weiß Hibiskus	*giliſei*	fein weiß Bananenfaden	*badj (udj)*
schwarz Hibiskus	*arier*	gröberes Bananengarn	*bāthadjik*

Soll eine andere Farbe in der Kette erscheinen, so wird zwischen Pflock 1 und 2 der Faden mit der kleinen, scharfen Muschel durchschnitten und das andere Garn angeknotet, z. B. beim Beginn der schwarzen Streifen. Auch werden schon bei Herstellung der Kette zwei weitere, fachbildende Stäbe in die Fäden eingelegt, um die bei Lamotrek S. 81 beschriebenen Schmuckmaschen innerhalb der schwarzen Streifen weben zu können. In Lamotrek geschah dies erst nach Aufbringung der Matte auf den Webstuhl.

Ist die Kette fertig, wird sie von zwei Frauen von den Pflöcken abgenommen und die Teile des Webstuhls treten an ihre Stelle. Beide Frauen sitzen sich gegenüber, beider Fußsohlen berühren rechts und links von den Kettfäden den Trennstab, den sie so zwischen sich festhalten. Die Weberin hat inzwischen das

[1] Webereigöttin s. S. 147.

vordere Spannbrett eingefügt und mit dem Rückenhalter an sich befestigt, während die andere das hintere Spannbrett in Spannung festhält. Das Ordnen und Verteilen der Kettfäden nimmt ziemlich Zeit in Anspruch, bis als erster Schuß ein flacher Bambussplitter eingelegt wird. Ein zweiter folgt beim nächsten Fach, und an diesen steifen Einlagen wird, mit der Handspanne abmessend, die Breite der Matte bestimmt und die Fäden gleichmäßig geordnet. Noch ein paar Einlagen von dickem Bast folgen und erhalten dies Gewebe in der richtigen Breite. Dann wird richtig mit dem Faden gewoben. Das Gestell ist auf Feis einfach wie auf den meisten Inseln, ein paar lange Pflöcke oder Stäbe, an denen

Abb. 171. Am Webstuhl.

das hintere Spannbrett befestigt wird, ein dickerer Stamm oder Balken darunter zum Anstäubern der Füße beim Weben, Abb. 171.

Die reichgemusterten Männerbinden *madji* sind aus feinem Bananengarn, durchweg in Leinenbindung gewebt; Anfang und Ende schmücken durchgeflochtene Muster aus tiefschwarzem Hibiskusbast in ansehnlicher Breite.

Um sich das Abzählen der Fäden zu erleichtern, haben die Frauen flache Stäbe in gewisser Ordnung eingelegt, die sich beim Weben nach hinten schieben lassen. Ist der helle Schußfaden durchgeholt und angeschlagen, kommt der Flachstab mit den abgezählten Fäden, nach vorn und die Weberin kann, das Muster danach

berechnend, hurtig den schwarzen Bast durchziehen. Nachdem der Flachstab zurückging, folgt das andere Webefach und ein neuer, heller Schuß, dann wird wieder der schwarze Bast im Muster durchgeflochten etc.

Die Matten sind gleich denen von Oleai, Taf. 20, nur sind die der Frauen zum Teil noch feiner. Eine vergrößerte Probe zeigt Taf. 26g von

Kr. 145 = 29291I Mannmattenkleid *guludj*, *uludj* (Kr. 203, 206)
Kr. 146 = 29301I ornamentierte Männermatte *madji*.
Kr. 147 *gilifei* gröbere Frauenmatte aus „Hibiscus".
Kr. 199 *gilifei*, Frauenmatte, mit Gelbwurz gefärbt.
Kr. 205 *gilifei* aus Hibiscus mit weißen Bananenstreifen.
Kr. 207 Feinste Männermatte, alt, als Umschlag.

5. Handel.

Tauschhandel *gälhilthil fangál*, Zwischenhandel *vul*.

Inefel von Yap ist der Besitzer aller östlichen Inseln, also gehört der Boden von Feis ihm (S. 361). Für die Benutzung des Landes bezahlen die Feisuner Kleidmatten, Gürtel, Tabak, Schnur, Tauwerk usw. Im Oktober holt Mogemog in Booten den Tribut. Bei der Navigation S. 367 ist zusammengefaßt, wie seit langer Zeit Mogemog den Handel zwischen Yap und den Ostinseln zu monopolisieren versucht hat. Sogar Oleai scheint meist nur bis Feis gekommen zu sein, wenigstens zu gewissen Zeiten (S. 250)[1].

Lamotrek bringt aber seine Kästen *(dafedaf)*, Kleidmatten *(djör)*, Schnur *(gólogol)* usw. nach Oleai.

Die Ost-Koralleninseln bekamen von Yap Kämme, Täschchen *(gaigadj)*, Gelbwurz, Tontöpfe, europäische Sachen, Tabak usw., so daß es sich also nicht um einen reinen Tribut, sondern um Tausch handelt, bei dem aber den Ostinseln die Initiative obliegt.

Man glaubt, falls der Tribut nicht gegeben wird, erkranken alle Menschen und sterben (s. Gesch. der Lorop.).

Mogemog holte von Sórol kleine Boote, Kleidmatten, Holzschüsseln, Ruder usw.; Aurupeg bringt nach Oleai rote Muschelscheibchen *gau*, Oleai bringt alles nach Feis, auch nach Mogemog und Uáp. Die Truksachen werden von Póloat abgeholt, ebenso die von Sêtoval; Pollap s. Bd. 6 I S. 259; auch Lamotrek holt von Sêtoval und bringt die Sachen nach Ifaluk und Oleai; Oleai bringt, wie erwähnt nach Feis, von wo sie durch Mogemog abgeholt wurden.

---

[1] Auch in Bd. 2 Yap S. 287 heißt es, daß die Inseln Áyái (Feis) und Sórol die Nautik *pelú* heute noch nicht besitzen; ihre Bewohner werden von Kapitänen aus Ugoi (Mogemog) abgeholt. Tsuk (Truk), Lámurig (Lámotrek) und Sftauon (Sêtoval) sollen die Kunst erst neuerdings von Volovót (Póloat) erhalten haben. Das ist natürlich Yap-Auffassung!

Die Frage, ob es sich um einen Tribut an Yap handelt, ist S. 82 schon angeschnitten. Zweifellos zeigen die unten angegebenen Mythen, daß Yóngelap (S. 144) und Yélafadj mit Yap stark verbunden waren, und daß also die Gaben als Opfer an die Götter oder als Tribute an die Oberpriester aufzufassen sind. Daß diese Auffassung nicht an allen Plätzen der Centralkarolinen die gleiche war und daß zeitweise Schwankungen des Pflichtgefühls vorkamen, ist naheliegend. So ist auch die Ansicht berechtigt, daß die Waren nur auf dem Handelswege nach Yap gelangten. Aber daß alle gerade nach Yap lieferten, und nicht nach Truk oder Ponape oder Saipan, diesem Drang liegen doch sicher die Götter zugrunde.

Daß auf Yap die verschiedenen Inseln, trotz des Monopols von Mogemog, ihr eigenes Land hatten, wurde früher schon erwähnt (Truk S. 301[8]). Es war auch genau abgeteilt, wohin die Gaben der einzelnen Inseln der Centralkarolinen gingen, wovon ich schon auf Oleai S. 251 einige Angaben bekam; wie gut dort die Namen Inefel, Fólăvu (Yap Taf. 5[4] Gólevu), Bugilrou, also von Oleai 1909, mit meinen Aufnahmen in Yap 1907 (Yap S. 379) übereinstimmen, beweist schon allein die genaue Fühlung unter den Inseln.

Auf Feis hörte ich nun folgende Empfänger auf Yap: Fólabu (Fólevu von Gagil) und Inefel von Delipébinau gelten als gleich angesehen und stark; sie empfangen aber nicht selbst die Waren, sondern jeder Ankömmling bringt sie in ein bestimmtes Haus. Dies gilt auch für die andern.

Empfänger:	Lieferer:
Fólabu und Búgilrou	Jórepig (Aurepik) und von Oleai (s. S. 251) Sóluap, Sógolap (Tagaulap) und das Dorf Jefang auf Voléa.
Inefel	von Ululsi: Mógemog und Fáterai; ½ Ifaluk; von Oleai: Raur, Távagap auf Máriong und Unamarai
Rúebong (Yap Taf. 5[3])	½ Ifaluk; ½ Sórol; Namodjek, Elato, Olimaráu; Sĕtowan; Póloat; Pollap; Truk; Pikĕlo, Pikelot; Saipen[1].
Rúngun in Gádjebar	½ Sórol
Manefel in Oneán	Feis.
Gádjebar und Oneán	Falálap (Mógemog).

Wie diese Verteilung kam, ist schwer auszumachen. Es wurde erzählt, daß die Ostinseln allen verschiedenen Familien von Yap gehört hätten, weil nämlich der Gott Yóngelap alles ausgeteilt habe. So wären also die Koralleninseln alle unter

[1] Ob Saipan damit gemeint ist, war nicht auszumachen; Sĕpen wird auch ein früheres Atoll Gáferudj genannt, angeblich das Hunter-Riff, 24 Sm NNO von Yap, 1791 zuerst gemeldet (S.-H. S. 46), mit 30 m Wassertiefe; W. Müller (Yap S. 304) nennt Sĕpín eine versunkene Zauberinsel, die mit Rumung kulturell zusammenhing; vielleicht liegen hier die Verhältnisse ebenso, wie bei Ngáruangal und Palau (II S. 45).

Yap'scher Botmäßigkeit gewesen[1]. Nur Feis habe Land verkaufen können, ohne zu fragen; es mußte nur dem Inefel dann einen Teil davon abgeben, der dann weiter verteilte (s. den Beginn).

Senfft 1905 schreibt, daß alljährlich zur Zeit des Nordostmonsuns, also ungefähr in den Monaten Dezember bis Juni Leute aus Osten, insbesondere von Feis und Ululsi eintreffen, um ihrem in Gatschbar wohnenden Suzerän, in dem sie gleichzeitig eine Art Hohepriester erblicken, ihren Gehorsam zu beweisen und Tribut abzuliefern. Beim Eintreffen seien sie einer Art von Quarantäne unterworfen, indem sie 4—5 Tage in einem großen, auf dem Riff errichteten Hause bleiben müssen[2]. Am 12. Juni 1904 sah S. die Versammlung. Der Priester saß gelb bemalt auf Steinplattform, einen Blumenkranz auf dem Kopf, neben sich den unteren Teil eines Kokoswedels und eine alte Kokosnuß. Auf einer Seite saß ein Jüngling mit Tritonshorn, auf dem Boden eine große Schar festlich mit Hibiskusblumen, Gelbwurz und bunten Grasröcken geschmückter Männer und Frauen. Zuerst setzte sich ein hoher Eingeborener dem Priester gegenüber; er betupfte ihn mit Farbe aus einer hohlen Betelnuß auf Stirn, Wangen, Brust und Rücken unter Gebetshersage, damit der Fremde vor übler Nachrede auf Yap und später in seiner Heimat geschützt sei. Dann sprach der Priester seine Gebete mit lauter, abgehackter Stimme und pflückte dabei von den Kokosfiedern; endlich schrie er mit „sich überhastender Stimme einen endlosen Satz, nachdem er die Rippe (Wedelstil Kr.) mit der alten, in Kokosschleifen gekleideten Kokosnuß, vertauscht hatte und schloß mit einigen lauten Rufen, zu denen sein Nachbar in die Muschel (Schnecke Kr.) blies. In diesem Augenblick erhob sich alles und schrie mit Lungenkraft, während die Frauen mit Stöcken und Kokosrippen auf die Steine, den Erdboden und die Bäume schlugen."

Der Priester verließ nun seinen Platz und begab sich, gefolgt von der Menge, an das Meeresufer, wo die Kanus auf dem Strande lagen. Er bestieg eins nach dem andern und klopfte je dreimal mit dem Zweige einer in Yap *dschiṭis (seṭiṭ* gelber Zingiber Kr.) genannten Pflanze auf den Rand und Mast; dann warf er den Zweig fort, löste die Schleifen der Kokosnuß und berührte mit ihr gleichfalls dreimal Rumpf und Mast. Für jedes Fahrzeug wurde ein neuer Zweig und eine andere Nuß gebraucht. Immer wenn er ein Kanu verlassen hatte, bestiegen es einige Männer, hoben den Mast aus der Öse und legten ihn längsseits nieder. Der ganze Vorgang wurde durch ununterbrochenes Schreien, durch das sich besonders die Weiber auszeichneten, begleitet. Damit war die Kanuweihe in

[1] Senfft 1905 schreibt: »Eine Reihe der zahlreichen Inseln des Ululsi-Atolls gehört Eingeborenen der Dörfer Gatschbar und Onean, und diese pflegen den Ululsileuten auch die Fahrzeuge zu den Besuchsreisen zu liefern«.

[2] Von W. Müller (Yap S. 300) als Mißverständnis erklärt; er sagte vorher: »In Gagil bleiben die Central-Karolinier, wenn sie den Riffeinlaß Gofenú passiert haben, noch vier Tage lang vor Rikén in ihren Booten«.

Onean beendet, und die Teilnehmer begaben sich nach dem benachbarten Orte Gatschbar, wo sich das Schauspiel wiederholte.

Als Priester war ein Mann aus dem Dorfe Riken[1] tätig. Die Beschwörungsformeln bestehen aus nur ihm bekannten Worten, die er von seinem Vater, der den gleichen Beruf versah, gelernt hat. Nur diesem einen Mann kompetiert die Weihe des Kanus, obschon er von niederer Herkunft ist; denn es besteht der Glaube, daß jeder, der ihm ins Handwerk pfuschen wollte, nach 10 Tagen stürbe. Für seine Verrichtungen erhielt er reiche Bezahlung in Matten und Perlschalen. Der Zweck der Zeremonie ist, die Orte vor Ansteckung zu schützen, vor allem vor Ringwurm und anderen Hautkrankheiten, sowie Augenerkrankungen[2]. Nach ihrer Beendigung steht den Ankömmlingen der Besuch der ganzen Insel Yap frei.

Die Fremden verweilen nun dort, bis westliche Winde einsetzen. Vor Antritt der Heimreise werden wiederum bestimmte Formeln beobachtet. Die Führer der einzelnen Kanus nehmen in die eine Hand einen brennenden Kokoswedel, in die andere einen Zweig des in Yap *ngäl* (wohl *gall* Hibiskus Kr.) und schlagen mit dem Zweig auf den Wedel, während die Kanusteuerer in die Signalmuscheln blasen. Wenn nach diesem Vorgange zwei Tage hintereinander günstiger Wind weht und wenn die Auguria günstig sind, treten sie die Rückreise unter dem Oberbefehl eines besonderen erfahrenen Seemannes an. Draußen auf offener See kommen später auf ein gegebenes Signal sämtliche Fahrzeuge zu dem Kanu des Oberführers, der nun nochmals durch Beklopfen der Masten, Segel und Steuer eine günstige Fahrt herbeizuführen sucht. Bei der Ankunft auf der Insel Ululsi wird wieder eine Art Quarantäne abgehalten. Vier Tage ist den Rückkehrenden das Betreten der Häuser und das Klettern auf Kokospalmen verboten; am letzten Tage der Frist schminken sie sich den Körper mit Gelbwurz und veranstalten ein großes Essen; danach wird durch verschiedene Manipulationen mit einem Kokosblatt die Insel vor Ansteckung geschützt und ihr Betreten den Ankömmlingen freigegeben. — Es stimmt dies alles mit dem schon Mitgeteilten im großen und ganzen überein. Von Rúebong erfuhr ich noch auf Yap: Yap hatte früher viel Krieg. Wenn aber Mógemogleute kamen, hörte der Kampf auf; denn kein Yaper darf einen Mogemogmann schlagen, weil beide Kinder des Éongelap sind, wie ja auch die Yaplandschaften Gagil, Tomil und Gorror deshalb eins sind; die übrigen Yaper sind Söhne der Brüder von Éongelap (S. 116[b]), wie Gesch. 1 es zeigt.

[1] W. Müller (Yap S. 300) sagte es sei der Priester Moón von Riken, der allein diese Art von Zauberei betreibt, einen Zauber *tamalas e ñan*, um die Hochseedämonen *yolóu* am Betreten des Landes zu hindern. Gad;ebar, Oneán und Rikén an der Ostseite der Teilinsel Gagil, die Eingangspforte der Fremden, s. Karte bei A. Kr. 1908.

[2] Vor allem auch vor dem Eindringen der Seegeister, wie schon W. M. betonte, die sich an Bord der Boote zu verbergen pflegen.

Tauschwerte.

5 Körbe Bataten für eine *gilifei*-Matte (Korb ½ Klafter lang)
4—5 Körbe Bataten für eine *goludj*-Matte
5 Körbe Bataten für eine *madji*-Matte.
1 *reng* (Gelbwurzfärbe von Kokosnußgröße) = 3 Korb Bataten.
einhundert Faden Schnur = 1 Korb Bataten.

Das Tragen von Lasten.

Traglast *godjóar*.

In der Hand tragen z. B. Korb *djúledjul*
Frauen: auf Kopf tragen *gádjem*
auf den Seiten *iéfief*
auf dem Rücken, *gadjoi*
auch am Stock.
Männer tragen auf der Schulter *fafár*
zwei Männer tragen an einer Stange *galuetág*.

6. Maaße.

1 Klafter *tagureſá*, *sángaf*
½ Klafter *sosolóp*
1½ Klafter *tagoriangáf*
1 Handspanne *séang*, zwischen Kanubindelöchern *djédje*
½ Handspanne *togoséang* (Daumenspitze und Zeigefingerknöchel)
2 Spannen *rúsang*
3 Spannen *thelúang*
bis Handgelenk *sabadjálem*
bis Ellbogen *samallú*
bis 2 Ellbogen *samallú palling*
bis Arm *sapái*
bis 2. Schulter *sévar* (½ Klafter + ½ Brust).

7. Haus.

(Vgl. Farbtafel 3 und Tafel 23, 24 und 25.)

Die Boothäuser und Wohnhäuser lehnen sich ganz an Oleai und Yap an, nur daß besonders letztere einige Eigenarten haben. Farbtafel 3 zeigt die Form und die Häufung in einem Gehöft vortrefflich.

Die Wohnhäuser mit offenem und verdecktem Giebel s. offen Taf. 24a, verdeckt Abb. 172.

In Gehöften s. Plan 3 und Taf. 23.

a) Hausarten.

Schuppen klein, sehr einfach Abb. 175.

b) Hausbau *gángalim*.

Wohnhaus, Inneres Abb. 176.

Zuerst werden die 4 Steinpfosten *sur elim* aufgestellt, auf denen die 2 Längsarmenbalken *thafél elop* lagern; auf diese kommen an den Enden die 2 Quer-

Abb. 176. Wohnhaus, zwei der vier Steinpfosten sichtbar

ramenbalken *godjóm* auf diesen stehen die beiden Stuhlsäulen *surethai*, auf denen der Firstbalken *unga lap* lagert. Auf dem großen Firstbalken und den Längsramenbalken liegen die großen Innensparren *uóu*, die durch eine Diagonalpfette *eélobei* (s. Truk S. 219) in ihrer Lage gehalten werden.

Auf und über den Sparrenspitzen lagert die kleine obere Firststange *unga djik*. Auf den Sparren lagern ferner abwärts die Pfetten *gápangag*. Über denen sind wieder kleinere Außensparren *gath*, und über diesen ist die dritte Firststange *sogolemál*. An den Außensparren bindet man die Dachblätter *eás* an[1]. Auf den First oben kommen Kokosmatten *ung*, die mit Stäben *thóu* festgesteckt werden (Abb. 173).

Der Verandenvorbau *matál i im*[2] erfordert auch eine Dachverlängerung, ein Vordach *tíbau* (Lam. S. 89), Abb. 177.

Dafür wird der kleine Firstbalken *ungadjik* verlängert, und ebenso springen die Pfetten vor, oben weiter wie unten, wo der verlängerte aber viel dünnere Längsramen *likolog* recht klein ist. Deshalb sind auch hier die drei Außensparren *gath* (die Innensparren fehlen) unten recht eng nebeneinander, während sie oben weit voneinander abstehen. An den Enden des kleinen Firstbalken und der Pfetten ist eine Grenzlatte *eáfel*, und zwar gedoppelt, da sie die Enden der Hölzer von innen und außen durch einen Bund sichert; und stößt sie auf das Ende des *likilog*, das durch einen Pfosten *sur e likilog* unterstützt wird. Auf der Farbtafel 3 sieht man dies recht gut.

Abb. 177. Vordach.

Es wird aber noch eine Verlängerung angebracht, damit das Vordach recht weit ausladet, wie Abb. 177 es vortrefflich an den Boothäusern des Strandes zeigt. Da das Dachgerüst dadurch zu schwer würde, werden die Pfetten nicht mehr verlängert; statt ihrer nimmt man drei Paare von kurzen Stäben *matalios*, die man einfach an das bisherige Dach schräg so anbindet, daß ihre Enden nach oben zeigen. Man verbindet sie untereinander durch zwei sparrenartige auch *matalios* genannten, schon recht schief stehende Stangen, die oben an eine Verlängerung der obersten 3. Firststange *sogolemál* anstoßen, unten an die Stange *iapúg* (mit

[1] Meist aus Kokosfiedern, die nur 1 Jahr halten. Dach *tíalim*.
[2] vorne *matalim litamálle*, hinten *m. malatwolár*.

ɛaffiaiapug, wenn eine Randbegrenzung wie *dafal* vorhanden); sie liegt meist etwas tiefer als die *lihiog*. Ist die Veranda ganz abgedeckt, kielförmig, so heißen die verlängerten Längsramenbalken, hier beiderseits schief nach vorne springend und zusammenstoßend, *sɔgolɛi*.

Die Bodenramenstangen heißen alle *tā*. Jetzt steht die Firstspitze so weit vor, daß sie durch einen Pfosten in ganzer Haushöhe unterstützt werden muß, den

Abb. 178. Innenraum eines Nichtplankenhauses.

sur ɛ lungedjek (s. S. 252) Farbtafel 3 zeigt das Kulthaus offen, aber die Wohnhäuser abgedeckt. In die Deckung muß dann die Tür gemacht werden, durch zwei Türpfosten *thīg*, namentlich wenn kein Plankenraum vorhanden ist, wie Abb. 178 zeigt.

Die Plankentüre *pillat* (Türöffnung *gátam)* zeigt auf Feis eine recht gute Ausbildung Abb. 179. Oben hat sie einen Falz *djimal ɛ pillat*, und unten hat sie Schlaufen *talenga mālil*, in die ein Querstab *vángel* gesteckt wird. Es können 6 Türen in einem Haus sein, je 2 an der Giebelseite, und je 1 an der Traufenseite.

Abb. 179.

Türe djimalepilat

Beim Einsetzen der Giebelmatten *bing (gili)* (bei fehlendem Vordach) und Auflegen der Firstmatten *ung* werden besondere Gebräuche beobachtet.

Der Bauherr sagt zu seinen Leuten, sie sollen Essen bringen, denn er wolle einen *volevol*-Zauber machen[1]; und die Familie pflegt sich einzufinden.

Das bereitete Essen wird vor der Veranda auf die Erde gelegt. Der Herr macht eine Giebelmatte fest und sagt zu einem andern, er solle eine angezündete Blütenscheide *gäkal* bringen. Ehe dieser kommt, nimmt er einen *ĕar*-Zweig, schlägt mit ihm die Matte und singt:

go selĕ Lugéileng, Lugéileng	Bitte L. L. (S. 144).
valengăi imel'lĕ imei	mach glücklich dies Haus, mein Haus;
uĕthog mongai	es komme das Essen
uĕthog uállŭ	bringt junge Kokosnüsse,
uĕthog ig	bringt Fische
ngaliĕi vălei	für mich heute!

Darauf steckt er den Zweig an den Giebel, nimmt dem Bringer des Feuers dieses ab, und schwenkt es vor dem Giebel hin und her, damit die bösen Geister entweichen.

Dazu spricht er:

go selĕle gafief	Ich schwenke das Feuer nach links,	
mogotomĕi legafief	ich schwenke das Feuer nach rechts;	
gugŭ pără	grulender Donner	*par* Donner
gogŏ pară	grollender Donner,	
i ĕlemagĕi fefisegálodj	die bösen Geister gehen weg,	
ealusŭllu metál im ellĕ	die Geister im Giebel dieses Hauses.	*metál* sein Auge, Giebel.
i ĕlemagĕi fefisegálog malătamăi	die Geister im Giebel dieses Hauses, die kleinen Tiere,	d. h. ihr übles Gerede

[1] *i tolevolengai imue* ich mache Zauber *(volevol)* für dieses Haus s. S. 89, 107, 110, 151.

i llemagil fefisegálog mathpil die Geister im Giebel dieses Hauses, das Gerede *maipil* s. S. 359

thiolog ĕ thiolog ĕ thiolog geht weg, geht weg, geht weg!

Zuletzt bringt er das Feuer ins Haus zum Feuerplatz, wo das erste Feuer entzündet wird. Darauf wird die gelöschte *gaudí*-Blütenscheide Abb. 180 auch an den Giebel gesteckt. Dann folgt die Essensausteilung an Handwerker und Familie.

Abb. 180. Gebrannte Kokosblütenscheide.

Schnur zum Binden *gólogol*
Ofen *ûm*, Herd *lim*
Wand (Brett) *seŏáb*, *us* (Pandanuswurzel)
Steineinfassung des Vorplatzes *odjodj*, bestreut mit Korallengrus *vassémag* Abb. 173
Umzäunung *óror*
Schlafstelle *liliei* (mein...)
alle Plätze *giegi* (Truk S. 162 *fáng* heißt ein Wandbord in der Veranda s. S. 89 und 98).
Kopfstütze *lúlung*
Feuerfächer *félang* (Abb. 168)
Brunnen *djál*
Kehrichthaufen *bés*
Unkraut jäten *tartar volúel*.

c) Bootshäuser.

Die **Boothäuser** *fal* werden angeblich ohne Zauberhandlungen gebaut. Das Dorf Ilotóu liefert das Essen, während Ledjódjoi und Falióu die Bäume schlagen und das Holz bearbeiten. Die Schnur wird von allen dreien angefertigt. Nach der Vollendung macht Ilotou das große Essen *galiengáng*, das es den beiden andern zusendet.

Der Vorraum des Boothauses heißt *rágarag* Abb. 181. Auf dem Bild sieht man links den Querramenbalken *godjom* (Truk S. 220 *audjam*) auf dem Längsramenbalken lagern. Dazu kommt zur Verstärkung der im offenen Winde liegenden Häuser (Abb. 135) ein zweiter Ramen außen vom ersten mit dem Längsbalken *moth* und dem Querbalken *godjom e le moth*. Das Bootshaus vertritt hier das Männerhaus s. S. 359, 360.

d) Hausrat.

Beim **Hausrat** sei auf die quadratisch geformten **Herde** in den Wohnhäusern aufmerksam gemacht, und die Matten die den Kieselboden bedecken. Abb. 176 und 178.

Abb. 181. Boothaus.

8. Boote.

Das Bild Abb. 135 zeigt die Hochseeboote *valivei*[1], wie sie von den frühern Inseln bekannt sind.

Die Gabelschwanzgallion (s. S. 149) wird hier *bar* genannt Yap *berur)*; auch als Schwanz des Fregattvogels *ataf* gedeutet.

Die Fischerboote haben auf dem Ausleger anstelle des *fáraf*-Brettes einen viereckigen Trog Abb. 182a (Truk S. 230) für die Fischleinen, Steine usw.

Luvwärts ruht er und ist begrenzt durch einen Querstab *varóro*, dessen über den Auslegerbalken *kio* hinausragenden Enden zum Tragen des Bootes dienen.

Luvwärts davon ist eine Gräting *eálau*[2], dann ist der Raum zwischen den *kio* offen, bis der Querstab *vasidjel* kommt, an den der innere Teil des Schwimmers *tham* angelascht ist. Die äußere Abdachung des *tham* hat auch einen Lochsteg, der mit dem äußeren Gabelpflock *láf* verschnürt ist (s. Abb. 182b); die beiden äußeren Pflöcke *láf* sind durch eine Stange *eólovei*[3] verbunden, damit sie feststehen,

[1] *ól* Boot, *vei* s. S. 159 Anm. 1.

[2] Luvgräting in Lamotrek *fáng*, s. S. 98; für die Ramung der Gräting hörte ich aber: Längshölzer *tilang ali feng*, winkelförmiges Querholz *ioi oli feng*.

[3] ...*vei* auf Abb. a ist Schreibfehler.

und ebenso geht von den beiden *kio* innerhalb von *vasidjel* je ein gebogener Stab *abidjé* herunter zu dem vorderen und dem hinteren Pflockpaar. Die Verschnürung heißt *tötö;* es sollen immer 6 Turen sein.

Das Ruder *fatuloilül* zeigt Abb. 182c.

Abb. 182a—c. Ausleger.

Abb. 183. Zeremonialaxt.

Kiel	*bull*	Segel	*ui*
Planke	*bäb*	Steinanker	*limetag*
Ruderbank	*dö*	Ruder	*fatuloilül*
Paddel	*fáthelt*	Ösfaß	*gámat*

Kochstelle eine Kiste mit Steinen *faláng ali gap*
Matten zum Auffangen von Regenwasser und Bootbedecken am Strand *giegi*.
Schnürung des *kio* an der Leeseite *olotarao kio*
Verschnürung der Bootleibplanken *ëágoëóg*.

Bootbau.

Wie auf Lamotrek (S. 92), so wird auch auf Feis das Bootbehauen mit einer Zeremonialaxt *gï*, begonnen (Abb. 183 Kr. 122 : 29061I, 42 cm lang), die geschmückt ist mit Kokosfiederknoten. Der Stil *mol* wurde neu gefertigt von Lengálemar, dem Großvater des jetzigen Hausherrn von Dapirë (H. Nr. 21). Die Axt selbst von dessen Großvater Eálamathaü. Beim Bootbau wird erst mit dieser begonnen,

Abb. 184. Zauberbemalung.

unter Zaubersprüchen, dann darf mit andern Äxten gearbeitet werden. Die *uvuth*-Knoten (s. Lam. S. 154) werden immer neu gemacht, um die Ahnen gutzustimmen. Es gilt als heiliger Schmuck *volial*.

Folgendes ist ein Gebet, wobei der Sprecher einen Flecken mit Gelb oder Rot über die Nasenwurzel malt (Abb. 184, *rang ale pálui* genannt, da die Bemalung auch für die Schiffsführer *palui* zutrifft:

fariga malóm gel e Solang	Sei gütig du Solang	beide Götter S. 144
ma gel Lugēileng	und du Lugēileng	
go lovüē vāte i feléfāla.	Glück soll schnell kommen durch Behauen.	

volebu Glück, *petég* Geld, *fálafal* Behauen soll heißen: wenn das Boot fertig ist, soll es schnell gegen Geld verkauft werden, oder man soll mit ihm Glück haben z. B. auf See, durch Fang eines großen Fisches usw. Schon beim Maaß nehmen mit einer Zeremonialschnur *talúa* (E. Kr. *sölang*[1]) (Taf. 26 h Kr. 125 : 29091I) werden Gebete, ähnlich dem vorigen, gesprochen; sie ist rot gefärbt; gespannt und anschlagend hinterläßt sie einen Strich (s. Palau III S. 187). Gebetet wird, während sie, von 2 Leuten gehalten, liegt. Dann erst beginnt der erste Schlag mit der Zeremonialaxt.

[1] Wohl nach dem Gotte Solang s. o.

359

IV. Geistige Kultur.

1. Gesellschaft.

a) Familie *djolóp, djolebúgetal.*

Frau folgt dem Mann, aber Stellung der Frau sehr begünstigt. Mertens (Truk S. 451) erzählt, daß die Frauen scharf widersprachen, als die Männer beim Tauschhandel die schön geschmückten Matten weggeben wollten, worauf der Handel nicht zustande kam. Eine Verstimmung sei aber nicht daraus erwachsen. Sie kamen auch selbständig an Bord wie auf Oleai, ohne sich aber mit den Männern einzulassen.

Worte über Familie Nr. 612ff. (S. 402ff.).

Worte von E. Kr.: Geburt *fam*, Hilfe dabei *rékufath*, Helferinnen *djole gadjāū*, Nachgeburt *pai*.

Die Wöchnerin verweilt 10 Tage im Frauenhaus.

Es wird täglich vor dem Essen gebetet; ein Gebet *(maipil uedi* Ansprache meine) lautet:

agēle mele tamdi	An dich mein Vater,	*mde* Partikel? gestorben
agēle mele sillē	an dich meine Mutter,	s. Nr. 620ff. gestorben
agēle mele uithi	an dich mein Bruder,	gestorben
agēle mele mēangai	an dich meine Schwester,	wende ich mich; gestorben
go le vūaeēi	seid gut zu mir,	*isēolovú* ich finde; ihr macht mich gut.
go fanga tota vágalai	ihr gebt mir ein wenig Essen!	*go vo ngalēei tot gálei* ihr gebt mir ein wenig Essensteil!

Heirat *riri.* (Exogamie S. 318).

Versprechung schon sehr früh, die Kinder bleiben bei den Eltern. Beim Verspruch holen die Eltern des Knaben viele alte und junge Kokosnüsse, die Mutter der Braut bringt Bataten, Taro usw.; Auswechseln der Nahrung. Wenn das Mädchen zum erstenmal aus dem Bluthaus kommt, geht sie ins Haus der Männer und bleibt bei ihrem Verlobten. Nach 2—3 Tagen gehen sie ins Haus der Brauteltern, bleiben einige Tage dort, um dann ins Haus der Manneseltern zu ziehen. Nach 2—3 Monaten hat [illegible] ein kleines Haus für beide gemacht. Vorher geht der

junge Mann den Tag über ins Boothaus, und die junge Frau zu ihren Eltern. Im Boothaus schläft der Ehemann, wenn seine Frau im Bluthaus ist; dort schlafen auch die Junggesellen und Fremden.

Beschneidung s. Oleai S. 269.

Geburt *fam.*

In Hockerstellung. Alles hilft mit Zaubersprüchen und Arznei *rékufath*. 2—3. Helfer bei der Geburt; Hebamme *djole gadjâu*. Der Nabelstrang wird mitten gefaßt, auf das Kind zu abgestrichen, dort geknotet und mit Bambus abgeschnitten. Meist kommt die Frau im Wohnhaus nieder, geht dann mit dem Kind ins *imëlipël*, wo sie 10 Tage bleibt. Die Wöchnerin schläft viel, während ihre Mutter, oder eine nahe Verwandte, nach dem Kinde sieht. Das Kind bekommt erst Kokospreßmilch, erst nach ca. 12 Stunden die Brust.

Sippen.

Auf Feis wurden mir folgende Höfe (s. S. 312) als Sippen *ainang* genannt und zwar als große *lab*

1. Mataliefang H. 7
2. Iper H. 20
3. Faipar H. 32
4. Pëmathol H. 23
5. Dápirë H. 21

als kleine *vadjidj*

6. Limataefoi (Lematêfoi) H. 14
7. Faliou H. 13
8. Farërep (Berérep) H. 2
9. Faludj H. 10
10. Béior H. 4 u. 5
11. Thangadjik (Sangadjeg) H. 6
12. Falegúrugur H. 26
13. Uothol H. 27
14. Ilefal (Lífal H. 30 u. 31?)
15. Morodj H. 18
16. Bémai H. 33
17. Itérau H. 16

Während die Sippen von Oleai S. 86 noch deutliche Beziehungen zu Truk zeigen, wenigstens 2 —3 von den 6 noch zu Truk gehören, hören auf Feis die östlichen Beziehungen hierin völlig auf. Die Gebundenheit der Sippen an die Höfe erinnert an ähnliche Bildungen, die *klebliil* auf Palau, wie Palau III S. 260 und 359ff. zu sehen. Auf **Ululsi** und **Yap** sollen folgende Sippen vorhanden sein:

Fasülüs *laṗ* = Yap Bëbinau
Lomerui *laṗ* = Yap Marelo
Falemei *laṗ* ..... Bëbinau
Lómadag *laṗ* ..... Bëbinau
Falegalau *laṗ* .... Bëbinau
Lugofälü *vadjidj* .. Márelo
Falegiiifei *vadjidj* . Mëriung

b) Häuptling *tamól*.

Er hält auf Ordnung, sorgt z. B. auch dafür, daß keine zu jungen Früchte geerntet werden, um die Ernährung auf der Insel zu sichern. Das Graben der Pfeilwurz ordnet er an (s. S. 332). In Wirklichkeit gehört das Land alles dem Inefel in Gadjabar (s. S. 345). Als Häuptlingstabu = *ealól tamól* gelten:

Niemand soll stehlen.
Niemand soll andere Leute schlagen.
Niemand soll Fischkörbe nehmen, außer auf des Häuptlings Geheiß.
Wenn er Fischen anordnet, geht alles trotz Wind und Wetter.
Was er sagt, wird ausgeführt.
Kokostabu kann er nicht machen, weil sonst alles stürbe.
Stärke *(mogemog)* ist tabu für Fischer und Seefahrer.

Der Oberhäuptling von Ledjodjoi gilt als Vater der Dorfschaft; von Tulei hieß es: Tulei *tamer re* Ledjodjoi, Tulei *eámi tamól pálling* = T. ist Vater von L., T. ist euer Großhäuptling.

c) Recht.

Erbrecht *mál*[1].
Totschlag *livémés*[2].
leihen *ivagási* *isagatafálithog*
ich nehme ich gebe zurück.

Beschimpfung *sik*:	*djábil e vuriel sil*	Arschbacken seiner Mutter[3]!
	beága sillom	Kot deiner Mutter!
	go vō	du stinkst!

Vergeltung durch Wiederbeschimpfung; bei Schlägen verhindern die Anwesenden s. S. 116.
Ehebruch *berafangali*.

d) Krieg *maul*.

Immer Frieden *siagamál*.
Freund *marierēi*.

---

[1] *sames tamei i saimeli imal, go saimeli.*
tot Vater, es gehört mir sein Haus; du erbst.
[2] *li* Schlag, z. B. *li bavuilavémes* Schlage das Schwein tot.
[3] s. A. Kr. Hawaii, Ostmikronesien und Samoa S. 320 und 336.

e) Tod und Bestattung.

Die Gräber sind bei den Häusern, s. Plan 13. Abb. 185 zeigt, wie die Einfriedigung mit Korallenplatten geschieht (s. auch Taf. 23c). Dies z. B. bei Haus Falekil Nr. 19.

Aufnahme von E. Kr. nach Beobachtung (s. Abb. 186): Der Tote lag in einem Wohnhause auf einer groben und einer feinen Matte, etwa 7—8 Frauen um ihn herum. Sein Gesicht und seine Brust waren mit Streifen von rotem Reng (Gelbwurz) bemalt. Eine alte und zwei junge Frauen waren damit beschäftigt, unter einer großen rot gefärbten, feinen Trukmatte den After und die Harnröhre mit kleinen Gelbwurzstücken zu verstopfen. Erst reinigten sie die Gegenden mit

Abb. 185. Grab mit Steinplatten.

Kokoshüllen, stopften dann ein und bemalten auch die Umgebung. Dann wurde dem toten Manne eine schön rot durchschossene Matte mit prächtigen Mustern nach Mogemog-Art umgelegt und darüber kam eine feine Frauenmatte, darauf ein *táral*-Gürtel (s. S. 37, 225); ums Haar eine Halskette aus blauen Glasperlen, von E. Kr. gestiftet, ein kleiner grüner Kranz, und ins Haar ein Kamm mit mehreren schwarzen und weißen Federn, mit rot und einem Federbeleg nach Trukart umwunden (Truk Taf. 14b). Der Körper der Leiche wurde mit hellerem gelben Reng eingerieben und mit einer kleinen Matte[1] umhüllt, wobei der Oberkörper aufgerichtet ist. Die große gröbere Matte zu unterst bleibt dabei geöffnet. Er sitzt in der Hausveranda und wird dort betrauert. Eine Frau fing einen Gesang an unter Heulen und Jammern; alle fielen dann im Takt mit ein ...·/...·, im Viervierteltakt in kleiner Terz, das letzte Viertel in den Grundton zurückfallend. Zeitweise sangen sie mehrstimmig in kleinen Terzen; viele hatten Tränen in den Augen.

[1] Totenmatte aus Pandanus heißt *mogós*.

Darauf wurde noch viel Reng gestreut, auf die Beine, auf die hinteren Teile eine mißfarbene grauweiße Art, wohl ein Rückstand. Schließlich wurden grobe Matten fest um die Leiche gelegt, dann trugen die Frauen das Bündel zum Grabe, das, von Frauen begonnen, von Männern vertieft worden war, Taf. 25a, b, während die Frauen um die Leiche saßen. Dann wurde sie ins Grab gelegt, den Kopf

Abb. 186. Leiche des Rog H 1.

nach Osten. Als Beigabe legt man Körbe, Matten, Reng usw. auf das Bündel, dann wurde Erde darauf geworfen und festgetreten. Ein kleiner Grabhügel wurde gemacht und auf ihn eine Steinplatte gelegt, Grabhütte Taf. 25c. Dies geschah zwischen Dorf und Strand, wo ein kleiner Friedhof war. Danach Erbteilung Taf. 25d.

Ein Totengesang lautet:

1. *ibo tangidjek*	Ich will bei dir weinen,	
lai ʃēgē(rē) iĕlog	ich bin traurig	*isaʃogor* traurig
sari uĕ raruiĕmāl	darüber, und zwei Jünglinge,	

	marĕ thĕ veiĕlog	du gehst mit ihnen in den Grund.
5.	*thithoe limesel*	Du weißt nichts mehr,
	remĕi regăróp	wir legen dich hin
	rĕolóp ĕ biĕrép	und füllen Erde auf dich,
	rogói li sĕua	zwei Mann in einem Grab,
	ma sóual li ſagoiál	die zwei sind auch nicht vergessen,
10.	*dji ĕ mamĕ*	und nun stirbst auch du;
	i lo tangidjek	ich will weinen
	ĕ lo tangidjek ſangáng	ich will weinen, ich!

f) Tanz und Fest.

Tanz *varug* scheint nur gemacht zu werden, wenn der Häuptling Tulei von Yap heimkehrt; dann findet auch ein kleines Essen statt.

Der Tanzschmuck *vuliágedj* besteht in der Hauptsache aus jungen Kokosfiedern *úvuth* (S. 154). Tanzplatz am Sandstrand.

Ein Tanz, der zum Spiel überleitet, ist der Handschlagtanz[1] *gadjúedju*. Ich habe hier den Text des Gesanges durch wiederholte Aufnahme besonders genau aufnehmen können, so daß er als zuverlässig gelten darf. Als ich ihn in dieser Fassung mit erhobener Stimme vor dem Mitteiler Rong vorlas, rief er wiederholt *e álus, e álus* aus, also „ein Dämon", was ungefähr den Sinn von Hexerei hat. Der Text wird gern von Frauen beim Kettenscheren S. 343 gesungen. Das Lied soll im Traume durch einen *álus* vermittelt worden sein.

1.	*lemóu alí uĕrái*	Möchte meine Haut schön wie *mou*-Blätter sein,	*mou* gelb aussehend, schön wie brauner Mann.
	samalú palú padjăg	blendend wie Feuer	
	savangaĭr e alus	oder wie die dämonische Tatauierschwärze	*sávang* schwarz s. S. 327
	ĕ aga pethŏlong mesigidj	mit Öl eingerieben,	*loi* Öl, *mesigidj* einschmieren
5.	*sagai thĕréng alliol*	bemalt mit Reng wie Sonne;	*iol* = *eal* Sonne

[1] Auf Butaritari *dágauburs* genannt und beschrieben, A. Kr. 1906 S. 322; s. S. 366.

sagátaguluiëthāg	auf der Wange gedreht,	*tebal* seine Wange, *sagatagul* mit Rengstück Kreis auf Wange drehen.
legaúthĕp ĕ mángudj ,	die Wange noch glatt.	*legauth* Wange, *mángudj* glatt, *mĕrĕrei* jung mit glatter Haut.
taugesoródj thī	Am Morgen kommt der Dämon und betört die Leute,	
a udjegoiáng le móirudj	er hat Curcuma in der Hand	*iúngedjik* Art Curcuma.
10. *ie melóm mesí módj*	er reibt alle Leute damit ein[1], und pflanzt sie dann.	der Mann träumt, er möchte schön sein; der *alus* macht ihn schön und blendet die Leute.

Die Übersetzung dauerte 2 Stunden, weil die Eingeborenen meist nur den Sinn angeben, die Bedeutung der Worte aber nicht anzugeben wissen; schuld waren auch heftige Böen, die unterbrechend wirkten.

Tanzgesänge von E. Kr. notiert, ohne Übersetzung.

a taga hōi thul illülóngo
ilüngĕ pa lügatára
uatsaró uagiłji móalla
uatja vulavulach

g) Spiele.

Spielen *kokom*, ringen (2 Jungen) *adada*, verstecken *ika móllomoll*
Schwirrer junges Kokosblatt *kaborthór* (Yap *mareríu*).
Fadenspiel *thīb*.
Ballspiel *lim*, *pik* (Abb. 187), Windrad *igadjodjo* 4 strähnig.

Abb. 187. Ball.

Spielboot *gabelór*, *oā le tétereg;* als Segel dient meist ein Taroblatt; mit Haus *oā ie kokom* (Kr. 164).

Drachen *gadjáig* aus großem Brotfruchtblatt (Abb. 159 Kr. 167 = 295011 Länge 71 cm) auch zum Fischen.

Kinderwebstuhl (Kr. 210 = 299211) Abb. 188; ein Kleiner wedelt die Stechmücken fort.

[1] Damit sie vor Angriffen anderer *alus* sicher sind.

Abb. 188. Webestuhl.

Handklatschspiel (2 gegenüber) *kamath* (S. 364), bald eigene Brust mit einer Hand, dann Knie, dann Hand des Gegenüber, dann Brust gegenüber; dabei eintönig gesungen ein Lied, das obscön schien:

maiółl, lagímarêre, oáth thabola gau pessédj
ia long alengaliédjog iá lathō uá falū
gĕ lĕttĕ sĕilepos iĕl le goug maliethó
alle mó godjú talēth iaremóa le loguoi
missió lüê fallū iél a thōūa idjidj
a le hēng a i tamółl nētje moê marûe ma
nga e uille daggí sēuotj *sase* = fertig!

varüch ist auch ein unzüchtiger Tanz (s. *varug* Tanz S. 364)

Mondscheinspiele *kokomolepi*.

Eingraben in Sand *gallevēg; alleuá* Häufchen machen und Steine verstecken, Löcher in den Sand machen *assevussu, lios* Bild eines Menschen usw.

Ein Zählspiel *so a so* geschieht in folgenden Anordnungen:

. *so*	. *so a so*
. . *a so*	. . *iĕ therü*
. . .	. . . *a i ell*
. . . .	. . . . *i fang* Zahlen S. 411—12
. . . . .	. . . . . *alim*
. . . . .	. . . . . *auoll*
. . . . .	. . . . . *avis*
	. . . . . *iuéll*
	. . . . . *ithiu*

2. Wissenschaft.

a) Navigation.

Die Feisuner treiben selbst keine Hochseefahrt, sondern lassen sich von denen aus Mogemog abholen, wenn sie nach Westen fahren wollen.

Dies kam so: Eongelap (s. S. 144, 279) sagte zu den Leuten von Mogemog: Wenn ihr nach Hause kommt und weiter nach Osten fahrt, findet ihr einen Platz namens Feis. Die Leute dort kennen noch weitere Plätze im Osten.

Als die Mogemog-Leute zu Hause angekommen waren, fuhren sie bald darauf nach Osten, nach Feis. Von hier holten sie 3 Leute ab und nahmen auch Tabak,

Abb. 189. Inselkarte.

Schnur usw. mit. Dann fuhren sie zurück nach Lósiop[1], blieben dort 2 Monate, fuhren dann wieder nach Feis, wo sie 2 Monate blieben, und dann endlich zurück nach Mógemog; beim Abschied sagten sie zu den Feisuanern: „Kommt nicht selbst nach Mógemog, und fahrt auch nicht nach Yap, das ist unsere Sache". Deshalb geschah es nicht.

[1] Hauptinsel des Nebenatoll im SO. Mógemog war jetzt Vorort.

Nach 4 Monaten kamen die Mogemogleute mit 2 Booten nach Feis, nahmen 20 Feisuaner nebst Schnur, Kokosnüssen, Tabak usw. mit nach Mogemog, blieben dort 2 Monate, um dann alle zusammen nach Yap zu fahren, wo sie 5 Monate blieben und dann von den Yapern Gelbwurz, Kämme, Schildpatt, Töpfe, Feuerstein usw. erhielten, womit sie zusammen nach Mogemog zurückkehrten. Von da fuhr alles zusammen nach 2 weiteren Monaten nach Feis, von wo die Mogemogleute nach 2 Monaten allein heimfuhren. So blieb es immer. Auch Oleai, das früher direkt nach Mogemog kam, wurde auf Feis verwiesen. Dahin brachten sie früher

Abb. 190. Inselkarte der Rüebong auf Yap.

ihre Waren und fuhren dann wieder heim. Jetzt warten sie dort auf die Rückkehr der Mogemogleute.

Alles dies deutet sehr darauf hin, daß die Fahrt nach Osten, nach Oleai und Lamotrek seit alters geübt wurde. Aus neuerer Zeit deutet die Fahrt des Sopi und Meireg auf Hochseefahrt hin, wie das Haus 24b in Lamotrek zeigt (s. S. 27).

Lúluei als Gott der Seefahrt ist schon oben S. 150 erwähnt; für Feis im besonderen in Gesch. 3 S. 383. Luluei, Maselēlau, Alumalesí werden als die Söhne des Kulung und der Ilegafasí von Potlap (oder Póloat ?) ausgegeben; ferner die übrigen Seeschrate, die in Gesch. S. 384 verzeichnet sind. Vorieng und Faludj erscheinen mit Lúluei zusammen in den Janusköpfen der Sturmzauber (s. S. 271).

Trotzdem die Feisuner wenig Hochseefahrt betrieben, sind ihnen doch die Lagen der Inseln bekannt, zu denen sie gelegentlich segeln (s. Lamotrek Sopi S. 27). Ihre Karte Abb. 189 zeigt dies. Im Süden haben sie wie auf Lamotrek den

Stern *vólovol*, im Norden den *fisimagut*[1] (Truk S. 302 *fusamókit* Polarstern); im nördlichen Teil liegt keine Insel, wie es sich richtig verhält. In der Mitte sind drei gleichlaufende Linien; auf der nördlichen liegt, nach Westen zu, Mogemog, auf der mittleren Yap; Ngulu liegt westsüdwestlich; im Süden, ein wenig westlich gerückt, Sorol, südsüdöstlich Aurepik, südöstlich Oleai; nur Ifaluk, das ja nahe bei Oleai liegt, ist etwas zu weit nach Osten angesetzt, und Fáraulap zu weit nach Norden, da es auf der südlichen der 3 Linien liegt, während es in Wirklichkeit ein wenig südlicher liegt. Man sieht also, daß die Feisuner im Westen und Süden besser Bescheid wissen als im Osten, wo sie nur für Oleai Interesse haben. Im ganzen ist auch ihre, der Feisuner, Ortskenntnis überraschend.

Im folgenden wird ein Verzeichnis der mir auf Feis als bekannt genannten Inseln gebracht, zugleich zum Vergleich meine Angaben auf Yap, die durch ein Kärtchen von Ruebong begleitet sind. Abb. 190.

Fremde Inseln.

Feis sagt: (im Osten)	Feis (im Westen)	Yap sagt:	Yap
1. Uluthi (Mogemog)	Eáp[2]	1. Ugoi	Uáp
2. Fais	Ngólui (Ngulu)	Uéiei	Ngulú
3. Voléé	Báloi (Palau)	Anangai	Vaiau
4. Soról	Sóngodjoi	Sorol	
5. Eórepig (Aurupég)	Merír	Jórepik	
6. Ifálug	Bul	Fálug	
7. Fodjólep (Fároilap)	Kathógobei (Tobi)	Fatsúlap

20. Fáiovál		20. Faiochil	
21. a Thó		—	
22. Mákor		—	

[1] So schon Kotzebue III S. 63 für Oleai *fisimogodigit*.
[2] Ein Yapmann auf Feis sagte Réiap.

Feis sagt: (in Osten)	Yap sagt:
23. Falálu	23. Falálĭ
24. Rúŏ	24. Iluo
—	25. Márilo
—	26 Riffe Falamar
—	27. Eótsolug
28. (Losap)	28. Losap
29. (Nama)	29. Lámŏ
30. (Lukunór)	30. Nukunot
31 (Satoan)	31. Githéu
32. (Etal)	32. Etal

Antreibungen *mel'log*.

Etwa um 1855 kam ein Europäerboot bei N-Wind aus Süden von Malaro (Menado?); es zerbrach auf dem Riff; die 4 Leute nahm Tulei in ein Haus, wo sie etwa ein Jahr lebten, bis sie ein Schiff nach Yap mitnahm. Die Namen der Leute waren Mangilo, Sivalav, Kabuésang und ein kleiner Láo. Es waren Malaien. Saumar erinnerte sich noch; sie sagten für alte Kokosnuß *mango*, für junge *brinka*.

Monate

Wie auf den andern Inseln, ist die Monatsangabe nicht festsitzend; die Angaben schwanken.

1. *tothŏ* NO-Wind Nov.
2. *lăg*
3. *giii* NO kommt.
4. *ŭl*
5. *iĭliŏl* NO wechselnd, auch Ostwind.
6. *măl* SO.
7. *idj* SO.
8. *serávol* Wind geht überall herum; Juni, Juli. Zeit für Reise nach Mogemog s. S. 332.
9. *eramălas* Ostwind wechselnd.
10. *thúmur* Ostwind.
11. *maidjuk* SW.
12. *mailap* SW., September, Oktober; Mogemog kam früher um diese Zeit nach Feis, um den Tribut zu holen (s. Handel).

Sadismus	*isasig*	Päderastie	soll fehlen
Fellare et irrumare	*sumusum*	Onanie	*siresir*

3. Religion.

a) Gottheiten, Kult.

Élulap wohnt im Himmel im Haus Falromál[2] (S. 144) oder Fáramal, das so groß ist, daß jedes Dorf 1 Zimmer hat und wo es viel zu essen gibt; er hat einen Sohn Lugeileng, dessen Sohn Jélefath heißt; dieser weist auf Yap I S. 307 bis 316 hin, wo er als Yélafadj erscheint, und im Haus Masanepáu wohnt (S. 313). Der Sohn des Yélafadj, der kleine Jelefath, ist der Olefat (S. 148); vgl. z. B. Yap S. 695.

Jélefath lebt im Himmel und ist nach anderer Angabe der Bruder von Saulal, der S. 144 als der Bruder von Alúelap gemeldet wurde; die Mutter von Jélefath und Saulal ist Jóural[3], die bei Saulal in der Tiefe wohnte; sie ist einmal eine Koralle (Fungia), dann ein Schwein oder ein Fisch. Der *alus se tel* (S. 51, 170) Saulal wohnt in einem Riffhaus als die Muräne *lábuth*; ißt man sie, so schwillt einem der Bauch an; auch sein Vater, der in Ilol in der Tiefe wohnt, gilt als solche.

Noch ein anderer Sohn von Élulap wird hier genannt, Róngola, den schon Kotzebue S. 57 und 128 als Rongala, den Gott von Feis *(é alus ule Feis)* genannt hat und mit Engalap, dem von Ulea befreundet. Ich hörte, er habe zwei Frauen, Lagasilang und Lemarêleng, beide von Feis stammend, und zwar die erste vom Hof 21 Dapirê und die andere von Hof 27 Uóthol.

Mit ihnen lebte er im Geisterhaus *bogot alê alus* (H. 7 u. 10 S. 314). Hier in Ledjodjoi war auch der Platz Gádjabuth, wo ein *fâng*-Gerüst Abb. 191 von den 3 Dörfern erbaut worden war, als Opfertisch für den Gott von Feis, *é alus ule* Feis

[1] Besonders auf Olosi an den Labia minora.

[2] Yap I S. 313: Fólrómán Clubhaus im Himmel, daneben S. 310: »Das Himmeldorf besitzt auch ein *pitsi* (Clubhaus), welches Foroman heißt«, ohne Wände; südlich von ihm ein Haus Fotsakomán. Lugeilings Tochter Nimegai (s. hier S. 144) heiratet den Yelafath (auf Yap).

[3] sou Palau „unter". S. 377 *sal* Tag.

Röngola. Wie die Abb. zeigt, ist es ein vierfüßiges Gestell, um einen Baum herum, auf dessen Platte die Opfergaben niedergelegt werden. Der Oberhäuptling Tulei z. B. hatte hier Gaben niedergelegt, damit er gute Ansprachen *maipil* habe; aber auch zur Abwehr von Taifunen, für Gedeihen der Früchte usw. sollten solche Opfer dienen. Neben dem *fäng*-Gestell, auch *fäng ä lieliss* von E. Kr. genannt, befand sich ein Steinsitz *(fäng a fas)* aus 3—4 Steinplatten, also senkrechte Pfeiler mit einer Platte darauf, zum Sitzen, damit der Gott von da aus seine ihm geweihten Gaben betrachten könne (vgl. Yap Taf. 68[3] und 69[2]). An einigen größeren Steinpfeilern sah man, daß hier früher ein Haus gestanden hatte, wohl ähnlich wie auf Lamotrek usw. Der etwa 60jährige Rong (Haus Nr. 29) konnte sich aber nicht erinnern, hier ein solches noch gesehen zu haben.

Abb. 191. Opferplatz.

Róngola kam einst vom Himmel nach Feis, blieb aber nur kurze Zeit dort, weil er nach Bur und Melfel wollte, wohin er denn auch fuhr, und nach 2—3 Monden wiederkehrte.

Er hat nichts wesentliches geleistet, sagte nur, man solle ihm seine Gaben auf den *fang* legen. Seine Frauen begleiteten ihn oft auf seinen Reisen; als sie starben, flogen ihre Seelen in den Himmel.

Lugeileng's Zimmermann ist Sēlang (s. S. 149), der die Boote und Häuser baut; er zeigte den Leuten von Ngulú und denen von Modj (Bd. 6 I S. 23) wie Haus, Boot und Deckelschüsseln gemacht werden, wofür er Gelbwurzpulver *reng* und Essen erhält. Ngulu zeigt es Yap, Yap zeigt es Mogemog, diese den Feisunern und diese den Oleaileuten; Modj aber zeigt es Póloat, Pollap usw.

Als jetziges heiliges Haus kann Nr. 10 Faludj gelten, in dem der Priester Molodédjeg wohnt. Das Aquarell (Farb. Taf. 3) zeigt es im Schmuck, wie wir es fanden, mit den 2 Booten *góal*[1] im Giebel (Abb. 192)

Abb. 192. Geisterboot.

[1] Gallion hier *mafilaf* »sein Auge« nach Iélafath, s. Truk S. 240.

Kr. 129 = 29131 Länge 76 cm) und den hölzernen Handkorb *votau* (Abb. 193 Kr. 193 = 29151 Länge 58 vcm Höhe 13, Breite 11 cm)[1]. Das Stück ist das Original vom Zauberhaus, das Moloaëdjeg erst herausgab, nachdem er ein Ersatzstück angefertigt hatte.

Abb. 193. Hölzerner Weihekorb, r. von unten.

Über die Bedeutung dieser Gegenstände hörte ich nur, daß Tangiol, der Großvater des Moloaëdjeg, einen Traum gehabt habe, in dem ihm Jelefath (s. o.) den Auftrag gegeben habe, die Stücke anzufertigen. Weiteres hörte ich auf Feis nicht.

Einiges steht aber zur Erklärung in Yap S. 316, wo Yelafádj einen Korb und einen Weiberschurz anfertigt, letzterer zur täuschenden Bekleidung (Yap S. 675 u. S. 685, 695). Was der Korb bedeutet, geht aber aus der Geschichte nicht hervor. Es bleibt die Frage offen, ob er einen Männerkorb darstellt, wie ihn z. B. jeder Palauer bei sich trägt; dieser heißt aber *tet* oder *tet ulóik* (Palau III S. 139), die Schnurkörbe *seu;* es handelt sich hier aber um einen *votau*, der schon von Truk S. 174 bekannt ist, und von den Koralleninseln Bd. 6 I S. 61, 179, 224, 265, und hier S. 69.

Das Wort ist also rein zentralkarolinisch und so auch die Mythe von Yap. Der Zweck des Korbes kann aber auch sein die Kokosnüsse einzufüllen, die der kleine Yelafádj aus seiner Vorhaut löst (Yap S. 316); dies ist aber wenig wahrscheinlich.

Endlich ist auch über die beiden Boote am Giebel nichts näheres bekannt. Aber der Name *gáoal* (Truk S. 239 *eávan, éavöl* usw.) und die Halbmondgallionen zeigen das gleiche Boot Truk S. 240 und Taf. 28; S. 334 dort ist die Gesch., wie Ólefat, also der kleine Yélafadj, das Geister-Boot schuf. Die sonstigen Weihegaben für den Gott an Blütenkränzen und Matten zeigt Farb. Taf. 3; das rote Tuch bezieht sich möglicherweise auf Yap S. 661. Links hängt auch ein Tritonshorn (s. o. Taf. 4c u. 10c).

Seele *ngoll*.

Schatten	*eóngol*
Gespenst	*ngolemór*
Traumgesicht	*thál*
Zauberei	*vólevol, tangdvang*
Wahrsagung	*sullé*

[1] Ornamente, an der Seite Haizähne *ngileboqou*, durch Linie *djal* getrennt; am Boden die Fransen des Korbes *faregeyil e* [illegible]*tals* (Abb. 167).

Beispiel: *djodjo sullē vel barēōe garoovūthog igela, gar toai vuthog*
Du wahrsage für Boot, ob es kommt jetzt, oder nicht kommt.
ivē sullē ich wahrsage
mommi vēvē es ist gut geworden.

b) Zauber *vōlevol* und *vangēvang* (S. 151); **Orakel.**

was auf Yap *madjemadj*, wird hier *tāpetōp* genannt.
Liebeszauber *vangevang ele ſāeſel.*
Fischzauber *vangēvang ele ig, djib eri ig.*
Hauszauber *volevol l'im.*
Ein großes Amulett zeigt Abb. 137.

Das bekannte Losorakel (s. Bd. 6 I S. 110 *boē*), hier *madjemadj sūluvē* genannt, stimmt in seinem Namen in der Hauptsache mit den westlichen Inseln überein. Auf Yap S. 374 heißt es *vei* (s. S. 143[1], 159[1]). Die Namen für die Knotenpaare sind nach den Angaben auf Feis den Seegeistern entnommen, die alle in einem Boot, dem Schwanzboot *bōbo*, von Ort zu Ort rudern und von Insel zu Insel.

W. Müller hat ähnliches gehört (Yap S. 375); er schreibt: »Diese Namen erklären sich aus der Sage vom Ursprung des *vei*, nach welcher es durch ein Dämonenboot nach den Zentralkarolinen gebracht wurde. Sie sind nämlich die Namen der 16 Insassen des Kanu's, von denen jeder seinen bestimmten Platz einnahm. Wenn daher ein Orakelkundiger seinem Nachfolger die Kunst des *vei* beibringen will, so ordnet er zuerst auf einer Matte 16 Steine in Kanuform an, mit Hilfe derer er ihm die Namen einprägt.« Es folgt dann eine Skizze der Sitzplätze.

Die Geschichte davon Yap S. 616 bringt auch eine Episode auf Lámotrek, wo mir aber über die 16 Dämonen nichts mitgeteilt wurde; von Námoluk nennt Girschner den Losgott Supuneman mit den 16 Losgeistern, aber sonst nichts (Bd. 6 I S. 105).

Die Namen auf Feis und Yap sind folgende:

	Feis	Yap
4+1	Bugólomar (gut)	Lifór
3+1	Langabarál (schlecht)	Lingeparón
2+1	Ilebai (schlecht)	Navāi oder Navailóg
3+2	Mogómei (gut)	Fugomó
4+2	Ilefau[1]	Nifáu
4+3	Djeluel (gut)	Vēngeg (3+4)
4+4	Saufag (gut)	Sēyóg
3+3	Fagálap (gut)	Djagalóp
1+1	Thilifeg ♀	Djilivég

[1] Bei Anfrage, ob einer heute oder morgen kommt, Bedeutung: morgen.

	Feis	Yap
3+4	Véngeg (schlecht)	Tsēnuúl
2+4	Lémâl (Kranke schlecht)	Namán
2+3	Mesóg (gut)	Masóg
1+3	Lubul (gut)	Nivúl
1−4	Ilefar (schlecht[1] für ♂, gut Fische)	Vunimór
2−2	Ilagomal ♀ (gut)	Nagēmón
1+2	Sópes (gut)	Sūpis

Die gute Übereinstimmung mit dem Osten zeigt Bd. 6 I S. 110. Bei Legung der Knoten z. B. zwischen Daumen und Zeigefinger, zählt man zuerst die inneren am Zeigefinger, dann die am Daumen außen; s. Abb. 194.

Eine andere Art, das Schicksal zu befragen, durch Faltung *gosedjevál*, heißt *djib*; auch in Yap S. 374 ist sie als *tsif* kurz erwähnt. Abb. 195 links.

Abb. 194. Lose.

Abb. 195. Knotenkette.

Man nimmt eine halbe Kokosfieder (ohne Rippe) und faltet sie zusammen, in Buchform (Leporello-Form), das Falzblatt — sagen wir — 10 cm breit. Der Rest, der übrig bleibt, ist der *matáldjib*; von seiner Länge hängt das Orakel ab.

Ist er lang:

a) gegen 10 cm heißt er *djēlog eitol*
b) 7—9 cm heißt er *i le mangalemeitol* schlecht
c) 5—7 cm heißt er *lēthogol djódjel* gut

[1] Bei Kranken sehr schlecht, bei Fischen sehr gut, viele Fische tot.

d) 3—5 cm heißt er *i le mangale meiet* gut
e) 1—3 cm heißt er *djēlog meiet* gut
f) unter 1 cm *udje mēlet* gut.

Die Bezeichnungen sind hier keine Namen!

Beabsichtigen die Leute, einen großen Fischzug zu machen, wird schon am frühen Morgen gefaltet; man macht also das *djib eri ig*, um zu erfahren, ob sie am gleichen Tage zum Fischen gehen sollen, oder nicht; e bedeutet dann, viele Fische *djolop ig*, e + f, wenig Fische.

Man singt dabei etwa folgendes:

djib āgó, djibelīēg mein *djib*, *djib* vom Fisch
i velá ʃeta ralēlē[1] ich gehe fischen heute,
ngovoior ig ich fange viele Fische,
sale kodjedjok das ist sehr gut!

Über den **Sturmzauberstab** *gósiliʃei*, der schon S. 155 u. 284 behandelt ist, hier nichts neues. Die Janusgesichter werden auch nach Ost dem Lúluei und Vórieng, nach Westen dem Faludj zu erkannt.

Ein Idol mit Füßen, statt dem die Rochenstachel in einem Bündel daneben hängen, wurde auf Feis in einem angetriebenen Boot von Mogemog gefunden (s. Abb. 196, Kr. 188 = 29711, Länge 23,6 cm).

Am Kopf sind 3 Rillen von 7 mm Breite und 2—3 mm Tiefe.

Auf Feis werden die doppelgesichtigen Köpfe so erklärt:

nach Westen (Mogemog) blicken für den *palui* (Kapitän) Luluei und Faludj (s. S. 368),
nach Osten, Oleaiwärts, blicken Lúluei und Vorieng.

Für den Taifun kannte Tulåi folgende Ansprache *(maipil)*:

Abb. 196. Sturmzauberidol.

ʃaraga málom gēlo Róngola Ich bitte dich Róngola
ma gē le Eóngalap und dich Eóngalap
gālobo ʃārēral ihr macht den Tag (gut). *gau* ihr, *ʃar* machen, *ral* Tag
gaugo maliáthi ihr macht Windstille
ē ángila den Wind da.
gamaliathi rálilē macht Windstille heute. *ralei* heute.

[1] Auch wie *valēlē* sich anhörend.

378

4. Geschichten.

Wichtig ist hier die Sage von der Entstehung der Insel Feis, die auf Yap und Feis und wahrscheinlich auch auf Mogemog gleicher Weise bekannt ist.

So weit sie von Lorop und ihren 3 Söhnen handelt, ist sie schon 1903 durch Born in den Mitteilungen aus den Deutschen Schutzgebieten Bd. 16 »Zwei westkarolinische Sagen« bekannt geworden; die zweite Sage dort handelt von verschlagenen Yapern, die auf Feis ermordet wurden. Die dabei erbeutete schöne Halskette (wohl die in Palau III S. 4)[1] wurde von einem Feisuner getragen, als er mit 7 Gefährten und einem Mädchen nach Yap verschlagen worden war. Als er eines Tages den Yapern erzählte, wie er zu diesem Schmuck gekommen war, erschlugen diese aus Rache die 8 Männer von Feis. Das Mädchen aber wurde eine der Ahnfrauen der Yaper.

Gesänge *taigoigoithul*.

1. Die Entstehung von Feis von einem Yaper erzählt.

Eigene Aufnahme.

Auf Yap lebte ein Mann Maraológ[2] vom Dorfe Ológ bei Okau[3] und seine Ehefrau Maragigi[4], die auf dem Berge Bodjēu den Äóngalap gebar (bei Yap I S. 324 der Yongaláv (s. o. S. 144), ferner ein Mädchen Ilabúluei (= Liomarar[5]), ein Knabe Lulumarasi (= Inegau) und Maselēlog (= Gáragar).

Die Eltern der Maragigi wohnten im Himmel; sie sagten zu ihrer Tochter, sie solle in 4 Tagen nach Rumung, jetzt die nördlichste Insel von Yap, kommen, wo sie auch hinkämen; so ging sie mit ihrem Mann nach 4 Tagen dorthin, nach dem Orte Atheból. Dort sahen sie im Norden den Regenbogen Rékim und seine Frau Ólthabeg, die Wasserhose, darunter, und sie liefen deshalb mit den andern Leuten des Ortes fort. Die Wasserhose umschlang die Nordspitze Rumung, so daß sie sich von der großen Insel trennte, dann umarmte sie mit gleicher Wirkung Map und endlich noch Gagil und Tomil, die eine dritte Insel bildete, die aber nicht so gut abgeschnitten wurde.

---

[1] Von K. Müller in Yap I nicht abgebildet.

[2] Yap I S. 321 Maralalog.

[3] An der Westküste; mitten zwischen Okau und der Kolonie liegt Alóg (Karte Müllers Yap I Schluß).

[4] *gigil* ein Vogel mit schwarzem Kopf, Rücken und Schwanz. Yap I S. 321, die Geschichte beider; sie heißt dort in Tamil Leevirang.

[5] Angabe von Ruebong auf Yap, genannt in Yap I S. 324; S. 323 Rüepóng. Yap I S. 324 wandert sie von Yap nach Mogemog weiter.

Maraolog kam dabei in Godjam[1] zu Fall, stieß mit dem Gesicht auf einen Stein und wurde dabei so schwer verletzt, daß er starb. Die Eltern der Maragigi gaben ihr als *madjemadj*-Zauber einen Rochenstachel und einen *tuf*-Stern, um ihn wieder zum Leben zu bringen, dann gingen sie wieder fort. Maragigi nahm beide Stücke in die Hand und stieg mit ihnen über den Toten. Da kam eine kleine Eidechse und als die Frau wieder zurückgestiegen war, erschien ein Star. Als sie nochmals über ihn gestiegen war, da wachte er auf. Da baute sie in Godjam ein Schutzdach, unter das sich der Kranke hinlegte. Maragigi aber wurde schwanger und sie gebar nach und nach folgende Kinder, die die Landschaften von Yap verkörpern:

1. Mágaragoi ♂[2] = Tomil (Yap I S. 322)
2. Útherei ♂ = Ueloi, Rul und Delipébinau
3. Tamair ♂ = Map und Rumung
4. Ath (Af) ♂ = Nímegil (= Giliman + Kanifai)
5. Ngul ♀ = Maki
6. Ávarik ♂ = Fanif
7. Eóngalap ♂ s. o.
8. Aeóng ♂ Haifisch, tabû in Gagil
9. Molóp ♂ Fregattvogel
10. Djoi ♂ Pandanus
11. Liomarar ♀ = Ilabuluei s. o.

Sie wurden die Götter der einzelnen Landschaften auf Yap. Da (1.) Magaragoi Tomil haben wollte und (3.) Tamair Map, so ging (2.) Utherei mit den Eltern nach Olog in der Landschaft Ueloi.

(7.) Eongalap frug: »Was soll ich haben?« Da sagte die Mutter: »Dir gehört Gagil und alles was ostwärts, der Sonne zu liegt[3].« Er ging nach Gadjbar, in das Haus Númerui und dann nach Osten, nach Mogemog[4]. In Numerui wohnte die Frau Negáu und seine Schwester Liomarar; diese ging eines Tages mit ihm. Eongalap fing in Gadjbar eine Schildkröte. Man schlachtete sie, während Liomarar Wasser holte. Als sie zurückkam, war für sie nur eine Flosse übrig gelassen worden, die sie ärgerlich verzehrte. Als bald darauf wieder eine Schildkröte gefangen worden war, ließ ihr ihr Bruder zwar etwas mehr, aber doch auch nur eine Flosse. Sie war verärgert und nahm die Flosse mit an den Strand, zwischen Gadjbar und Oneán, schabte eine Kokosnuß aus und füllte die eine Schalenhälfte

[1] Auf Müller's Karte Gatjám in Tamíl; Yap I S. 321: Gegend von Tageréng.
[2] Die 7 Vegetationsgötter Yap S. 320: Magorogoi, Uetheré, Tamair, Adj, Ngul, Averig, Yongalap.
[3] Sie soll auch gesagt haben, daß die östlichen Inseln ihm Tribut bringen sollen, aber dies ist unsicher. s. Handel.
[4] Er blieb 6 Monate auf Yap und 6 in Mogemog. Am 25. Okt. war ein kleines Fest für ihn in Gadjbar, und im November ein großes, wenn die Mogemogleute schon fort sind. Nach dem Fest ist alles wieder frei (s. Yap I S. 324 ff.).

mit dem Geschabsel, die andere mit Sand. Dann wanderte sie aufs Meer hinaus, ostwärts, bis Yap verschwand. Da nahm sie die zweite Schalenhälfte und schüttete den Sand aus, der sich alsbald so mehrte, daß Ugói[1] entstand. Zuerst legte sie ein kleines Tarofeld an. Die Flosse der Schildkröte brachte sie nach Eor[2]. Dadurch kamen eine Menge Schildkröten zu der Insel und durch das Kokoskerngeschabsel, das sie mitgenommen hatte, gediehen auf der Insel auch viele Kokospalmen, so daß sie in den Ruf großer Fruchtbarkeit kam und viele Menschen von allen Seiten herbeiströmten, so daß sie reich bevölkert wurde[3]. Liomarar bekam eine Tochter Lórop und diese bekam auf Losiŏp[4] 4 Kinder: Mótal ♂, Morŏngarang ♂; Mŏtíketik, ♂[4] und endlich eine ♀ Maus, mit der sie nach Feis ging.

Lórop kehrte unter Mitnahme von viel Essen[5] nach Losiop zurück, während die Maus auf Feis blieb und eine Tochter bekam[6].

Lórop wurde krank. Ihre beiden ältesten Söhne Mótal und Marongaráng kümmerten sich aber nicht um sie und beauftragten ihren jüngeren Bruder Motíketik, nach ihr zu sehen. Sie starb bald darauf. Sie hatte ihm ihr Grab beim Baum Gílio[7] gezeigt; die Brüder sagten ihm, er solle sie in die See werfen, er aber nahm sie nach Feis zu ihrer Tochter. Als er nach Yap heimgekehrt war, wollte er fischen gehen und wollte deshalb Fischleinen machen. Aber er band Kokosfaser an Kokosfaser[8] und schnitt aus der *mereberib*-Kokosschale Fischhaken[9]. (Abb. 197). Alles steckte er heimlich ein.

Abb. 197. Heiliger Fischhaken.

Als Motal einen Fisch gefangen hatte, schnitt Motíketik für sich ein Stück heraus, um seine Haken damit zu beködern, worüber seine Brüder schimpften. Er ließ darauf seinen Haken hinab und holt zuerst Bananen herauf, die seine Brüder ihm wegnahmen und aufaßen. Als er dann beim zweitenmal mit dem neubeköderten Haken einen Bund junger Kokosnüsse heraufholte, erging es ihm

---

[1] So wird das Mogemog-Atoll auf Yap genannt, während Feis Ueiei heißt S. 369. Für Ugoi hörte ich *loco* 1907 Ulúlithi, das sich Ulúlasi anhört (s. Marine-Karte No. 93); Dieser Name gilt für beide Atolle. Dieser Teil der Mythe s. Yap II S. 321. XXXVIII.

[2] Eor oder Ior, auf der Karte Loziĕp bezeichnet, die Hauptinsel des Nebenatolls; s. später Losiop.

[3] Alle ihre Wünsche gingen in Erfüllung, alles kam, was sie wollte, wofür der Spruch gilt: *i gamasúr, i galalóg, i sesial* = ich schließe die Augen, ich mache sie auf, ich bin schwanger (zweifelhaft, s. 788 S. 407); ähnlich Palau IV S. 48.

[4] Yap II S. 526: Lorov, Söhne Motál, Morongrang und Mŏtgitig in Nosŭop.

[5] Nach Yap II S. 526 geschah es, weil die Söhne hungerten; sie ging an's Ende des Riffes, zählte 1, 2, 3, 4, und tauchte dann unter, um nach Feis zu kommen, das noch unter Wasser lag. Auf Feis hörte ich's genau ebenso, nur daß sie die Maus *gedj* mitnahm und auf dem Meeresboden hinmarschierte; die Maus blieb zurück.

[6] Rŭebong wußte die Namen nicht; s. Gesch. der Maus.

[7] Müller: begrub sie neben einem *au*-Baum; an einer Wurzel hakte auch der Fischhaken, als er Land heraufzog.

[8] Er machte dabei unsern Webleinsteg (s. Abb. 61 m).

[9] Diese heiligen Fischhaken (s. auch Abb. 89) waren zuzeiten des Großvaters von Rŭebong verrotte; die Angabe von Tetens, daß man sehr Angst vor diesen Haken habe, sei richtig, nur seien sie eben nicht mehr da.

ebenso und ebenso beim dritten Male mit dem Taro. Die vierte Beute war Diimele feregóa, die NO-Spitze von Feis, die Matol für sich in Anspruch nahm. Beim fünften Mal kam Rēthi, der W-Teil und schließlich die ganze Insel Feis[1].

In Ledjoidjoi (mittlerer Dorfteil von Feis) war ein Grab Gubulúa, an dem das Boot der Brüder liegen blieb. Motiketik schlug mit einem Kokoswedelstil darauf. Motal sagte: Lorop *falilitei mellê*, und Lorop sagte, als Motiketik mit dem Wedelstil schlug: *faliel i* Motiketik![2] Die beiden Brüder ärgerten sich und gingen nach Mogemog. Motiketik aber blieb auf Yap; er machte die 3 großen Einlässe Thaualap, Thauas und Thaualegedj (s. Karte 13). Dann machte er Palmwein und kochte ihn ein[3]. Darauf kamen 3 Männer von Matáng[4], worauf die Leute nach der Westseite wegliefen. Motíketik dachte, sie würden erschreckt werden, aber sie naschten am Palmsaft. Er sah sie dabei sitzen und lief weg. Da sah er ein Mogemog-Boot am Strande von Gadjbar liegen und Motiketik ging zu der Besatzung und erzählte ihr seine Erlebnisse. Eongelap war dabei und hieß die Leute, in Feis nachzusehen. Die Brüder gingen mit[5].

2. Die Entstehung von Feis und die Maus.

Auf Feis ermittelt. Eigene Aufnahme.

Die 3 Söhne waren Morangaráng, Mótal und Motiketik. (Bis hierher ist die Geschichte mit der vorhergehenden ziemlich gleich.) Verschiedenheiten oder Neues ist schon dort in Fußnoten angemerkt.)

Es geht hier so weiter:

Die zwei Brüder gingen eines Tages fischen. Die beiden älteren sagten zu dem Jungen: Bleibe du zurück und passe auf. Der Junge Motíketik sah die Mutter zum Riff gehen und hörte sie 1, 2, 3, 4 zählen, dann tauchte sie unter. Er wartete bis sie zurückkam. Als sie wieder auftauchte, hatte sie viel Essen bei sich. Beim nächsten mal machte sie es ebenso. Da sprang Motiketik ihr nach; da er aber nur 1, 2, 3 gezählt hatte, stieß er mit dem Kopf an einen Stein. Da kehrte er zurück

---

[1] s. Palau IV S. 40.

[2] Nach Yap II S. 527 war es so: Sie stritten um das Land. Motal schlug zuerst mit einer »Kokosrippe« auf das Grab der Lorov und sprach: *Lorov gú lörövd falü li temele?* Es kam keine Antwort. Ebenso beim zweiten. Erst als Motgitig schlug, antwortete eine Stimme: *fálü li* Motgitik »Es ist das Land des M«.

[3] s. den *aildot* von Palau.

[4] s. Palau IV S. 9 Gesch. 8; Eluelap soll von dort stammen, nach Ansicht der Yaper. Matang gilt als das fabelhafte Land, wo Riesen wohnen.

Nach Yap II S. 527 ist einer von den dreien der Gott Rôngola, vor dem Motgitig floh, wobei er *lits* verschüttete. Der Gott tauchte seine Hand in das Verschüttete, leckte daran, was ihm schmeckte. So blieb er auf Feis.

[5] Ruebong sagte, sein Vater habe die Schicksale der drei noch gewußt, aber er hätte die Sagen nicht weitergegeben; sie seien verloren.

Yap II S. 527 heißt es, der Haken sei auf dem Tabuplatz Numuruf gewesen. Im Kriege sei er von Gatsapar ins Meer geworfen worden. Dadurch kam ein Erdbeben, das halb Feis versenkte.

und versuchte es nochmals, wobei er richtig auf 4 zählte. Da öffnete sich der Stein und er gelangte nach Feis, das in der Tiefe sich noch befand. Dort verwandelte er sich in einen *mollei*-Star und setzte sich auf einen *löll*[1]-Baum, denn es war nirgends ein Haus und nirgends sah er jemanden. Auf dem Strauch fraß er eine Frucht. Als Lorop den Vogel gewahrte, wußte sie, daß es ihr Kind sei. So frug sie ihn: Warum kommst Du mir nach? Du willst wohl, daß ich bald sterbe. Da kam er herab und verwandelt sich in Menschengestalt. Sie zeigte ihm darauf den Platz, wo sie beerdigt werden wollte. Darauf kehrten sie beide nach Mogemog zurück; am Tage der Heimkehr aber erkrankte die Mutter.

Motiketik erzählte alles seinen zwei Brüdern und erwähnte auch das Land, das er in der Tiefe gefunden hatte. Eines Tages gingen die beiden älteren fischen; sie trugen dem Jüngeren auf, bei der kranken Mutter zu bleiben. Aber als sie fort waren, starb Lorop. Motiketik wickelte sie in eine Matte, verschnürte sie, nahm das Bündel mit aufs Riff, zählte bis 4 und brachte sie darauf glücklich nach Feis, wo er sie am bestimmten Ort bestattete. Dann kehrte er nach Mogemog zurück. Als die Brüder vom Fischen heimkehrten, teilte er ihnen den Tod der Mutter mit. Sie frugen, wo sie liege, und er sagte, er habe sie ins Meer geworfen.

Als die Brüder nun 3 Fische verzehrten, hatten sie nichts dazu, weil die Mutter fehlte. Motiketik wollte nun eine Fischleine machen, in der Absicht, das nahrungsreiche Land hochzubekommen, aber da er nichts davon verriet, schimpften die beiden über sein Vorhaben. Da ging er an einen abgelegenen Platz, band dort Kokosfasern zusammen und schnitt einen Haken aus einer Kokosschale. Beides nahm er verborgen mit. Er fuhr aufs Meer hinaus und warf nun seine Angel aus, die nach kurzer Zeit festkam. Als seine Brüder dies gewahrten, lachten sie und kamen ihm beim Aufholen zu Hilfe, da er schier verzagte. Sie zogen nun vereint und förderten einen Bund Bananen zu Tage. Als aber Motiketik zum zweiten Male die Angel ausgeworfen hatte, machten sich die beiden Brüder an die Früchte und fraßen sie auf. Genau so gings mit einer Traube von Kokosnüssen, die von den beiden Brüdern getrunken und gegessen wurden, während Motiketik als drittes einen Topf mit gekochter Brotfrucht emporhob. Beim vierten Male hakte es wieder, und als sie alle zogen, erschien ein Stück Land und zwar die Ostküste von Feis, Feregoág[2] genannt. Der Erfolg kam nur dadurch zu Stande, daß Motiketik rief: »Lorop bitte hilf!« Zuerst kam der Osten, dann der Süden, dann der Westen.

Die Brüder bekamen nun Streit, wem das Land gehören solle; da sagte Motiketik: »Wißt ihr, wo das Grab unserer Mutter ist?« Als sie verneinten, zeigte er es ihnen und fügte hinzu: »Dies ist mein Land!« Aber damit gaben sich seine beiden Brüder nicht zufrieden. Morangarang frug zuerst:

Lorobogó, Lorop, *falilitéi falieí*.
Lorobogó, Lorop, wem gehört das Land?

[1] Morinda. [2] Djimele feregoág, die NO Felspartie von Feis.

Aber es kam keine Antwort *(taimaliĕli)*. Dann frug Mótal, aber auch jetzt blieb alles still. Endlich frug Motíketik und Lorop summte erst m.....! Dann sprach sie: *faliem(ut), djugelĕ*

Es gehört dir (das Land), mein Kind!

Da gingen die beiden älteren Brüder fort nach Mogemog. Motiketik aber blieb da. Er machte drei Booteinlässe für Feis: in Ilŏtou den Thaûalap
in Ledjódjoi den Thauás
und in Falio den Thaualegédj.

Als er am letzten arbeitete, kamen drei Geister *alús* von Matáng aus Osten. Sie hießen Móroa[1], Songosongomál und Semágor und waren die Lehrer von Hausbau, Bootbau, Weberei, Korbflechterei, Fischerei usw.

Motiktik lief aus Angst weg und versteckte sich am Geisterhaus Gádjabuth. Dort nahm er einen Topf voll Palmweinsirup *ludj* und goß ihn über den Platz aus. Dann lief er weiter in den Busch. Als die drei nach dem Platze Gadjabúth kamen und die Melasse fanden, schleckten sie sie auf. Motiktik schwamm unterdessen fort nach Yap, wohin seine 2 Brüder auch gekommen waren. Er lebte in dem Hause Eóngelap[2] in Gadjbar, wohin heute noch der erste Tabak einer Anpflanzung gebracht wird, den Inefel in Empfang nimmt, als Weihegabe für Eóngelap und seine Brüder; Inefel gilt jetzt als Besitzer der östlichen Inseln.

Die Ratte auf Feis gebar ein Mädchen Lengelengemók, das als es herangewachsen war, von Semágor, dem Bruder des Móroa, geheiratet wurde. Ihre Kinder waren: ein Junge Lullĕ und eine Tochter Langemar; diese gebar drei Kinder Mĕlelai ♂, Mlelul ♂ und Thélamog ♀. Diese bekam eine Tochter Lípeg, die von Lugolfor geheiratet wurde, der von Yap über Mogemog nach Feis gekommen war. Sie hatten zwei Kinder, ein Mädchen Ilagaróng und einen Sohn Lŭg. Die Ilagaróng freite den Malálefel von Feis und zu ihrer Zeit war es, daß eine Menge Leute aus dem Westen zuströmten. Ihre Kinder waren Itulei ♂, Vĕlemog ♂, Saethau ♂ und Málemet ♀; von Malálefel stammte auch ein Sohn Djl, der der Vater des Häuptlings Túlei ist (s. S. 317).

3. Kulung (s. Bd. 61 S. 280 Pollap).

Der Kulung kam von Westen. In Palau, Yap, Mogemog, überall wurde er nicht satt. Weiter flog er nach Feis, Oleai, Ifaluk, Falóelap, Namodjek, Sĕtoval, Póloat, Sou, Djuk, Pidjeladj, Ulol, Pollap; hier endlich wurde er satt, denn jede Kokosnuß füllte sich von neuem und auf den Holzschüsseln kam immer neues Essen. Hier lebten Luluei[3] und seine Frau Ilabúluei (S. 378) mit ihren Kindern Vórieng,

[1] Bekannt als Großer Gott auf Tombara (s. A. Kr. Die Malanggane von T. S. 33). Er liebte die Ratten; s. o. S. 56. [2] siehe Yapgeschichte.
[3] Oleai II S. 284, Luluei Sohn von Paluelap, oben S. 150.

Faludj, Sābu, Fángala, Levútavut, Olopálipel, Ūmal, Kapioúmulifadj, Ságul, Paluelap, der die Frau Lisābag von Pollap geheiratet hatte und die Söhne Rongothik und Róngelap besaß. Paluelap erhielt von seinen Eltern das Essen, das er dem Kulung gab. Dieser zeigte ihm dafür die Segelkunst. Palúelap versuchte zuerst eine Fahrt nach Póloat, wobei ihm der Kulung voranflog; von dort kehrte er wieder nach Pollap zurück. Ebenso fuhr er dann nach Djuk (Truk). Dabei zeigte der Kulung ihm nachts die Sterne, und wie er nach ihnen fahren müsse. Nach der Rückkehr besuchte er dann Fálau, Pik, Aurepik, Ifaluk, Namodjek, Sētowal und Poloat.

Eines Tages sah der Kühlung einen andern *kulung* Fische fressen. Alles bekam ihm gut, nur der Rochen setzte ihm zu, so daß er starb. Da wußte der Kulung, daß dieser Fisch sehr stark sei. Er nahm deshalb den Stachel *gos* und gab ihn dem Palúelap, damit er sie als *madjemadj*-Zauber gegen starken Wind anwende, und gegen starke Strömung.

Dies alles zeigte Paluelap seinen Söhnen und deren Kindern, denn Rongelap heiratete Baibai von Pollap, die Failepāl ♂ gebar. Dieser hatte einen Sohn Djōsalug, und dieser den Djorig, der alle Plätze kannte, und seinen Nachkommen alles zeigte.

5. Musik.

Keine Beobachtungen.

6. Kunst.

Lamotrek (s. S. 73ff.) schmückt seine Häuser, Webstühle und Matten hervorragend schön.

Auf Oleai tritt dies schon sehr zurück und nur die Strahlentatauierung erscheint dort als etwas besonderes, die ja auch auf Feis vorhanden ist. Aber sonst wird wenig nennenswertes geleistet, obwohl ja wegen der Nähe von Yap und Palau eine stärkere Schmucklust vermutbar wäre.

Dagegen erscheinen für dieses Gebiet der Westkarolinen indonesische Rankenornamente, auf einem Bootmodell, dessen Herkunft freilich unsicher ist. Ich fand es während meiner Spanienreise (Palau I S. 17) zu Valladolid im Kloster, im Convento de los Augustinos filipinos[1], wo eine kleine Sammlung karolinischer Eka's sich befindet. Auf dem Bug und unter der Reling sind zahlreiche Ornamente (Abb. 198), die so aus der Ornamentierung der Karolinen herausfallen, daß sie nur von Indonesien stammen können, wogegen das Boot unbedingt unserem Gebiet zugehört. Auch die Kiste, die auf dem Ausleger lag, zeigt 4 herzförmige Muster. Es ist möglich, daß verschlagene Eingeborene (s. Palau I S. 14) das Boot mit nach den Philippinen gebracht haben, wo es ornamentiert wurde, oder neu vertriebene Karolinier haben das Kult-Boot den Patres zuliebe auf Luzon mit dem malaiischen Beiwerk angefertigt.

Abb. 198. Ornamentiertes Bootmodell, wohl von den Filipinen.

[1] Schon kurz erwähnt Truk S. 240 Anm. 2 und S. 410.

386

V. Kulturvergleich.

für die Zentralkarolinen, besonders von Lamotrek, Oleai und Feis.

Lamotrek ist noch stärker mit den östlichen Inseln, besonders mit Truk verbunden, als das westlichere Oleai, auf dem die Strahlen-Tatauierung (S. 323) erscheint. Allerdings wurde schon bei Lukunór (Bd. 61 S. 42) erwähnt, daß vor 100 Jahren diese Ordnung auch dort vorgekommen zu sein scheint. Wir sahen aber auf den Inseln östlich von Oleai keine Spur mehr von ihr, und es ist unwahrscheinlich, daß sie in der kurzen Zeit völlig verschwunden ist. Ihr Hauptplatz ist ja zweifellos Mogemog, wie aus den Geschichten bei Feis hervorgeht, und so scheint sie nur den Westkarolinen, außer Palau und Yap (s. S. 324), an, zugehören, ostwärts bis Oleai.

Eben aus den Geschichten geht die starke Verbundenheit von Feis mit Mogemog und Yap hervor. Anthropologisch verhalten sich die 3 Inseln gleich oder doch sehr ähnlich. Was Cantova S. 318 sagt, daß es unter den Westkaroliniern viele Mestizen und Neger oder Mulatten gebe, die wohl von Neu-Guinea stammten und als Bediente lebten, traf 1910 wenigstens nicht mehr zu. Wohl findet man nicht selten krause Haare (vgl. Lámotrek S. 10), aber die Dolichocephalie, die auf Truk S. 23 so vorherrschend ist, ist im Westen selten.

Sprache: Wie aus den Aufnahmen erhellt, ist von Ku bis Feis (Mogemog), einschließlich, Truk eine Sprache, die örtliche Verschiedenheiten aufweist. Dies ist begründet in diesem Verkehrsgebiet, das denselben Bedingungen unterliegt wie Polynesien. Die genaueren Unterschiede müssen der Linguistik vorbehalten bleiben.

Die Verbundenheit mit Yap in religiöser und kommerzieller Hinsicht drückt sich am stärksten im Reiseboot und in der Wohnung aus.

Das Reiseboot reicht mit geringen Unterschieden von Yap bis Lukunór einschließlich Truk.

Haus: Das sechseckige Haus mit viereckiger Zelle und 2 dreieckigen Veranden reicht ebensoweit; aber Truk ist hier nicht einbegriffen.

Das Vorhandensein oder ein Rest von den Plankenhäusern auf den Atollen nördlich von Truk ist allerdings so spärlich, daß man ihre Ostgrenze nach Lámotrek verlegen müßte, wenn nicht die Lukunór-Inseln und Losap-Nama sie aufwiesen. Aber auf Lámotrek setzen sie erst eigentlich recht ein, und die sechseckigen Häuser, deren Grundform auf Yap hinweist, erreichen ihre schönste Aus-

bildung auf Oleai, wo ja auch eine Art besonderer Männerhäuser vorhanden war, wovon S. 256 die Rede war. Sie hatten steinerne Hauspfosten, genau so wie es bei den Wohnhäusern von Feis der Fall ist, aber nicht auf Yap, während die Bai von Palau einen Rest von Steinunterlage bewahrt haben. Yap und Palau sind aber besonders in der Sprache abgetrennt.

Die West-karolinische Strahlentatauierung beginnt ja eigentlich erst auf Oleai; genau wie das Ramenhaus vereinsamt auf Ku noch vorkommt, so steht es mit der Strahlentatauierung wie erwähnt. Eine Erklärung dafür liegt nicht vor.

Daß Lütke sie auf Ku beobachtete, kann, wenn richtig, auf der zufälligen Anwesenheit eines Westkaroliniers beruhen; die Möglichkeit der früheren Ausbreitung über das ganze Gebiet Mogemog-Ku liegt aber vor.

Die Weberei reicht übers ganze Gebiet; viel- und breitstreifige Matten kommen von Yap bis Ku vor.

Die dreistreifigen gehören besonders Lámotrek und Oleai an. Die *madji*-Matten von Mogemog (ähnlich Truk Taf. 8e) fehlen ostwärts. Der Kokosfiederrock ist auf Feis oft ähnlich mächtig wie auf Yap.

Über die Kunst besonders den Rankenschmuck der Bootmodelle von Valladolid (Abb. 198); leichter Anklang bei der Strahlentatauierung, die sonst von den geometrischen Mustern beherrscht wird.

387

VI. Indices.

1. Fauna (s. Wörterv. Nr. 110ff).

a) Säuger, Lurche usw.

Schweine *bābui* und Hühner *málug* s. o. S. 305, 331
Hund S. 305
Über Ratten s. Gesch. S. 383
Falle *tafédj (tafidj) le gédj*

2. Flora (s. Wörter Nr. 179ff.).

Mertens, der Begleiter von Lütke, hat schon viel Beobachtungen über Pflanzen gemacht; in den Notices sur les iles Carolines Bd. III S. 132 nennt er Kokos, Brotfrucht, Jaquier (Jack), Pandanus (vaquois), Aroideen, Bananen, Zuckerrohr, Ficusarten, Barringtonia, Sonneratia, Rhizophora, Terminalia, Calophyllum, Tournefortia, Scaevola usw. Von Feys sagt er: wenig Brotfrucht, viel Bananen; sonst scheint sich das meiste auf Guam zu beziehen.

Bei der Landesbeschreibung schon einiges genannt, sowie bei der Wirtschaft (näheres Palau IV S. 304).

(g)avalaval rotes Kraut
augus le Feis, oder *gogidj* Fetthenne mit gelben Blüten, Kraut s. S. 332; *a. le besés* fremd, Polygalaähnlich (s. Bd. 6 I S. 221).

Woleaians
West Fayu

We hunted in vain for the Mannaïjö sandbank, which Don Luis de Torres had mentioned, and then we steered west again, and on the 22nd of February we sighted the little islands Pyghellá and Fajähú. Neither one is inhabited; on Pyghellá we saw some coconut palms rising above the succulent bushes, on Fajähú there were tall trees, but no palms.

5: Kittlitz--148
116, 131, 171

(1827-8) 1858

Woleaians
Lamotrek

...we sighted the so-called Swedish Islands, which consist of three coral groups: Namurrek, Elato and Namolia-ur. Early the next morning several canoes came from the most eastern one, Namurrek; they were built exactly like the boats, which we had already seen.

5: Kittlitz--148

(1827-8) 1858

Woleaians-1-2
Lamotrek

Unlike the inhabitants of Lugunor and Anoun, however, they did not bring us any fish or other foods. On the contrary, they asked us for something to eat, and they devoured what we gave them. It was evident that there was a real famine on these islands, and apparently this situation occurs at least once during the year. According to the information, which Dr. Mertens obtained from W. Floyd, this hunger period comes in the fall; but here there was no doubt but that it is in March for we found the same thing on all the coral islands, which we visited during the latter part of this month. It is possible that there are several seasons during the year, when there is more or less hunger, depending on the circumstances; the greatest shortage is in the supply of fish, and they constitute the [p. 149] major part of the diet of the islanders. It may be too that W. Floyd was mistaken when he said that this famine lasts over two months. Unless it varies on the different islands, which seems highly improbable considering the fact that they are so similar, at the utmost it can last during the month of March; and this is assuming that what we saw was the regular yearly starvation period. For all during February we had seen an abundance of fish everywhere, and soon after the beginning of April we found quantities of them again on the Uleai group. If there is a short famine in March and a longer one in October and November, then W. Floyd is mistaken for he said that there is only one period in the year and that during that time there is a scarcity of edible fruits as well as of fish. The islanders have to fall back on their supplies of prepared breadfruit, and it seems that they get more of this from the high islands, than they can raise

themselves. During our stay the preservation of fish was utterly unknown on any of the islands.

5: Kittlitz--149
116, 484, 177

(1827-8) 1858

Woleaians
Elato

Several inhabitants of Namurrek, the farthest east of the three neighboring groups, took advantage of our ship to sail with us to the most western one, Elato; a tamol happened to be there with his sailing canoe so he took them to shore.

5: Kittlitz--149-50
116, 177, 438

(1827-8) 1858

Woleaians
Elato

Elato is more closely connected with Guaham than the other Caroline Islands; the Spanish ships which come from there generally stop at the harbor when they visit the Carolines to get holothurians, especially trepangs, which are used for their commerce with China. Then you usually find some of the Elato natives on Guaham; [150] they frequently spend years there and enter their canoes into the government service. They keep up a kind of regular communication between Guaham and the other islands of the Marianas and transport the local products to the main island. During our stay we got acquainted with a tamol from Elato, whose name was Orolitau; he and a considerable number of his countrymen took charge of this Spanish trade between Guaham and the neighboring islands, Seypan and Rota. They gave Captain Lütke a lot of valuable information about the situation of the various coral islands near Elato.

5: Kittlitz--150 (1827-8) 1858 Woleaians
116, 595, 551 Elato

We asked about their [MR: a tamol from Elato and others who were occupied in trade in the Marianas] families too, and learned that [MR: tamol] Orolitau has no less than three wives (although they might be sisters or other near relatives). Their names were: Letaurŭru, Lagŭol and Lamŏarup. One of his assistants, Sepa, named two: Mairuk and Mesa-uro; the third, Orotak, only had one; Namŏarimet.

5: Kittlitz--150-51
116, 133

(1827-8) 1858

Woleaians
Elato
Lamotrek

The Elato group is composed of a chain of small islands, which are bound together by a common reef; there is no approach on the western side, and this may be the reason why nobody came to see us during the short time that we were there. There is supposed to be a good anchorage inside the lagoon, but the entrance is on the eastern side, consequently against the prevailing wind; usually the reverse is true on the coral groups, and the reef projects farthest against the wind so the deeper channels are found under the wind on the western and southern sides. Accordingly these three island groups [MR: Namurrek, Elato, and Namolia-ur], which lie so close together, are doubtless the highest portions of the same shallows whose real entrance is on the southern side; so that the Elato lagoon [151] is really only a part of the common lagoon of the whole group.

These coral islands all look about alike from the sea; narrow low strips of sand lie between the breakers on more or less exposed stony reefs.

5: Kittlitz--151

(1827-8) 1858

Woleaians
Faraulep

According to the information we secured from Don Luis de Torres and the Caroline Islanders, the Faroïlap group was located northwest of the Swedish Islands. On the morning of the 28th of March we sighted three islets in this area, and soon some canoes came to greet us; they answered our first question by crying Faroïlap.

5: Kittlitz--151
116, 262

(1827-8) 1858

Woleaians
Faraulep

This little island group was just as short of food as the others [MR: in March].

5: Kittlitz--151
116, 177

(1827-8) 1858

Woleaians
Faraulep

Among our callers was a tamol, who spoke Spanish fluently, and who had charming manners. His name was Alberto, but he had probably adopted this during his two year sojourn on the Marianas.

5: Kittlitz--152 (1827-8) 1858 Woleaians
116, 175 Olimarao

Here [MR: Faraulep] we were forced to retrace our steps for several days, and this involved tacking against the wind. This was because the information that the captain had received, and according to which the island group Olimirao lay near Farolap, was absolutely false. Not until the first of April did we glimpse the two little islands, composing this group....

5: Kittlitz--152 (1827-8) 1858 Woleaians

The population was fairly large, but the natives did not make a very good impression on us; they were selfish in their barter, and attempted to steal on several occasions; this confirmed what we had heard about these little islands from the fishermen on some whalers. There were some unusually large sea-shells, which were in fairly good condition, among the things that were offered to us for trade. Here again [MR: early April] there was not enough to eat, and all the natives wanted to be given food.

Until the third of April we hunted for two coral islands, which were shown on the maps, and which the Captian thought might be the same one which the natives of some other islands called Ifaluk. In reality there were four islands, the largest of which was Ifaluk; it had apparently given its name to the rest, just as Lugunor and some others did.

5: Kittlitz--152-53 (1827-8) 1858 Woleaians
116, 175 Woleai

...we sighted the extensive coral group Uleai. It was of particular interest to us as the home land of Kadú, the man whose remarkable adventures... were described by Chamisso. The Russian Captian Kotzebue of the Rurik found him stranded on one of the Marschall Islands and [153] took him back north. Apparently he adopted the name Kadú while he was living there in Radak for this name was utterly unknown on Uleai, and we were unable to obtain any information about him whatsoever although it was barely fifteen years since he had left the island.

5: Kittlitz--153-55 (1827-8) 1858 Woleaians-1-2
116, 131, 137, 136 Woleai

Toward noon, we tacked to the anchorage inside the lagoon [MR: on the southern side]; this spot was remarkably like the one at Lugunor. In both places the strip of land, which lay just a short distance from us, was the eastern part of the island group, but here it was composed of three separate islands, which were separated by very narrow canals, while the other was formed by the long island Lugunor, the principal one of the group. The southern one of these islands is Ra-ur, the central one Palliau, and the northern one Ulea or Uleai; it is also the entrance to the north side of the whole group. Uleai, which is the largest island of the group, is shaped like a triangle with flattened sides. Farther north on the edge of the shallows is Marion Island, which is to Uleai what Funoar is to Lugunor, except that the partially submerged reef between it and the main island is not so long as the one between the other two islands. All of these places that I have mentioned are like the Lugunor group in that they are partially covered with very tall trees, in whose shade the houses are [154] scattered, with little lawns around them. At low tide it is very easy to wade through the canals between the islands of this eastern shore, especially the one between Ra-ur and Palliau. We noticed that the large forest trees included more varieties than on Lugunor; there are fine specimens of Callophyllum ...and the Hernandia ovigera.... We saw the sea-swallow (Gygis candida) around the crowns of these trees.... Among the beach birds we saw the Strepsilas collaris...and the Numenius tenuirostris... In the bushes I found the Sylvia Sryinx and the black variety

of Lamprothornis....

On this island group there are neither hens nor doves, and we also missed the Pteropus. On the other hand I once saw [155]...the cuckoo...

The vegetation of these islands is naturally very similar to that of the Mortloks Islands... The Tacca pinnatifida, whose root should produce a fine arrowroot...is much more common than on Lugunor....

The houses were similar in construction and arrangement, but some of them were better built and cleaner. We were often surprised at the size of the planks and boards which are used for partitions and most of which are made out of the suckers of the breadfruit trunks, which are used in ingenious fashions. When these are hewn you obtain large three-cornered planks, and then you can divide them into smaller pieces of the desired shape.

In spite of the abundant supply of the coconut palms, the natives charged high prices for the fruit, which the inhabitants of Lugunor had given us in great quantity. It is true that this food must be highly prized in a land where there is no fresh water, and then too, the denser the population is, the more reluctant the natives are to part with the fruit, which they need themselves. But we missed many other tokens of the cordial hospitality of the Lugunor inhabitants. Although the essential characteristics were the same for both peoples, these natives had developed a much more selfish attitude because of their frequent association with strangers.

Here too all the women were hidden at first, and the men who accompanied us kept crying: farak! farak! [156] every time that we came near one of these little houses that were all closed up. If anyone of us made any move to stay there, the natives all behaved like people who did not want any fooling about the matter. But on the whole they paid much less attention to us than did the men on Lugunor, and it soon came about that I took one of the most frequented paths on Uleai and met a woman who was walking alone too. She did not flee as the ones on Lugunor had done; but when I tried to talk to her, she looked around anxiously as if she were afraid that somebody might be angry if she were seen with me; and on this account, I did not accompany her as far as the door of her dwelling. On the fourth day after our arrival the men themselves began to present their wives to us, but it was simply in order that we might give them presents because immediately afterwards we heard the farak! farak! again. On the morning of the 8th of April we saw several canoes of women, who were rowing around our ship and who seemed to be looking at it attentively although from a safe distance.

116, 439 Woleai

To our great surprise Captain Lütke purchased a large sailing canoe, with all its appurtenances from the tamol Tapeligar, the chief of Ulea Island, for the very modest price of three clubs. We were the more amazed at the cheapness of this article, which plays such an important role in the life of the islanders because we were accustomed to paying high prices for everything here. But the quantity of canoes on hand, which was a proof of the industry and skill of the islanders, provided an explanation for this. Then too the natives here and on the neighboring islands must often trade these canoes to the Spaniards on Guaham in exchange for iron utensils; the latter bring high prices, so three clubs is probably the usual amount paid for this kind of boat.

5: Kittlitz--161 (1827-8) 1858 Woleaians
116, 226 Woleai

We noticed fish baskets, similar to the ones at Lugunor, but no instruments to pull them out of the water; divers always brought up the ones which were sunk here inside the lagoon.

5: Kittlitz--161-62 (1827-8) 1858 Woleaians
116, 481, 151 Woleai

The natives of Uleai excelled even the other Caroline islanders in their diving ability; we saw some remarkable proofs of this during our short visit. One half-grown boy, who seemed about fifteen years old, [162] often amazed us by the skill with which he could catch anything that we threw over board. We were anchored at a depth of nineteen fathoms, and he always managed to reach the object before it touched the bottom. He even succeeded in finding very small articles like pocket knives and other iron things, which we always showed him before tossing them into the water. Like a flash he jumped out of his canoe, which was on the other side of the launch; he swam under the keel of this boat and reappeared a few minutes later with the booty.

5: Kittlitz--162-63 (1827-8) 1858 Woleaians
116, 133 Woleai

Early on the morning of the 9th of April we sailed, and our first task was to make a geographical survey of the southern side of the island group. As usual in the coral islands, there is a much smaller amount of land visible here; even the reef is mostly submerged, and during the day you can only recognize it by the bright green color of the shallows; at night [163] these places are very dangerous for ships when the Captains are not well acquainted with the waters.

5: Kittlitz--163

Aurupik

We now looked for the Eurupyk Island group, which lies south; the Uleai inhabitants had given directions to the Captain, and we found it easily on the 12th of April. It consists of just two little islands, whose inhabitants did not make the slightest effort to associate with us. We saw several canoes through our telescope, but they remained quiet on the beach, and we did not see a single boat on the water. At the time we thought this was very strange, but later W. Floyd's explanations shed some light on the matter. Probably the natives on those islands were celebrating the great yearly festival, and during the first few days they are not permitted to use their boats at all; later this tabu just applies to the use of sails.

6: Senfft--53 (no date) 1905 Woleaians
116, 134, 136, 137 Woleai

The soil seems to be altogether coralline. There are no mountainous regions, and the vegetation is abundant. In spite of the thin layer of humus, the usual plant products of atolls are found here, chiefly coconut palms, which are strong and healthy, large breadfruit trees, pandanus, bananas, Calophyllum, marshmallow, arrowroot, some sugar cane, taro, Cystosperma edulis, and curcuma. There are few mangroves, and no bamboo or areca.

The fauna consists of pigs, chickens, dogs, cats, rats, and sea and land birds; there are few beetles and butterflies.

6: Senfft--53
116, 131

Woleaians
Woleai

Lamutrik or Swede Island is also an atoll. Its shape is that of an isosceles triangle. At the corners of the triangle Lamutrik, Puch (not Pugun), and Fleit (not Faleite) Islands are situated. The Lamutrik group also includes the Elato Atoll about five nautical miles to the west, which consists of the islands of Elato, Oletel, Kari (not Karigun), Tauas, and Falipi, as well as the atoll one nautical mile south of Elato, with the two islands of Lamrior and Ulor. The names Namaliauon and Tauas given on chart 772 of theBritish admiralty are not familiar to the natives. Puch and Fleit are the only uninhabited islands. According to the chart of the British admiralty, the geographical position of Elato is 7° 29' 30" North and 146° 19' 0" East. The chart based on a sketch by the explorer Lutke is not correct. The errors may be seen by a comparison with a sketch I made together with the pilot Davenport during my stay on Lamutrik in September 1903. According to this there are several openings in the reef. There are two passages into the lagoon which lead to a safe harbor by Lamutrik Island.

There are no natural springs since the islands are so small. On those islands which are inhabited there are wells in which the water is slightly brackish but quite good. The water from the wells on other islands is said to be so bad that it even harmed the pigs which were formerly kept there.

6: Senfft--53 (no date) 1905 Woleaians
116, 136, 137 Lamotrek

The vegetation is the same as on Oleai. In the central section of Lamutrik Island there is an extensive swampland in which there are copious taro and sugar cane plantations. The fauna is also the same, but there are far more sea birds and rats on this atoll, while there are no cats at all. The rats do a great deal of harm to the coconuts. The natives wrap pandanus leaves around the trunks to protect the palms from the rats; the sharp thorns of these leaves prevent the rats from running up the tree.

The state of health at the time of my stay there was still so bad that I sent the governmental physician to that island for a longer period. Dysentery seems to be one of the chief causes of death, and the prevalence of this disease can probably be explained by the use of sour toddy; this beverage is made from the axis of the inflorescence of coconut trees. It is very intoxicating and usually produces a desire to quarrel; it is also said to have the effect of an aphrodisiac. I was told that its effect is increased by placing the bottles on the beach in the hot sun and then mixing the juice with salt water.

The number of other diseases is also very high. There are many cases of elephantiasis, eye disease, and paralysis. The report of the governmental physician will treat of matters of health in more detail. Two military policemen have been stationed on the island, and they have been ordered to use all possible means to suppress the use of toddy.

The flesh diet of the natives consists of pork, chicken, fish, crabs, and sometimes turtles. The chief foods are coconuts and sweet toddy, the juice used for sour toddy before it is fermented; this seems to be a wholesome food because of its high sugar content. Few people eat eggs, and it is said that formerly no one ate them. Breadfruit is also an important food. The natives make breadfruit jam by kneading the fruit and then burying it in grooves which they seal hermetically with stones and leaves. They consume these during the time when the trees do not bear fruit. They also eat bananas, taro, Cystosperma, and sugar cane.

Their canoes are made of the wood of the species of breadfruit tree which bears seed. The canoes may be as long as 10 meters from bow to stern; the keel curves downwards and the end pieces are forked. On one side of the hull there is an outrigger and a sturdy bar running parallel to it, on the other side there is a broad platform where members of the crew may rest and where the supplies are kept. This platform is provided with a roof as a protection against the rain and the sun. The sail is made of plaited pandanus leaves; it has the shape of a triangle two sides of which are framed. The corner of the sail formed by these two sides is inserted into a groove in the end piece. The fore and aft end pieces are constructed in the same way. All parts of the boat are sewn together with coconut strings and the cracks are calked with fibers and the resinous sap of a plant. They do not groove the planks used for the canoe; for that reason, and because of the fact that there is no cover for the hull of the canoe, it is always necessary to bail water. A sturdy paddle with a broad leaf is used for steering. The canoes used for shorter trips, within the lagoon or for fishing expeditions, are built according to the same pattern.

The natives do not take great pains with the construction of houses. The foundations consist of two planks at right angles to each other; short, upright planks are placed on these, and two more planks at right angles to each other are placed on these props. On the beams which join the framework there are buttresses which support the roof tree. Between this and the middle layer of planks there are lattices which form the frame of the roof. The roof is pointed; it is covered with coconut fronds. The walls of the house consist of boards. No distinction is made between doors and windows; most of them cannot be closed. Pictures of fish are carved in the upper beams, which are painted with limestone dye. The roof juts out on all sides so that neither sun nor air can penetrate the houses; the interior is therefore dark but seldom cool. On one of the narrow sides the roof juts out further and is supported by props; coconut mats are stretched between these so that another, more airy room is formed. The natives strew small pebbles chipped off coral rocks on the yard around the house. The average dwelling house is about 3 meters high, 2 meters wide, and 5 or 6 meters long.

In the Oleai atoll, each island has its own chieftain. The head chief of Lamutrik also has jurisdiction over the two neighboring atolls, Elato and Lamrior, and claims possession of the uninhabited islands of Olimarau, Pikela, Pikelot, Toas, and West Faju. The office of the chieftain is passed on, not to the chieftain's son, but to the oldest son of the brother nearest the chieftain in age, or, if there is no brother, to the oldest son of the sister. It is said that the chieftains formerly exercised great authority; today their power is rapidly disappearing. They are nothing more than village mayors and have no means of enforcing their authority other than that of tying the accused to a tree for a short time or of destroying his house or his canoe. A native of Yap is the head chief and has the supreme authority; this is always the man who is the head chief of the district of Gatschbar. He, too, has no actual means of enforcing his authority; but the natives believe that all who do not obey his orders must die. On what basis this power rests is not clear; neither the present head chief nor his aged father were able to give me any information about it. Their authority extends even further than this atoll and includes those Carolinians who live in the Marianas.

The only outer symbol of this dependence is that the subjects of this head chief come to Yap at least once every two years to give proof of their devotion. They bring tributary payments which consist of mats, Chama shells, or necklaces made of these shells. They remain on the island for several months and are received hospitably. When they depart they are given the valuable pulverized curcuma (reng).

There is a cookhouse by the dwelling. This consists of a simple hut, open on two or three sides, without gables.

The canoe sheds are used as assembly halls. Since the canoes are large, these are from 15 to 20 meters long and equally high. The gable is pointed and rests on large buttresses in the center. The roof is made of leaves and is supported by short, strong posts along the sides; it almost touches the ground. The narrow walls are left open. The boards and beams of the houses also are not grooved or nailed together; they are simply lashed with rope. The men often sleep in these sheds, since they are nearer the beach and therefore more airy than the dwellings in the bushes.

The so-called "bloodhouses" are the fourth type of houses. Here the women stay during their menstrual period. These are erected at some distance from the main dwellings; they are still lower and [57] are built with even less care than the others. There is no adjoining room such as may be seen in the regular houses.

For fishing they use weir baskets, nets, spears, and fishhooks. There is one very practical method which I have not seen anywhere else. It is used to catch a type of fish which has a long mouth almost like a beak and strong teeth; it leaps out of the water with great force and is therefore quite dangerous. To catch this fish, the natives make a kite out of the ribs of coconut leaves. The kite has a rounded shape. Instead of cloth or paper, they wrap a leaf of the breadfruit tree around the framework. They take the kite into the canoe and fly it above the water. One line is attached to the kite which is held by the fisherman; the other is suspended into the water and the bait is attached to it. If the kite remains stationary, the fisherman can leave as much room between the boat and the bait as he likes so that he is safe from danger and only reaches the line on which the fish is caught when the fish has bitten into the bait.

The domestic utensils are the following: 1. A spoon made of the ribs of a turtle (gadip), and a round basket made of plaited coconut leaves (kopass). 2. Chairs (longeburol) are made of a piece of wood about 30 centimeters wide. Seen from the side, this looks like a chaise lounge without legs, a piece of furniture which by European standards is anything but comfortable. This is used only on Lamutrik. 3. A spoon to scoop water (kom'met), in the shape of a trough, with a handle attached to the hollow part. The halves of coconut shells are also used to scoop water. 4. Baking dishes or cooking pots (moi jal) made of a shell the opening of which is enlarged. 5. Baskets (bod'dan or sanaseu) made of split coconut fronds which are plaited. These are a substitute for pockets. Both men and women carry articles of necessity in these. There are also baskets with a handle (chaperau) which are also made of plaited coconut leaves and have the shape of a pouch. 6. Small cups made of pandanus (guot' tal) in which banana leaves for cigarettes are kept.

There are also shallow wooden dishes or plates (tabbi), wooden mortars (faii) and pestles made of tridacna shells, which old people use to squash hard foods; it may also be used to pulverize burnt coral lime from which dye is to be made.

2. An ax (tale). The blade forms an acute angle with the shaft, like that of an adze. Formerly this instrument was cut out of tridacna shells; today it is made of metal. The natives use this tool very skilfully; it serves them as a hammer, a plane, knife, and file. 3. A small sea shell with a sharp edge (Kilgil), used to cut banana shells into stripes to be used for plaiting. 4. A scraper (waigung) placed on a tripod with a toothed point consisting of a shell or coconut shell, used to scrape coconuts and hard fruits. 5. An auger (wurewur) with a wooden drill bow; the point was formerly made of shell or stone and is now made of metal. The tool for rope-making consisting of three pins in the shape of crosses, which is used everywhere on the western and southern islands, is not used here according to my information.

The total population consists of a single family, 48 people in all. They are all attractive, healthy people. [195] There are 17 men, 18 women, and 13 children. The head of the family, a native of Jap by the name of Malai, told me the story of their origin. About 45 years ago, he and two other men from his island had gone to Palau; they lost their course and were stranded on Aurepik, a distance of five hundred nautical miles. Aurepik at that time had a large population. One of the two men with him died and the other made an attempt to sail back to Jap but was never heard from again. He himself remained on the island and married there. Once the entire population went on the customary expedition to Oleaĭ; his wife had just given birth to a child so that he and his mother-in-law remained behind to stay with her. The expedition never arrived in Oleaĭ and was never heard from again. About a year later a tidal wave swept over the entire island of Aurepik and destroyed all the vegetation so that for a long time he lived only on crabs and shells. His wife had born him nine more children who, when they were older, married natives from Ileaĭ and brought them back to the island.

8: Senfft--283 (1905) 1906 Woleaians
116, 273, 625, 681 Woleai

The coconut stocks on Oleei were normal. Two years ago extermination measures were taken against the rat plague and by now the trouble has decreased considerably. Since the recall of the police post who was in charge of enforcing these measures nothing had been done and the natives had started once more to drink sour toddy. In a condition of complete drunkenness a native had first threatened a dealer with a long knife and then with a spear. The man was taken to Jap and later sentenced on that island. A rumor circulated that three years ago an Australian dealer, who was old and feeble and who had been working on Oleei for a Jap firm, had died an unnatural death. I started extensive investigations on the spot which really produced incriminating material. It seems that a Sonsol native attacked the dealer in his bed, made him unconscious by blows of a hammer and then strangled him. It is said that the housekeeper of the dealer --a fellow islander of the murderer--had been an accomplice to the crime. Other witnesses are said to exist on the islands of Lamutrik and Satuwal. The main witnesses needed for the trial had to be called and set out on the voyage. At the present time the two accused are on Palau.

In a general meeting I discussed everything of importance and informed the population that once more I would leave behind a policeman with far-reaching powers. Fines in the form of naturalia were imposed for neglect of the tree protection law directed against destruction by rats and for the consumption of sour toddy.

.8: Senfft--283 (1905) 1906 Woleaians
116, 245, 273 Lamotrek

Here [MR: Lamotrek] again I had occasion to observe that previously given orders for the protection of the palm trees and the prohibition of consumption of sour toddy had in several instances gone unheeded; it is indeed a sad fact that as far as drinking is concerned the white dealer serves as a very poor model to the natives. A walk through the island revealed the occurrence of cochineal insects on four palm trees; the trees were cleaned and in future the chief will be responsible for the burning of the leaves attacked by the insects.

8: Senfft--284 (1905) 1906 Woleaians
116, 101, 175, 133, 136 Gaferut

This island [MR: Grimes] is known to the natives by the name of "Gaferut," but they have never visited it. They call it the "devil's island" and are afraid to come near it. Yet they were unable to explain their fear for not even any member of the crew of the ship had seen it. We reached the island on December 5 after dark and could not find any anchor ground. The captain sent some of his men on land who during the night were to maintain a fire in order that the ship could stay close to the land. At dawn I rowed ashore. The map of the Admiralty characterizes Grimes as an elevated island, but in reality it is a flat sandbank which in some places rises up to an elevation of 2 meters. The only type of vegetation is a species of mangrove. Apparently a strong storm hit the island a few months ago for most of the trees had lost their branches and many---including the strongest---had been completely uprooted. The fauna consists of innumerable sea birds, which had their loose nests either in the trees or on the level ground; furthermore there were coconut crabs and--to judge from the traces--large turtles, which do not visit the island but at night. The birds were so tame that they could be seized by hand. Gaferut, including the reef, has a length of about 1300 meters; exclusive of the reef it is 600 paces long and 300 paces wide. We could not find anchor ground during the day either.

9: Senfft--13 (1903) 1904 Woleaians
116, 164, 162 Lamotrek

The census showed 68 men, 64 women and 68 children, altogether 200 persons; there had been about six deaths in the course of the year, and as far as can be judged from the description, three died from consumption and two from dysentery. What I saw of diseases there were two people suffering from elephantiasis, one blind man, two persons with eye-diseases (one of which could see only at night), one woman with a saddle-nose and two children with abnormally swollen abdomens; lues and gonorrhea are said not to be existent.

9: Senfft--13 (1903) 1904 Woleaians
116, 167, 731 Lamotrek

This group of islands had formerly had a denser population; a typhoon together with a flood had destroyed almost everything about 60 years ago. A few men who had gone on the six remaining canoes to the Oleai Group at a distance of 150 nautical miles had brought a number of vessels on which the whole population emigrated to the Marianas, Truk, Yap, and other islands. Only after many years part of the population returned.

9: Senfft--13 (1903) 1904 Woleaians
116, 137 Lamotrek

Lamutrik is a typical atoll in the form of an isosceles triangle with the islands Falaite, Puch, and Lamutrik, of which only the latter is inhabited, situated on its three points. It offers a pleasant view with its white sandy shore and a small bay where the German flag can be seen in the background. Coconut palms, breadfruits, pandanus, hibiscus, some curcuma and arrowroot, some Calophyllum, Crataeva speciosa, and Averrhoa carambola trees and taro thriving on marshland, sugar cane and Cyrstosperma edule can be seen growing densely on the island; yams and bamboo are entirely lacking. Fowl and pigs are not very numerous, and the amount of fish in the lagoon has decreased; on the other hand there are many land- and seabirds living in the trees. The cultivation on the other two islands of the atoll is supposed to be the same. Accordingly a plantation of coconut palms on these islands is not possible or at any rate only to a very small extent.

9: Senfft--13 (1903) 1904 Woleaians
116, 132 Lamotrek

Since the last heavy typhoon the island had been only troubled by some more or less violent winds. About the rainfall since 1901 an account had been made and sent to the Foreign Office.

9: Senfft--13

(1903) 1904

Woleaians
Lamotrek

The yearly production [MR: of copra] including that of Flato and Satuval amounts to approximately 45 tons. In spite of the assertion of the merchant, who is stationed with the firm of D. D. O'Keefe, that the scale insect disease does not exist on Lamutrik, I noticed a few young palm trees bearing the sign of this sickness. Another enemy of the palm tree are the numerous rats which eat the nuts from the trees. The leaves of the pandanus which have sharp thorns and wind around the palm trees serve as protection. Among the banana trees a disease could also be noticed that probably has its origin in a colorless worm of 1.5 to 2 cm. in length and which is to be found in the roots and the top of the tree. I, therefore, ordered one of my best policemen to take immediate measures for the protection of the plants.

The population is peace-loving and good-natured but indolent.

9: Senfft--13-14 (1903) 1904 Woleaians
116, 103, 131 Woleai

Oleai is also an atoll; [14] it consists of 23 islands of which Raur, Palián, Oleai, Máriom, Tagánlap, Séliap, Olemari (Ot'thogan), and Falális are inhabited.

9: Senfft--14 (1903) 1904 Woleaians
116, 165 Woleai

Unfortunately we learned that the population had been lately to a great extent diminished by diseases. According to the chiefs a third of the inhabitants had died in the last few years. The great mortality is in the first place caused by dysentery which is probably due to the excessive consuming of sour toddy (the fermenting juice of the blossoms of the coconut palm); the natives are passionate drinkers of this toddy which they mix with salt water and cook in the hot sun at the beach in order to have it stronger. Sudden deaths occur often; the dying man feels a burning pain which starts in his feet and spreads over the entire body until it reaches the heart. Another malady which is also fatal starts with swellings on the neck and breast. Eye-disease and elephantiasis also occur and I saw a man inflicted with severe paralysis.

9: Senfft--14
116, 433, 477

(1903) 1904

Woleaians
Woleai

Economically the island is taken care of by the firms of D. D. O'Keefe and S. Murayama in Yokohama, who both are in the possession of trade settlements. The yearly production of copra in Oleai together with that of the neighbor island Ifaluk is approximately 90 to 100 tons. In order to prevent unhealthy competition the two firms introduced at my suggestion the same prices for the limited time of three years for the most marketable articles--tobacco and cotton.

9: Senfft--14 (1903) 1904 Woleaians
116, 157, 463 Woleai

The population is peace-loving but is greatly inferior to that of Yap in intelligence, industry and character; they are efficient, though, as canoe constructors, seamen and fishers.

9: Senfft--14 (1903) 1904 Woleaians
116, 162, 145 Woleai

Looking at the statistics of these islands we notice the disproportionately great number of the female population as compared with the male, on the other hand the proportion of children to grown-ups is not unfavorable if we take into consideration that only children up to eight years have been counted. The very low percentage of young girls, though, is conspicuous; girls, who according to their build and expression could not have been more than sixteen years old, already showed traces of age.

9: Senfft--14 (1903) 1904 Woleaians
116, 761, 152 Woleai

As depressing as it is to see a gay people surrounded by graves it impressed me as even worse that they do not seem to realize what death is. They speak with laughter about their dead, with laughter did they show me the hopelessly sick and the efforts of the paralyzed man who was painfully trying to get up with the help of two sticks in order to demonstrate the violent trembling of his sturdy body was accompained by the laughter of the people around him. There is no doubt that this blunt attitude towards death is due to the accumulation of misfortune which these people experience.

9: Senfft--14 (1903) 1904 Woleaians
116, 162 Woleai

A census taken on the islands of the atoll brought the following results:

Island	Men	Women	Children	Total
Olemari	41	40	50	131
Raur	12	10	7	29
Palian	15	20	13	48
Oleai	45	88	50	183
Mariom	5	15	12	32
Taganlap	17	21	14	52
Seliap	26	38	46	110
Falabis	25	40	11	76
Total	186	272	203	661

9: Senfft--14 (1903) 1904 Woleaians
116, 625, 643 Woleai

In the first place I stationed two reliable policemen at the island who can in case of emergency ask three former soldiers living now on the island, for help and who received the order to prevent the drinking of toddy [MR: which he considered a cause of dysentery] and to use force if necessary. The chiefs cannot be relied upon in this respect. Their authority is limited by many considerations and is not greater than that of our village magistrates. There is no chief over the whole group of islands and the above mentioned Follebu in Yap is also the ruler over Oleai.

9: Senfft--14 (1903) 1904 Woleaians
116, 245, 262 Woleai

The cultivation is the same as on Lamutrik, partly more abundant, but here, too, yams and bamboo are lacking. Fowl, pigs and fish are numerous. The islands are planted to the highest density with coconut palms in luscious green. I noticed the disease caused by the presence of the scale insect on only two young palm trees each on the islands of Mariom and Taganlap, but here, too, the greatest damage to the palm trees was wrought by rats.

10: Miklucho-Maklai --295 (1876-1877) 1877 Woleaians

Their [MR: the Eauripik natives] appearance reminded me of the natives of the islands southeast of Ceram and the Kei Archipelago. In both instances I am doubtful whether we are dealing with natives who have some Papua blood.

10: Miklucho-Maklai--295 (1876-1877) 1877 Woleaians
116, 175 Aurupik

The group of Auropik consists of three low islands. I did not go ashore...The people who approached us were not very dark (No. 37 of Broca's chart) and had wavy or frizzly hair arranged in high hairdresses. The bridge of their noses was pierced. Large numbers of tortoise shell rings and other ornaments of various types of white and red shells pulled the pierced earlobes down to considerable length. Tattoos could be seen above and below their elbows; they looked almost like bracelets and arm rings. In their thick hair they wore large combs with flying feathers and through the bridge of their noses they had put flowers and leaves. Their costume consisted of a tight cloth slung around the waist and pulled up between their legs.

The Oleaï Islands belong to the West Carolinian and Palauan district politically. They are situated about 380 nautical miles to the east of Jap, and form part of the island group which extends from Palau to the Marshall Islands over an area of more than 40 degrees of longitude. They comprise 21 islands of varying size. Only eight of them, the largest in size, are inhabited, although all of them have abundant growths of coconut trees and tall breadfruit trees. Raur, Paliau, Oleaï, Marijong, Tagaulap, Saliap, Utagal, and Falalis are the islands which are inhabited.

The islands form two semi-circles which meet at Tagaulap Island, in such a way that they form the arabic numeral 3. The opening of the 3 forms the passage to the inner lagoon.

Through this large opening in the reef, the lagoon is exposed to the southwest monsoon, so that this wind causes a rough sea within the harbor. There are also many reef banks scattered throughout the harbor. One of the most dangerous of these is situated to the northeast of Motogosu (Motagu) Island. During stormy weather, which is frequent during the time of the northeast monsoon, the sea here is very rough; it swells and there are breakers and strong currents from all sides.

There are two narrow passages which are navigable for canoes and small craft, one between Fareiles and Jalangigereil, the other between Tagaulap and Marijong; the latter has more depth. Near this, towards Tagaulap, there are breakers [176] even during calm weather. During the northeast monsoon the surf is strongest at the apex of each of the two semi-circles.

In former times the people of Oleaï went on frequent expeditions to Gatschbar to make their tributary payments, consisting of woven mats, Gau, the gold of Jap, and ornaments, as the people of Ululssi still do today. In our time, however, world trade has modernized communication among the Micronesians. A few months ago, the head chief, Follebu, went to Oleaï on a trade schooner to survey his territory. He also levied a tax of 17,000 coconuts on his subjects; this tax is collected by an American company which gives the chieftain its equivalent in European articles of trade, which are worth about 150 Mark.

Woleai

All the natives have their houses along the coast, on that side of the islands which faces the inner lagoon. There are no visible boundaries, although there are separate communities. There are about three or four villages, each with its own chieftain, on each island. There is no head chief within the atoll, not even a "first among equals". The actual head chief is the chieftain Follebu, or rather his father Bugolrau, in Gatschbar on Jap.

There are several legends concerning the origin of this political dependence on Jap. One of the most common variants is the following: Once a woman from Oleaï lost her course and was stranded at Gatschbar. She was received hospitably, and, when the winds changed, some people from Jap provided her with the necessary supplies and took her safely to her native island. The peaceful people of Oleaï recognized their superiors in these armed, warlike men who had saved the woman, and accepted them as their masters. The consciousness of their dependence is deeply ingrained in the natives of Oleaï. They believe that if they should secede from Jap and break faith with their head chief, a huge tidal wave would wash away their island.

11: Born--176
116, 132

(1903) 1904

Woleaians
Woleai

About 15 or 20 years ago, at the time of the southwest monsoon, a tidal wave swept away the entire southern tip of Tagaulap, together with all the houses, coconut and breadfruit trees on that section, although no lives were lost; this island is most exposed to the rough sea of the southwest winds. Today the tip of the island consists only of sand, and nothing is left but the bare branches...

Even today, however, the peoples of Oleaï still go on sailing expeditions which take them as far as Ruck to get Reng, the [177] pulverized roots of the curcuma plant which is the money of the Oleaï, in exchange for woven mats, ornaments, and canoes.

During my stay there, a fleet of 10 canoes was expected every day; they had departed for Puluad a year ago. Unfortunately I was not able to wait for their arrival. I did see, however, the arrival and departure of canoes almost every week. They went back and forth between the island and Faraulip, Ifaluk, and Aurepik. The people of Oleaï have close economic and family ties with these three island groups. There is a constant exchange of articles of trade and even of persons among them. Because of the many intermarriages they are all closely related. Aurepik is a distance of 80 nautical miles from Oleaï, Ifaluk is 40 and Faraulip 100 nautical miles distant.

11: Born--177 (1903) 1904 Woleaians
116, 142, 101 Woleai

In physical structure, dress, language, and customs, the Oleaï natives belong to the Central Carolinians. They are closely related to the natives of Truk, Ululasi, Lamutrik, Satuwal, Sorol, Sonsol, Atogui, and Merir.

For the most part, they are of medium size and slender build; their skin is lighter than that of the people of Jap, and their features are regular and attractive. Their iris is dark brown, the conjunctiva bulbi has a yellow tinge and pigmentary spots. The shades of hair vary from dark brown to almost black, but the children are often dark blond; many of them have curly hair. Many of the women are as tall as the men. Frequently they have beautiful, well-proportioned bodies. The men have only a very slight beard.

11: Born--177 (1903) 1904 Woleaians
116, 502 Woleai

It frequently happens during stormy weather that a canoe is overturned...In that case, some of the men hold on to the food supplies, coconuts, breadfruit pudding, dried fish, etc., while the others turn the canoe over and swing it from side to side to bail out the water. Then they sail on, although the same thing may happen again within a few hours. Fortunately, few lives are lost on these daring trips. If a canoe loses its course, it usually drifts to another island, to Ululasi, Jap or Sorol.

The men wear a narrow loincloth, tor, which is worn like that on Jap. Formerly this consisted of a narrow mat, but today most of the younger men use blue and red cloth; red cloth especially is very popular. When they wade in water that reaches above the hips [178] they remove the loincloth. Children of both sexes wear no clothes until they are about five years old.

Although the dress of the men is very simple, their ornaments are even more colorful and varied than those of the Jap natives. They often wear a wreath of fragrant white and red flowers, which they wind around an elaborately carved comb, makal. The white blossoms are taken from the Ut trees (on Jap they come from the papaya trees), the red blossoms from the Sorr trees. They wear two or three necklaces made of coconut shells cut in the shape of rings, tagag, or of small disks of Gau (chamotsch, feipar, lamoluk). There are also bracelets, worn around the wrist made of the green fronds of coconut trees, lag, or ankle bracelets made in the same way. With these, they also wear bracelets made of tortoise shell, botschall, or small disks of sea shells, chamelat. The latter come from Aurepik and Sorol; they are never made on Oleai. One very rare ornament, imported from Puluat, is a belt, worn either around the stomach or around the neck, which is made of large rings cut from coconut shells, tagag.

Besides these ornaments, the natives also use the valuable Reng (Rang) which they rub into the entire body several times, and coconut oil, loi, which they rub into their hair until it shines.

The lobes of their ears are distended so that they often reach halfway down to the shoulders. On these they wear ornaments of all kinds, from the ordinary rings of coconut shells, tschi, to the valuable Gau disks, fol Aurepik, as well as the strange pendants made of the vertebrae of sharks. Most of the natives wear their hair short, I saw only a few men who had tied their hair in a knot behind the head, following the custom of Jap.

Most of the older women also wear their hair short, but the young girls prefer curls. The wreath as a hair ornament is also very popular among the women, and they wear it almost constantly. Sometimes they wear a fillet made of yellow fiber, marmar, instead. Their necklaces are small, and consist either of Gau disks or of rings made of coconut shells or tortoise shells. They wear numerous earrings made of rings cut of coconut or tortoise shells in all sizes. They wear bracelets made of grooved tortoise shell bent to the proper shape; sometimes, less frequently, they are made of coconut shells or disks made of sea shells strung up together. There is also the bracelet which is the favorite of the girls on Jap; this is made of the hinge of jagoiok shells. The natives of Oleaï copied this ornament and the method of making it from the Jap natives, so that the term jagoick has been taken over into the language of Oleaï.

The women's dress consists of a woven mat, [179] gapalepal, which they wind around their hips. When they sit down they push the front part of the mat between the upper legs. This garment encloses the hips and legs so tightly that the women all have a strange, stiff and mincing walk. The garment of the young girls is more comfortable. This siwesiw does not require as much labor as the mats of the women which have to be woven. A short apron, attached to a belt worn around the region of the navel, hangs down in front and back; this is made of fresh green leaves. They also wear a narrow strip of leafy material, chatiletach, between the legs. Today some of the young girls wear grass skirts, jungejung, similar to those worn by the Jap women, except that there they are wider and are made of several kinds of leaves and grass, while the skirts here are made of coconut fronds which have been cut into strips.

All the women wear a belt around the hips; this may consist of any kind of material. Often it is made of hairs which are plaited, tschiim, but usually it consists of three or four strands on which black beads made of coconut shells have been strung up, tartar. The strands are held together by small white disks made of shells, maijal shell. These disks are called pak and are made on Oleaï. Several holes are drilled into them; they are inserted into the belt at regular intervals. There are usually nine disks in one belt. The belt is tied into a knot at the stomach; the strands, which consist of coconut yarn, are twisted together. I saw one beautiful belt of this type, more valuable than the type commonly worn. Rings made of polished tortoise shells had been substituted for the

coconut beads, and Gau disks which had been polished a dark red were inserted in place of the white shell disks. The jil is worn only at special occasions. This is not the property of one woman; it is a family heirloom, and may not pass out of the family without the permission of all its members. This ornament is an admirable example of Micronesian art, and shows a great deal of taste and aesthetic feeling. It is made on the islands of Ululssi, Feis, Aurepik, Ugulu, and Sorol, where the people of Oleai buy it in exchange for mats, canoes, and food, The best jil are made on Aurepik. They are about 60 to 70 centimeters long, and 4 or 5 centimeters wide; they consist of shell disks and coconut beads strung up on nine strands which are held together by ten tortoise shell buckles, pak-ele-jil. The basic pattern is always the same, with only a few slight variations in details: there are two black areas with a [180] white line through the center, three smaller areas with a black line through the center, and two white areas at each end with a black cross, which again has a white area in the center.

The value of these belts varies considerably, depending on the care with which the work has been executed and on the type of materials chosen. The most highly valued belts are those which have black beads made of tortoise shell rings. These are made on Ugulu and Aurepik. Those made on Sorol and Feis have the lowest value. Here the separate strands are shorter and they are not held together as firmly as in the other belts, and the beads are not made with as much skill and care as those on Aurepik.

11: Born--178-180 (1903) 1904 Woleaians-3

Both men and women wear the hat made of pandanus leaves which is worn on Jap. Here it is called tscholifatsch.

Among the buildings of the Oleaï Islands, there are first of all the large houses, fal. Here the men spend the larger part of the day and night, a custom which is also found on Jap. However, the women and girls are also permitted to stay in the large houses, and the custom of keeping mongol, hetaerae, is not known here; in these two respects the houses here differ from those on Jap. There are two kinds of community houses. One, called falepai, is erected on large, rectangular wharfs, which jut out into the water several meters from the beach. The style of these falepai is reminiscent of the bâwai on Jap. The former, however, are small, and the timber used is not as good; they are made of wood from coconut and pandanus trees. The houses are used to store sails, nets, weir baskets, and mats. At night the natives light large fires within and in front of these houses, so that they provide a cool shelter, with fewer mosquitos than the houses on the beach. The inhabited islands each have one house of this type, Utagal and Falalis each have two.

The other type of community house, faloa, is used during the daytime, and serves as a place for work. There are three or four of these on each island, except for Tagaulap and Marijong, which have only one. These houses are nothing more than large, open halls without front or side walls. A sloping roof which nearly touches the ground takes the place of the side walls. The front and back are open. Here most of the canoes owned by the people of the surrounding villages are kept, both the large canoes used for deep sea sailing and the smaller craft which is not used very much today, as well as sails, nets, and weir-baskets. During the day the men build or repair canoes in this house, or they plait weir baskets or make nets. This is also the place where the fish caught on a common fishing expedition are distributed among the individuals....

The house for menstruating women, im-mel-jagobung are not isolated and far removed from the dwellings as are those on Jap. They are situated within the village. The houses for women in labor and for women lately confined, im-mellipel, are built anew for each individual case; these are situated as far as possible from the village, mostly on the beach.

There are also a few storage houses for coconuts, im-motscho, made of wood from breadfruit trees. These have a very solid build and have a more attractive appearance than most of the dwelling houses. They are scattered among the bushes. Recently the natives have erected small sheds for the canoes, (thapal, a term which in the language of Jap means house for menstruating women), but these consist of plain rectangular huts,

covered with leaves; they do not resemble the complex structure used for the same purpose on Jap.

11: Born--181 (1903) 1904 Woleaians
116, 342 Woleai

The dwelling house, im-molut, of the Oleaf natives stands in about the same relation to that of Jap as a hut does to a mansion. It has the appearance of a temporary shelter which even a slight gust of wind might blow away. The walls and the roof are made of coconut leaves. There are no foundations, no floor, and no partitions dividing the inside into separate rooms as there are on Jap.

Recently, however, the natives have built more substantial houses, probably under the influence of the Jap natives. These have regular planks and walls made of the wood from breadfruit trees, im-pap.

Some houses have a small veranda, im-mal-paloi, which is separated from the interior of the house and surrounded by partitions made of leaves.

The yard around the house is kept very clean. Usually it is covered with coral pebbles. The adjoining buildings are cookhouses, malam. There are no separate houses for women and girls as there are on Jap; the entire family ...which usually includes a number of unmarried female relatives, most of them older, live together in one small room.

There are two basic types of canoes, which again have two subdivisions each, those used for sailing and those used for rowing. The generic term for canoe is w(u)a. The canoes for rowing are privately owned; of these, some are built for one or two persons, tschosmal, and some are larger, accomodating 11 or 12, wafetul. They are made of wood from breadfruit trees, and the separate pieces are lashed together with coconut yarn and glue. This glue is made of burned pulverized coral lime, ashes of coconut shells and the juice of fatsch roots. The two outrigger, tamur, poles are placed in the center of these canoes [182]; these are forked and are set into the outrigger and made fast with coconut ropes, golgol, tied in elaborate knots. In the small canoes, a board made of wood from the breadfruit tree is placed over the outrigger poles to be used for sitting. The large canoes have eight or nine narrow benches for the men who are rowing, and a rectangular wooden platform with a reenforced edge, faref, which is used to store equipment and supplies; it takes up half the length and the entire width of the canoes and is placed on the outrigger poles, toward the outrigger and outside of the canoe proper. The canoes are equipped with short paddles which are easy to handle, fatel; there are made of safang (Calophyllum) wood and are slightly curved at the points.

All of these canoes have an attractive, slender shape. They have forked end pieces like those of Jap, rassim. On Jap there are no canoes for rowing; they are very handy for the people of Oleai, however, who use them for short trips among the neighboring islands.

11: Born--181-182 (1903) 1904 Woleaians -2
116, 396, 501 Woleai

The natives here are experts in the construction of canoes for sailing. There are two types of these: wamar, small canoes used within the lagoon, and waluwe, the large canoes used for deep water fishing and for the large expeditions to Ruck. By European standards, these large canoes are also quite useful for shorter trips. There are wide benches with back rests, falak, in the center of the canoe; for protection from wind and rain on longer journeys, there are huts, geimeru, on the outrigger.

The natives use carefully finished blocks of wood for the tackle. They learned this device from merchant ships; on Jap it is still unknown.

11: Born--182 (1903) 1904 Woleaians
116, 262 Woleai

The diet of the natives is chiefly vegetarian. Coconuts, nu, are a staple food; during the long periods of cold at the time of the northeast monsoon when the winds are too strong for fishing expeditions, coconuts are often the only available food for two weeks or more. Next to the coconut in importance is Lack, here called bulak, which is not as abundant on these islands as on Jap. Only women may dig the hard, small root of this plant; they must do this before sunrise, and they must abstain from sexual intercourse and from smoking the night before. All the Lack fields of all the islands together (Tagaulap is the only island which does not have a Lack field)are not enough to yield a supply of this food for the entire population.

A favorite recipe of the Oleaï women consists of slices of Lack cooked together with coconut scrapings; this jarong keeps for one or two days.

Another staple food is breadfruit, mei. This is used for the marr recipe. The fruit is pared before it is quite ripe, sliced, and put into a basket made of coconut fronds together with the seeds. The basket is then placed in a shallow groove lined with the leaves of breadfruit trees and covered with large pieces of coral rock. They are left there for several months, and the leaves are changed several times. When they are taken out, the breadfruit pudding has a yellow color, a strong, unpleasant odor and is full of worms and larvae. The pudding may be left in the groove for as much as a year. The method of washing this marr is the criterion of a good cook. It is then placed in clean, woven mats and made into a paste with sweet toddy (the juice of the florescence of coconut blossoms) and coconut oil, and is then ready to be eaten.

There are also bananas, wuitsch, pandanus fruits, wele-fatsch, papayas, gatoruk, and jabatsch (abiutsch on Jap) fruits, which have a very unpleasant odor: these are not consumed as much as the foods mentioned above as they are not found in such abundance. There is, however, a reddish fruit, somewhat like an apple, called arefas on Jap and faliap on Oleai; the season for this is December and January, and it is a favorite food, especially among children. These are stacked up on wooden poles by the dozen. They are said to cause digestive disturbances in older people, but they are believed to be very healthy for young people. I myself found that one of these fruits may cause a slight feeling of nausea when eaten on an empty stomach, but that after a meal a dozen may be consumed without any harmful effects. Judging from their taste, I should say that they have a high content of tannic acid. It should also be remembered that arefas plays an important part in Jap medicine.

In the consumption of animals, fish (ik here, nik on Jap) are, of course, one of the chief foods. If a large number is caught on a fishing expedition, there is a great rejoicing among all the natives and they hold large banquets. They dry those fish which they cannot eat. On calm nights, fires may be seen all along the beach; the fishermen and their families roast their fish and eat them immediately, whether they are hungry or not.

There are very few pigs, silo, and chicken, maluch, today; the former especially

are very scarce. Formerly they existed in [184] abundance. One reason for this is that more boats visited the island formerly and payed high prices for pigs and chicken, another that the pigs caused great damage to the Lack plantations and the marr grooves, and, finally, that a large number of chickens were consumed by patients during the epidemics. Today there are probably less than a dozen pigs in the entire atoll. Pork is sometimes cooked in large pots, as is customary on Jap, but more often large pieces are roasted over a fire.

Several varieties of clams and turtles, uong, are also popular.

11: Born--184 (1903) 1904 Woleaians
116, 273 Woleai

Besides water, the natives drink the juices of young coconuts, tschalelu, especially toddy, which may be sweet, gatschimem, or sour, faloba. The sweet kind is not intoxicating, the sour kind is very intoxicating and has an immediate effect. The men climb the toddy trees every morning and evening and take down the full bottles. After the first cut into the core of the tree, it takes about two weeks to accumulate a sufficient amount. There are many trees which never yield good juice; this is ascribed to the kind of cut used and to the sharpness of the knife. A coconut shell is suspended below the place where the tree has been cut. The shell has a hole in the bottom, and the juice runs through this into a bottle attached directly under the shell. Sour toddy is made of fermented sweet toddy. The juice drips into a coconut shell and is left thus for several days; from time to time the sediment is poured off. After three days the toddy has intoxicating properties, which are increased if the shell is not cleaned. Sour toddy causes intestinal disturbances and is one of the factors causing dysentery, a disease which is especially violent in Oleai. Although the preparation of this drink is now against the law, there are still many natives who drink it. One chieftain told me, "You white people have beer, wine, and rum to get intoxicated, we have toddy for that purpose."

Besides the construction of houses and canoes, the main task of the men is fishing, seloch. They go fishing both within and outside of the lagoon, and they use spears, koboi, fishhooks, bau, fish-traps, buiau, nets, jedeng, and weirs, kassutsch.

When they use fishhooks, the fishermen, most of them boys and young men, stand up to their chests in the water. The bait consists of pieces of coconut or marr. The hook, cho, is attached to a line which is tied to [185] sticks 1 or 1 1/2 meters long. Formerly the fishhooks were made of shells or tortoise shell. Today all the natives get both the hooks and the lines from traders.

The fish-traps vary considerably both in size and in shape. Divers place the baskets in the water and then take them up after two or three days.

Often, if nets are used for fishing, all the inhabitants of the island help. The net is spread out into a semi-circle, and men and boys swim along the periphery and hold it taut; I noticed that the oldest natives, including the local chieftain, were stationed at each end to pull it toward the land. All the rowing canoes which are available are posted around the net. The net is dragged slowly toward the shore with much noise and shouting. The result, however, usually does not correspond to the amount of time, labor, and noise that went into this work. I observed several occasions at which not more than 20 fish were caught. At other times there may be a large number of fish. I was told that one of the natives of Paliau Island had caught several thousand skibijaks (jaringab) at one time, this fish apparently is similar to the salmon and is large and tasty.

Weirs are seldom used. I saw only one, constructed like those used on Jap, which was made of large pieces of coral rock and had been placed in the outer lagoon by Tagaulap Island.

Flying fish, tülimingar, are caught at the same time and by the same method as on Jap. During the period from February to May, the men go out at night with their torches to catch large numbers of flying fish in circular nets. At this time, the same rules apply to the fishermen as on Jap; they may not have sexual intercourse or sleep in their own houses.

It is said that the custom of catching flying fish was introduced on Jap by Ululssi and Oleaï.

There is one kind of fish, the bright red bolé, which the natives of Oleaï never eat; it is taboo for them. The people of Jap eat this kind, although they do not consider it a delicacy.

When a canoe returns from a fishing expedition, everyone on the beach runs away and hides, [186] from the fishermen. After the men have landed by the large house, they go to the fireplace in the hall of the house, hold their finger into the flame, and touch their tongue. As soon as the people in the bushes see this, they emerge from their hiding place and the fish are then distributed.

11: Born--186 (1903) 1904 Woleaians
116, 285, 142 Woleai

The women also plait all kinds of mats, handbags, and small pouches in which tobacco, tinderboxes, kindling implements, and all the other small articles which the natives carry about with them may be kept. Betel, however, and the articles that go with it are missing; the Oleaï natives do not chew betel and therefore have beautiful white teeth.

11: Born--186 (1903) 1904 Woleaians
116, 304 Woleai

Today, no one except the older people is tattooed over the entire body; the younger people only tattoo their arms and legs. Latin letters, crosses, and fish are popular patterns; the fish designs are tattooed in a long row from the hips to the ankles. The technique of tattooing is the same as that on Jap. The patterns used for tattooing the entire body closely resemble Kubary's drawings of the patterns used on Sonserol.

11: Born--186 (1903) 1904 Woleaians
116, 462 Woleai

The main task of the women is the preparation of food and the weaving of mats. The people of Jap consider the women of Oleai very lazy, but that is doing them an injustice. Most women and girls are busy from morning till night.

Formerly the women used pots which were made of large sea shells; today most of them use iron pots for cooking. They keep food in wooden plates and oval-shaped dishes; these have no supports or ornaments of any kind.

The women and girls are also expert at handling the canoes for rowing; they have as much endurance, and they paddle as quickly as the men. I have seen many of them row out beyond the lagoon without men.

The most difficult task of the women is weaving, which they do with great skill and taste. This is very slow work and requires a great deal of patience. It may take months to weave a single mat. Even the preparation of [187] banana and hibiscus fibers, cleaning and dyeing them, takes a great deal of time and care. The loom, paap, is attached to a belt, talletói, worn by the weaver. The sword, which beats down the weft, is made of black jengi wood which has a high natural polish; the term for sword is gopóp (opóp on Ruck). The term for shuttle is gasáp (asáp on Ruck).

They make narrow belts for men, wide mats for women, and large plain mats which are made of hibiscus fiber; the mats used for clothing are made of banana fiber. These large mats are used as a protection against mosquitoes and as a cover for the marr paste after it has been washed.

The pattern most frequently used is black and white longitudinal stripes; there are seven black and six white stripes. There are more attractive mats, which have three narrow black vertical stripes in the center and horizontal stripes at the ends. There is a large variety of horizontal patterns; I have never seen two that were identical.

Recently, a few women have been using red aniline to dye the fiber.

The average price of a mat is approximately equivalent to one Mark.

11: Born--187 (1903) 1904 Woleaians
116, 515 Woleai

The women of Oleai are very particular about cleanliness. They go into the sea to bathe about three times a day, and wash their entire bodies as well as their clothing with coconut scrapings. They wash the children at the same time, beginning with the youngest infants. They wash out the ears, mouth, nose, and eyes with leaves, a process which is, of course, accompanied by cries and shrieks on the part of the children.

11: Born--187 (1903) 1904 Woleaians
116, 304, 832 Woleai

Many, but not all of the women and girls are tattooed on the mons Veneris. The pattern represents a bird or a kalong with outstretched wings, the tips of the wings touching the groins, the point of the beak pointing toward the vulva.

When a woman gives birth to a child, she utters several strange, piercing cries. This is a signal which can be heard by everyone. Each house used for a confinement is newly built especially for that occasion. These im-mellepel are situated at some distance from the dwelling houses, on the beach, and a woman remains there for ten days after the confinement. [188] The members of her family, even the men, visit her constantly, except for those men who are skilled in the art of navigation and who are in charge of deep sea sailing expeditions. Her food during this time is the same as that of the other women.

After the ten days have passed, the hut and all the mats used by the woman during her stay are burned down, and she returns to her home. During the pregnancy and for a long period after the confinement the woman may not have sexual intercourse. I was told that this rule covered a period of several years. There are ways, however, to circumvent this prohibition.

The woman gives birth either in a kneeling position, leaning slightly forward and pressing her hands on her thighs, or she rests in the lap of another woman in a half sitting, half lying position. A shell with a sharp edge, gilgil, is used to cut off the navel cord. The cord is not tied; one of the women present chews a herb and spits it on the bleeding wound; this is said to stop the bleeding immediately. They bury the afterbirth, pei.

I was told that many women have twins; some time ago, a woman from Falalis had even given birth to quadruplets, but they did not live. The natives believe that white women, "like cats and dogs", always give birth to several children at a time.

During their menstrual period, pungelog, the women and girls stay in a small house for menstruating women. The girls wear a bunch of light green leaves inserted in their grass skirts at that time. They have strict dietary rules; they may not eat anything prepared or even touched by a man.

It is against the custom to have sexual intercourse with a girl who has not yet begun to menstruate. This, however, is frequently disregarded, especially by older people, in spite of the belief that it may hurt the girl's health.

The Jap custom of isolating a girl for three months after her first menstrual period and blackening her teeth does not prevail here. Public opinion disapproves of sexual intercourse before marriage, while this is allowed on Jap. A girl is always accompanied by a group of children of both sexes, who are, as it were, the guardians of her chastity. It is considered very [189] improper for a girl to go into the bushes by herself. In spite of that, many girls follow their own inclinations at night. There are, however, a large number of 15 and 16 year old girls who remain virgins until their marriage.

The development of art among the Oleaï natives is on a very low level. I saw no musical instruments of any kind. There is said to be a kind of jew's harp for children, consisting of a single string which is plucked to produce different notes.

The dancing songs of the natives here are, if possible, even more monotonous and lacking in melody than those of the Jap natives. The dances, baruk, are more rapid and lively. Here, too, clapping the hands and beating the thighs and armpits are the chief movements of the dance. In some dances the performers produce a peculiar sound by puffing out their cheeks and snapping their index fingers against them.

There is no law against polygamy, because of economic reasons monogamy is almost universal. If a young man wishes to marry, he must make large payments to his future father-in-law, and he must have some possessions, such as breadfruit and coconut trees and canoes. Poor men are badly off; it is extremely difficult for them to find a wife. Even a wealthy suitor may be rejected by the girl with the expression, "itoai (I do not want to)", if his appearance does not please her.

Adultery among the inhabitants of the same island is not unusual and is not regarded as anything important since in that case the inhabitants consider themselves almost one family. If the offender comes from another island of the atoll, however, adultery is considered a serious crime and is revenged. As soon as a crime of this sort has been discovered, the word spreads to all the islands, and almost all the men sail to the island of the guilty man to punish him. They burn his house, cut down his breadfruit and coconut trees, and break his canoe, in short, he loses his fortune. There is never any corporal punishment.

Few of the houses have ornaments on the gables or the equipment. The only attempt worth mentioning is a pattern on the front and back of the houses, consisting of a row of fish painted on a white background. I found no carved human and animal figures such as those made on Jap. I saw one carved canoe, [190] but the workmanship was crude and careless, and could not be compared with that of Jap. The reverse is true of the actual canoes used. The crude, unattractive canoes of the Jap natives cannot compare with those of the natives of Oleai.

When a man dies, his friends and relatives from the entire atoll come to the funeral. They take part in the lamentations and bring presents to the family of the deceased. There are no dances. The body is wrapped in a mat. Two or three days after death it is placed in a casket made of the parts of a canoe. It may be buried at the outskirts of the group of dwelling houses; otherwise, the casket is taken outside of the reef, weighted with stones, and buried at sea. No mounds are erected above the graves. A rectangular stone wall encloses the grave, on which coral pebbles have been strewn. The natives give as a reason for burials at sea the fact that a stranger might walk across the grave and so disturb the peace of the departed, or that children might laugh and play on the graves and thus "play with the dead"! A body may be buried in the grave of a deceased relative.

The natives use all sorts of magic and enchantments for animate and inanimate objects. They twist their bodies into grotesque shapes and clap their hands as they utter their formulas. The formulas are applied to all the accidents of human existence. They are used to prevent illness and death, to help canoes which have lost their course, or at least to guide them to a neighboring island. If a rainstorm is approaching, a formula prevents it from hitting a canoe out on the open sea. Once when I was on my way to visit a woman who was very ill with dysentery, I met a canoe in which a woman adorned with flowers was sitting. She sang magical formulas and made strange movements with her paddles as she rowed out toward the sea. The purpose of this was to induce the devil, aissis, to leave the sick woman and to follow her voice. Later, when the woman recovered, her relatives probably explained it by this magic, and not by the Ipecacuanha which I had administered.

The Oleai natives are by nature a very friendly and peaceful people. They have never had any wars, and they have no weapons for warfare. It is all the more striking, then, that, after a longer stay with them, one becomes aware of behavior which can only be described as forward, if not impudent. [191] In their relationships with white people they make no attempt to conceal the fact that their only object is to make as great a profit as possible. This is in marked contrast to the charming and sincere behavior of the Jap natives which make all transactions with them pleasant and friendly.

No matter how unimportant the transaction, the native in question never fails to ask mita gatschau (What will you pay?). The term gatschau, to pay, might be called the leitmotif of the Oleaï natives in their dealings with white people. Whoever pays well is a good man, and he who does not is bad. This is true of the natives of all ages.

A small birl, barely three years old, once saw a picture of a woman in one of my magazines. She asked me if it were my wife, and when I laughed and said that it was, she immediately asked, "mita gatschau?".

While the people of Jap often refuse payment, even for a large amount of work, with the words "pelnou olag (It is only an act of friendship)", and never demand payment outright with very few exceptions; the natives of Oleaï immediately counter a request with the question, "Do you have enough tobacco to pay for this?". If one wants to rent a canoe, it must be paid for; then payment is demanded for each of the natives who goes along, whether his presence is necessary or not, and finally every time a magical formula is used for a possible squall, far removed from the course, it must also be paid for.

I believe that this unpleasant trait in the character of the natives is a result of the poor example which white people so far have set to the natives. For the most part, they have come into contact only with traders and sailors, who in a sense were dependent on the natives and always demanded something from them. The natives themselves were always the givers, not the receivers. Added to this is the fact that there were many

drinkers, rough men, and other undesirable elements among the Europeans, which naturally did not increase the respect of the natives for white people.

West Fayu

Following our way west on the next day (February 22) we saw Pyghella and Faïeou islands which Don Louis Torrès had also seen, and which he called Pigouelao [AN: Pikelot] and Faliao [AN: Fayu]. The former [108] had already been seen by Captain Duperrey. Both of them are very small, not being more than a hundred and fifty meters long; they are almost at water level, surrounded by a reef forming a cove on Faliao, and both of them are uninhabited.

12: Lutke--127 (1828) 1835 Woleaians
116, 142 Lamotrek

These men seemed better built to us than their eastern neighbors. There is no particular difference in their features.

Elato

I steered first for the islands which Wilson called Islands of the Swede (Swede's Islands), because a sailor on his boat, who was born in Sweden, remained there. We did not meet anything worthy of notice until the 25th, when we passed seven miles from the shore of Taïeou Island (western) [AN: West Fayu] which we had already surveyed. On the evening of that same day we saw the Swede's Islands at the west. At dawn on the 26th we had drawn near to them; then we were joined by several canoes and the natives informed us that the easternmost of the three separate groups which form these islands is called Namourrek (or Namouttek) [AN: Lamotrek]; the westernmost is Elato and the most southern, Namoliaour.

12: Lutke--127

Above all and before [128] anything else they asked for food: they all cried comi, comi (the Spanish come), and kept pointing to their empty stomachs. They ate everything that we gave them not only with gusto but with almost ravenous eagerness, and they even devoured our worm-eaten biscuit. It was evident that they had not had enough for a long time.

12: Lutke--128-129 (1828) 1835 Woleaians
116, 131, 175 Elato

After observing the latitude between the Elato and Namourrek groups, which are situated almost on the same parallel, we went to the western side of the former. This side consists of an open reef with several islets one of which is called Falipi. On Cantova's map, in almost this very spot you see Banc de Falipi. Could what was formerly a shoal have become an island in a hundred years time? There is a harbor in the Elato group the boats sent from the Marianas to get the trepang always stop there. However, we were not able fo find [129] the entrance to the lagoon which according to what we had been told is on the eastern side. This is contrary to the law generally observed in the coral atolls, where the openings of the reef are to be found on the side under the wind.

To our great surprise we were not met here, as in the other places; we only saw one canoe on the water and it did not appear particularly anxious to communicate with us. When we hove to the natives tacked around us at a respectful distance and without paying attention to our signals of invitation; my passengers [AN: natives of Lamotrek], were too pleased with their gifts and their biscuits to bother much about the canoe. I was afraid that they might cause us delay and so I told them that I was going to start immediately for Ouleaï and that they would have to come with me if the canoe did not take them. This announcement produced an effect; they began to gesticulate, and finally the canoe drew along side. It held the tamol of the group, a big fat man, who knew a few words of Spanish; [130] I hastened to give him some presents, so that he would not tarry long; for I was anxious to complete my survey of these groups before nightfall. Finally, after making a few difficulties, he took the whole group, but they had a hard time to find places in the canoe.

One impudent fellow seized a belaying-pin, and plunged with it into the sea. At that time the big chief of the group was on the boat; I told him that I should detain him on board until the stolen object had been returned. The old man was very frightened; but all the others remained calm, and promised me that the belaying-pin would be brought back instantly. And in fact, one of the chiefs found it on the canoes and brought it back, demanding an ax for the service he had just rendered. While all this was taking place, and while I was trying to reassure the old tamol by giving him some presents, another man repeated the same performance, and jumped in the water from the top of the stern. But after a few minutes the same chiefs forced him to restore the stolen object himself. For the sake of example, I was strongly tempted to give this rascal several lashes, but the poor devil was so frightened [135] that I let him go, and he fled in his canoe lest we change our minds.

12: Lutke --135

While we were lying still there were fully seventy canoes gathered around us; I gave orders that for some time no one should be allowed to come on board because these inlanders interfered greatly with our work. Finally one of them pointed to himself and began to cry pilote [136]. Although I frankly did not expect to get much assistance from this man in that capacity yet I thought that he doubtless knew a little Spanish and that he might be useful in that way. I therefore invited him to come on board; but it then developed that, except for the word pilote, he did not know any Spanish at all. In a little while he showed us a man in shirt sleeves, who was holding a package in his hand, and he said that this man was also a pilot. We asked him to come up. He gave us two amusing letters, which were carefully wrapped up in an old English newspaper. One was addressed to the previous governor of the Marianas Islands, the other to Mr. Torrès, and they were written by the captains of some whalers which had called here during the previous year. In one of these letters, the bearer, who was called Tapeligar, was given the title of "second governor." As Tapeligar had received these letters which were supposed to be sent to Guahan, he kept them as a sort of recommendation. We got the explanation of the word pilote when we discovered that Pilote, Capitan and Tamol are all synonyms here; so the people who we thought were pilots were really only chiefs.

12: Lutke--136-137 (1828) 1835 Woleaians
116, 131 Woleai

Mr. Zavalichine came back when he had found a good anchorage, and then we entered the lagoon. After tacking a few times we threw anchor about noon [137] across from the northern point of Raour Island.

12: Lutke--137 (1828) 1835 Woleaians
116. 574 Woleai

We did not find the same hospitality here as at Lougounor; on that island every host invited us to sit down and treated us to coconuts; here we had to ask for them, and often more than once.

12: Lutke--137 (1828) 1835 Woleaians
116, 562 Woleai

We went to the eastern side of the island and round its northern tip. We were accompanied by a very joyous little troupe; but when we came to the places where there were women imprisoned, we heard again the annoying farak! farak! as we did on Lougounor.

12: Lutke--137 (1828) 1835 Woleaians
116. 857 Woleai

On the wind side we noticed with pleasure how the boys ran bravely and skillfully into the breakers and captured some enormous sea-urchins.

12: Lutke--137-138 (1828) 1835 Woleaians

116, 152, 437 Woleai

The inhabitants of Ouleai had no more hesitancy about begging than the natives of Lukunor; the little boys were the worst, and when they saw that Doctor Mertens was collecting sea-shells they brought him all sorts of atrocities which they tried to sell. They tossed them on the ground if he refused to pay the price that they demanded.

12: Lutke--138 (1828) 1835 Woleaians
116, 504 Woleai

On the western side of Raour [AN: Raur] Island there are four or five artificial harbors which were something new to us in the Caroline islands. A jetty of large stones extends from the shore into the water for a distance of about fifteen meters; and then rows of stones extend both right and left from the end at an angle of about 60°, so that the whole thing looks something like an anchor. There are no harbors of this type in the other islands of the group; the reason seems to be that the west winds bring most of the waves on to Raour island.

12: Lutke--138-139 (1828) 1835 Woleaians
116, 152, 177 Woleai

Far from hindering, the natives tried to help us. The only thing to which they [AN: the natives] objected was the firing of our hunters. At the beginning [139] they trembled and screamed at each shot, even in the distance, and begged us not to make so much noise; they soon became accustomed to it, however; and they finally cried ouai! each time they heard a gun.

12: Lutke--139 140

We were surrounded all day long by a crowd of natives in their canoes; they bartered gaily fish, shell fish, materials, but very little fruit, and then only coconuts. They were perfectly honest but they made a great deal of noise. The chiefs brought us coconuts as a gift, not in canoes full as on Lougounor, but in clusters of six, and they did not fail to demand knives and axes in exchange for them. They had a great deal of fish and of different kinds. They asked high prices for the ropes, which I would have liked to buy; but, strange as it may seem, the canoes, which are the most trouble to build and which form the basis of their wealth, were sold for a song. I purchased a small canoe for an ax, and one of the largest, with [140] all its equipment, for three; and they will surely wear out two of them while they are building a new canoe. It is perhaps because of their abundance that they are so cheap. We saw several canoes in front of nearly every house, and there were a great many in process of construction. A large number of these canoes go to Guahan in exchange for iron.

12: Lutke--140 (1828) 1835 Woleaians
116, 574, 609 Woleai

The chief Tapeligar was one of our most frequent visitors. I found him seated on his canoe under a tent. It appears that on land as well as on the water their canoes serve constantly as thrones. We scarcely ever saw the chiefs doing anything except sitting on their canoes. Tapeligar acted on the boat as if he were at home; but he did not seem disposed to repay me in the same way; after sending for some coconuts he suggested that we return to my launch, and he did not seem too pleased when I said that I wished that he would accompany me around his island instead.

As usual we were surrounded by most of the male population of the group, and this time there were women too. Several canoes full of them kept circling around the schooner, and they made more noise than all the other boats put together. They did not ask if they might come on board; perhaps they were waiting for the invitation which we did not extend. That may be because they were all dreadfully ugly. It is not likely that there are not some pretty ones on the island; possibly the jealous men do not permit them to leave the house.

12: Lutke--141-142 (1828) 1835 Woleaians
116, 574, 643 Woleai

Towards evening we received a call from the big chief of the whole group, Rooua, who is described in the Memoires of Mr. Chamisso. I had told Lieutenant Zavalichine that when he was surveying the eastern part of the group he should call at Rooua's residence, Oulemarai, and should present gifts and pay him homage. They had had a good deal of trouble in making the old man understand who was responsible for all these fine things, and by what fortunate chance they should descend upon him in this way; but as soon as he understood the situation, he insisted on coming to see us himself; [142] and he quite forgot that paralysis had deprived him of the use both of his arms and legs. I should have liked to receive this feeble old man, who could scarcely breathe; but he almost fell in the water and it took him a long time to recover. So the conference had to take place on his canoe. I gave him and his wife, who was slightly younger than he, everything that I could think of. The tamols on the sloop said that I could have him lifted and brought on board on a chair, but I thought that it would be dangerous to expose the old man to this ordeal, and we separated after paying him all due honor on his territory.

12: Lutke--142-143 (1828) 1835 Woleaians
116, 131, 175 Woleai

The Ouleai group is fifteen miles in circumference; on the old maps it appeared twenty or thirty times larger. It is composed of twenty-two islands, whose names are given with a fair degree of exactitude both by Mr. Chamisso, and on Captain Freycinet's map. According to our observations the [143] southern tip of Raour island, the most eastern one of the group, lies latitude 7°20' 7" north, and at longitude 216°3' west.

12: Lutke--143-144 (1828) 1835 Woleaians
116, 131 Woleai 1.2

The wearisome uniformity of the coral islands has this advantage at least, it dispenses the traveler from the obligation of describing in detail the form of each group. After seeing one, he has seen them all. We have already noted their appearance on the sea side. From the lagoon they all look like a round sandy streak, covered with thick woods, and broken by certain gaps which are framed by the breakers; these do not break the horizon line, however.

But the Ouleaï group differs from the others in this connection. Its form is highly irregular; there are two angles which project toward the north, and a deep recess lies between them. According to the hypothesis of the coral island formation, you can not explain this shape except by assuming that two entirely independent groups were formed here at this place, and simultaneously. The six-meter canal between the Angaligaraïl and the Faraïle islands seems to mark their separation. The reef which extends SE from there joins on the other side of Motogozeu Island the reef which starts from Raour Island, and this completes the eastern group; while a [144] depth of five fathoms, and the reef which extends E and NE from Felalis [AN: Falalis] Island indicate the direction in which the reef will have to go from Felalis, if it is ever to reach Feraïlles and to separate the western group.

The island Ouleaï stands out not only from the ones in this group, but from most of the ones which we had seen up until now. Its southern side does not have the shallow, which makes the other islands so inaccessible; instead the ground slopes down rather

rapidly to a bottom, which is level and sandy; through several fathoms of clear transparent water you can see each grain of sand on the floor. The interior of the island is charming; it is a grove, intersected with paths leading in every direction, and dotted with clearings where there are houses. The coral islands generally have the shape of a horse-shoe, and the sea always looks ready to occupy it. Scarcely have you left one beach when you reach another. Ouleaf on the contrary, is fairly large and there is a kind of park with some beautiful breadfruit trees.

The chief's houses are better and cleaner here than those of the Lukunor people. The walls are wide planks of breadfruit tree which take on a nice polish and a pretty red color; these give the houses an air of neatness which could not be duplicated in the Caroline Archipelago, or even in the whole South Sea. They are really jewels. It seems that they only use for this purpose the parts of the trunk which are near the root, and which are of no value for the canoes. Because of this all the planks on the walls are in the form of large squares and all these pieces are well roped together.

The language is not just the same as at Lougounor, either because of a real difference of idiom and pronunciation, or perhaps on account of the mixture of Chamorro and Spanish words, which they use in some cases, in preference to their own. For example maoulik, instead of mamal, good; pighillili, children, from the Spanish pequenini. Lios (Dios) is apparently used to designate Divinity, or heaven in the religious meaning. When they speak of the dead, they always use the word Lios and point to the sky. They do not seem to recognize any positive difference between Spanish and the Chamorro language because the latter is the language of the common people at Gauhan, and it is spoken by all the Spanish, even those of the upper classes.

After surveying the southern side of the Ouleaï group, we steered south to hunt for the Eourypyg group about whose location I had obtained some information at Ouleaï. Acting on these advices on the twelfth we found this little group which is made up of only two islands. While sailing along its northern side we saw some men on the beach but to our great regret they did not launch their canoes which were on the bank. We did not see any in the lagoon either; so we never learned [149] the names of the islands which form this group.

When we left Farrŏilap we headed S one quarter SW at full sail during the whole night; this is not dangerous in the larger part of this archipelago, and in the morning we saw Ouleaï. After sailing around this group to the east, we hove to in front of the harbor.

Tapeligar, Aman and most of our former friends came to meet us. Aman, from his canoe cried at the top of his lungs: Maoulik Ouleaï.* They all seemed happy [300] to see us again, a joy which may have been real or feigned. They tried to make us understand that we had done well to return to their island after having been in Russia: Fragata Farak Roussia, Farak Ouleaï, Maoulik etc. Of course each one expected that these manifestations would be followed by a prompt reward, and this despite the fact that they had all come empty-handed themselves.

---

* Just as at Lougounor they cried Mamal Lougounor; this confirms the supposition that mamal and maoulik, like aidara at Radak, are used in the sense of friend.

Among other natives, we met a tamol whom we had seen in the spring at Elato and he told us that the tamol Oralitaou, whom we had met at Guahan, had returned from there to his own country. During our absence the old Rooua had died; his brother Rooua-meun, who was now in Namourrek, had succeeded him. Tapeligar had gone to Fais and to Mogmog, and Aman to Farroflap.

Tapeligar assured us that after our departure he was so bored that he had started to travel, and that he had done so in the hope of finding me somewhere. He declared that when our ship had appeared, his wife had begged him with tears in her eyes to take her to capital Litské, for he would surely give her some lujeuche (pieces of glass, trinkets, etc.). Among the other Caroline natives we did not see such trickery which was clearly designed to make us give him presents. In general you see more envy and spite here than in the other places; if you give a gift to one you may be sure that all the others will ask for the same thing.

Without being in favor of obscurantism, I can say that in general the more contact the savages have with civilized people, the more corrupted they become. These relations make them acquainted with luxury; then new needs, and the desire to satisfy them bring more vices. In this sense the natives of Ouleaï will soon attain the same degree of civilization as their compatriots of the Pelly islands (Palaos) * unless they are preserved from it by their small population.

---

* How far they are, the natives of these islands, from the simplicity and purity of customs in which Captain Wilson found them! Doctor Chamisso speaks of this change. Today they plunder and steal boats, just like the natives of New Zealand and the Marquise islands, and the only difference is that these men do not eat their prisoners.

At Ouléaf the women came quite close to our vessel, but they never arrived in the men's canoes. They took pleasure in crying and calling us by our names, which they sometimes pronounced in the most comical manner. Though they reiterated their demands [AN: for ornaments] unceasingly, in order to obtain more than we had given them, they appeared to receive our gifts with a kind of disdain, and this greatly amused us. Some of them wore pretty belts, of the width of about two fingers, made of the wood of cocoanuts and of white shells put together in a way that recalled mosaics...as I wanted to [p. 150] own one of these belts very greatly, I offered them a considerable price, in their eyes, for this single article; but these women multiplied their demands to such an extent on every occasion I yielded to their instances, that I could not succeed in obtaining one for myself. It seems, besides, that the women set great store by them; I sometimes saw men adorn themselves with them, but they were no more inclined to give them up, alleging, to justify their refusal, that this ornament belonged to their wives.

116, 136 Woleai

Three days spent in the lagoons of Ouléaf provided us with a great quantity of new fish of the most interesting kinds. A new genus of the family of the Labridae (Axodon. Cuv.) was established from a single specimen I obtained; this fish appeared to us to be rare wherever we were. It is remarkable above all for the width of its front teeth; in the general shape of its body and coloring it resembles somewhat the genus Julis. We also caught [308] some specimens of the magnificent Julis Gaymardi of Quoy, as well as some new species of Chaetodon and Balistes, the Holocanthus dux and trimaculatus, the celebrated Chelmon (Chaetodon rostratus, Linn.), a couple of new species of Acanthurus and several others.

This coral group seemed to us poorer than that of Lougounor in animals of the higher orders. No Pteropus presented itself to us; and even the rat which, it would appear, is found on all these islands, is rare here. We were shown two domestic cats that were very carefully shut in, of a breed with long legs and of a reddish yellow color; we were told that they had been brought from Manilla. [sic]

We noticed here the same birds as on Lougounor, except for the hens and pigeons; on the other hand, I saw the same long-tailed cuckoo I had seen twice on Ualan and had been unable to see on Lougounor. The Sterna alba is very common here and likes to rest on the trees; the Sterna stolida and tenuirostris, on the contrary, just as on Ualan, are seen more on the water; the Sterna melanauchen...was noticed singly and seemed to

nest on the sandbanks; there we took some young specimens which we thought [309] belonged to this species; the other sea swallows, mentioned above, nest in common on the trees. We were able to obtain the nests and eggs of the Sterna stolida.

On March 27 the government schooner "Ponape" returned to Oleaifrom a trip to Ifaluk, where it had gone on Sunday, March 24, because I [MR: Dr. Born] wished to investigate alleged excesses of foreign sailors against the natives of this atoll. The weather, which until then had been fine for weeks, was already beginning to change when we departed; contrary winds and squalls made the journey to the group, 35 miles from Oleai, take forty-two hours...After I had fulfilled my official obligations on the island, which I was visiting for the first time, the "Ponape,"...returned on the morning of Wednesday, March 27, to Oleai, arriving there in the afternoon, with a favorable wind, after a five and a half hour trip.

...we succeeded in negotiating the difficult entrance into the lagoon of the atoll, which winds between large coral blocks. On the chart only an entrance for small boats is shown, and ships usually anchor outside the reef at a depth of 9 to 16 fathoms.

Wednesday evening [MR: March 27, 1907] passed quietly with almost complete calm and beautiful moonlight. Early the next day several sharp thunderstorms passed over the islands from north and east, and a strong wind with rain squalls set in by fits and starts. The wind let up again and again after a short time, and then there was almost complete calm. From morning on a striking phenomenon was the ever stronger surf from the east and south, which had no relationship to the strength of the wind. Likewise, there appeared early in the morning numerous huge frigate birds, which hovered aimlessly back and forth over the island. I had not noticed these birds in Oleai before. In the usually quiet lagoon there was already a heavy sea at noon, rolling up on the sandy shore in mighty breakers. The first officer of the "Ponape" explained this phenomenon to me as the beginning of a spring-tide, which might be expected the next night (full moon). Towards one o'clock P.M. I went aboard the "Ponape" to consult with the captain about the weather. He told me that under the circumstances a departure that day was not to be considered, the barometer was falling sharply; there was the possibility of an approaching typhoon. He further declared that in such an event he would try to hold fast as long as possible in the lagoon. Finally, he asked me to stay on board because I would be safer than on land. However, considering the impossibility of bringing my bulky baggage on board now with the constantly heavier sea, I preferred to go ashore again.

In spite of the fact that astonishingly there was almost no wind, there was, [568] when I left the ship at about 2:30 P.M., a fearful sea, both on the outer reef and in the lagoon so that the "Ponape" had to change her anchoring place. Shortly after I left the ship a strong rain squall suddenly came blustering from the north-northeast, which struck the canoe I was in violently so that we almost sank. Summoning all their strength, the natives succeeded in holding the canoe and bringing it to land. Here I found my house already evacuated for during my absence powerful waves had come up over the 80 to 100 meter long dunes as far as the house. In the course of the next two and a half hours this whole dune, the eastern point of the island of Oleai, was washed away; there was now a wide passage between the islands of Oleai and Talian, and through this the waves coming over the outer reef from the northeast crashed wildly into the lagoon, where they met the equally heavy surf from the southwest so that the waves towered very high. At 5 o'clock, while I sat writing on the veranda, a heavy sea with slight wind again broke over the reef and, striking towards my house, it threw me several meters away through the splintered veranda railing. My left thigh was severely bruised by falling beams, which made walking very difficult for me and on the next day would have been almost disastrous. At 5:15 I sent a note to the captain of the "Ponape," in which I transmitted to him the advice of a Spaniard who was with me to move the anchorage of the "Ponape" near the village of Isang, under the protection of the northwestern point of Oleai. I thereupon received a note saying that the barometer was standing still and abating of the

wind was to be expected, but that on the other hand the surf would still increase. Shortly before 6 o'clock I had to abandon the already half demolished station; I moved back into the adjacent village of Leuleperik, where I took quarters in a recently finished finely built native house. Late in the evening the wind from the north-northeast began to grow still stronger so that branches of trees were already being broken off. From 1 A.M. on one heard through the whistling of the wind the constant snapping of branches like musketry fire and the crashing of huge falling trees like the thunder of cannon, above it all rose the thundering noise of the surf, but the houses stood firm through the whole night. Towards 5 o'clock we (the Spanish trader Villaçon and I) were awakened by the watch we had posted with the news that the waves were already striking in the village of Leuleperik and that there was already water around our lodging. Leuleperik is about 800 to 1,000 meters away from the northeast shore. The water rose so fast that we scarcely had time to give the most necessary instructions for saving the luggage. We hurried to the Japanese station, which is in the village of Jaur, at the widest part of the island, and in the middle of it. The way was already blocked by fallen coconut palms and other trees lying in all directions, in some places forming real barricades. In spite of the coconuts, branches and trees whistling down to the right and left of us, we reached the Japanese station without accident, and had there an open view of the lagoon to the south. The schooner "Ponape" was not to be seen. Glaring lightning flashed on the horizon in the west. The surf in the lagoon was already beating against the houses of the village. We

soon left the Japanese station and betook ourselves to the most westerly canoe house of the village of Jaur, where a large part of the inhabitants of the island had gathered. The people had completely lost their heads. Like birds in a cage unable to find their way out, they ran aimlessly back and forth, anxiously listening to the roar of the surf. No efforts to encourage or console them did any good. All believed that the sinking of the islands had come and that the old prophecy would now be fulfilled that Oleai would one day be washed away by the sea. When the sea began to come further and further inland from the lagoon, we had to abandon this place, too. The Japanese traders appeared and reported that a wave coming from the interior of the island had washed away their trading station in a moment. So we had to withdraw into the interior of the northwestern point of Ifang. That was our last recourse. If the sea reached this part of the island too we were lost. Here there stood a house on a little knoll in which a large crowd of screaming, weeping natives had taken refuge. Some women were singing death laments in their distress. When a man suddenly announced that the sea was now coming also from the northeast out of the bush, the confusion reached its climax. I climbed a broken down coconut palm and saw the waves, like white cats, leaping through the woods from the northeast. When I came down from the tree the water was up to my hips. We provided ourselves with planks of wood and strong [570] ropes and turned again to the lagoon side of the island. The water was fortunately rising slowly; the wind was weaker. Then we saw a mighty breadfruit tree which had been wrenched from the ground with all its

roots. We climbed up on these roots, which stood several meters high, and found ourselves relatively secure there. Scarcely had we found this place of refuge (it must have been about 9 in the morning) when the real typhoon set in from the east-southeast. It is impossible to describe the strength of this wind. It was as if a thousand express trains were racing close by our tree. The air was so full of rain and sea spray, mixed with sand, that is was impossible to see to a distance of even a few meters. Thus the storm raged uninterrupted until towards 3 in the afternoon, coming from east-southeast to southeast.

At this time it calmed a little. The sun even broke through, though veiled, for a few minutes, and it was now possible to orient ourselves. It turned out that we were quite close to the shore of the lagoon in the northwestern corner of the island. The water had fallen. Around us there stretched a wide desolate waste, the ground was covered meters high with fallen trees. Only now and then, where a blooming, delightful garden had been, did the bare stump of a breadfruit tree and some withered palms project. Far and wide there was no trace of human habitation. Only a few disordered heaps of ruins marked the places where the great canoe houses, filled with the pride of the natives, the artful high-sea canoes, fishing wier baskets and nets, had stood. There was no human being to be seen. When we approached the village of Jaur, we found the water there meter-high. Suddenly we saw two fantastic figures, youths, rubbed bright red all over their bodies, carrying a pig. We followed them and wading in water up to our hips we reached,

after difficult climbing stretches, the place in about the center of the island where the natives had already partly gathered again. It turned out that by good fortune none of the inhabitants of the island of Oleai had perished. A bivouac was quickly put up, huts constructed of bush work, and a fire lit. In this bivouac we spent the first night of pouring rain.

On Saturday, March 30, in the morning, the wind had let up considerably. We went to the shore and looked around. The sea was still wildly whirling and seething in the lagoon; there was no trace of the schooner "Ponape." A walk along the shore of the island showed us everywhere the same ghastly devastation. The islands of Paliau and Raur seemed to have suffered especially badly. At the place where the lovely island of Raur had been opposite Oleai, only a long, white sandbank with a few palms and tree stumps was to be seen. On the beach at Leuleperik we found the first victim of the catastrophe, the body of a boy about 5 years old....

14: Born et al--570 (1907) 1907 Woleaians
116, 132, 173 Woleai

As to the question of the cause of this horrible catastrophe [MR: typhoon, March 1907] I should like to impart some observations which I made after the typhoon, but without the intention of drawing conclusions from them. It seems to me that it is not out of the question that volcanic, undersea eruptions had something to do with it. During the typhoon at 10 in the morning earthquakes could be felt; many pumice stones were washed ashore, which competent people said were lava. The whole atoll seemed even to the natives to have lifted since the high water mark had receded considerably. A new island emerged between Falalis and Motogosu, where, to be sure, there had already been a reef. This island is called Met and is supposed to have been inhabited long ago in the dim past. The native legend relates that a tidal wave washed it away in those days. Between the islands of Paliau and Oleai there used to be only a small passage, which was almost dry at low tide. Now, after the typhoon, this passage is very considerably widened and deepened. The reef bank between these two islands was cracked like a marble slab thrown on the floor; great pieces were split out of it. The ground on the islands of Paliau and Raur also looked as if shattered. On the outer reef of Raur, where the tidal wave had broken over it, there were three longish piles of coral rubble like little lonely islands. The outer reef side of the same two islands, formerly grown with thick bush, was a flat surface strewn with coral gravel, smooth and even as a table, where it had been exposed to the tidal wave. The direction of the tidal wave was presumably from east-northeast to west-southwest; its height cannot be given with certainty.

The accounts of those saved from Raur and Paliau unanimously gave the following picture of the events on those islands: As early as the evening of March 28, experienced people concluded from the peculiar roar of the surf that a tidal wave was approaching. So all precautions were taken to save the women and children, and they were fastened with ropes in the branches of breadfruit trees. On March 29, towards 8 in the morning, after the water had risen a meter and a half high on the island during the night, a dark cloud appeared with a terrifying whistling noise over the tops of the highest breadfruit trees, thus over 40 meters high: the tidal wave. It broke like a gigantic jet of water in the middle of the islands and poured with a terrific flood into the lagoon. However, this first tidal wave did not tear away the tightly bound people; but directly after the first came a second and still higher wave, which swept away all trees, houses and people. The lagoon at this moment was a great whirling eddy, into which the trees full of men were torn. Those who did not drown were crushed by the trees in the surf on the reef ledges.

14: Born et al--570-571 (1907) 1907 Woleaians
116, 731 Woleai

When we returned to the camp [MR: after surveying the damage caused by the typhoon, March, 1907] the sound of loud crying and lamenting met our ears, not to cease all day. The first reports of tragedy had come in, and more and more were added. Only two inhabitants of the island of Raur had survived, a man and a woman. The loss of human life here came to a hundred and thirty. Nine inhabitants of the island had been on other islands during the typhoon, and had thus been saved. On Paliau fifty out of ninety inhabitants had perished, among them the able military policeman Jeuloch, who had drowned with his whole family in the attempt to save his wife and child. On Tageulap a woman had been killed by a falling house. Four women from the island of Saliap, who had been on Raur during the typhoon, had perished, 10 inhabitants of Utagal, five of Falalis, so that the total loss of human life came to two hundred. The number of injured was very great; but fortunately most of the wounds were not serious. I could give no assistance even to the slightly wounded since all my equipment of medicines and bandages as well as instruments, had been [571] lost. Throughout Saturday and on Easter Sunday the sea washed ashore many corpses, often horribly disfigured. Only with difficulty could the natives be persuaded to bury them. I should like to mention a few strange rescues; for instance, two children, a boy of five and a girl of eight, swam across the lagoon in the typhoon sea a knot and a half to Marijong. Several natives from Paliau were driven to Saliap, four from Raur to Utagal 4-1/2 knots away, two women and two men. The number thus saved was twelve.

14: Born et al--571-572 (1907) 1907 Woleaians
116, 731 Woleai

The first concern after the typhoon [MR: March, 1907] was to collect the survivors of the completely destroyed islands of Raur and Paliau on Oleai in a joint bivouac. Here there prevailed admirable order and discipline among the natives so that in this respect no measures had to be taken. I want here to call attention to the fact that the natives most willingly complied with all my directions and that in the fourteen difficult days after the typhoon there was no case of disobedience or other disturbance.

The worry about a famine hung over us like a threatening spectre; it was so much the worse since, because of our uncertainty about the fate of the "Ponape," we had to expect to be without help until May 25 or 26 (that is, three to four days after the arrival in Jap of the Reich mail steamer "Germania" from Hongkong. So we immediately began collecting the masses of coconuts which were lying about; the taro which was still usable was brought from the fields, in which process the women had to dive to fish out the roots. Even days after the typhoon the water was two and a half to three meters deep in the large taro field on Oleai. All usable provisions were brought to special [572] huts and put in charge of the chiefs; they distributed the necessary rations several times daily to every individual, men, women and children.

An additional hard affliction was the dryness which set in after the typhoon. No rain fell up until the arrival of the "Germania" on April 11. The sun burned down pitilessly day after day on the ravaged islands. So we greeted the Reich mail steamer "Germania" which arrived unexpectedly on April 11 from Saipan, with large stores of provisions, as a true rescuer in distress. It also brought us the very cheering news that the "Ponape" had arrived safely in Saipan on April 4, after a very dangerous trip.

While the people were all so busy gathering together the food, I set about to salvage the extensive stocks of the O'Keefe firm, which maintained a trading station on the island of Marijong. The station itself was completely levelled to the ground...By good fortune we succeeded in saving a large part of the stock, above all most of the provisions, so that we had enough food for six to eight weeks. The rice damaged by sea water was washed, then dried in the sun, and had to be eaten, in spite of the danger of beri-beri.

We made the ruins of the trading station into a raft on which we went over to Oleai, where we quickly put together a house in Isang. I took possession of a large part of the stock of goods and all the provisions, on account, for the district office, and distributed them as needed to the inhabitants of the worst damaged islands of Falalis, Raur, and Paliau, things such as covers, loin cloths, hatchets, knives, cooking pots. I also gave as much as possible of the indispensable tobacco to the unfortunate people.

14: Born et al--572-573 (1907) 1907 Woleaians-1-3
116, 502, 731 Woleai

We [MR: Captain Martens] reached Oleai again on the afternoon of March 27, 1907 and returned to the same anchorage....From...[MR: about 3 o'clock] sea watch was kept because the weather did not look good. At 5:15 we dropped the second anchor. A strong swell and sea without wind came up in the lagoon; trees and parts of houses were driven by the ship from the corners of the island, torn down by the breakers; it seemed to be a tidal wave, for there was not much wind. Rapid sinking of the barometer, however, warned me to expect trouble, and also the wind and sea were gradually rising considerably.

A full fledged typhoon blew on Friday, March 29 from 7:30 P.M. on. It is impossible for any of us to describe the strength of the wind. We took [573] on deck all the anchor chains we could find on board and made moorings as necessary with the increasing wind. We saw no more of the land then, though the moon was full. One squall followed another.

It must have been about 8:30 when we began to drift; even before that, at about 8 o'clock, all the boats, the gasoline in the galvanized tanks, and all the deck ladders, the chicken house and the joiner's bench were washed from the deck by heavy waves. How and by what route we went out of the lagoon no one can say, the ship was wheeling frightfully; no one could stay on his feet. We sat in life-jackets in the saloon and awaited the worst. On deck heavy waves were hurtling across from both sides; one would have been thrown overboard immediately. Around us trees, coconuts and plants of all kinds were swirling about, some of them thrown up onto the ship. From 10 in the morning on (the 29th) the

barometer began to rise; but the typhoon continued to rage. The sails were blown out into shreds between the rudders. Only the schooner sail stayed whole. Judging from the appearance of the water we must have been already outside the lagoon at 10 o'clock; it was not possible to confirm this by sounding.

Our little ship did very well, and thanks to her exceptional seaworthiness we survived the storm. Many times the ship was thrown over 40 to 45 degrees and completely enveloped in water, but she always righted herself in a few seconds, only to be thrown over again. We used quantities of oil to calm the sea. Towards noon we realized that a great deal of water must be in the ship. The bulkhead was broken down from the saloon, and now we saw that the water was up over the machine platform. Now I ordered volunteers to the pump, for to command anyone directly would have been an outrage; the heavy waves continued to break over the deck without cease. The machine pumps could not be used, because the batteries were completely destroyed. The water had come in chiefly through the ventilators on deck to starboard. At 4 o'clock the barometer had climbed to 29. 10, the sea continued high and rough, the typhoon continued to blow in full strength. I think it can be assumed that nothing is left of Oleai, for the trees which floated by us were all very large and came from the interior of the islands.

On Saturday March 30 it was squally, but somewhat brighter. I was not able to determine the ship's position, for the sun did not come through. In the afternoon we cleared out the hold, of necessity, and found there some dry rice. At 2:30 the corpse of

a native floated close by our ship on its back. The wind now declined steadily; the barometer rose slowly. There was still a heavy sea. On Sunday at noon I held a conference with my officers, in the course of which we decided to go to Saipan or possibly to Guam. For it was not possible to get to Jap, because the current was too strong towards the northwest and we did not have enough sail surface. The engines were not damaged and possibly usable.

From April 1 to 4 we had moderate weather. At daybreak on the morning of the 4th we sighted Tenian and Agiguan. We sailed and steamed towards Garapan. Shortly we sighted Saipan. At noon we anchored with our kedge-anchor in Tanapag harbor.

On April 11 in the evening the steamer [MR: "Germania"] anchored in the lagoon of Oleai. Dr. Born came aboard immediately.

Some of the islands which I [MR: district official Fritz] saw three months ago in the full splendor of their luxurious coconut groves, are wholly destroyed; only a few trees project from the heaps of fallen ones, standing, but without their tops; not a green leaf is to be seen.

14: Born et al--573

I [MR: district official Fritz] intend to move as many as possible of the population [MR: affected by typhoon of March 1907] to the Palau and Marianas Islands, and in fact, on the present trip of the "Germania," 200 to 300 from Ifaluk (in all over 400 inhabitants, 25 typhoon victims) to Palau, on the trip back 200 to 300 from Oleai (formerly a total of 1,000 inhabitants) to Saipan. The "Seestern" expected in July is then to visit the other islands in the east, which presumably were also struck by the typhoon, and bring as many people as possible to the Marianas.

14: Born et al--576 (1907) 1907 Woleaians
116, 157, 731 Ifalik

On April 12 we [MR: district official Fritz] arrived at Ifalik and brought the people the share of the provisions allotted to them [MR: after the typhoon of March, 1907]. But none wanted to leave their destroyed home; much more, the ruling chief turned down my proposal. All depictions of the coming distress were useless; the chief frankly and rightly feared a lessening of power with the emigration of large numbers of his subjects. But I am convinced that when after a few months bitter want strikes, the obstinacy of this gentleman will yield of its own accord.

14: Born et al--576-577 (1907) 1907 Woleaians
116, 656, 731 Woleai

On Oleai, on the recommendation of Dr. Born, I [MR: district official Fritz] appointed a Spaniard from Jap, known to me as dependable, Julio Villaçon, as deputy of the administration, and gave him the task of putting through the following measures [MR: after the typhoon of March 1907]:

The distribution of the food brought with us and requisitioned by Dr. Born from the traders.

The preparation of planting land for the seed to be brought in on the returning "Germania" (sweet potatoes, taro, and others).

Looking out for the 200 to 300 emigrants to be taken to Saipan until the return of the "Germania."

Forbidding traders and natives to buy, sell, or export copra or coconuts since all fruit on hand is necessary for food. [577]

Forbidding traders and natives from crediting goods or objects in order to prevent the people from falling into debt servitude to foreign traders exploiting their plight.

14: Born et al--577

(1907) 1907

Woleaians
Woleai

The destruction of the copra trade [MR: after the typhoon of March 1907] for the duration of several years will probably result in the suspension again of the Japanese settlements on these islands. It is a matter of the branch establishments of the Jap firm Marutani and the Saipan firm Muragama. O'Keefe also has a trading station on Oleai.

14: Born et al--576

According to my [MR: Fritz's] unfortunately extensive experience of typhoons, only a small number of the palms will recover [MR: following typhoon of March 1907], and will not bear fruit again for two or three years. On high islands (Saipan, Ponape, Jap) the natives are not so exclusively dependent on the coconut palm for food; large stretches are planted with tuberous plants and maize; in protected places breadfruit survives the storm, usually animal nourishment is available (Saipan). But on the low coral islands the life of the inhabitants depends almost entirely on the coconut palm, the breadfruit trees break down in the storm, the taro plants are washed away. For the next few months the fallen ripe and unripe nuts, the marrow of the fallen trees, can be used, but then threatens a state of emergency.

15: U.S. Hydrographic Office--540-541 1938 Woleaians
116, 131 West Fayu

"West Fayu (Faiu) Island (8°05'N., 146°44'E., H. O. Chart 5426), 54 miles west of Pikelot Island is a small, thickly wooded islet [541] near the middle of a reef which forms a lagoon westward of it. This lagoon has depths of 16 to 22 fathoms, except for a 2 1/4 fathom patch in the middle. The entrance to the lagoon, on the southeastern side, is 1/2 mile wide, but the channel is considerably limited due to shoal depths of 1 to 2 1/4 fathoms. Boats can easily reach the landing place at the southern end of the island."

15: U.S. Hydrographic Office--541 1938 Woleaians
116, 161 Lamotrek

"In 1930 there were 165 inhabitants, all of whom lived on Lamotrek, the southeastern islet."

15: U. S. Hydrographic Office--541 1938 Woleaians
116, 161 West Fayu

"There are no permanent inhabitants on the island, but natives from Satawal Island often visit it."

15: U.S. Hydrographic Office--541 1938 Woleaians
116, 131 Lamotrek

"Lamotrek Islands (southeast end, 7°27'N., 146°24'E., H. O. Chart 5426), 39 miles westward of Satawal Island, consist of three islets lying on a triangular atoll enclosing a lagoon. Coconut palms and breadfruit trees grow on the islets. . . .

'Entrances. -- The northern side of the reef is continuous, but the other sides are broken, leaving several entrances to the lagoon. The entrance on the northeastern side and south of Pugue is wide and clear of detached dangers, but during strong northeasterly winds high seas set through it into the lagoon. Though the entrance at the middle of the southern side is difficult to find, it is 400 yards wide and a good channel when the northeasterly winds are strong. Westward of the latter is another entrance about 320 yards wide. All the other entrances are narrow.

Anchorage. -- Off the western side of Lamotrek Island there is anchorage with shelter from northeast winds, but when westerly winds are blowing hard the sea is rather high. The sandy beach on the western side of Lamotrek Island can easily be reached by small boats."

15: U.S. Hydrographic Office--541-542 1938 Woleaians
116, 131, 221 Elato

"Elato Islands, 5 miles westward of Lamotrek Islands, consist of two atolls, the southern enclosing one lagoon and the northern two lagoons. Elato Island is the largest of four islets on the northern atoll, and Toas Island is the larger of the two on the [542] southern atoll. Elato Island is flat, sandy, and covered with trees; natives from neighboring islands come here to obtain material for canoes. Trees also grew on the islet of the southern atoll. . . .

Anchorage has been found in a depth of 11 fathoms in the northern lagoon and about 1/2 mile south of the western extremity of Elato Island. The sandy beach on the southwest side of this island is easily reached by small boats.

A narrow entrance, available only to small boats, leads into the lagoon of the southern atoll."

15: U.S. Hydrographic Office--542 1938 Woleaians
116, 161, 225 Olimarao

"There are no permanent inhabitants but natives from Elato Islands come here occasionally to gather tortoise shell."

15: U.S. Hydrographic Office--542 1938 Wolesians
116, 131 Olimarao

"Olimaroa Islands (northeast end, 7°42'N., 145°53'E., H. O. Chart 5426), about 21 miles west-northwest of Elato Island, consist of two flat islets on an atoll reef; they are covered with coconut palms and other trees. The reef on the northwest side is marked by breakers at all times. On the southern side are two passages, of which the eastern is 1,000 yards wide and the western 600 yards wide. The depths in the lagoon appear to be regular, with no dangers.

. . . . The reef surrounding Olimarao Island makes landing difficult.

In 1934 a shoal, with a depth of 14 fathoms over it and marked by discolored water, was found 3 1/2 miles north-northeast of Olimarao Island."

15: U.S. Hydrographic Office--542 1938 Woleaians
116, 161 Elato

"In 1930 there were 72 inhabitants."

15: U.S. Hydrographic Office--542 1938 Woleaians
116, 131, 161, 223 Gaferut

"Gaferut (Grimes) Island (9°14'N., 145°23'E., H. O. Chart 5426), 97 miles north-northwest of Olimarao Islands, is low, thickly covered with trees, and encircled by a reef. There are no coconut palms and no inhabitants, but natives from Faraulep Islands visit it to catch birds, which are numerous on it."

15: U.S. Hydrographic Office--542-543 1938 Woleaians
116, 131 Faraulep

"Faraulep Islands, 62 miles southwest of Gaferut Island, consist of three low wooded islets on an atoll. On the southern side of the atoll are three narrow channels leading into the lagoon; they are [543] not suitable for large vessels. Small boats can reach the lagoon sides of the islets at half tide."

15: U.S. Hydrographic Office--543 1938 Woleaians
116, 161 Woleai

"In 1930 there were 539 inhabitants on the islands."

15: U.S. Hydrographic Office--543 1938 Woleaians
116, 161 Faraulep

"In 1930 there were 155 inhabitants."

15: U.S. Hydrographic Office--543 1938 Woleaians
116, 131, 504 Ifalik

"Ifalik Islands (7°15'N., 144°27'E., H. O. Chart 5426), 9 miles southwest of Gamen Reef and 81 miles southward of Faraulep Islands, lie on a small atoll reef. The three largest are wooded and have coconut palms on them. Between the two southernmost of the three largest islands is a shoal passage available to small boats; it is also very narrow due to a reef immediately inside. There are two jetties on the southern part of the western shore of Ifalik Island."

15: U.S. Hydrographic Office--543-544 1938 Woleaians-1 -2
116, 131, 504 Woleai

"Woleai (Anangai) Islands (east end, 7°21'N., 143°55'E., H. O. Chart 5426), 32 miles westward of Ifalik Islands, consist of several islands covered with coconut palms and other trees. The reef on which they lie forms two lagoons, open to the southward. A number of reefs and shoals are scattered throughout the lagoons. Motegosu, on the western side of the entrance to East Lagoon, is composed entirely of sand and pebbles, and cannot be made out from a distance. . . .Raur, the southeastern island, was formerly the trade center, but was devastated by a storm that took place over 15 years ago. . . [544]. . . .

Entrances. -- Raur Channel, at the southern end of East Lagoon, is about 1/4 mile wide and has depths of 6 to 12 fathoms in it.

West Channel, on the southwestern side of West Lagoon, has a 3 1/2 fathom patch in midchannel.

North Channel, on the northeastern side of West Lagoon, is about 200 yards wide and has depths of 3 to 7 fathoms.

A shoal and narrow channel, suitable only for small craft, leads into the western part of East Lagoon from northward of the atoll. The tidal currents in it are strong.

Tidal currents. -- In the southern entrance to East Lagoon the flood current sets eastward at a maximum drift of 0.5 knot, and the ebb west-northwestward at 0.3 knot. The currents turn at about high and low tide.

Anchorage. -- East Lagoon is too limited to afford anchorage for many vessels;

West Lagoon, however, is extensive and deep, but its shoal entrance is a hindrance to large vessels. Since both lagoons are open to the southward, a swell sets in during the season of south-west winds. At such times small vessels will find suitable anchorage in the northwestern part of East Lagoon. Northward of Tagaulap, about 1 mile southwest of Woleai, is a comparatively shoal area which affords good anchorage during southwest winds.

Of two wooden piers in front of the South Sea Trading Co.'s office, the southern is safe for small boats to come alongside. The northern pier and another at southern end of the island are not secure. Row boats can land inside the coral reef on the south-western part of Utagal, where there is a sandy beach."

15: U.S. Hydrographic Office--543-544 1938 Woleaians
116, 361 Woleai

"The white houses of the police station and [544] the branch office of the South Sea Trading Co. are located on the southwestern side of Woleai, the northeastern island."

15: U.S. Hydrographic Office--544 1938 Woleaians
116, 161 Aurupik

"In 1930 there were 113 inhabitants."

15: U.S. Hydrographic Office--544 1938 Woleaians
116, 131, 504 Aurupik

"Eauripik (Kama) Islands (east end 6°41'N., 143°05'E., H. O. Chart 5426), about 58 miles southwest of Woleai Islands, consist of six small islets, all except the westernmost of which have coconut palms on them. They lie on an atoll reef which is 5 1/2 miles long east and west, and which is steep-to with over 100 fathoms at a distance of 400 yards off. The reef on the southern side is generally low. The sea breaks on the northern side during southwesterly winds of force 1 to 2, but not on the southern side. At high tide small boats can land at a jetty on the southern side of Eauripik, the easternmost island."

16: Gt. Britain, H.O.--501 (no date) 1933 Woleaians
116, 133 Aurupik

"In 1921, the Japanese vessel Matsuye, when 3 1/2 miles south-south-eastward of Eauripik, experienced a current setting north-north-west at a rate of about one knot, which appeared to be caused by the direction of the wind.

In September, 1926, the Japanese warship Manshū found no current in a position about 6 miles southward of the same island."

16: Gt. Britain, H.O. --501 (no date) 1933 Woleaians
116, 133 Aurupik

"Eauripik or Kama islands, about 180 miles south-eastward of the Sorol islands, lie on the reef of an atoll which is generally low and steep-to. With light south-westerly winds there are usually breakers on the northern side of the atoll, but not on the southern side.

All the islets, with the exception of Edarepe, at the western end of the atoll, which is awash at high water, are covered with coconut palms. There is a jetty on the southern side of Eauripik which a boat can reach at high water.

There is no passage into the lagoon, but boats can cross the reef at high water."

16: Gt. Britain, H. O.--501 (no date) 1933 Woleaians
116, 131 Woleai

"Woleai or Anangai islands lie about 60 miles north-eastward of the Eauripik islands. The atoll, the southern side of which is mostly submerged, is divided into two lagoons by a ridge of reefs extending south-eastward from Tagaulap island (Lat. 7° 22' N., Long. 143° 53' E.). West lagoon is wide and generally deep, but with scattered shoals; as the entrance to it is shallow, large vessels cannot enter it. Both lagoons are open to the south, and during the south-west monsoon a swell sets in. A sand cay lies on the reef, on the southern side of the atoll, nearly 1 1/2 miles southward of Tagaulap island.

All the islands are covered with coconut palms and other trees. Motogozu islet, on the south-western side of East lagoon and nearly one mile westward of the southern point of Raur island, the south-easternmost island of the group, is low and formed of sand and gravel.

There are two white houses on the south-western side of Woleai island, the north-easternmost island of the group, but they are not conspicuous. There are two wooden piers in the middle of the southern side of Mariaon island, situated about 4 cables westward of Woleai island; the northern pier is weak. There is also a pier at the southern extremity of the island."

116, 161 Woleai

"In 1930, there were 539 inhabitants in the group."

16: Gt. Britain, H.O. --501-502 (no date) 1933 Woleaians-1
116, 131, 504 Woleai

"Entrance Channels. --Raur channel, leading into the southern end of East lagoon, is about 2 1/4 cables wide between the reef extending south-westward from the southern end of Raur island and the reef surrounding Motogozu islet, and has depths of from 10 to 25 fathoms (18^m3 to 45^m7) in the fairway, but the depths may be less in the approach.

[502]West channel, on the south-western side of West lagoon, close south-eastward of Falulap islet, has a 3 1/2-fathom (6^m4) patch in the fairway.

North channel, on the north-eastern side of West lagoon, between Farailes island and Jalangigereil is land, south-eastward of it, is about a cable wide between the reefs on either side, and has depths of from about 3 to 7 fathoms (5^m5 to 12^m8).

There is a passage between the reefs extending from the eastern end of Tagaulap and the southern end of Mariaon island, but it is narrow, and as the tidal streams in it are strong it is unsuitable except for small craft.

Shoals. --There are numerous shoals in West lagoon, which can best be seen on the chart. In east lagoon there is a shoal ridge, with depths of from one to 6 fathoms (1^m8 to 11^m0), situated about 8 cables south-eastward of Mariaon island. There is a 2-fathom (3^m7) patch about 2 3/4 cables south-westward of the south-western extremity of the ridge, and another 2-fathom (3^m7) patch situated 3 1/4 cables northward of the southern extremity of Raur island.

Anchorages. --Large vessels may obtain anchorage in East lagoon, in depths of from 15 to 20 fathoms (27^m4 to 36^m6), fine sand, with good shelter about 4 1/2 cables

16: Gt. Britain, H.O. --501-502 (no date) 1933 Woleaians-2
116, 131, 504 Woleai

westward of the northern part of Raur island.

Small vessels may obtain anchorage during the south-west monsoon off the south-eastern side of Mariaon island, and also off the northern side of Tagaulap island (Lat. 7° 22' N., Long. 143° 53' E.)."

116, 131, 136, 161 Gaferut

"Gaferut island, about 60 miles north-eastward of Faraulep islet (Lat. 8° 36' N., Long. 144° 33' E.), is low, wooded, and surrounded by a fringing reef, which extends about 3 cables north-westward from its northern extremity, and about 2 1/2 cables south-south-westward from its southern extremity. The island, which is 65 feet (19m8) high to the tops of the trees, is uninhabited. Numerous booby gannets, which are similar to seagulls, inhabit the island."

16: Gt. Britain, H.O. --503 (no date) 1933 Woleaians
116, 131, 175 Faraulep

"Faraulep islands, about 80 miles northward of Ifalik islands, consist of three islets on a circular reef forming an atoll, the largest of which is Faraulep islet, 78 feet (23^m8) high; they lie on the northern and eastern sides of the reef of an atoll and are covered with coconut palms and other trees.

There are three passages into the lagoon on the southern side of the atoll, all narrow and unsuitable for large vessels to pass through but boats may enter the lagoon and obtain a landing on any of the islets.

....There are many turtles in the vicinity of this group.

Earl Dalhousie bank, with depths of from 14 to 25 fathoms (25^m6 to 45^m7) over it, lies about 56 miles north-north-eastward of Ifalik islands. Tarang bank, over which there are depths of from 14 to 25 fathoms (25^m6 to 45^m7), was discovered by the schooner Tarang in 1910; it lies with its shoalest part, which is near the middle of the bank, about 83 miles north-north-eastward of Ifalik islands. Between Earl Dalhousie bank and Tarang bank is Akashi shō, a bank with a depth of 14 fathoms (25^m6) over it."

16: Gt. Britain, H.O.--503 (no date) 1933 Woleaians
116, 131 Olimarao

"Olimarao island lies on the northern side of the reef forming an atoll, about 95 miles south-south-eastward of Gaferut island; it is covered with coconut palms and other trees; all round the island the bottom shelves and it is unsuitable for landing.

On Falifi, at the western extremity of the atoll, trees grow luxuriantly, but there are no coconut palms.

The atoll has no permanent inhabitants, but is occasionally visited by natives from Elato.

There are shallow depths on the north-western side of the atoll, where there are always breakers on the reef, and there is no passage into the lagoon. On the southern side there are two shoal passages, the eastern of which is half a mile wide and the western about 3 cables. It is reported that the depths in the lagoon are even, and there appear to be no dangers."

16: Gt. Britain, H.O. --503 (no date) 1933 Woleaians
116, 161 Olimarao

"The atoll has no permanent inhabitants, but is occasionally visited by natives from Elato."

16: Gt. Britain, H.O.--504 (no date) 1933 Woleaians
116, 131 Elato

"Elato islands, about 20 miles south-eastward of Olimarao island, consist of two atolls. On the northern are four islets, the largest of which is Elato, at the northern end; it is 101 feet (30^m8) high to the tops of the trees, and sandy.

On the eastern side of the atoll, about a mile south-westward of Elato islet there is an entrance into the lagoon about half a cable wide, with depths of from 5 to 6 fathoms (9^m1 to 11^m0).

In February, 1862, H.M.S. Sphinx entered the lagoon and anchored in a depth of 11 fathoms (20^m1) about half a mile southward of the western point of Elato islet.

Landing can be made on a sandy beach on the south-western side of Elato islet...

The southern atoll, on the south-eastern side of which are Toas and Ulor islets, is separated from the northern atoll by a passage about 1 1/4 miles wide. Both islets are wooded.

There is a narrow passage through the reef about 2 cables northward of Toas islet, which, except for small craft, is difficult to navigate."

16: Gt. Britain, H.O. --504 (no date) 1933 Woleaians
116, 161 Elato

"In 1930, there were 72 inhabitants [MR: on Elato]."

16: Gt. Britain, H.O.--504 (no date) 1933 Woleaians
116, 131 Lamotrek

"Orairuguron bank, over which there is a depth of 21 fathoms (38^{m}4), lies about 10 miles southward of Toas islet."

16: Gt. Britain, H.O. --504 (no date) 1933 Woleaians
116, 133, 504 Lamotrek

"Lamotrek islands, about 5 miles eastward of Elato islands, consist of three wooded islets on a triangular atoll. Lamotrek islet, 107 feet ($32^{m}6$) high to the tops of the trees, lies at the eastern extremity of the atoll.

The passage about three-quarters of a mile southward of Pugue islet, the northernmost islet, is the widest and best of those leading into the lagoon, but during the north-east trade a heavy sea sets into the lagoon and caution is necessary. There is a passage about 2 cables wide, nearly in the middle of the southern side of the atoll; its position is difficult to detect, but it is a good passage when the north-east wind is strong. The next passage westward is about 1 1/2 cables wide; all the other passages are narrow.

Anchorage may be obtained on the western side of Lamotrek islet (Lat. 7°28'N., Long. 146° 24'E.), sheltered from north-easterly winds, but it is reported that during westerly winds the sea becomes rather rough. Landing can be made on a sandy beach on the western side of Lamotrek islet."

16: Gt. Britain, H.O. --504 (no date) 1933 Woleaians
116, 161 Lamotrek

"In 1930, there were 165 inhabitants on Lamotrek islet, including one Japanese. Pugue and Falaite islets were uninhabited."

16: Gt. Britain, H.O.--505 (no date) 1933 Woleaians
116, 131 West Fayu

"West Fayu island is densely wooded, and lies about 46 miles north-north-westward of Satawal islands. Reefs extend eastward, westward, and southward from it; that extending westward curves round and running eastward forms a lagoon with the reef which extends southward. There is a passage half a mile wide between the extremities of these two reefs, but the navigable channel is much reduced by a shoal, with depths of from one to 2 1/4 fathoms (1^m8 to 4^m1) over it.

There are general depths of from 16 to 21 fathoms (29^m3 to 38^m4) in the lagoon, but there is a reef, with a depth of 2 fathoms (3^m7) over it, nearly in the middle of it.

Landing can be made near the southern extremity of the island."

16: Gt. Britain, H.O. --505 (no date) 1933 Woleaians
116, 161 West Fayu

"The island is uninhabited, but natives from Satawal visit it occasionally."

16: Gt. Britain, H.O.--505 (no date) 1933 Woleaians
116, 131 West Fayu

"Oraitilipu bank, over which there is a depth of 8 3/4 fathoms ($16^{m}0$) at its south-eastern extremity, lies about 32 miles eastward of West Fayu island. It extends for about 4 1/2 miles north-west and south-east. The depth immediately round the bank is over 100 fathoms ($182^{m}9$)."

Lamotrek

Lamotrek is the common name for a group of 3 small lagoon islands West of Satawal. The easterly one, Lamotrek, is 1 miles long in a northwesterly direction; on the reef which surrounds the approachable lagoon are 3 larger and 7 small islands. The southern one, Lamoliork (Lamoliaur) is the smallest; the westerly one, Elato (7°30' N., 146°19' E.) is the same size as Lamotrek and has numerous reefs on the east sode of the reef; the west side is almost completely bare; on both sides a channel leads to a good harbor in the lagoon. SW from this island lies the dangerous sandbank Janthe (5°32' N., 145°40' E.); it was given this name after the ship which discovered it in 1845 and is perhaps the same sandbank that the people of the Carolines call Falipi.

Lamotrek (Lamurek, Namurek) were discovered in 1797 by Wilson and named Swede, Haweis and Low;

17: Meinicke--358-359 (Prior to 1875) 1876 Woleaians
116, 131 Woleai

Ulea is barely a mile and a half long from east to west. The lagoon is an elongated oval but it is divided into 2 portions by a reef going out south from the island Tagoilap on whose south end is a small island Motogozen; of these two portions the east lagoon makes a fine [359] protected harbor into which wide and safe channel goes from the east of Motogozen and another narrower one north of this island; the west part of the lagoon is far larger but on account of the numerous coral banks half of it is scarcely usable as a harbor; 3 passages which all ships can go through make it approachable from the sea; the widest is on the S. side W. of Motogozen; the second on the W. side north of Felalis, the 3rd on the north side by the little island Angaliagarail. There are 22 small well wooded islands on the reef of which the most important are Raur (7°21' N., 143°57' E.) Paliau and Ulie, the biggest of all, on the east of the small lagoon; Tagoilap (Thagoilip), Seliap, Ulimirai on the north and Felalis on the south side of the larger lagoon.

18: German Government--2997 (1903-04) 1905 Woleaians
116, 164, 744 Woleai

The governmental physician was stationed for two and a half months on the Oleai atoll. He found that the state of health on the whole is better there than on Jap. The natives there suffer chiefly from dysentery, as well as gastric and intestinal diseases in general; there are skin diseases, chiefly ringworm, fewer ulcers, and there is filariasis (elephantiasis).

18: German Government--2997 (1903-04) 1905 Woleaians
116, 435 Woleai

On the suggestion of the district office, the traders of Jap, the Palau Islands, and Oleai entered into an aggreement regulating prices of goods and wages of native employees. This has given a secure basis to all business enterprises.

18: German Government--2997 (1903-04) 1905 Woleaians
116, 499 Woleai

The natives on the Oleai atoll have built roads without compensation....

18: German Government--3313 (1903-04) 1905 Woleaians
116, 164 Woleai

From November 18th until January 20th I was on the Oleai atoll; I found the state of health there much better than that on Jap. There fewer ulcerous skin diseases occur. The most frequent diseases are ringworm, which affects a large percentage of the natives, dysentery, and various types of intestinal ailments which I believe are due to excessive indulgence in sour toddy and fermented breadfruit pudding; there are also the various diseases caused by the filaria worm.

19: German Government--5302 (1901-1902) 1903 Woleaians
116, 197 Woleai

The language of Truk, which is spoken on all the island groups of the East [AN: Central] Carolines not previously mentioned, and extends as far as Woleai; hence, it is the means of intercourse between about 19,000 people in the East [AN: Central] Carolines.

20: German Government--4123 (1906-1907) 1908 Woleaians
116, 164, 744 Woleai

All in all the health of the whites and natives was good. On Oleai an epidemic broke out which in the beginning looked suspiciously like smallpox and which seized almost all the natives. Extensive precautionary measures were taken; the government physician vaccinated all the natives, but determined finally that this was not an epidemic of real smallpox.

21: German Government--84 (1905-06) 1907 Woleaians
116, 682 Woleai

Although public safety was not endangered investigations were necessary in two cases of murder, one of which dated from 1903. In the latter conviction was possible for the murder of a white trader on Oleai; in both instances the death sentence was pronounced.

Until June rainfall left much to be desired; besides the strong northeastern trade wind completely dried out the thin-layered soil and was very disadvantageous to the flora. In spite of the lack of rain and the prevailing strong winds a mosquito plague again proved most disagreeable during May and June.

The amounts of precipitation recorded at the three weather stations were as follows:

	Jap	Palau	Lamutrik
1904	2986.0 mm	--	--
1905	2917.3 mm	3218.6 mm	1961.10 mm.

22: German Government--184 (1909-10) 1911 Woleaians
116, 167, 731 Woleai

[AN: In the Western Carolines, West Central Carolines, and Marianas] ... the peace was not disturbed in the year covered by the report [ER: 1909-10]; relations with the natives remained untroubled.

The typhoons of the last years [AN: 1905 and 1907] had necessitated resettlement of supernumerary persons from the most devastated islands of the Oleai and Mortlock groups [UMR: Nomoi], and from Pingelap and the atolls south of Palau, on the thinly populated islands of Ponape, Palau, and the Marianas; on the latter there was more than sufficient food available for them, and they were to be settled there permanently as an economically valuable addition. Disturbances on Ponape and the danger that they might become enslaved, about the end of 1908 required removal of the Mortlock natives to Saipan. Unfortunately, this transplantation did not prove successful. In contrast to the people of Oleai who are closely related to the Saipan Carolinians, the people of Mortlock could not feel at home on Saipan. In April 1910, together with their companions in misfortune on Truk, they were sent back to their own islands, which in the meantime had recovered from the damage wrought by the typhoon. Earlier the inhabitants of the southern atolls, that had been destroyed in 1905, had been resettled on Saipan; they, too, returned to Sonserol. 129 of them remain on Palau; on the Marianas there are 200 people from Oleai, 60 from Pingelap, and 64 from Samoa, who, in 1909, had to be removed from their home lands for political reasons.

22: German Government--185
116, 245, 731

(1909-10) 1911

Woleaians
Woleai

Repeated trips of the district official and the Imperial Government physician. . . to the Central Carolines and the southern islands were undertaken to investigate the present condition of those atolls and their inhabitants after the typhoons of 1905 and 1907. It was ascertained that all islands had recovered almost completely. The coconut palms bore abundant fruit; on Oleai 20,000 new trees had been planted under the direction of a minor police officer. Only the breadfruit trees do not yet bear fruit again, and the washed-out and salt-soaked taro fields on the islands that had been hit by the tidal wave do not yield any crops.

23: Pereiro--13-14 (No date) 1895 Woleaians
116, 131, 437 Woleai

According to Coello, Don Luis Torres made a map of the islands that constitute this group in 1804, which number 23 and are located on a barrier reef 10 kilometers long and 5 wide. The location at the extreme north of the island of Raur, which is the most south west, if 150° 9' 54" long. N. This island is the point at which the boats trading in copra stop. The reef on which these [14] islands are situated has a 15 mile circumference and is open at the south.

Woleaians
Lamotrek

"It was not long before Lewis started with reminiscences of the ways of the Lamotrek islanders. 'These people,' said he, 'have a regular grace before meat like Christians. When the fish is taken cooked out of the oven, before they taste a solitary fragment, one of them takes a bit from the head and solemnly mutters, "Ka Toutop arai" -- "Do thou bless me, oh Toutop." This Toutop is a Deity greatly honoured in the Lamotrek Pantheon. Then he throws away the bit, and the people immediately begin their meal. But if anyone were to partake of the food before the blessing was asked, the fishermen would have no luck any more, but storms and heavy gales. For Toutop, like the rest of the Caroline gods, is very jealous of any slight put upon him.'"

24: Christian--239 (No date) 1899 Woleaians
116, 226, 784 Lamotrek

"'For four days before a fishing expedition the Lamotrek natives sleep apart from their wives. They go out fasting in order to ensure success. When they make their first haul they drink one green coco-nut apiece, and put in shore for the ceremony of Yaf-ilok--The Coming in of the Fire. A fire is made, each takes a fish, broils it, and eats it. Each fisherman then goes down to the sea, washes mouth and hands in the salt water, and invokes the blessing of Aliu-set and Sau-lal, gods of the sea. This ceremony over, the distribution of the heap of fish commences. If any women or children come near and break the taboo by helping themselves, the same will receive swelled ankles or elephantiasis as a punishment and visible token of the anger of the spirits.'"

"LAMOTREK STAR-NAMES

1 Uiliuil-al-evang. The Pole-star.
2 Uiliuil-al-eaur. The Southern Cross; also called Pup, or the Leather-Jacket Fish.

[JJH: The observer found it necessary to be absent several times. On his return he always measured the amount of rainfall that had collected in the gauge during his absence. Thus the yearly total can be relied upon, with the exception of the slight amount lost by evaporation.]

The north-east trade wind blew steadily from Jan. to the middle of April. The winds were irregular from then until the beginning of November. Although during this latter period winds were observed coming from the eastern quadrant, southwest winds were also frequent. During November the southeast to northeast winds again won supremacy.

Storms almost without exception came from N, NE to SE.

"The Ifaluk atoll is part of the larger culture area known as Micronesia. Micronesia lies north of Melanesia, occupying the region between, approximately, 20'N. and 5'S. latitude, and 130' and 180'E. longitude. It includes five major island groups: the Palaus, Carolines, Marianas, Gilberts, and Marshalls.

The Caroline Islands, of which Ifaluk is a part, lie south of Guam, west of the Marshalls, north of New Guinea, and east of the Phillipines. They form a broad belt extending from 131'E. longitude to 163'E. longitude, and from 1' to 10'N. latitude."

Geologically, these islands are of three forms: the coral islands, or atolls, represented by Ifaluk; those of sedimentary rock formation, such as Yap; and those of volcanic origin, like the northern Palaus."

28: Spiro--1 [3] (1947-48) 1949 Woleaians
116, 131 Ifalik

"Ifaluk, a low coral atoll, is located at 7'15'' N., 144'27'' E. The atoll is two miles in length, and 1.6 miles in breadth. It has three fairly large islands: Felarik, in the north-east, Falalap in the south-east, and Ella on the south side of the atoll. There is also a small islet in the south-west. The oval lagoon is about 5 miles in circumference, and is nearly one square mile in area. It is entered by a shallow passage between ella and Falalap. (1)"

"1. The native canoes have no difficulty at all, of course, in making the passage. But only the smallest of navy ships can do so. The LSM that brought us to Ifaluk got in without too much difficulty, but it required three attempts to get out. As a result no attempt was made by the succeeding ships to enter the lagoon."

116, 132 Ifalik

"Data on climate in Ifaluk are hard to obtain. The few instruments we had with us became casualities of the humidity. But the figures on temperature we did obtain seem to corroborate the official temperature recorded for the entire area by the Germans and Japanese. These give a mean temperature of 80' F. with variation of no more than four degrees. (2)

The average relative humidity for the Western Carolines is about 81 per cent. Despite this relatively high humidity, the climate is not uncomfortable; on the contrary, I found it quite pleasant. This is probably due to the prevailing winds and the trees which shade the islands and protect them from the glaring sun.

Rainfall is relatively heavy. The figures vary, but an average of 100 inches is a safe figure."

"There are two seasons in this area, that of the prevailing westerlies, and that of the prevailing easterlies. The latter is the season of the tradewinds, and enters about the middle of November. The natives largest unit of time is this climate season, which is called a rag. They recognize neither the solar nor the lunar year, but the rag is easily ascertained because of the abrupt change in the direction of the winds. The months in the rag are named, but are of little importance in the culture; most of the people, indeed, do not remember the names. The current month is the important month, and is referred to by the generic name for month, maram, which is also the name for moon. [2]

There is, of course, no conception of the week. The day is divided into fourteen parts, all of which are named, and indicated by the movement of the sun. The night, too, is divided into fourteen parts, indicated by the position of the stars, of which the natives named and identified forty for me. But these divisions are almost never used. The four divisions, morning, noon, afternoon, and night are usually sufficient for their needs."

"Very little is known of the origin of the Carolinians, (1) The evidence seems to indicate that the islands were originally inhabited by a wave of migration from Indonesia at an unknown date. It is believed that the Polynesians moved into the Pacific about 1200 A.D. via Micronesia, but it is still a moot point as to whether the Micronesians preceeded or succeeded them. Diego da Rocha, a Portuguese captain, seems to have been the discoverer of the Western Carolines. He sighted Yap and Ulithi in 1526, five years after Magellan's discovery of the Marianas. Except for a voyage by Sir Francis Drake in 1588, the only visitors to the area for the next century and a half were Spaniards. Nevertheless, Spain made no attempt to establish trade, colonies, or missions in the area during either the sixteenth or seventeenth centuries. In the eighteenth and nineteenth centuries traders and explorers of various nationalities added information to the growing stock of knowledge concerning the islands."

"1. Civil Affairs Handbook, West Caroline Islands, 1944. Davidson, Sutherland D., Oceania, 1947. Krieger, Herbert W. Island Peoples of the Western Pacific, 1943."

"Ifaluk was discovered by the Englishman, John Wilson, in 1797, and was visited by the Russian scientist, Lutke, in 1828.

The contacts of the natives with the early Spanish and Portuguese explorers were very slight. Discouraged by early abortive attempts to establish missions in Sonsorol and Ulithi, the Spanish withdrew from all activity in the Western Carolines until the end of the nineteenth century. The British raised a flag on the Palaus in 1790, but did not pursue their interest any further.

The Western Carolines were first brought to the attention of the United States by the published reports of an American crew that was shipwrecked on the Palaus in 1832.

After 1840, western traders became interested in the Western Carolines. The natives at first welcomed them with cordial hospitality, despite some sporadic attacks. The westerners introduced livestock, firarms, small-pox, and syphillis into the area.

With the development of trade in the middle of the nineteenth century, Spain, Great Britain, and Germany came into conflict over the sovereignty of the islands. The Spanish rule lasted from 1886 to 1899. Except for some missionary work, Spanish activity in the islands was slight. They established missons [sic] on Yap and Palau, and built military fortifications on Yap, but did not interfere with native life. [3]

At the close of the Spanish-American War, in 1899, Germany bought the Marianas

(except for Guam) and the Carolines from Spain. The Germans began their administration auspiciously. They established administrative headquarters for the Western Carolines on Yap, where they built a new administration building; constructed a hospital, with a resident physician, who trained native assistants, and made tours of the other islands; and established a police force composed of trained natives. The district officers visited the outlying islands and explained to the chiefs that Germany has assumed hegemony over the islands. But aside from depriving the chiefs of the power of inflicting the death penalty, they made little, if any, attempt to interfere with native culture. Only in the promotion of trade did the Germans use dictorial methods. They required an increase in coconut planting, and greater care in the maintenance of the groves. But on the while [sic], 'the German administration was moderate, enlightened, and efficient.' (4)

"4. Civil Affairs Handbook, p. 25"

In October, 1914, Japan acquired hegemony over the Carolines, when a Japanese naval squadron took possession of the islands. They were later ceded the islands as a mandate territory by the League of Nations. The primary aims of Japanese imperialism in the islands were political and military. Native rulers were deprived of much of their power, but, again, no concerted attempt was made to change native culture to any appreciable degree. However, the Japanese did establish schools on Yap, to which young boys from the outlying islands, including Ifaluk, were brought for instruction. Here they were taught to read, write, and speak Japanese; arithmetic, drawing, Japanese history, athletics, and political indoctrination. The Japanese also inducted young men from the outlying islands to mine phosphate on the Palaus and on Fais."

"Despite this long period of contact with the west (and the east) the Western Carolines show little acculturation. This is particularly true of the smaller islands, such as Ifaluk, for the obvious reason that contact was very slight. Trade never became extensive, and what there was was confined pretty well to the larger islands. Missionary activity was restricted to the larger islands, with no attempt to enter the smaller ones. Nor did the islands attract colonists, except for Yap and the Palaus.

Ifaluk, being one of the smaller islands, is, therefore, relatively unacculturated. However, there are some indications of acculturations, particularly in material culture. Although most of the clothes worn by the natives is woven by the women on their looms, many loin cloths are made of cloth introduced by the Japanese. Furthermore, almost every household has some articles of western apparel, such as military coats, jackets, and pants, some shoes or sandals, and many rain coats are in evidence. In preparation of food, almost all the utensils in use are of foreign origin. The wooden bowls, formerly used, have almost completely disappeared. Iron pots and hettles [sic], and tin pans have taken their place. Coconut graters, made of shell, have all been replaced by iron graters. Rain water is collected in rain barrels; the palm wine is collected and kept

in Japanese beer bottles. Fire is made with flint and steel, rather than by means of the aboriginal fire plow. (5)"

"5. Note: As so often happens, a practical art when if [sic] falls into disuse, becomes a toy, game, or sport. Boys and young men attempt to light a fire by means of the fire plow in the same spirit that characterizes the attempt of boy scouts to do the same."

Woleaians
Ifalik

"Food supply has also been effected by contact. Chickens and pigs, both in the smallest of quantities, have been introduced into the islands, as well as dogs. The latter are eaten under certain conditions. But more important than what has been introduced are those food products that the natives have tasted, and which have not been introduced, such as rice, milk, and beef, or 'carabou', as the natives call it. These, they tasted while on the larger islands, or when brought in occasionally by the Japanese, and they are very eager to obtain them again. The mothers, particularly, would like canned milk for their babies. One old man said that if he went to American he would do nothing but eat 'carabou'."

28: Spiro--4 [3] (1947-48) 1949 Woleaians
116, 177, 276 Ifalik

"One of the earliest of borrowed traits was tobacco, which the Spanish introduced into Guam, and which thereafter spread throughout the entire area. Ifaluk grows some tobacco, but not nearly enough for its needs, and, consequently, obtains its tobacco by trade with some of the other islands in the area, such as Faraulep and Lamotrek. The tobacco is smoked as a cigarette, being rolled in banana leaves."

28: Spiro--4 [4] (1947-48) 1949 Woleaians
116, 177, 771, 757 Ifalik

"In other aspects of culture little acculturation is to be found. Native religion and medicine is intact, despite the introduction of western medicine by the Japanese. The Navy has continued the Japanese policy of holding sick call on its field trips, and of leaving medical supplies with the chiefs. The only item the natives use, however, is cotton, which is used for a head decoration in their dances.

In religion, proper, I found on evidence of borrowing, of whose source, my informant was completely unaware. Arogeligar, the medicine-man, told me what was ostensibly a native creation myth, but which was, unquestionably, the Genesis story. When I asked where he had learned the myth he insisted that his paternal grandmother had taught it to him. Its origin, undoubtedly, is to be traced to missionary influence. Arogeligar, incidentally, was the only person who knew this story. The chiefs, who are the repositors of the folklore, were ignorant of it."

"Since neither Dr. Burrows nor I did any physical measuring, the following descriptions are entirely impressionistic. One of the most impressive facts about physical type on Ifaluk is the degree of variation that obtains, in what is genetically as homogeneous a population as one could possibly find. As far as we know, the natives have never mated outside the little group of islands comprising the Yap district, and within that area, the population is considerably under 1000. And yet there is variation in skin color from light brown to dark (6); in stature from fairly tall to short; in hair form, from frizzly to straight; [5] in nose form, from wide, 'negroid', nostrils to narrow, 'caucasoid' ones; in lip form, from thin to thick, inverted lips. Yet, despite this variation, one would have little difficulty in identifying an Ifaluk as a Carolinian, and as quite different from the 'average' negroid, Caucasoid, or Mongoloid."

"6. There is one albino on Ifaluk--a woman."

"The Ifaluk are members of the so-called Micronesian race, which is closely related to the Polynesian. Their features definitely bespeak a racial admixture, but whether this contact was in historic or prehistoric times is still a moot point."

28: Spiro--5 [2] (1947-48) 1949 Woleaians-1-2
116, 161, 621 Ifalik

"The 252 natives on Ifaluk live on two islands--the island of Felarik with 151 people, and the island of Falalap, with 101. Of the total population, there are 112 males, and 140 females. The islands and the village are identical, so that there is no political name nor boundary. There are two districts on each island, which are distinguished demographically, rather than ecologically. The two districts on Felarik are called Rauau and Felarik, the former being in the southern end of the island, and the latter in the northern half. There are eleven households in Rauau, strung along the main path, which runs parallel to the shore, about twenty-five feet from the beach. Between Rauau and Felarik there is a stretch of uninhabited land, about 200 yards, and then houses appear again. There are eight households, again stretched along the path. The two districts on Falalap, Ievang and Ievol, occupy the southwestern and northern parts of the island respectively, there being six households in the former and four in the latter, and again a stretch of uninhabited land separates them.

These districts are administratively distinct. That is, men of one district will go fishing, without informing the others; or, if seines or fish traps are to be made, they will be made by districts. There is no hard and fast rule dictating this behavior, but it results from the convenience of working with those who live continguously. The districts enjoy a quasi-political status in that each of the five chiefs is recognized as the chief of

at least one of the districts. But this jurisdiction is very tenuous, since the chief of the district does not necessarily live in 'his' district, three of the five chiefs living in Rauau. It is true, however, that a chief will spend much time in his own district, or supervise their work."

28: Spiro--5-6
116, 361, 342

(1947-48) 1949

Woleaians-1
Ifalik

"Within the district there is no indication of a city planning board, which might have allocated homesteads with an eye to symmetry. The homesteads are scattered throughout the district, some touching the main path, some being much further inland, some being isolated from others, some being contiguous, so that the boundaries of the two touch. But within the court yard of each homestead there is almost monotonous regularity, each having at least one 'sleeping house' (im), a cooking shed (malum), and almost all having a menstrual hut, the architiecture [sic] of each structure being similar, if not identical, to that in the other households. The average house is a one room building about 12 feet at its apex. [6] The frame of the house consists of four upright pillars, stuck into the ground. These are connected by light, supply branches, arranged in wicker-work fashion, to form the walls, which are about four feet in height. The gabled roof is constructed in the same fashion, the entire structure being held together by native rope. The walls are enclosed with coconut branch mats, and the roof with plaited coconut branches, tied to the frame, and superimposed one on the other in tile fashion, so as to repel the rains. The roof overhangs the walls, and reaches within three feet of the ground, protecting the house from the sun, and the dripping water. The house has a number of entrances, usually one at each of the four corners, and two on each side of the house. The entrance which is quite low--one must stoop in order to enter--is a

passageway, not a door. In the case of rain or cold it is covered with a mat, but ordinarily it is open, there being little need for privacy, nor any fear of burglary."

28: Spiro--6 (1947-48) 1949 Woleaians
116, 352 Ifalik 16

"The inside of the house is distinguished for its simplicity. The low-slung gable prohibits standing, except at the center of the house, so that after crawling through the passage way, one remains seated on the floor, the latter being comprised of a number of juxtaposed coconut mats. There is no furniture of any kind in the house, the pepple sitting and sleeping on the floors, and since all eating is done in the open air, there is no need for tables. But though furniture is lacking in the house, it is not bare. The loom is ubiquitous, and stands in a corner of the house, though, being small it occupies little space. Also in a corner is found the sleeping mat, made of pandanus, as well as the Japanese-introduced blankets. In the rafters a congeries of objects can be found--Japanese--introduced mosquito nets, bottles, clothers, rope, tobacco, and other assorted odds and ends. If there is an infant in the house, its cradle hangs from the rafters, a foot above the floor."

28: Spiro--6 [2]
116, 596

(1947-48) 1949

Woleaians
Ifalik

"The house is an extended-family dwelling (7) and is occupied therefore by a number of people, though everyone has free range of the house, each biological family occupies a certain section of it, by usage, so that its effects are separate from those of the others, it sleeps in a certain part of the house, and it has a hearth of its own. The hearth is not used for cooking, since all cooking is done in the malum, but it is used to warm cooked food, and to give heat on a cool day."

"7. See below, section on social organization."

28: Spiro--6 [3] (1947-48) 1949 Woleaians
116, 343 Ifalik

"The malum is constructed like an im except that it has no walls, the absence of which permits the smoke to escape.

The menstrual hut is similar to the im, except in size. It is occupied by the women only for the duration of their menstrual period, and though her children may sleep in the hut with her, it is not required to be as large as the im."

28: Spiro--6 [4] (1947-48) 1949 Woleaians
116, 351 Ifalik

"There is no rule dictating the relative positions of the various structures within the courtyard, so that each presents its own pattern. Nevertheless, the malum is usually at the farthest extremity of the courtyard, near the bush, so as to facilitate the obtaining of brush for the fire."

28: Spiro--6 [5] (1947-48) 1949 Woleaians
116, 552 Ifalik

"Each homestead is named and the natives, down to the small children, when informing you of their movements, say that they are going to Rapevelu, or Alingliu, not to see Maroligar or Taroman."

(1947-48) 1949

"Each district also contains at least one canoe-house, whose structure similar to that of the malum, in that it has no walls, but it is much larger, the average canoe-house being about four times the size of the average house, [sic] The canoe-house not only serves as a protection for the canoes, but it also acts as the men's club-house, a phenomenon, we shall discuss later. Formerly each district had a club-house as well as a canoe-house, but most of them were distroyed by a typhoon in the 1920's and have not been rebuilt. One remains, however, on Falalap, and in structure is that of a house, only larger.

In the district of Rauau stands the fanap, the 'town hall' (literally, the big house), which again is architecturally, a large house."

28: Spiro--7 [2] (1947-48) 1949 Woleaians
116, 361 Ifalik

"Aside from the cluster of settlements which is cleared of all vegetation, (8) the interior of islands are uncleared bush, though there is a net-work of footpaths traversing the two islands."

"8. Trees are cleared because of the danger of falling coconuts. This fact reveals the naivete of the urbanite in the tropics. I often commented to Dr. Burrows when we first arrived on the stupidity of clearing the courtyards of coconut trees, which could protect the houses from the hot rays of the sun. It was not until we had lived on the island for some time that I realized the dangers of the falling coconuts, particularly in a blow."

28: Spiro--7 [3] (1947-48) 1949 Woleaians
116, 137 Ifalik

"Vegetation is dense in the bush, the luxuriant flora compensating for the paucity of fauna."

28: Spiro--7 [4] (1947-48) 1949 Woleaians
116, 136, 825 Ifalik

"The only indigenous mammals are rats, whose activities are by no means restricted to the bush, however. Aside from the rats, lizards are the only other indigenous animals. There are a number of species of lizards, ranging in size from the very tiny to the giant lizards, of which there are two, both of whom were imported from Yap for the purpose of exterminating the rats. (9) Neither rats nor lizards are eaten, and the natives were repelled by the suggestion."

"9. An interesting sidelight on 'primitive logic' confronts us at this point. The natives distinguish each species of lizards by a separate name, and do not classify them under a generic title. To them they are different kinds of organisms, so that one kind is the object of a genuine phobia, but the others are looked upon with indifference."

28: Spiro--8

"At present there are only two dogs on Ifaluk, though there were five when we first arrived. The high mortality is a result of a succession of deliberate killings. Children would tease the dogs incessantly, pulling their tails, hitting them, etc.; nor were the adults innocent of such behavior. After exhibiting remarkable patience two of the dogs attacked their tormentors, and were consequently killed. One dog attacked me, for no apparent reason, and the chiefs immediately ordered him killed. In all three cases some of the natives cooked and ate the corpses. Since the two remaining dogs are of opposite sex, it is improbable that the canine population will become extinct."

28: Spiro--8 [2] (1947-48) 1949 Woleaians
116, 262, 252 Ifalik

"The largest single source of protein food, quite obviously is fish, though the supply is not as abundant as one would expect. Fish are prepared by either men or women, and are invariably cooked by taking them, uncleaned over burning embers. There are no taboos on non-noxious fish, with the exception of sharks, and grown octopus. (10) There is, however, a discriminatory taboo on turtle flesh. Only the males of the lineage of Uluas, from whose line descend the paramount chiefs, are permitted to eat of the flesh. Visiting anthropologists, of course, are exempt from this taboo."

"10. Here again, a note on 'primitive logic' might be injected. One afternoon, Taroman, one of the chiefs, brought us a baby octopus, which he had caught in the lagoon, offering it to us as a rare delicacy. We decided to prepare it for dinner, but in the interim Dr. Burrows told Tom, our interpreter, that Taroman had given us a tayo, the native name for octopus. Tom replied angrily that we should not eat it, and said he would reprimand Taroman for offering us food, that the natives considered unfit. We followed his advice and discarded it. But that evening Tom came to visit us, and ribbed us good-naturedly for our ignorance. Taroman had not given us a tayo, he had given us an xyz, the latter being a rare delicacy. The point of this being that an adult octopus is considered a different species from a baby, so that tayo is one thing, but xyz is something entirely different."

28: Spiro--8 [3]
116, 241, 262, 271

(1947-48) 1949

Woleaians
Ifalik

"All other foods are starch in content--coconuts, taro, breadfruit, and bananas. Mention should be made of sugar cane, papaya, pineapple, and lime, all of which were introduced since contact, but which are so scarce as to be non-existent for all practical purposes.

The coconut tree yields three different kinds of food. The ripe coconut is eaten as is, or is grated and mixed into the various puddings that the women prepare. But the green coconut is much more important than the ripe, for it constitutes almost the entire liquid supply of the island. Coral atolls, obviously, have no natural water supply, and the rain water that is stored in pits or in tin garbage cans is usually unfit to drink, with the result that the green coconut water provides the one substitute for drinking water on the atoll."

28: Spiro--8-9 (1947-48) 1949 Woleaians
116, 262, 273 Ifalik

"The coconut tree is also the source of what is one of the most important foods, from the native point of view, gari. Gari is the sweet sap-like liquid [9] that is obtained by tapping the coconut frond, and permitting it to run into a container, the natives using an empty coconut shell for the purpose. The men collect their gari twice a day, morning and afternoon, in rain or shine. Indeed the collection of the gari is the first activity performed in the morning by the men, and its collection in the afternoon signals the end of the economic day. It is consumed in three forms: when freshly collected, it is a pleasant soft-drink, and is drunk copiously by all the natives, and is fed even to the babies. If allowed to ferment, it has a beer-like taste, and is drunk, at least to my observation, only by the adult men. It is called lis. This fermented form has a definite 'kick', and though I have seen men become quite 'high' by overindulgence, I have never seen a man become intoxicated. Finally, the fresh liquid is used by the women in the preparation of the various puddings they make."

28: Spiro--9 (1947-48) 1949 Woleaians
116, 241, 251, 262 Ifalik

1.2

"The natives distinguish at least three major species of taro, and they are prepared in a number of ways. Taro plants grow the entire year, so that it is an ubiquitous food.

Breadfruit seems to be the favorite starch food, perhaps because it is not as abundant as the others, since it grows only during the prevailing westerlies, but it is absent during the Trade Wind season. It, too, is prepared in a number of ways. Breadfruit is preserved, by salting cooked breadfruit with water, patting it into balls, each wrapped in a separate leaf, and stored in underground pits. It is eaten during the off-season. I could not get myself to eat any because of the---to me--- extremely offensive odor it emits.

Bananas, though abundant, are not a favorite food, and are fed to the hogs and to visiting anthropologists, though the natives do eat them."

28: Spiro--9 [2] (1947-48) 1949 Woleaians
116, 631, 622 Ifalik

"Ifaluk is one of eight small islands in the Central Carolines, all of whom recognize their political subservience to the island of Yap, and more particularly to the Gagil district on Yap. There seems to be two traditions that account for this subservience as far as Ifaluk is concerned. Dr. Burrows was informed that Ifaluk was originally populated by settlers from Gagil, with the result that Ifaluk looks to Gagil as its mother country. This Yap colonization presumably holds true for the other small islands as well. In discussing religion with the chiefs, I received another tradition, however. The Ifaluk creation story has it that when Autran, the primordial mother goddess, created man, she first created the people of Gagil, then those of the island of Mogmog in the atoll of Ulithi, and then the people of Ifaluk, and finally the people of the other islands. However, the traditions might differ, they both agree that Gagil occupies first rank in the native 'international' hiearchy, followed by Mogmog, with Ifaluk running a close third. It is of importance to note, however, that relative prestige is verbalized in terms of the prestige of the chiefs, rather than in terms of the respective peoples. That is, Yap is 'more high' because the Gagil chief is of preeminent importance, and Mogmog and Ifaluk occupy high positions because of the high positions of their chiefs."

Woleaians-1-2
Ifalik

"This recognition of the superiority of Gagil is more than a conceptual scheme; it entails material obligations on the part of the subservient islands. At periodical intervals the various islands bring a tribute to Gagil, called Autinzauwei or autineiwin, though the intervals are not fixed because of the native lack of conceptual temporal categories. Nevertheless, it is probably not too far from wrong to state that at three to four year intervals, Ifaluk pays a sizeable tribute to Gigil. The five chiefs select one of their members to deliver the tribute, and accompanied by an entourage, he makes the trip to Yap, about 400 miles away. The tribute is not fixed, but usually consists of women's skirts [10] (lavalavas), rope, and canoes, which the chiefs levy from the people. In terms of the native economy this tribute is of no negligible value, for, as we shall see, canoes, skirts, and rope, are the only articles the people manufacture, and the time consumed in their manufacture elevates them to objects of real value, of great wealth. A tribute

of a few small canoes, and one ocean-going canoe constitutes a real drain on the island's capital. Nevertheless, this tribute is offered voluntarily, without coersion, or military pressure on the part of the Gagil chiefs. (11)"

"11. It is of interest to the student of acculturation that the Yap chiefs accompany the navy station ship on its periodical tours of the islands, and collect their tribute during these trips, transporting them on the navy ships. Nonetheless, the local chiefs continue to travel to Yap, since the trip is a kind of pilgrimage, in a quasi-religious sense, and is an occasion for social intercourse, as well."

28: Spiro--10 (1947-48) 1949 Woleaians
116, 651, 631, 386, 793 Ifalik

"This tribute [WPM: see pp. 9-10] is not entirely unreciprocal, however. Yap supplies Ifaluk with gifts, both of a material and a non-material nature. The material goods consist of turmeric, the native paint, which is highly valued on Ifaluk for both bodily decorations and for painting canoes. They also supply them with bamboo poles for construction purposes, for though bamboo grows on Ifaluk it is not too plentiful, nor is it as good in quality as the Yap bamboo. Finally flint stones are brought from Yap to be used to make fire.

Furthermore, Yap makes a non-material, or spiritual, contribution to Ifaluk. The Gagil priest accompanies his chief, and performs a religious ceremony, whose nature unfortunately, I did not manage to get any information on."

"Viewing the system from the outside, rather than from the inside, or native perspective, it is of importance to note another, sociological contribution, made by this international organization, and that is the maintenance of peace. The possibility of the existence of inter-island war is, of course, an entirely speculative point, though tradition tells us of a number of wars in the past. The facts are, however, that there have been no inter-tribal wars in historical times, and it is not unfair to assume that the mutual subservience of islands to Yap has been a major factor in this history of pacifism, for the Yap chiefs consider all the islands as their own people, and intertribal war would be considered civil war, or treason, by them. And though Gagil might not be able to enforce its demands by physical might, its prestige is great enough so that its expressed disapproval would be sufficient, in most cases, to enforce its will.

That this role of benevolent paternalism is felt quite consciously by the Yap chiefs is indicated by my meeting with Foneg, the paramount chief on Gagil. While waiting on Ifaluk for our ship to embark, Foneg, who had accompanied the ship, approached me, and after exchanging the usual amenities, he said that he hoped that the people on Ifaluk had been friendly and cooperative, and he thanked me for having lived with 'my people.'

This hegemony of Gagil presents an interesting psychological problem, which I can only pose at this point, without attempting to offer an answer. The Ifalukians, of course,

accept Gagil's hegemony as part of the natural scheme of things, no one having ever questioned either its necessity or its desirability. Tribute is offered to a people that is different in language--the two languages are mutually unintelligible--and different, to a considerable extent, in culture. Furthermore, the people's attitude towards Gagil is not one of abject humility. On the contrary, the Ifalukians criticise the Yapese for their uncleanliness and their immorality. The Yapese, say the people, 'stink too much', and they 'talk lie'. Nevertheless they continue to pay their tribute, though they could successfully throw off this yoke."

"Though subservient to Gagil, Ifaluk enjoys a position of high prestige vis a vis the other small islands in the Yap district, for, aside from Mogmog, it occupies the highest rung on the political ladder, and it is one they are very jealous of. Again, two variant traditions account for this high position. Ifaluk has great prestige, the chiefs informed me, because of its seniority in creation. On the other hand, Dr. Burrows collected some legends which purport to explain Ifaluk's ascendancey, and which parallel the reason for Yap's ascendance over Ifaluk. These legends tell of Ifaluk having had wars with the outlying islands, each war for a different cause, in the course of which Ifaluk took the the occasion to massacre the entire populations of the various islands, and a man and woman from each clan were chosen to settle on the depopulated islands. As a result the population and culture of the islands are derived from Ifaluk, so that Ifaluk is the mother country to the other islands.

The historicity of these stories, obviously, can not be validated. It is true, however, that the peoples on the various islands speak identical languages, and, as far as we could check, have quite similar, if not identical, cultures. Particularly important is the identity of social organization, so that the same clans are found on all the islands, and inter-island marriage, which is not infrequent, is governed by the same clan exogamy as intra-island."

28: Spiro--11 [2] (1947-48) 1949 Woleaians
116, 186, 554 Ifalik

"The people are very proud and jealous of their prestige, would often remind me of it. One evening, for example, while talking with a young married man usually ungiven to bravado of any kind, he bragged of Ifaluk superiority, and of the deferential treatment accorded to an Ifalukian who visited another island.

This consciousness of rank extends to their relationship with the outside world as well. As a matter of fact, I first became aware of the importance of rank by an incident that betrayed the people's concern with maintaining their high position in the eyes of the Americans. One evening, while talking with a number of men about what we intended to do during our stay, I mentioned that other islands were being studied by other anthropologists. The men responded as a man: that means that they will have to cooperate with us to the fullest, lest the other anthropologists receive better cooperation, submit superior reports, and then Ifaluk would be 'more down.' The men immediately told Tom, our interpreter, to pass this information to the chiefs, and the next day a special meeting of the entire island was convened by the chiefs, and the people instructed to carry out all our demands."

"As indicated above the inter-island relationships are marked by continous peace, the only wars of which the natives have knowledge, being the wars described in the legends referred to above, and they occurred 'musuwe, musuwe', ('before, before.')."

28: Spiro--11-13 [WPM: Manuscript 116, 484, 574 omits p. 12] (1947-48) 1949 Woleaians Ifalik

"The natives are excellent seamen, so that inter-island travel is frequent. These voyages, though undertaken primarily for recreation pure and simple, serve important social and economic functions. All these islands are small, geographically and demographically, and the opportunity to travel, to see different landscapes and different faces, is eminently desired. [13] At the same time, most people have friends and/or relatives on other islands, and they are most desirous of visiting with them. Furthermore, visiting travelors bring back reports of their travels to their fellows, informing them of all major as well as minor events--deaths, marriages, petty gossip, etc."

28: Spiro--13 (1947-48) 1949 Woleaians-1-2
116, 431 Ifalik

"But these trips [WPM: see pp. 12-13] also further international trade, which is important, though not vital for the native economy. Ifaluk, as we shall see, has no division of labor, each household being a self-sufficient economic unit. Yet, the island as a whole practices a certain division of labor vis a vis the other islands, and their surpluses are exchanged. The two commodities which it obtains from other islands are tobacco and women's shell belts, the former being obtained from Faraulep and the latter from Eauripik, while it exports lavalavas and rope. This trade does not involve any financial transactions, since none of the islands have money economies; nor even barter, in the strict sense of the word, since there is no bargaining nor any concept of fixed value, either intrinsically in the exchanged commodities or in terms of some third object. Hence the only rubric under which this trade falls is gift exchange, though this concept is really an ethnographic classification, rather than a native conceptualizaion. That is, a native traveling to another island, will return with tobacco or belts, obtained usually from friends or relatives, given freely as a gift. When his donor visits Ifaluk, he will give him rope or lavalavs, presumably as a gift, without any formal consideration of the value of the relative exchange. Apparently both parties to the exchange are usually satisfied, because no one could tell me of any case of discord arising from an unsatisfactory exchange.

Gifts are not only given to the individual traveler, but they are given to the chiefs, as well, both by individuals, and by chiefs."

28: Spiro--7-8 (1947-48) 1949 Woleaians
116, 177, 231 Ifalik

"The other animals on Ifaluk were introduced by the Japanese. These are the pigs, dogs, and chickens. The pigs are few, and their flesh--they are invariably roasted--is considered a rare delicacy. The hogs are tethered to trees, though the small pigs are allowed to roam in the courtyard, and are looked upon as pets, being freely handled and fondled by the natives, to the point of being suckled at times by the women.

The chickens, too, are scarce, though not as scarce as the hogs. Chickens are allowed to run free, and consequently are not entirely domesticated. It is quite an amusing sight to watch a chicken 'hunt'. A gang of boys will chase a chicken for a considerable length of time with sticks and stones until they finally catch one. Indeed to watch them stalking a chicken, one would think [8] that they were hunting big game. Because of their scarcity chickens are eaten infrequently, though many natives are not particularly fond of them. Eggs are eaten when they are found, and since the natives do not know the chickens" roosting places, they are not found as often as would be desired."

"Persons visiting other islands will stay at the homes of close relatives, or of clan members, where they will sleep and eat. They may stay as long as they like, though all but one of the visitors to Ifaluk during our stay remained no more than a week, their departure being determined by favorable winds and currents. [14] One boy from Woleae whose sister was married to a native of Ifaluk remained for six months. Since the islands fall into groups, a canoe will usually visit a number of islands on one voyage. A departing canoe will receive a send-off by a number of people, who fill it with coconuts and food for its journey.

The upshot of this discussion, and the point I wish to stress, is the high degree of cooperation and mutual aid obtaining between the islands. The people are deeply interested in the other islands and express genuine concern about their wellbeing. This is best illustrated by the aid Ifaluk extended to Woleae during World War II. The Japanese established a navy base on Woleae, which is approximately 30 miles from Ifaluk, preempted the food supply, and left the natives to their own ingenuity. When Ifaluk learned of their desperate condition, the Ifaluk chiefs extended the hospitality of their islands to the entire population of Woleae, about 400 strong, and despatched Ifaluk canoes to transport the Woleaneans. The lived on Ifaluk for the duration of the war, without payment of any kind. When asked to comment on this generosity, Ifalukins remark that the Woleanens

are 'all same brothers this place', and this was just a brotherly gesture, not any unusual display of generosity or sacrifice."

Ifalik

"The domestic political life on Ifaluk is characterized by hereditary chieftanship, of which there are five. Since Ifaluk is a matrillineal society, a chief inherits his office from his mother's brother, and transmits it to his sister's son. The five chiefs are formally ranged in a descending hierarchy, being designated as 'chief number one, number two, etc.' but in actual practice it is next to impossible to discover any functional differences between them, either in terms of responsibility or of privilege. The number of chiefs (tamon), and the lineages from which chiefs are chosen was already ordained by Autran, when she created the people of Ifaluk. (1)"

"1. The clans and lineages from which the chiefs are chosen, with the names of the current chiefs, in descending order of rank, are:

Wolptau: Kovalu--Ulepi
Maroligar: Sauvelarik--Somat
Wolpaitik: Sauvelarik--Falitre
Paluelimar: Mangaulevar--Linoa (Palueimar died shortly before our departure from Ifaluk. His household was abandoned because of much illness, the lineage split up, and I do not know who his ultimate successor will be.)"
Taroman: Rapevelu--Valevelu

"Though informality characterizes Ifaluk culture, some attempt is made to give some formal training to the future chief. A chief will select his most likely successor, when he is in his early teens, at the latest, and will instruct him in the duties and responsibilities of chieftanship. Maroligar's successor, for example, was Uvelimun, and every afternoon I would see him taking him into the bush where they would remain for about an hour or two.

The nature of his instruction is a secret, and I obtained no information concerning it. One of the things he learns is the body of myth and legend, because the chiefs are the custodians of the cultural traditions. Aside from the formal instruction, the boy receives informal instruction from the women of his lineage, his maternal grandmother, aunts, as well as his mother. This instruction consists of general admonitions regarding his most important roles. 'Suppose I die, you savvy talk. You like my talk, you talk good that people, (then) find that place. Some man come, you look out good. That man go back, he say: "Very fine that Chief." If a place bad, he say: "Very bad that chief." You all same papa and mamma for people who come here. You give them chow. You no enough that chow, you tell people they bring to you, you give to that people from another place.'

The young boy has impressed upon him, then, his responsibilities, both with respect to his own people, and to visitors. The chief is the patriarch of his people, responsible for their behavior, so that their character and behavior reflects on him. Notice, too, the stress on the opinions of the stranger. Be a good chief, so that the visitor will tell his people of your ability and competence. Also to be emphasized is the stress laid on gift giving, particularly of food.

This lesson is learned well. The chiefs constantly offered their services to us, supplied us with a regular supply of food and coconuts. It was quite apparent from the day we arrived that we were to be the special wards of the chiefs.

Though the chiefs' authority extends over the entire island, each chief has official charge over a particular district, and is responsible for its welfare. Unlike the feeling of friendly rivalry and consciousness of prestige that characterized inter-island interraction, inter-district interraction reveals little, if any, such characteristic.

The responsibilities of the chiefs are much more than political, in our understanding of that term. They are the leaders of Ifaluk, par excellence, in all aspects of culture, not only the narrowly political. This follows from the fact that Ifaluk, like other primitive societies does not conceptualize its culture into different categories, each serving its own end. There is no term, for example, for religion, or politics, or economics, etc., all of these categories being western concepts that we shall use for convenience of

analysis, but which do not exist in the minds of the natives themselves. The very title of this chapter, [16] political organization, is a travesty on native thought. The tamon are the leaders of their people, which means that all social activities are performed under their leadership, and/or with their sanction. All activity is performed becasue the chiefs endorse it, either explicitly or implicitly. But their leadership, or direction, is unobtrusive, and neither their individual personalities, nor their institutionalized behavior corresponds to that of the western politician or statesman. The chiefs, if I may be permitted an analogy are not only the starters that get the motor of the car running, but they are lubrication, that keeps the motor running without undue friction, the accelerator, the brakes. The chiefs serve, albeit unconsciously, as the guarantors of this culture, as a going concern, without whom it would collapse. And what makes their influence so remarkable is their lack of any mark of office that we are so accustomed to in the west. They possess no external symbol of power nor any punitive power to enforce their 'demands.' I deliberately enclose the term, demands, in quotes because this too, would be a term alien to native mentality. The chiefs do not legislate for the people, nor do they give commands to the people, but rather, they express the will of the people; they articulate the demands of the people. This culture exhibits a real benevolent paternalism. It is the chiefs who know what is best for the people, and their orders are

conceived as the objective articulation of the subjectively felt needs of the society. This is sophisticated, but I think, accurate description of the native view of the chiefs derived from many conversations with many natives. And this, I am sure, is the conception the chiefs have of themselves. Never did I see any indication of self-seeking, of quest for power or prestige. If anything, just the opposite is the case. The chiefs are retiring and selfless, seeking neither honor nor glory. Though, theoretically, their power is absolute, I saw not a single instance of abuse of this power, in the form of demanding of property or gifts or women or privileges. Their leadership is viewed as a vocation, in the Protestant sense of the term, that is, as a service to the society, a moral duty that must be fulfilled. And defection from this ideal would result in great shame. That this conception of themselves is felt by them quite consciously is born out objectively by the Bavelais Moral Ideology Test and by the Stewart Emotional Response Test. The responses to these tests by the five chiefs were almost unanimously alike, and quite different from the responses of the people. All showed a profound personal identification with their people, so that their feelings of happiness or sadness, shame or anger, were determined by the conditions or feelings of their people. If their people were wellfed or were healthy, then they were happy. But if their people were hungry or ill, or if they quarreled or were not industrious, then they were sad. Their consciousness of leadership responsibilities emerged quite clearly from these tests, as well. The activities that were praisworthy or blameworthy were not personal activities, but rather communal ones. If

they performed their duties, saw to it that the people cleaned their yards, planted taro, made rope, etc., they would be praised, but any derelictions in this regard would evoke blame. This observation, in conjunction with their response to those things that cause them shame, namely, to be found wanting in communal responsibilities, not ordering the people to go fishing, or to prepare food, etc., substantiates two further points: they conceive of their office as the fulfillment of responsibilities, and their responsibilities involve the expression of the will of the poeple, not the giving of orders that may or may not coincide with the latter's desires. It serves to emphasize the fact that the people recognize the necessity of engaging in certain social or economic activities, but wait for the chiefs to take the initiative in instigating them, so that if the latter do not do so, they are not done, with the result that the chiefs are to be blamed. These observations are of far reaching significance for Ifaluk personality development, and cultural psychology, points which we shall [17] examine later. Here, I only wish to point out that despite the absence of any of the accoutrement that we associate with democracy, with, on the contrary, all the external signs of despotism, we have as complete a democracy as is possible. The great responsibilities of the chiefs, combined with a concommitant lack of privilege, leaves little room for surprise over the fact that not one young man expressed a desire to be chief. They all informed me, in great earnest, that they would not like to be chiefs, and their reasons, to a man, were that the responsibilities were too great."

28: Spiro--17 (1947-48) 1949 Woleaians 1.2
116, 622, 226 Ifalik

"With these remarks in mind, we can now turn to the actual functions of the chiefs. In the first place the entire economic life of Ifaluk is under their direction and supervision. Communal fishing expeditions are never undertaken without their direction or consent. A man may go fishing any time he desires, but only the chiefs are empowered to order the entire village to go fishing. Since fish is a vital part of the native diet, it is important that these trips be successful, so that the chiefs must be well-acquainted with the habits, movements, and habitat of the various species of fish, so as not to order the men on a wild goose hunt. Once the fishing begins, certain men, who are recognized as expert fishermen direct the work, and since two of the chiefs are so recognized, their share in this responsibility is large, but they function not as chiefs, but as fishing experts.

All communally-owned capital goods are manufactured at the orders of the chiefs. Fishing traps and seins, which are vital to the Ifaluk economy are made only when the chiefs order them to be made. Now, it must be realized that every man is fully aware of the importance of replenishing these objects, and yet no one will undertake to do so, or take the initiative in getting others to do so, unless ordered by the chiefs."

28: Spiro--17 [2] (1947-48) 1949 Woleaians
116, 622, 653, 681 Ifalik

"All public works are undertaken at the chiefs' behests. The building of overwater heads, at the request of the navy; the removal of trash from the courtyards, the cleaning of the bush and public paths, the repair of a canoe-house, the initiative for all these is the responsibility of the chiefs, without whose orders they would not be done.

But his responsibilities do not end with public works or communal economics. Should a private house need repair, or a courtyard be dirty, should a man be indolent or a woman not take care of her taro patch, the chiefs will step in, and order this situation be rectified. Again, this is not viewed as a curtailment of freedom, or as an encroachment on individual rights, for this is part of the chief's responsibilities, the neglect of which, would lead to censure on the part of his people.

Other economic activities, though not initiated by the chiefs, require their permission All construction that requires the cooperation of a number of men, such as a house or an ocean-going canoe cannot be undertaken without first receiving the consent of the chiefs."

28: Spiro--17-18 (1947-48) 1949 Woleaians
116, 574, 622, 157 Ifalik

"But the chiefs have responsibilities other than economic. The chiefs are the official hosts of any traveler to the island. If by chance, the visitor has no kinsmen on Ifaluk, or if he be a dignitary, such as a chief or an American, it is the responsibility of the chief to make his stay as pleasant as possible. Thus, if people gave us gifts of food, they did so as a gesture of friendship, but the chiefs took upon themselves the responsibility of caring for our wants and needs, as part of their duties as chiefs. Not a day would pass when we were not brought food or drinking coconuts by at least one of them, and they were assiduous in [18] dropping in on us to inquire about our welfare, and to ask whether we needed or wanted anything. Of course they, as individuals, were interested in our welfare, but there was little doubt that they were acting as chiefs, as representatives of their people, lest our needs not be satisfied and then Ifaluk would be 'more down.' All the chiefs responded in the Stewart Emotional Response Test, that one of the things that would cause them great shame would be a comment by a chief of another atoll to the effect that the Ifaluk chief was a poor host."

28: Spiro--18
116, 622, 184

(1947-48) 1949

Woleaians
Ifalik

"The chiefs also act as the depositories of the cultural traditions. Myths and legends are almost unknown to the people, but they are transmitted by the chiefs to their successors. This is also true of religious and other cultural values. If one questions a native about any aspect of religion, morality, social and cultural values, he will tell you what he knows, and they say, that for a complete and thorough account you should speak to the chiefs, because they are the ones who really know these things.

Finally, the chiefs are the moral guides of the culture. Ifaluk religion and ethics are not connected as they are in western religion, so that the chiefs, rather than the priest-shaman are charged with the perpetuation of the mores."

28: Spiro--18 [2] (1947-48) 1949 Woleaians-1-2
116, 681, 622, 182, 554 Ifalik

"As in most primitive societies shame and social censureship are the greatest deterrants to immorality. This is particularly true on Ifaluk, where there are no supernatural sanctions. But the ultimate sanctions for moral behavior are the chiefs. It is their approval or disapproval that motivates much of the Ifalukian interpersonal relationships. And this role is felt very consciously by both the chiefs and the people. When discussing the subject of chieftanship, they informed me, that: 'Chief all same pappa this place.... If no chief, all same canoe have no people, canoe turn around. Place, too, by'n by turn around, people fight. Pappa talk to boy, maybe boy no like (i.e., won't obey), for only little bit afraid. But all people afraid chief. Chief work--talk. Chief no talk to people, tell them what they do, all same ship break.'

This is as accurate description of Ifaluk chieftanship as one could want. Besides this very interesting 'ship of state' idea, this statement displays a genuine insight into the real significance of the chiefs in this culture. That the statement reflects not only the chiefs conception of themselves, but also the conception the people have of them, is brought out clearly in the Stewart Emotional Response and Moral Ideology tests, in which the people maintain that they are afraid to be indolent, to steal, or to fight lest they incur the wrath of the chiefs; and conversely, that they are good, generous, etc., because this pleases the chiefs.

This role of being the ultimate sanctioners of the cultural values is very interesting in view of their lack of any punitive power. There are neither police nor prisons on Ifaluk to enforce the mores or punish violations of them. It is true that a murderer or incorrigible thief can be punished by the chiefs by banishment and/or confiscation of property, but such punitive powers must rest on the consent of the people, since they have no physical power to enforce these punishments. What is even more significant is the fact that the mere disapproval of some behavior by the chiefs acts as a sufficient deterrent, and that their approval is one of the strongest motivations for culturally approved behavior."

(1947-48) 1949

Woleaians-1-2
Ifalik

"Further reflection on the nature of Ifaluk society makes us pause even longer over this phenomenon. In theocratic societies, or in societies in which the ruler enjoys divine or magical rights or protection, it is understandable that his demands should be respected. But no such concept of supernatural power or protection obtains in Ifaluk. The chief is a man among men, who happens, it is true, to descend [19] from a particular lineage. Add to this the objective fact of the smallness of the island, in which the child knows everyone from the moment that he begins to perceive and distinguish objects, and every one knows every one else as intimately as one person can know another. These people grow up together, they plan and work together and learn very soon the virtues and vices, abilities and foibles of their fellows. Now the chiefs grow up as part of this process. In huge empires the prince lives apart from the commoners, he grows to adulthood in the court, where few people can know him, so that he can maintain the aura of magical greatness. But on Ifaluk this is impossible. The chief is remembered by practically all of the people, as that young foolish kid, who would never obey his parents, or as my friend with whom I participated in a number of pranks, who is a poor fisherman, or inept carpenter. And suddenly he is thrust into the position of authority, at which time he not only receives the respect of his fellows, but becomes the ultimate sanction of their good behavior. This is indeed a perplexing question, and one to which

we shall return in our discussion of Ifaluk personality and psychology.

The people accept the chief's authority without question. One afternoon I asked a group of men why they obeyed the chiefs. This was obviously a very perplexing question for them. Apparently it had never been articulated before. Obedience to the chiefs is just accepted as part of the natural order of things. After stating the question in a number of different ways, I could get only the stock answer: 'We don't know. Before, before, all the same now.' That is, this is part of our tradition, and inheritance from the past, and we accept it. As we continued the discussion, other points were made, however. 'Suppose no have chief, all people fool. (If) chief see people very bad, he tell them "You no make that. No my talk I talk to you, talk before, talk my house, my place." If another man come, see no chief, very bad.'

What is said in this statement is that the chiefs are the ultimate guarantors of the culture, and its values. If there were no chiefs, the people would be 'fools', or 'make bad', that is, they would violate the mores, and the culture would disintegrate. The presence of the chiefs prevents the people from such violation. For, 'If people talk, no somebody afraid. Chief talk, all people afraid.' That is, the people accept the authority of the chiefs, and abide by their reprimands if they commit a wrong. But a reprimand from another would have little effect, because they fear only the chiefs."

"When asked why the chiefs elicit this obedience, and no one else, the answer is immediate--because their lineages are 'more high.' This superiority of descent is accepted implicitly. It is not the person is personally superior, has greater ability or knowledge, but that he is descended from the 'royal family.' The obedience, then, is to the status, not the individual. When I asked, for example, how they felt about obeying a young chief, whom they had ordered around when he was a boy, and who now is their superior, though they probably have greater skills and knowledge than he, they expressed surprise. Why not? Isn't he a member of the lineage of chiefs?

No person could remember one instance of disobedience of a chief. 'Men afraid that chief. (If) one man no like talk for chief, very bad man. All people no like. Why he no like talk for chief?'

I might illustrate this point by one incident in which we were involved. One morning Tom, our interpreter, came to us saying that he would not work with us for a few days since the canoe, that he was building with the assistance of some other man, was not being completed rapidly enough because the other men were not indiligent [sic] in their work, and that he would have to devote more time to the work. Later in the day, he came to me, saying that the chiefs had heard of his not working with [20] us and were angry with him. I told him that I wanted him to complete his work as soon as possible and that

both Dr. Burrows and I would rather he worked on his canoe for a few days. But he looked at me very contritely, and in a very pathetic voice, he answered that the chiefs are 'too angry at me', and therefore he was afraid to work on his canoe because he was afraid of the chiefs. Now this is from a man who had lived in Manilla for four years, who was descended from a chiefly lineage himself, and was next in line for a chieftanship, and who often decried the chiefs to me, impugning their abilities, and calling them 'fool fellows' because they had not had the experiences that he had had."

"The chiefs assemble the people for public meetings whenever they wish to announce a new policy or some new event. Before the people are assembled, however, the chiefs meet alone to decide among themselves what actions or decisions are to be taken. And though the chiefs are ranked in a descending heirarchy, the decision is always arrived at by a concensus rather than by any one prevailing over the others. From the nature of their discussions, which we were always permitted to attend, it seems that a majority decision is not sufficient, so that they continue to discuss the matter until they can all agree on the course to be taken. At times this requires a long time. For example, Dr. Burrows and I asked Tom if we might rent a canoe for the duration of our stay. He said that he would speak to the chiefs, since a matter of that kind would require their consideration. The chiefs had a special meeting, requiring three hours to decide what objectively looked like a very simple matter. The decision, incidentally, was to give us a canoe for the duration of our stay, but with the stipulation that we confine our canoeing to the lagoon, lest we go into the ocean, and capsize, in which case the chiefs would feel 'very bad.' It is also of interest parenthetically, in terms of the Ifaluk emphasis on status, that after informing us of the chiefs' decision, Tom told us that when we return to America we should inform the people and the chief that the Ifalukians were very good to us, and had given us a canoe, and 'then, Ifaluk more high.'"

"After making their decisions and deciding on an agenda the chiefs let it be known that a public meeting will be held the next day, or in two days. On the morning of the designated day, the chiefs assemble in the canoe-house next to the Fanap, the public meeting house. (1)"

"1. The entire plot of land, holding the canoe-house and the fanap, is called Atelu, and quasi-sacred property, which belongs to the chiefs, and which people seldom frequent: The chiefs had us pitch our tent on this land."

28: Spiro--20-23 (1947-48) 1949 Woleaians-1-8
116, 623 Ifalik

"Taroman, the fifth ranking chief then announces the meeting by blowing on a conk shell, which hangs in the fanap, and is used only for that purpose. Time is relatively unimportant on Ifaluk, and the people show no great alacrity in assembling. A delay of one to two hours between the sounding of the conk and the assembling of the people is by no means unusual. When the people begin to assemble the chiefs enter the fanap, where they sit near the front pillar. (1) There are no [21] special seating places at these meetings, any one sitting where he chooses, some in the fanap, some along the sides or

---

"1. To stand in the presence of another is an insult, this being one of the first things an Ifaluk child is taught. Not even the chiefs will stand in the presence of the people, even when addressing them. The American Military Government officers respected this folkway, as did the anthropologists, which contrasted very favorably, in the eyes of the natives, with the Japanese practice of talking to the natives while standing on a table."

in front of it. The one invariable practice in seating arrangement, however, is the complete separation of the sexes, under no circumstances do men and women sit together.

Since there is little formality in Ifaluk, the meetings are conducted in a fairly haphazard manner, any one of the five chiefs making the opening speech. The chiefs, as we shall note later, are always informal and their behavior at the meetings is no exception some reclining or actually lying flat while the meeting is in progress.

Before noting the general features of these meetings, it might be well to describe some of the individual meetings in terms of subjects discussed as this will give not only the form of the meetings, but also the values with which the culture is concerned.

There were four meetings held during our seven month stay. The first was called on the occasion of our arrival, and we did not attend as we were in the midst of setting up camp. This was on July 29, and its purpose was to discuss our arrival, the manner in which people were to respond to us, and to appoint a boy to assist us in our camp, the latter being done on their own initiative, without a request from us.

The second meeting, on August 14, was occasioned by my mentioning to the men that other anthropologists were making studies of other islands. The chiefs informed the people that they were to follow implicitly the recommendations made by the Military

Government officers and the Navy doctors, about clearing the rubbish around their houses, and building over-water heads (1). Furthermore, they must cooperate with us, and do whatever we might request. There was little discussion by the people, but their response to the recommendations was immediate, for at the close of the meeting the men began to erect over-water heads, and the women were already cleaning their courtyards as I walked through the village. The admonition to cooperate with us had already been

---

"1. This is an example of navy unwarranted generalization. On Yap the natives defecate on the ground, with the result that Yap is plagued with diseases of all kinds. The Navy has encouraged the natives to build over-water heads to preclude the polluting of the ground, and thus preventing disease. When they arrived on Ifaluk, they assumed that the Ifaluk pattern was similar to Yap's, and suggested to the chiefs that over-water heads be erected. This suggestion, however, was entirely unnecessary since the Ifaluk natives almost invariably use the lagoon for their ablutions, abhoring the sight and smell of faeces."

practiced before the meeting had been called.

The next meeting was called on September 4, and it seems that I was indirectly responsible for its occasion. On September 2 our first (and last) station ship arrived, and after it left I informed the chiefs that the officers had commented on the cleanliness of the island (1), and had said that except for a few spots, Ifaluk was the neatest island they had seen. The chiefs were very pleased by this compliment, [22] and decided to call a meeting to instruct the people to better their efforts in cleanliness.

At this meeting, which lasted about one hour, Wolptau and Taroman, the first and fifth ranking chiefs, respectively, bore the lion's share of the talking, with Paluelimar, third in rank, making a minor contribution, and Maroligar and Wolpatitik not uttering a word. Both chiefs and people were very serious, the former speaking long, loudly and

---

"1. This was later born out by my own observations, for on our way home we visited most islands in the Yap district, and most of them revealed rubbish and litter strewn about, whereas Ifaluk was always tidy and neat."

impassionately. The people listened in silence, and the impression was that of a father admonishing his children. The chiefs began by telling the people that I had informed the officers that the village was always clean and neat, and that they would have to confirm this report in deed, by beginning a general cleanup. They then reported to the favorite theme of all meetings--the admonition not to engage in 'bad talk', and conversely, to speak only 'good talk.' This simple message was repeated by all three speakers numerous times, and in many variations.

Quite significant was the attention devoted to the women, for despite the fact that women shoulder most of the work, it was they who were told that they were not to be indolent, but must work, must prepare food and make lavalavs. The men, too, were warned to exercise greater diligence, but not to the same degree as the women.

The people remained silent throughout, neither questioning their chiefs nor addressing remarks to them. At the conclusion, Wolptau distributed tobacco and American cigarettes to all the people assembled. The distribution of tobacco is an invariable, unqualifiedly universal feature of Ifaluk social life, it being distributed after every political meeting, religious ceremony, communal work. It is to be noted, also, that the cigarettes that Commander Kenney, the Commanding officer on Yap, had given to the chiefs as personal gifts, were not kept by them, but were given to their people. This

distribution followed the pattern of all such distributions--the chief would call the name of each district, and any adult male would respond for his district, obtain the tobacco from the chiefs, and then pass it among his fellows--male and female alike. But the cigarettes, Wolptau distributed personally, and as he approached the women, who of course were seated apart from the men, he spoke to them, warning them not to defecate on the ground, but to retire to the lagoon, and if this were too difficult, they were to use a basket for this purpose and then dispose of the facaes in the lagoon. This speech, delivered with a broad grin on his face, evoked wide laughter, and when he repeated it the second time, the entire people burst into a spontaneous cheer. This little incident is very significant for an understanding of Ifaluk chieftanship, and gives real insight into the intimate relationship that obtains between chief and people. Some of the psychological implications of this relationship will be dealt with in another connection, but here I wish to point out the psychological meaninglessness of a bold ethnographic statement to the effect that a society is governed by a chief or chiefs, for this rubric covers a multiplicity of political realities from the formal, West African potentate to the informal, fatherlike person, just described.

It may be remarked here that the response of the people to the clean-up order was immediate. The following day, the entire population had retired to the bush to carry out their instructions.

The fourth and last public meeting we witnessed was held on October 23. The chiefs had been asking us when we expected the next ship, and we had told them that one should arrive any day, so they called this meeting to inform the people that a ship was due, and that they should prepare for its arrival by another clean-up. Again, as at the previous meeting, Maroligar and Wolpaitik, did no talking at all, Taroman doing most of the speaking, but joined by Wolptau and Paluelimar. Taroman began by warning the people to do no wrong, special emphasis being placed on stealing and lying. He warned the women in particular not to abscond with taro from another woman's taro patch. To be noted in this connection is the paradox of warning people [23] against a transgression of which they are never guilty, for, as we shall see, robbery or thievery never occurs in this culture.

When Taroman was finished, Wolptau took over. He told the men that should any of them go fishing they were to bring their catch to the chiefs for distribution so that the old and the sick would be provided for. This is the customary procedure, but Wolptau saw fit to remind the men of it, since some of the men had been violating this custom. This demonstrates how violations of custom are handled. No individual is rebuked, or singled out, but a general rule of conduct is enunciated, which apparently is sufficient to ensure conformity.

He then turned to the women, warning them against working in the taro patches while menstruating. Again we see the same method of dealing with violations of taboos. The taboo of not entering the taro patch, on supernatural punishment of crop extinction, is known to every one. His necessity of mentioning it at the meeting means that Wolptau had become aware of the violation of the taboo, and dealt with it by this general, admonition, rather than by reprimanding the individual culprit or culprits.

He then turned to the real reason for calling the meeting--he announced the pending arrival of the ship, and ordered the people to begin another general clean-up.

Paluelimar spoke at the conclusion of Wolptau's address. He announced that a dance was to be held in the near future, and that the young men should begin to prepare for it. (this was at our request, for we hadinformed the chiefs of our desire to witness a dance.). He repeated Wolptau's order about the clean-up, and then said that Dr. Burrows and I were to be treated as chiefs, that the people were to do whatever we asked of them, as we were concerned with their welfare.

At the completion of his speech, the chiefs again distributed tobacco, and the meeting broke up informally.

It is discernable from these sketches that the pattern of the meetings is the same in all. But aside from the similarities in the content of the meetings, there are also similarities in the formal aspects, that should be noted."

"Both men and women come to the meetings supplied with work-materials, which keeps them busy during the entire meeting. The men bring their coconut sennet, to be twisted into rope; and the women bring flowers, out of which they make leis, or banana bark fibres, which they make into thread. Throughout the meeting, men and women are busily engaged in their work. The chiefs, too, bring their sennet, and continue to make their rope, even when addressing the people. Though this occured at all the meetings, it was not until the last one that this procedure presented itself to me as a problem. If the people were very diligent and frugal with their time, one could understand this practice without difficulty. But the fact is, as we shall see, the people can, and do, sit around for an entire day, without engaging in a single productive activity. Why, then, this burst of industry at the meetings? When I queried him on this point, Tom answered that a man would be ashamed if he were to be seen just sitting at the meeting without doing anything, for it was not right to be seen doing nothing. In other words, the fact thay they loaf at other times is not important, but at a public meeting no one wishes to be accused of indolence. And yet, plausible, as this interpretation might be on the surface, it is far from satisfying. Why is a man ashamed to be seen without work at a meeting, but not at any other time? Surely, just the opposite should be true. The meetings are very important, and as such, should they not hold the people's undivided attention? At this point we can only indicate the problem, but we shall take it up again when we consider the psychological correlates of Ifaluk culture."

"Another fairly constant factor at the meetings is the contrast between the attitudes of the older and younger people. Whereas the former take the meetings very seriously, with one exception--that of the priest--doctor--the younger men seemed little interested in the proceedings. For example, at one of the meetings, the young men were very slow in arriving, and did not sit in or around the fanap, but sat in the canoe house quite a distance from the fanap. Taroman rebuked them for this, and ordered them into the fanap, and they were quite slow in obeying his directions."

116, 623 Ifalik

"Like everything else in Ifaluk, the meetings have little, if any, plan. The chiefs may decide to call a meeting a week in advance of its actual occurence, but they make no attempt to plan a definite agenda, or decide who is to speak. It seems that they speak whatever comes to mind, are prodded by the other chiefs, while speaking, frequently turn to the other chiefs for suggestions, and often debate among themselves as to whom is to do the talking, each one passing the buck to the others."

"The speeches of the chiefs shows a definite pattern of delivery. They talk for a certain time, and then lapse into complete silence for an extended period, the only sound being the swishing of the coconut fibre that the men are making into rope. This interval of silence, theoretically, gives the people an opportunity to express themselves, or to take issue with the chiefs if they desire. I say, theoretically, because at none of the meetings we attended did any one make use of this opportunity."

(1947-48) 1949

"As I have pointed out above, informality characterizes the relationship between chiefs and people, there being no overt symbol that might distinguish one from the other to a stranger. The chiefs assume the same economic obligations that the other men have. They participate in communal clean-ups, fishing expeditions, building repairs, and all other work, working with the other men, with no special dispensations of any kind.

Socially, they receive no special recognitions. They are addressed by name, as any other man. When sitting in the canoe-house they occupy no special seat of honor, nor is their arrival or departure signaled by special courtesy. In conversation their opinions are given no greater weight than those of a commoner.' Nor are they treated with any special respect or deference. For example, Dr. Burrows administered anti-dysentary shots to five men when we first arrived, for a period of five days, one of the men being Wolptau. On some days, the men would come at least an hour after the arrival of Wolptau (he was on time, they were late), and he waited till the others came; he not complaining, they not apologizing for having kept him waiting.

Nor do the chiefs attempt to keep themselves aloof from the people. This cameraderie is carried to the extent of Maroligar, the second ranking chief, playing cards with the young men and small boys, and being kidded for making a foolish move.

But despite this informality, when they function ex cathedra, their word is law, and

obedience is immediate. When they sit in the canoe-house adjacent to the fanap, conducting a meeting, no one will enter uninvited, or else will enter through the rear, so as not to intrude upon them in an obtrusive fashion. Furthermore, the entire plot of ground, Atelu, referred to above, is the property of the chiefs, and symolizes the chiefly office (or the government, to use an abstraction foreign to native modes of thinking), so that the village path that traverses the island skirts this section, and unless a person is going to Atelu itself, he will take this circumscribed route. Furthermore, when a person passes Atelu, he pays his respect by bending his entire trunk his hands clasped behind his back. This motor behavior becomes entirely automatic, as it is already inculcated even in the very young children.

The chiefs, also, receive special seats of honor at all religious ceremonies, and no ceremony begins in their absence. Furthermore, mourning at the death of a chief [25] is more extensive than for that of a commoner. On the other hand, as far as I could determine, no special rite commemorates a chief's taking office. His successor merely assumes his responsibilities, and begins to function with no ceremony of coronation."

28: Spiro--25

Woleaians-12
Ifalik

"The material benefits accruing to the chiefs are minimal. There are informal benefits, of course. After a fishing haul, the chiefs will usually receive the largest fish, though even this is not an invariable proceedure. Of course, visiting travelers often bring gifts for the chiefs, and under both American and Japanese rule the chiefs receive special gifts of cigarettes or paint.

But as far as I could ascertain there are only two institutionalized material rewards. (17)

The first of these benefits is the peremptory right to all turtles. When a person catches a turtle, it is brought to the Fanewang, the canoe-house belonging to the Uelepi lineage, from which stems the first-ranking chiefs, and there it is butchered by the chief, and becomes the sole possession of Uelepi. He distributes some amongst the other chiefs, and to other commoners if he desires.

"17. This, despite the fact that theoretically, as we shall see later, all property is owned by the chiefs, and as such, they could levy any duty or tribute they desired."

The only tribute, or taxes, they receive, is the annual gift of breadfruit and toddy that is presented to the second-ranking chief, of the Somat lineage. He is the chief of the district of Felarik, and twice a year, in the rainy and dry seasons respectively, the men of Felarik bring him en masse bottles of toddy. However this is really a symbolic recognition of his authority, rather than a payment or a levy, because after receiving the toddy, he then redistributes it among the men, retaining very little for himself. I did not witness the offering of breadfruit since it did not occur during our stay, and I omitted to inquire whether it, too, is redistributed, but my guess would be that it is. Thus, even this formal, institutionalized, tribute does not remain in the chief's treasury, but reverts to the people. This redistribution, should be kept in mind for our later discussions, because this role of the chiefs as the givers or redistributors of food and tobacco plays a significant role in Ifaluk culture, having important psychological significance."

28: Spiro--25 [2] (1947-48) 1949 Woleaians
116, 622, 554, 157 Ifalik

"The most important function served by the chiefs we may conclude, is that of cultural or ethical fathers. It is to the chiefs that the people look for the source of their basic values and for their sanctions and validations. The chiefs, recognize this role, and behave towards their people in a paternal manner. This interpretation comes out very beautifully in the following incidental statement by Tom. I had been collecting folklore from the chiefs, and after finishing the mythology, they told me some stories about some 'fool fellows', Ifalukians, who had responded to certain situations in a very foolish manner. The chiefs told me that I was to keep these stories secret, since the people did not know them, and they preferred that they not be told. I asked them the reason for this secrecy, and they answered that the people would laugh at these foolish acts, and would be ashamed that their own people had committed such stupidities. Tom then added that the chiefs would not laugh or be ashamed, since they are 'all same pappa this place,' and thus would treat them as a parent might treat some ontoward act of his child."

"Ifaluk social organization is simple, compared to other Pacific peoples. The two islands of Felarik and Falalap have eight matrilineal and strictly exogamous clans, (ailang). The clans are not localized, and vary considerably in numerical strength, as is shown in the following table.

District	Kovalu	Sauvelarik	Mangau Ievar	Rape velu	Sauwel	Kailan gailuk	Bwol	Kailangai luelea	Total
Felarik	4	8	21	0	8	10	0	0	51
Rauau	29	17	11	13	16	13	0	0	99
Falalap	19	23	24	6	4	2	13	3	94
Totals	52	48	56	19	28	25	13	3	224

The origin of the clans is accounted for by the same two traditions mentioned in connection with the origin of chieftanship. One tradition has it that these clans constituted the original colonizers from Yap. The other maintains that the clans were instituted by Autran when she created the people on Ifaluk."

28: Spiro--26 [2] (1947-48) 1949 Woleaians
116, 621, 582, 835 Ifalik

"When a native is asked for the purpose of the clan, his answer is, to control marriage. One may not marry a member of one's own clan. This taboo on clan endogamous marriage is very stringent, and the complete geneologies reveal no case of its violation. However, a very interesting problem arises in this connection that unfortunately, I did not investigate. Theoretically, the clan controls not only marriage, but all sexual relationships, it being taboo for a person to have sexual relations within his own clan. Yet, my conversations with the young men, of whom at least two were sexually active, revealed that, with the exception of one person, they were ignorant of their clan affiliations. That is, they were all very aware of the existence of the clans, and they also knew of the exogamous rule, but they did not know to which clan they belonged. Neither their parents nor any one else had informed them of their clan memberships, and the one person who did possess this information, discovered it by sheer accident. When the question was posed to them, they were all eager to know their clan affiliations, and asked me to tell them, but none had spontaneously asked their parents for this information, saying that their parents would tell them when they were about to be married, and if they will have chosen a woman within their clan, they would have to forfeit their claim to her. This implies, of course, that these young men take sweethearts from within their clan with impunity. Thus, it would seem to appear that clan exogamy is concerned wholly with the cultural phenomenon of marriage, rather than with the biological fact of intercourse."

28: Spiro--26 [3] (1947-48) 1949 Woleaians
~~116~~, 621, 574, 431 Ifalik

"Besides the control of marriage, the clans possess only one other important function--the channeling of hospitality, in inter-island relationships. That is, a native visiting another island will resort to a member of his own clan for food, housing, and trade. This trade is really gift exchange, for the natives do not use money, nor do they barter, in the sense of exchanging value for equal value. The visiting native will bring gifts, and will receive some gift in return. The term gift, is used advisedly because that is how the natives conceptualise this exchange."

28: Spiro--26-27 (1947-48) 1949 Woleaians
116, 601, 596 Ifalik

"All members of a clan view themselves as relatives, but though their kinship terminology is classificatory, the kin terms do not extend to the entire clan, but are restricted in use, as we shall see.

Intermediate between the clan and the lineage, in size, is the extended [27] family (airo) which serves no particular function, nor is it clearly conceptualised in native thought. The airo is a bilateral, not a unilateral kin grouping as the clan and the lineage are, including relatives in both the mother's and father's lines. It is merely a classificatory term, used much as the term family, is used in our own culture to designate certain individuals, who are related in both the maternal and paternal line."

28: Spiro--27 (1947-48) 1949 Woleaians
116, 596 Ifalik

"To say that the airo serves no function, is not strictly accurate. It serves no institutionaled [sic] function, but there are patterns of interaction of a purely informal nature that characterize the relationships of airo members. For example, though the natives are very generous with food, to the extent that any person in the vicinity of another house will be asked to partake of available food, an airo member will be treated even more generously, and often will be offered food to take home with him. Furthermore, a man constructing a canoe can anticipate the assistance of his airo member, not because this assistance is mandatory, but again, because of the closer degree of intimacy existing between them."

(1947-48) 1949

Woleaians-1 -3
Ifalik

"The existence of the airo indicates that Ifaluk kinship system is not entirely unilateral, or conversely, from a unilateral to a bilateral system. This, of course, is conjecture, and without historical evidence, cannot be documented. We can conclude, however, that the Ifaluk system is intermediate between the two extremes. . .This is demonstrated much more convincingly by marriage regulations. As pointed out above, clan exogamy is strict and universal, but clan endogamy does not exhaust the category of tabooed spouses. For aside from the parent-child taboo (which, of course, in the case of father--daughter is not a function of clan exogamy), a person may not marry a member of his airo. Though the natives do not express this taboo in these terms, as they do in the case of the clans, they do point out that a man may not marry either his father's sisters' children, or his father's brothers' children, neither of whom are clan members, but an airo. This inclusion of the airo members within the cultural definition of incest finds expression in other forms of sexual avoidance taboos. Though sexual references in conversation are taboo in mixed company, they are permitted in the presence of children. Tom, for example, would often joke sexually with the young girls, but never with a child in his airo, since they are 'all same my boy.' After administering a Rorschach to the daughter of his brother, I told him to tell her that she had a 'very fine stomach and a very fine head', and that when she had children they would too. He smiled, praised her 'stomach' and

'head', but did not repeat the prediction about her children. When I asked him, he explained that since she was his brother's, she was like his own children with whom he could not discuss sexual matters."

28: Spiro--27 [3] (1947-48) 1949 Woleaians
116, 596, 601 Ifalik

"This importance of airo is also displayed in kinship terminology, in which the father's brothers have the same term as the father, my father's sisters have the same term as my mother, and the children of my father's sisters father's brothers, and mother's brothers all have the same nomenclature as my own siblings and mother's sisters' children, who are of the same lineage and clan."

28: Spiro--27-28 (1947-48) 1949 Woleaians
116, 613 Ifalik

"More important than either the clan or the airo is the matrilineal lineage, known alternatively as Lebwutae ('my place'), or as Bwotae or Aramatae ('my people'), according to whether the reference is to the homestead or to the people. The lineage, by definition, includes a matrilineal descent group that is related by descent from one woman. Now, since marriage is matrilocal, with some exceptions, and since every homestead is named, this group is well defined. It includes all persons born of the women of a particular homestead, say that of Uelepi. When a man says that he is going to his 'Lebwutae', or that he does not commit some act because he would be shamed by his 'Aramatae', he refers, not to the house in which he lives, but to his maternal home, his matrilineal lineage. [28]

The clan, as we have seen, is not localized, persons from any clan living in all districts. Given the existence of matrilocality, the lineage is not localised either, but it does enjoy a certain localization, in that all the women of the lineage, as well as the unmarried males, inhabit the homestead, and the men, though scattered, do have a focal, geographic, point of reference, in that the homestead in which they were born, remains in the lineage in perpetuity, and thus serves as an integrating factor, in spacial terms. Thus, though my aramatae are scattered, my lebwutae remains fixed."

(1947-48) 1949

1-3

Wolcaians
Ifalik

"Reflection, as well as empirical evidence, reveals the relative instability of the lineage, as compared to the clan. The eight clans are fixed, and cannot be increased in number, though they can be decreased by the extinction of one or more clans. This seems to be the future fate of Kailangailuela, of which there are but three members, two of whom are women past their menopause. Normally, however, clan extinction is rare.

The number of lineages, on the other hand, may increase or decrease. Decrease, a priori, is more frequent in lineages than in clans, because of the small number of persons within any lineage. It seems, however, that the greater proportion of change in the number of lineages is by increase, which results from the setting up of new households. For a number of reasons, a person may break off from a household and construct a new house. At first this house is viewed as an extension of the parental homestead. After a time, however, this house assumes a special name, though it still looks to the original home as its source. But after the elapse of a few generations, this 'splinter group' becomes a homestead in its own right, and thereby becomes a new lineage group as well.

For example, Nesangogara married Taroman, and did not remain in her lineage house, but set up a new household, known as Warigin. Now, Warigin is actually in the lineage property of Taroman's lineage, Valevelu, but this new house now has its own name, the married daughters and their children live with their parents, and a new lineage has unquestionably been created."

"The lineage is the most important group in Ifaluk. It regulates property, its members cooperate in economic functions, and it is a recognized religious grouping. These functions of the lineage will be dealt with under these separate categories.

The attachment of the person to his lineage and its house and district is revealed not only in terms of personal feelings, but in certain important activities. The men do most of their work and gossiping in the canoe-houses. Should a man marry a woman from another district, he usually returns daily to the canoe-house of his own district, not the one in whose district he is now living. In fishing expeditions, which are undertaken by districts, a man often fishes with the men of his lineage district rather than with those with whom he is at present living. Finally, in the dances, the men dance with men of their lineage district. This constant return to their own district indicates that the men feel a greater sense of affinity with the people with whom they were raised, but it also indicates the attachment to the lineage house in which he spent his formative years."

28: Spiro--28 [3] (1947-48) 1949 Woleaians
116, 592 Ifalik

"Smaller than the lineage, though in part comprising it, is the household, for which there seems to be no native name. The household lives in the lineage house, and is an extended family, which includes the elder woman or women of the lineage (sisters), their husbands, unmarried sons and daughters, married daughters, the latters' husbands and children. Thus, all but the men who have married in, are members of the lineage. The household is the basic economic unit in the Ifaluk social structure, for despite other economic functions or obligations that the members of the household may have elsewhere, the household is the basic production and consumption unit, as we shall see when we discuss the economic organization."

"The Ifaluk kinship system is classificatory, though as noted above its terms are not as inclusive as are those in other types of classificatory systems. It should also be remembered that the kinship terms are terms of reference, rather than of address. Every individual is addressed by his proper name, including parents. The following kinship terms are given in the first person possessive singular. Ego's generation: Bwiz-iwis, refers to my biological siblings, of the same sex, and Mongyal to my biological siblings of opposite sex, as well as my mother's sister's children, mother's brothers' children, and father's sisters' and brothers' children. Again it may be pointed out here that only the mother's sisters children are ego's lineage and clan members, yet the same term applies to the other categories mentioned here; showing the impprtance of the airo. First ascending generation: Silei, refers to my mother, my mother's sisters, and my father's sisters. The same comment made for Bwizinis applies equally here."

"Tamae, refers to my father my father's brothers, and my mother's sisters' husbands. Malelapae, refers to my mother's brothers, and is the only non-classificatory term. Second ascending generation: Sinisin, refers to any one my mother calls, mother. This technique of reduplication extends to any ascending generation, for example, Sinisinisin, Sinisinisinisin, referring to the third and forth ascending generations, respectively. Literally, of course, these terms translate, my mother's mother, my mother's mother's mother, etc. The same principle applies for the other grandparents, and I shall not repeat this example in the other cases, having mentioned it here.

Sinitamae, refers to any one whom my father calls, mother.

Temaesin, refers to any one whom my mother calls father.

Temaetemae, refers to any one whom my father calls, father.

First descending generation: Lau, refers to my children, my brothers' children, and my wife's sisters' children.

Fatuei, refers to my sisters' children. It is the complement of Malelapae, and like it, obviously, is not classificatory. Second descending generation: Launau, refers to all the children of the people whom I call son or daughter. As in the reduplication noted above, this can be expanded indefinitely to cover as many generations as necessary."

116, 601 Ifalik

"This grouping together of a number of relatives under the same nomenclature does not imply at all, that the natives do not distinguish between them. This distinction is most emphatically made, between the biological mother, say, or sister, and the classificatory mother or sister. When a person refers to his father or mother in conversation, he invariably means biological father or mother, unless he specifically designates the classificatory relative. Even the very young children are accustomed to make this distinction. For example, when I administered the children's drawings I would ask the names of their parents and of their siblings. They invariably gave the names of their biological parents and siblings, except in the case of adopted children, in which there was no consistency, some naming them as siblings, and some not."

"Though parents and children distinguish between biological and classificatory children and parents, it is true that the relationship between these relatives is closer than the relationship between 'strangers.' This is to be expected given the [30] existence of multiple family dwellings, where all adults function as parents to all the children. A woman treats her sisters' children with as much care and love as she will her own, though there is little question that the degree of love and intimacy that obtains [sic] between biological parent and child is greater than that between persons so classified culturally. As in our own culture, I think it fair to say that if a complete stranger were to enter an Ifaluk house, and observe the interpersonal relationships, it would take him little time to distinguish the individual family units within the extended family household."

"An interesting problem arises with respect to the mother's brother. This relationship also seems to indicate the intermediate position of the Ifaluk social organization, without indicating whether or not it is in a transitional stage. That is, we have a matrilineal clan in which the mother's brother and the child belong to the same clan, whereas the father belongs to a different clan from his children. Furthermore, the father is classified with the father's brothers and the mother's sisters' husbands, the latter of which are fairly remote relatives, whereas the mother's brother is given an entirely different term, unique and unclassified. Yet, the avunculate does not exist here, though there are certain forms of interaction that are reminiscent of the avunculate, which in the light of our question concerning a transition in kinship system, may be 'survivials' from a full blown system."

28: Spiro--30 [2]

"In the first place, every homestead, which is really every lineage, has its tamon, its household chief, who is the eldest male of the house. Though descent is matrilineal, it is this eldest male, not female, who is the titular head of the lineage, who manages its property, settles intramural disputes, if any should arise, and in general is the overseer of its welfare. His visits to his Lebwutae, his parental home, is frequent, since his toddy is collected from the coconut trees which he inherits from his mother's grove, and he collects his toddy twice a day, so that he usually visits his homestead at least once, if not twice, a day. This frequenting of lineage house, that is, of his sisters and their children, is also characteristic of the other men of the lineage, for they, too, return to the district of their parental home to collect their toddy. And though, it is only the eldest male who is known as tamon, the others have an influence and an intimacy of relationship in the household that strangers do not have."

"But the intimacy of relationship consists of more than daily visit. There are certain mutual obligations, that obtain between brother and sister, which are not rigidly institutionalized, but which function as if they were. A man's sister, for example, prepares food and lavalavas for her brother. That is, when she prepares taro, say, she will bring a dish to her brother, or will offer it to him when he visits the lineage house. Of course, this practice is related to the rules of inheritance, because the taro patches are held in perpetuity in the lineage, but the women work the patches and prepare and consume the taro in their homes, that is, the matrilineal homestead. Legally, however, it is apparent that the men have as much preemtive right in the taro as the women, and the sister's preparation of food for her brother, therefore, is, from this point of view, an indication of that right. However, it involves more than this legal obligation, because this would only entail the offering of the raw taro, and not the cooking or preparation.

The sister also makes lavalavas for her brother. These are not for his wife's consumption, but are used by him as gifts to be presented to his clan members when he visits other islands.

In return the brother will bring gifts of fish to his sister, if he goes fishing by himself, and will bring her presents upon returning from a visit to another atoll.

The great intimacy of brother and sister is also revealed in case of illness. [31] It

is the sister who is most attentive to the needs of her sick brother. If his illness lingers on he returns to his lineage house, where his sisters care for him, devoting as much time and care as his wife.

This relationship, it is apparent, is far from the reciprocity that characterizes Trobrian society, for example, and the same is true of the relationship between the man and his sister's children. The real influence in the child's life, despite their different clan and lineage affiliations is his father, and his mother's sisters' husbands, and the role of the mother's brother is minimal, though not entirely absent, for the latter does assume certain economic responsibilities for him. A young man, constructing a canoe can expect to receive the assistance of his mother's brother, and conversely a man can expect the same assistance from his sister's son. But this reciprocity is not uniquely characteristic of these relatives, for a man expects and receives the same cooperation from his sister's husband, his wife's brother, his father, and his own sons.

The same is true of certain avoidance relationships between these groups of relatives. For example, it is strictly taboo to mention any sexual term, even indirectly, in the presence of one's sister's children. But this same taboo applies to your own children, as well as to your brother's children."

28: Spiro--31 (1947-48) 1949 Woleaians-1-2
116, 597 Ifalik

"An obtrusive, but integral part of the entire fabric of kinship, one that is well-nigh universal in the Pacific, is the institution of adoption. (aevan) The incidence of adoption is fairly high, there being 32 aevams in Ifaluk, out of 81 children. There are basically two reasons for adoption. If the couple is childless, they wish to have a baby, because 'only they chow.' That is, being without children, they eat their meals alone, which is to say, they are lonesome. Secondly, a couple with only one child may desire a child of another sex, a girl to work the taro patch, a boy to do the men's work. If they decide to adopt a child they go to a pregnant woman of either the husband's or wife's clan, never to a non-clan member, and inform her that they would like to adopt her baby. If the woman has no other children, she may refuse the request, but if she has children, she does not, because 'all people and chief very angry at her,' though she may not be compelled to part from her child. However, the natives know of no cases of refusal, for the woman always cooperates, as she says, 'I give to you, bout (because) I am very very sorry to you.' The adopting parents give no gift or any symbolic offering to the parents of the child.

The mother of the infant, of course, feeds it. When she leaves the birth-hut, she is accompanied by the foster-mother, who spends much time in the home of her adopted

son. At the end of the three month period, during which time the mother and infant are confined to the house, the baby is taken to the home of its foster parents by its mother, both returning home in the evening. When the infant can walk it remains permanently in the home of its foster parents."

"The aevam is treated as one's own child and the patterns of interaction, both formal and informal are identical for him as for a biological child. The child, however, is by no means abandoned by its real parents, the relationship being a close one in both cases. Since the atoll is small, it is possible for an adopted child to see its real parents daily. Actually, then, adoption means that the child has four parents, instead of two, and two houses instead of one. Talimedja, for example, joked about his having two families, so that if he were hungry he could eat in either house, if he were dissatisfied with the fare in one. The same is true of other activities. The aevam may sleep in either house, may expect to receive shelter, protection, security from either one. [32]

This dual interactional pattern applies to his entire life. He belongs to two kinship groups, his 'natural' one and his foster one. This means that he has not only the incest taboos of his biological siblings, but also those of his foster siblings. Despite his belonging to two kin groups, he inherits only from his natural group, not his foster group."

28: Spiro--32 (1947-48) 1949 Woleaians 1-2
116, 597 Ifalik

"Though the cultural or institutionalised pattern of interaction between aevam and foster duplicates that of biological child-parent, the quality of the relationship displays variations. Some foster children are much more intimate with their foster parents than with their biological parents. But, on the other hand, there are instances in which the converse is true. Talimedja, a boy in his middle teens, almost always referred to his biological mother when he spoke of his mother. When I asked him to take me to his home, he took me to the home of his biological mother. On the other hand, Morolivok, a boy in his late teens, always referred to his foster parents as his parents, and he and his foster brother were inseparable. But Tom, who is his foster-father, definitely makes a distinction between him and his biological son, Alemwal. When Tom speaks of 'my son', he invariably means Alemwal. This distinction comes out in behavior as well. When I administered a battery of tests to Morolivok, Tom asked him to sit on the ground besides us. When Alemwal came to take the tests, Tom insisted that he sit with us on the mat. These subtle manifestations, I am sure, are unintentional, and unconscious, and if he were asked, Tom would say that he loved both sons equally."

28: Spiro--32 [2] (1947-48) 1949 Woleaians
116, 575, 561 Ifalik

"There are no sodalities in Ifaluk, no groupings of a voluntary nature, that is. Professional, secret, or religious societies do not exist. Neither are there age grades. It is true that there are five categories into which all ages are classified, but they are highly nebulous and fluid, and are, by no means, organized into groups with definite social responsibilities and privileges."

28: Spiro--33 (1947-48) 1949 Woleaians-12
116, 462 Ifalik

"The Ifaluk economy does not fit into any of the classical 'stages,' at least not in a pure form, for this is a fishing-agricultural society, both aspects being of equal importance. However, as one might expect in a population of 250 people, there is no division of labor, though there is specialization. This statement, however must be qualified for there is a sexual division of labor, though the division is not a sharp one, except in one or two matters. Nor is the labor of one sex taboo to the other, or provoke a shame-reaction on the part of one performing the economic function of the opposite sex. For example, women do engage in reef fishing at low tide, though this is normally men's work, and men will assist their wives in the taro patches, though this is women's work. Furthermore, in heavy construction work the men do not scruple to call upon the assistance of the women at certain stages in the work. By and large, however, sexual division of labor is defined, each sex making its own unique contribution to the productive aspect of the economy. This dual division is indispensable to the maintenance of any household, for each household is a self-sufficient economic unit, so that the dereliction of either sex with respect to his productive role, would result in economic collapse. It is little wonder that economic proficiency is one of the first criteria demanded of a prospective spouse.

The men are responsible for all construction work-canoes, houses, canoe-houses--

the manufacture of rope, seines, fish-traps; the tending of the breadfruit and coconut trees, as well as the planting of coconut sprouts, collection of toddy, and the picking of coconuts, and fishing. The women are responsible for the cooking; the weaving of skirts and loin cloths; the manufacture of thatch, mats, baskets, and canoe-sails; the preparation of sennet for the making of rope and the planting and care of the taro patches.

Both men and women are responsible for private and public cleaning. Since Dr. Burrows has made a special study of Ifaluk technology, my discussion of the productive process will neglect this aspect, except where necessary for clarity, and will be concerned primarily with the cultural or institutional character of these activites."

28: Spiro--33 [2] (1947-48) 1949 Woleaians 2-3
116, 476, 156 Ifalik

"The first thing that strikes the observer about Ifaluk production is its cooperative nature, this being true not only in the manufacture of objects which are obviously for public consumption, but even for those which are for private use, and which are owned privately. Furthermore, even those activities whose very nature requires individual effort, are performed not in private, but in the company of others, each person doing the same work. Gregariousness is characteristic of this society, and has important psychological implications, since it is a compulsive gregariousness stemming from a deep-seated need to be with people, to avoid isolation."

28: Spiro--33 [3] (1947-48) 1949 Woleaians
116, 462, 283, 556 Ifalik

"The one ubiquitous activity engaged in by the men is the making of rope. Rope is indispensable for it is the universal fastener. In the absence of nails every object that requires the adhesion of parts requires the use of rope. But rope has other uses as well. One of the important objects used in Ifaluk's inter-atoll trade is rope. Rope forms part of the tribute that Ifaluk pays to Yap. And finally, when a person dies, his corpse is wrapped in an almost fantastically copius amount of rope. Rope, functions both as a crucial element in the subsistence economy, as well as an important factor in the prestige economy, since it is a sign of wealth. A man with little rope is looked down upon. Every man, then, desires to accumulate as much rope as possible, and spends the major part of his productive energies in its manufacture."

28: Spiro--33-34 (1947-48) 1949 Woleaians
116, 592, 345, 283 Ifalik

"Rope is made in the canoe-houses, these most important social and economic structures. Objectively viewed, there is little, if any reason, why the canoe-house should be the locale of its manufacture. It would be just as convenient to manufacture it in the home, except that there seems to be an aversion for doing any work in the house. For that matter the house is actually used for sleeping and conversational purposes only, since the cooking is done in the malum, and the people eat [34] outside, except in the case of rain. So that despite the desire for rope, a man will never make it in his house, though his evenings could very well be taken up by its manufacture. There is no taboo on the performance of economic activity in the house; it just is not so used."

"A factor of major importance in the use of the canoe-house for the manufacture of rope is its function as a social as well as economic center. Since the destruction of the men's club houses in the last typhoon the canoe-houses have taken over their function, so that the men now congregate in the canoe-houses as formerly they congregated in the club-houses. Now this fact is important for an understanding of Ifaluk culture. Though there is a word for work in the Ifaluk vocabulary (engan), it refers to discrete and specific forms of labor, and is not used as a generic term, as it is in our own culture, as when a man says he is 'going to work.' No one has his special work to perform each day, from which he rests at the end of the day or the end of the week. So, too, there is neither a term nor a concept corresponding to our word economics. Our conceptualization of life activities into economic, social, recreational, etc, does not hold for the Ifaluk. This means that the various kinds of work (engan) that are performed are recognised as responses to certain basic survival needs, but the concept of work as vocation or as moral career that this term has assumed in western society, at least in its Puritan and Calvinist tradition, is completely foreign to the natives, and indeed would be inexplicable to them. Theoretical considerations aside, this means that a man's day is his own, to do with what he desires, and among the activities he engages in, are certain activities of economic importance. A man goes to his club-house in the morning

because there he will be with the other men, where he can discuss the events of the day, engage someone in a conversation, and at the same time, make rope, if he so desires. But there is nothing compulsive about his rope-making, or for that matter, about any economic activity. There is no concept of an economic obligation, 'this ought to be done', except insofar as it relates to basic biological needs, and then 'ought' has no place at all, for it is obvious that if a man wishes to eat, he must fish etc."

28: Spiro--34 [2] (1947-48) 1949 Woleaians
116, 283 Ifalik

"The manufacture of rope is simple, (1) and readily lends itself to conversation and conviviality. Rope is made from the coconut sennet. The coconut husk is allowed to seep in stagnant ponds--this is the women's task--until the fibres are loose, after which the women take it from the pond, separate the fibres, beat them soft with a wooden board, remove dirt and other grime, and then let them dry in the sun. The men store the sennet in baskets, until such time as they wish to use it. They manufacture the rope, by twisting the individual fibres, which they draw with great agility from a bunch held in the crook of their thigh and leg, while sitting, into cord, twisting it on the thigh. This is the basic process from which ropes of any size can be made, from thin cord, to very thick rope that could well be used as mooring rope, on a ship. The completed rope is either taken home, where it hangs from the rafters of the house, or is allowed to remain in the canoe-house, each man having his own peg, with the assurance that no one will abscond with it."

"1. Simple, if you know how. I tried a number of times, but with little success, for the twisting of the fibres requires an agility, and a motor set, that only comes from practice."

28: Spiro--34-35

Ifalik

"Like the making of rope, the collection of toddy is, intrinsically, an individual process--only one man can climb a tree at one time. Yet this, too is done in a semi-communal fashion. The toddy is collected twice a day, and is collected at fairly regular times, so that a number of young men within a district collect their toddy [35] simultaneously, proceeding together to their individual groves, and returning together. This practice is even more marked in the afternoon than in the morning, so that we facetiously referred to this spectacle as the 'toddy parade', because the sight of eight or ten men walking single or double file through the village, was reminiscent of an American parade."

28: Spiro--35
116, 476

(1947-48) 1949

Woleaians
Ifalik

"The tending of the trees is the only individual phenomenon in the economy. The men gather the coconut sprouts in rows in their groves, and at certain seasons of the year, plant them. The trimming of the coconut trees is performed when they climb a tree to collect toddy or coconuts, and the picking of the breadfruit is determined by the desire for it.

The other forms of work except for canoes and houses are genuinely cooperative, in that the commencement of the work is decided by the chiefs, is performed by the men, each with a special task directed towards the common end, and the products of their labor are shared equally."

28: Spiro--35 [2]
116, 358, 476, 462

(1947-48) 1949

Woleaians
Ifalik

"If a canoe-house needs repair, the chief of the district will inform the men, and on the scheduled day, they will assemble for the task. If it is a relatively minor task, only the men of the district will cooperate in the work, but if it is a major one, all the men of the island will assist, and at times, many from the other island will participate. In other public works, the thatching of a roof, or the clearing of the bush, the women assist as well, and where women participate there is a complete separation of the sexes, the men confined to one section, the women to another."

28: Spiro--35 [3]
116, 462, 342, 476

(1947-48) 1949

Woleaians
Ifalik

"If a roof is to be thatched, it is the task of the men to cut off the coconut branches from which the thatch is to be made. Both men and women bring the branches to the canoe-house, and then the women weave the branches into thatch, after which the men climb onto the roofs to do the thatching. Here, too, there is a division of labor according to age, for generally speaking, it is the younger men who climb the roof to put on the thatch, while the older men stand below and pass the thatch to those standing on the roof."

28: Spiro--35 [4]
116, 462, 476, 358

(1947-48) 1949

Woleaians
Ifalik

"The participation of the women is not always restricted to the lighter work. Where man-power is required, as in the raising of the entire frame of the canoe-house, which is accomplished by a complicated lever principle, the women work with the men in pulling and straining on the ropes which lift the frame."

28: Spiro--35 [5] (1947-48) 1949 Woleaians
116, 462, 476, 351 Ifalik

"In public clearing the men and women work separately, though there is little division of labor except that the women seem to bear the brunt of the labor. The entire population of a district, including the young children, clean the wooded sections of the island immediately behind the village, or the cleared ground in the area of the canoe-houses. The actual interior of the island, of course, is not cleaned or cleared. In this work the people work in small groups, some clearing up, some digging pits for the disposal of the refuse, others carrying the brush to the sea, where it is burned on the beach or allowed to float away. The women and men work separately, each small work-gang, being comprised of one sex only. As mentioned above the women seem to bear the brunt of the work, for they have the arduous job of digging the pits and of doing the hand weeding, while the men worked on the heavier grasses, with their long knives. Furthermore, the men complete their work much earlier than the women, returning to their homes, while leaving the women to do the final odds and ends."

28: Spiro--35-36 (1947-48) 1949 Woleaians
116, 476, 527 Ifalik

"There are a number of institutional, as well as non-institutional characteristics of these communal undertakings. All are completed with a feast, prepared by the women, at which the men sit about in small groups by the structure on which they had been working. Furthermore, when the men assemble for their work, they bring coconuts which are deposited in a common store, it becoming the sole function of certain [36] of the men to husk them. At the completion of the work, the chiefs distribute the coconuts among the men who receive them with great pleasure. This distribution of food, at other times of tobacco at communal gatherings raises a perplexing problem: Why should coconuts or tobacco, which all people possess in abundance, be distributed by the chiefs at the completion of these affairs, and why should a handful of tobacco or 4 coconuts be received with such obvious pleasure by the people, particularly when as in this case, they bring the coconuts themselves, and they are now merely being redistributed? We shall have occasion to discuss this point in some detail in our chapter on psychology."

28: Spiro--36

(1947-48) 1949

Woleaians-1-2
Ifalik

"When doing major construction work, there are a number of taboos and rites which are practiced. Food is taboo until the completion of the job, so that the meal is very welcome when it comes. If the job requires more than a day for its completion food may be eaten only at the end of the day's work, and then the men must resume their fast until the completion of the next day's work. (2) Women and children are not permitted near the canoe-house during these major operations, and those living adjacent to it must

---

"2. This fasting illustrates, I believe the psychology of all sacrifice--fasting of course being a sacrifice, the sacrifice of food. You sacrifice a lesser good in order to obtain a greater good. Conversely, you accept a lesser evil in order to avoid a greater evil. In this case you sacrifice food in order to retain life and/or limb, and there is little question but that abstinence from food is a great sacrifice in this culture. Lest the reader ask how the native might lose life or limb, I should point out that the beams and pillars of the canoe-houses are huge, and if a person were to be struck by one he might very well be injured or killed."

remain in their houses. This is sharply contrasted with the other repair jobs in which children are very much in evidence, shouting, playing, laughing, and getting in the way. Furthermore, on these major jobs, the men wear young, white coconut branch strips about their arms and their ankles, which serves as talismen, and protect them from falling beams and other forms of potential injury."

"If a man is engaged in constructing something new, he may not participate in the repair of an old object. For example, since Tom was building a new canoe he could not participate in the repair of his own canoe house when it needed rethatching. Should a person violate the taboo, he becomes ill. (3)

The day after the job is completed, the chiefs may tell the men to go fishing, while the women prepare food, and then a feast is held, each household bringing his own food and fish, but all eating together. A characteristic of these feasts, and of other feasts following a religious rite is the complete absence of conversation during the meal. The people eat uninterruptedly, no one speaking to any one, let alone holding a conversation."

"3. This taboo on the mixing of opposites is a symptom found quite widely in obsessive compulsive neurotics."

"There are, however, other characteristics of communal labor, of a non-institutional character. The first thing that strikes the observer is the cammeraderie and esprit de corps that pervades the entire assembly. The people are cheerful and gay, and a festive spirit seems to hang over the activity. This spirit seems to be infectuous, everyone participating in the general gaiety. And when the men and women tug together on a rope, the spirit is almost hilarious. Observing the hoisting of a beam, I recorded in my field notes of December 10, that 'the men and women now hoist the beam, and there is a tremendous conglomeration of screaming, shouting, yelling, and laughing.'"

"This spirit of good-fellowship characterizes even the minor cooperative work, such as the carrying of a canoe from the beach into the canoe-house. They seem to view it as fun, as a lark. This convivial spirit is accompanied by another, institutionalized pattern. That is, all heaving, pulling, and carrying jobs, are performed by the accompaniment and rhythm of a shanty. One man takes the leadership and shouts a line of the shanty in a sing-song voice, and then the others repeat the line after him, while they heave at the rope, or pull the canoe. The shanty expedites the work, by offering the men a rhythm by which to work, as well as by providing amusement for their work."

"Another characteristic of cooperative work is the seeming absence of direction or plan. No one has a definite assignment, but fits himself in where he thinks he is needed. To make matters worse, no one individual assumes over-all direction, with the result that everyone shouts orders to everyone else, and men are seen jumping from one station to another, many with the same object in mind. Now when as many as 36 men are working on one canoe, the result is utter chaos and confusion, at least to the observer. But somehow, the end result of this turmoil and absence of plan, is a unified activity, with the end-in-view accomplished, and, what is even more important, with no injuries.

This lack of plan or leadership is patent not only in the actual undertaking itself, but in the absence of foresight in its preparation. Almost invariably something that should have been prepared in advance is remembered all too late in the midst of an intricate engineering job, which precipitates much confusion, until someone finally corrects it. One would think that the men would agree upon some one individual to act as the leader of the work gang, but no one suggests this, and no one will voluntarily take over this job, with the result that there are a number of leaders.

This lack of leadership, I hasten to add, applies only to the actual process of work, not to the general undertaking. There are specialists in construction, trained in engineering principles, who plan the repair that is to be done, and who direct the operations.

It is only in the particularised aspects of the total job, such as hoisting a beam, or lowering a keel that this chaos reigns."

116, 476, 342 Ifalik

"The kind of cooperative work we have been discussing is cooperation whose results redound to the benefit of the entire society, or at least to the district. But this pattern of cooperation operates even where there is no direct return to the participants. When a man wishes to thatch the roof of his own house, the young men of his district offer their services with no hesition. Of course, they receive a gift of tobacco or food upon completion of the job, but this gift is a mere token of appreciation, rather than payment for work done. However, this cooperation is always reciprocal, because the man who is assisted by his neighbors in one instance will assist in another instance. Then there are occasions in which one district assists another. For example in one of the clean-ups, the district of Rauau, which is smaller in size but more numerous in population that its neighboring district of Felarik, completed its work before the latter, whereupon a number of boys and men of Rauau proceeded to Felarik and assisted the people of that district for an additional two days, until the work was completed. This was done entirely voluntarily. When I informed the chiefs of this cooperation, they were very pleased, and all proclaimed a spontaneous 'erat'. (Very good)."

116, 476, 286 Ifalik

"This concern for the people of another district, which is expressed in this kind of cooperative labor, is in some cases enjoined by the chiefs. For example the island of Falalap required additional seins. Now a sein is usually about sixty feet long and about nine feet wide, and its construction, is a long and arduous job, requiring a huge quantity of rope. The Falalap chiefs ordered their men to make seins, and the [38] Felerik men, at the order of their chiefs, also made seins for Falalap, with their own rope though they would receive no direct benefit from this work."

"The other construction [WPM: other than sein making] that is performed cooperatively is canoe-making, and here kinship plays a significant role, particularly in the construction of small canoes, which are owned and used by one person. In the construction of large canoes, many men will assist the owner because the task requires a number of hands at certain stages of the process, and also because, though owned privately, it is used for many communal purposes, such as burial and inter-atoll travel."

28: Spiro--38 [2]

"In analysing the kin relationship of those assisting in canoe construction, we again observe the functioning of patrilineal and affinal relatives, as well as matrilineal relatives. For example in the construction of Tom's ocean-going canoe, the men most in evidence were his brother, his sister's son and a classificatory sister's son, as well as his sister's husband, his classificatory sister's husband, and his wife's brother, besides a number of men of both Rauau and Felarik who were not related in any form. In the construction of a small canoe that I observed, those who assisted the owner were his mother's classificatory sister's son, his mother's brother, his foster brother, and his dead mother's classificatory sister's husband--the latter doing the brunt of the work. In another instance, the man was assisted by his father, the foster father of his daughter, and his sister's husband. I list these in detail to indicate the importance of kin other than the lineage or the clan in economic activity."

28: Spiro--38 [3]

Ifalik

"In the construction or repair of an ocean-going canoe, a number of other men participate [WPM: other than kin], particularly the men of the man's district. When the hull on Tom's canoe was to be fitted I counted 36 men participating in the job. The owner of the canoe provides food for all the participants when the task is completed, and in the case of the main workers, presents them with gifts of rope and lavalavas.

Now, aside from kin, whose cooperation is culturally ordained, the cooperation of the other participants is entirely voluntary (4), so that the degree of cooperation is a function of the esteem and respect that the initiator holds in the society. The well-liked man will receive much assistance, whereas he who is less well liked will suffer accordingly. We have already alluded to the lack of cooperation Tom received in the construction of his canoe, and his need to appeal to the chiefs to get fuller cooperation. This may be contrasted with the cooperation that Gaveleisei received when his ocean-going canoe required a complete over-hauling. He let it be known that he would need assistance, and the next day the entire man-power of his district had turned out, as well as many men from Felarik and Falalap. This display of cooperation was unquestionably a function of

---

"4. There are exceptions to this, however. When he arrived on the island, and Tom was appointed as our interpreter, the chiefs ordered the men of Felarik to assist in the construction of Tom's canoe, since he would have little time to devote to it."

Gaveleisie's personality. He is a person highly respected by his fellows, and justly so; he is a magnificent human being, intelligent, talented, and sensitive. When I informed Tom of the great number of men who had come to assist Gaveleisei, he explained that the task was easy, and that any person knew how to perform it. Tom was correct in saying that it was a relatively easy task, but there is little question that it was Gaveleisie's personality that accounted for the large turn-out, and that Tom was trying to rationalize the discrepancy in numbers between those who assisted him, and those who assisted Gaveleisei. The simple fact is that Gaveleisei is liked and respected more than Tom."

"There is one ritual ceremony connected with the construction of a large canoe. After the canoe is painted, a fire is lit outside the canoe-house for four consecutive nights, the canoe remaining in the canoe-house for that time. Failure to light the fire, would result in the men being unable to catch fish from that canoe--the fish would simply not bite."

"Except for the rare gathering of crabs by the women, and the even rarer slaughtering of a hog or killing of a chicken by the men, fish is the only source of meat, and it is highly prized. Fishing is done both individually and communally. Private fishing is of minor importance, as compared to the communal fishing. It consists of reef fishing with rod and line, and canoe fishing inside the lagoon and on top of the reef with line and bait, either live or lure. The natives make hooks of mother-of-pearl, and also use those introduced by the Japanese and by us. The term, individual fishing, must be qualified. It does not mean that an individual fishes privately, for this is very rare. Individual fishing is almost always practiced by a number of persons whether it be three or four boys casting into the surf, or nine or ten canoes, each trowing inside the lagoon or on top of the reef in a moonlit night."

"A minor form of cooperative fishing is the use of a fish trap in the shape of an arrowhead, made of the piling of stones to a height that juts above the water in low tide, but which is submerged in high tide. The fish inside this trap cannot escape at low tide because of the jutting rocks, and the men catch them with hand nets. There are three such traps on the island, and they provide sardine-sized fish, but only at certain periods during the year, which the natives know intimately and control quite well.

Another minor form of cooperative fishing is the use of a portable coconut-twig fish trap inside the lagoon, close to the shore in shallow water. The fish, the same kind caught in the stone traps, are 'driven' into the traps by the men standing patiently in the hot sun for many hours. The men stand behind the school of fish preventing them from altering their course, gradually heading them towards the trap. When one enters, the rest will follow, and the traps are constructed so that ingress is easy, but egress is well-nigh impossible. This work requires the cooperation of a number of men to guide the fish and to provide relief for each other as they work in shifts.

The fish caught by these techniques are either eaten immediately by the men themselves, if the haul is small, or is taken to their homes to be consumed by the entire household, if the haul is large. In the former case the men cook the fish themselves; in the latter it is prepared by the women."

"None of these techniques [WPM: using traps] compare in importance to the large co-operative fishing ventures, of which we can distinguish two kinds--sporadic fishing inside the lagoon or in the ocean, in the trade-wind season, and a period of three month persistent daily fishing, at the beginning of the prevailing westerlies.

Communal fishing might be undertaken at the initiative of a group of men, with the permission of the chief, sailing outside of the lagoon, and trolling with seins. The fish is then divided among the participants. Most communal fishing, however, is all-island, at least all-district, and it is initiated either at the express order of the chiefs, because they think the fish might be abundant, or to celebrate a religious ceremony or the completion of some public works; or it is initiated by some one observing a large school of fish inside the lagoon, and conveying the information to the entire village. The latter kind of innauguration is the most colorful and dramatic. Fortunately two expeditions were initiated in this fashion in front of my eyes, so that it was possible to observe the entire operation. On the morning of one of these expeditions we were preparing breakfast, and Maroligar, the second ranking chief, was sweeping the decaying vegetation from Atelu. The village was quiet and serene with only the shouts and cries of children to interrupt the morning calm. Then, precipitately, Maroligar began [40] to shout in a manner that led me to believe he had gone stark mad. He had seen a school of fish, and this was his way of informing the people. They responded in an instant. Everyone

dropped his work, and ran to the canoe-houses. The village became a veritable mad-house. Men, women, and children, were all helping to carry large canoes, as well as traps, fishnets, and seins to the beaches. And the moment a canoe was launched, it was filled with men, who paddled furiously towards the fish. After the initial excitement the men settled down to a day of fishing, the object being to surround the fish with seins, gradually narrowing the circumference of the seins, until the fish were isolated in a small area, and then haul them in with nets and traps. The main problem, of course, is to surround the fish, and this may take two or three hours, chasing them back and forth across the lagoon. Once this is accomplished, the rest of the task is primarily watchful waiting, surreptitiously closing in on the fish, and preventing them from eluding the dragnet. This takes a long time, the men usually working under the hot sun from early morning until dusk.

The same technique is applied in the fishing announced in advance, except that there is no school to catch, and the process here is to systematically drag the shore side of the lagoon in sections, surrounding the fish, and catching them in nets and wires. This continues until the entire beach has been dragged, and again consumes an entire day."

"The women are not inactive, for while the men fish along the shore, the women are preparing starch foods to be eaten with the fish. When the men are after a school of fish, the women dance and sing. For reasons, which no one could explain, except by the universal explanation of 'from before', the women perform a bwaruch while the men engage in this kind of fishing. A bwaruch is a love song-and-dance. Normally it is performed by a woman for her sweetheart as a prelude to lovemaking. The dance is very suggestive and lascivious, and the words to the song are quite candid, in their reference to sexual anatomy and physiology. Yet, while the men are engaged in catching the fish, the women assemble on the beach, one or two households together, and perform these dances, and sing the songs sometimes entering the water.

When the men return with their catch, it is taboo for small children and women to witness them or the fish, and they must retire to their homes until the fish is unloaded on the shore and distributed.

There are other taboos connected with fishing. The men may not have sexual intercourse the evening preceeding a fishing expedition, for they 'stink' and Solal, the god of the ocean will make them sick. After a fishing expedition the men may not have sexual intercourse, nor may they work, for three days. Should they violate this taboo the fish will not bite in the future."

"The distribution of fish is usually the task of Taroman, the fifth ranking chief. Every person who participated, as well as those unable to participate because of debility or illness, shares in the catch. The remaining fish are divided equally among the clans, and any surplus is then divided among the chiefs. If the men catch more than can be consumed within twenty-four hours, the fish is preserved by being smoked on a wooden rack, and is smoked every day until it is consumed. In the drive referred to above, 301 large bonito were caught, which was much more than could be consumed, and the [41] smoked-fish lasted for about two weeks without spoiling, by which time it had all been consumed."

"The second category [WPM: see p. 40] of fishing is the three month fishing period at the beginning of the westerlies. Fishing during the other seasons of the year is sporadic because fish are not abundant. But in these three months the 'flying fish' are found in large quantities, and the men catch them in the open sea at night by the light of flaming torches. This period is characterized by the complete separation of the sexes. The men and boys sleep in the canoe-houses and are brought food by the women who sleep alone in their houses with the babies. All sexual relations are completely taboo during these three months."

Woleaians-1-2
Ifalik

"The arts of the palu [WPM: navigators] and zenap, [engineers] were both supernatural dispensations, according to Ifaluk tradition, having been taught by 'gods', and were then handed down orally from generation to generation. These arts are taught to an apprentice over a considerable period of time, by the practitioner, for which instruction he receives gifts of lavalavs, skirts, tobacco, food, and other valuables. Though there is no hard and fast rule both these arts usually run in families, in the widest sense of that term, a practitioner giving preference to his own bilateral relatives, as well as to his in-laws. For example, the palus are Tom, his brother, his wife's brother, a distant kinsman, and two whom Tom is training, his son, and his sister's son. The Palu and the Zenap are among the most respected men on Ifaluk, and their offices are aspired to by the young men. In the Bavilais Moral Ideology Test a significant number of young men, when asked what they would like the most, answered that they would like to be a palu and/or a zenap.

That these two crafts are highly respected should occasion little surprise. Almost any adult male knows how to construct a house or a small canoe, or how to navigate a canoe in the open seas around the atoll. But the construction and repair of a canoe-house, or the navigation of a canoe on an overseas trip requires a highly specialised skill, which only the specialist possesses. The need for great skill becomes obvious when one

considers the engineering principles that are necessary for the construction of a large structure or the knowledge required to sail as many as hundreds of miles over open sea, without aid of a compass or navigation chart, let alone Radar or Loran. (5) When any such task is to be performed, therefore, the specialist is called in, and payed for his services with lavalavas, rope, and food.

A few men have acquired skills in all these fields. Tom, for example, is a navigator, as well as a canoe carpenter and structural carpenter. This is unusual, for there are some who are canoe-carpenters, but who are not competent to build or repair [42] buildings, and there are very few who are navigators as well as carpenters."

"5. The skipper of the LST that brought us home, informed me that his Radar was not working on his trip to Ifaluk, and he was worried lest he not find the atoll since the slightest deflection of the needle of his compass would cause him to by-pass the island. The native navigator has only the stars, sun, moon, currents, and physical signs, such as reefs, flying birds, and schools of porpoises, to guide his directions."

28: Spiro--42

"The women's economic activities have been enumerated above, and need little technical explanation. The cooking is done in the cook-sheds, usually a number of women in the household working together. In the preparation of food for feasts two and three households may cooperate. Most cooking is performed over the open fire; the um, the underground stone oven distributed universally thoughout Oceania, being used only on the occasion of feasts."

28: Spiro--42 [2] (1947-48) 1949 Woleaians
116, 241, 462 Ifalik

"The Taro is the only plant that needs expensive care-planting, weeding, fertilizing, weeding, and this is the women's responsibility. It is hard, hot, labor, and usually all the women of a household, and sometimes two or three, work together on their own plots of land. As a result of this sexual specialization, the women are the botanical experts. When asked the names of different varieties of taro, Tom admitted his ignorance and referred us to his wife, saying that the women knew the names, but the men were ignorant of them, since horticulture was not their work. Despite the heat, a woman may not drink from a coconut while in the taro patch. Should she violate the taboo, the taro will not grow."

28: Spiro--42 [3]

Woleaians
Ifalik

"The women weave their skirts and loin-cloths on a true loom. The fabric of which these clothes are made is the bark of the hibiscus or banana tree, which is stripped into long threads. These threads are allowed to dry in the sun, and are then dyed in natural dyes, made by immersing certain kinds of coral into water, creating a chemical reaction, so that the water assumes the color desired, and in turn dyes the thread. Young girls are taught to strip the bark into thread, and to tie the thread together, and in their early teens they are already weaving. But the job is an arduous one, even the most skillful women requiring a minimum of two weeks to complete a skirt, if she does nothing else but weave."

28: Spiro--42 [4] (1947-48) 1949 Woleaians
116, 462, 517 Ifalik

"The women's tasks are more numerous and time-consuming than the men's, so that it is not unusual to see the men sitting in the canoe-houses with nothing to do, but quite unusual for the women."

28: Spiro--42 [5] (1947-48) 1949 Woleaians
116, 431, 592 Ifalik

"Distribution presents no problem of Ifaluk, each household being an economically-autonomous unit, and hence exchange is not necessary. There is inter-atoll trade, as we have already seen, but, as was pointed out, this trade really falls into category of gift-exchange."

28: Spiro--42 [6] (1947-48) 1949 Woleaians
116, 437, 423 Ifalik

"The only commercial transaction involves the acquisition of some raw material, and this is rare. I observed only one such transaction during our entire stay on the atoll. I was sitting with Tom and two other men in a canoe house in Felarik, when a canoe paddled by men from Falalap came up. The men beached their canoe, and then sat on the beach, conversing among themselves. Tom asked them what they were doing there. They said that they had come to acquire a certain tree, which they wanted to make a canoe. Tom told them who the owner of the tree was and some of them went to call him. In the meantime the others unloaded a number of blankets and coils of rope, which was the payment for the tree. There was no bargaining or discussion, the Falalap men giving what they thought the tree was worth, and the owner accepting the payment without question. He neither examined nor counted their payment, nor did he attempt to keep the tree. Later, I asked Tom whether the exchange was fair, and he said that the payment was very generous."

28: Spiro--42 [7] (1947-48) 1949 Woleaians
116, 471, 421 Ifalik

"Property rights and laws of inheritance of property are clearly defined. Theoretically, the Ifaluk economy can be characterized as state socialism, for all property, the natives claim, is owned by the chiefs. The entire atoll, land and water is their property, as is all manufactured goods, since they can confiscate these, if they wish. Functionally, however, in terms of usufruct, we may distinguish five kinds of property. 1. Free-property: 2. Public property 3. Lineage property 4. Patrilineal group property 5. Personal or private property"

28: Spiro--43

Ifalik

"Free Property: All the uncultivated land in the bush is free property, and can be used by any one, tresspass not being recognized."

28: Spiro--43 [2] (1947-48) 1949 Woleaians
116, 423, 226 Ifalik

"Public property: This includes the seins, fighting traps, canoe-houses, and the Fanap. The seins and fishing traps are constructed by the men of a district, and remain in the canoe-houses. They are communal property, and are used by the men in their fishing expeditions. The Fanap is the 'town-hall', and though it is said that is 'belongs to the chiefs', it is actually used for all public meetings, and is repaired, in case of damage, by all the men of the district. The canoe houses, are theoretically owned by one individual, in that one of his ancestors is reputed to have built it. But, actually it is used by all the men, of the district, and is repaired by them. Any attempt on his part to prevent some one from using it would be unthinkable."

28: Spiro--43 [3] (1947-48) 1949 Woleaians
116, 423, 613 Ifalik

"Lineage property: The houses and taro patches are included in this category. Theoretically the house is owned by the eldest woman of the lineage, and at her death is inherited by the next oldest woman. This is just another way of saying, however, that it belongs to the matrilineal lineage, for it descends in that line in perpetuity. This means that the house in non-transferable, that it can not be bought or sold. Theoretically, the taro patches are owned by the men, but again analysis reveals that it is lineage property. The women of the man's household work his patch, the taro belongs to them, and they use it to feed the members of their household, including their husbands who are members of a different lineage. However, a woman gives some of the prepared taro to her brother indicating that it belongs to all the members of the lineage. That the taro patches belong to the lineage is also revealed by the fact that they descend to the man's sister's sons at his death."

28: Spiro--43 [4] (1947-48) 1949 Woleaians
116, 423, 613 Ifalik

"Patrilineal group property: Coconut and breadfruit trees are owned by the males of a patrilineal descent group, so that a man's death, his trees descend to his son's and brother's sons, and like the taro-patches and houses, belong to this line perpetuity, being non-transferable."

28: Spiro--43 [5] (1947-48) 1949 Woleaians
116, 428 Ifalik

"Strictly speaking, the above two categories of property-matrilineal lineage property, and patrilineal descent group peoperty are not subject to the laws of inheritance, as we commonly understand that term. A house is used by the members of the household, and continues to be so used regardless of any-one's death. The same is true of the taro patches and the trees. A well-recognised group uses the fruit of these plants, has legal right in them, and continues to use them as members of this group regardless of the changes in its membership through birth or death. This is, of course, merely another way of stating that these are group property, owned by the group in perpetuity, and therefore unaffected by changes in the membership of the group. It is not that a man's sons or sister's sons inherit a particular piece of property from him at his death, but rather, it is their descent from him at birth, and not his death that confer upon them the use of the property. The property is not divided into individual plots of ground or trees, each individual in the group receiving an equal share, but remains as a whole in the group, all individuals in the group having equal rights in it."

28: Spiro--43 [6] (1947-48) 1949 Woleaians
116, 422 Ifalik

"Personal property: This category includes a man's canoes, tools, rope, all clothes, and personal effects-combs, baskets, etc. At his death a man's canoes are divided among his sons and sister's sons. His rope is inherited by his sons, and his clothes and personal effects are disposed of as his family sees fit."

28: Spiro--43-44 (1947-48) 1949 Woleaians
116, 421 Ifalik

"Even a brief acquaintance with this culture reveals that private property plays a minor role. Only what a person himself creates belongs to him, and only such objects may be transferred. All other objects belong to a group, ranging in size from a unilateral descent group to the entire society and remains in the group in perpetuity. Two polar attitudes characterize the dynamic aspects of property rights--the punctiliousness with which a person refrains from using another's real property, and the culturally expected generosity of use of another's property upon request. That is, when a person wants a coconut he will never climb a tree that does not belong to him to [44] obtain one. Though the islands are dense with coconut trees, and every one has many more trees than he can possibly use, and though the taking of one nut would be of no economic significance, no one would dare take a nut from a tree that is not his. Each man knows his own trees, though they may be scattered and mixed with trees of others, and will pick only his own. This holds true for the taro patches. A woman will not take taro from another's patch, though there is taro enough on the island to feed many more mouths than there are on Ifaluk. But the proprietary rights in these patches is felt very strongly, and people are quite jealous of these rights, as is indicated by the TAT and by the admonitions of the chiefs to refrain from taking another's taro."

116, 421 Ifalik

"One is expected to be generous with his movable property. Though the canoes are owned individually, any one may borrow another's canoe, preferably with his knowledge, but even without it. A man wishing to make an overseas journey asks permission from an owner of an ocean-going canoe to use his canoe, with full assurance that permission will be granted, a refusal being unheard of. And the same holds true for tools, traps, and other objects that a person may wish to use."

28: Spiro--44 [2] (1947-48) 1949 Wolcaians
116, 565, 422, 556 Ifalik

"All of this [WPM: see pp. 43-44] indicates a basic economic equality, and the absence of social classes based on wealth. Though the size of taro patches or coconut groves are not equal, these are so abundant that any inequality is unimportant, particularly where land and trees are viewed purely functionally and not as indicators of prestige. In perishable objects, such as canoes, or rope, or lavalavas, some may own more than others, but this inequality is a function of relative diligence, rather than wealth, for all know the techniques of their manufacture, and accumulate many or little as they see fit. Property is desired and respected, but it is not something which, though aspired to by many can be attained by only a few. It is something that any one with the requisite technical abilities can have, since every one creates his own property."

28: Spiro--44 [3] (1947-48) 1949 Woleaians
116, 421, 181 Ifalik

"It is important to understand that the natives adopt a very pragnatic attitude towards this property. It is desired for use, not for prestige or 'conspicuous consumption.' Thus, though in economic terms they possess wealth, in psychological and cultural terms, they possess only property, and they aspire to property and to possessions, not to wealth, in the abstract. What is respected, therefore, is not mere possession, but rather the skills that enable one to possess, by creation."

"Economic acculturation, in that it provides certain individuals and not others with certain objects, has resulted in a desire for certain kinds of property, and confers upon their owners certain prestige. This merely illustrates the universal economic law of scarcity as a primary contributor to economic value. Western gadgets, and tools, introduced by the Japanese or by the Americans, including the anthropologists--and of necessity distributed to a few--incur the admiration and envy of the others. The knives we distributed among the chiefs were the envy and admiration of all the men. The playing cards we gave to our 'boys' were admired and longed for by the others. The perfume we gave to Tom's wife or to the chiefs' wives was desired by the other women. Thus one can safely predict that as long as real property remains in the lineages, and as long as other property can be acquired by any one with the requisite skills that property and wealth will create no psychological or social tensions. But if native system of land tenure should be changed so as to enable some to accumulate more at the expense of others, or if the Navy should offer jobs to some of the men and not to others, and thus enable them to buy western manufactured objects--particularly objects, like flashlights, that can be used only by one person at a time, tensions will inevitably arise as they have in other colonial areas.

There are two factors, then, that have served to almost eliminate economic tensions on Ifaluk: The culturally ordained pattern of cooperation and generosity in the distribution of goods and their use, and the abundance of those things that are desired, so

that all can share in them. A change in either the cultural or natural resources, indigenously or through contact, would soon alter this."

28: Spiro--45 (1947-48) 1949 Woleaians
116, 771 Ifalik

"Ifaluk religion cannot be considered apart from the culture of which it is an integral part without doing violence to both the religion and the culture. The fact that our society is unique in consigning religion to a separate category--one among a number of aspects of culture--has been pointed out by numerous authors, and has become commonplace in our thinking. Yet it is necessary to stress this point in a discussion of Ifaluk religion because the inter-relationship between religion and the entire culture is so inextricable that the natives have no term for religion. Religion is not something apart, a special realm of being to be distinguished from mundane, everyday existence. On the contrary, religion is part of the entire culturally constituted world of the natives, in which dichotomies of natural-supernatural, material-spiritual, etc., which are an intergral feature of western thinking, play no role."

Woleaians
Ifalik

"The disproportionate length of this section results from the disproportionate emphasis placed on these matters in the culture and in the minds and behavior of the people. Food and health (or illness, to look at its adverse), are the two foci, to employ a concept of Herskovits, of this culture and the subjects with which we identify the term religion, are inextricably interrelated in Ifaluk with health and disease."

28: Spiro--45-46 (1947-48) 1949 Woleaians-1-5
116, 772, 184 Ifalik

"Cosmogomy and cosmology: The following account was received from all five chiefs in a number of sessions. It is unknown or only vaguely known by the people, who would invariably respond to my questions with a confession of ignorance. As we shall observe in another connection, this ignorance of the people reflects their indifference to cosmological problems, since this knowledge is not taboo, and the chiefs, who are the repositories of this information have no compunctions about imparting it.

Like many other cultures, the concept of a creatio ex nihilo is completely absent in Ifaluk. There is no creator, the world having always existed. Nor were the chiefs concerned about the problem of first causes. When asked how the world came into being, they replied that they did not know; it was always there. At some time in the distant past--how far back they could not say, since they have no system of time notation--there appeared a primordial mother, Legobub. Again, her appearance is unexplained. Legobub had three children, whose creation is unaccounted for. That is, it is not known whether she fashioned them out of some material, or whether she conceived and gave birth to them. In any event, it is clear that she did not have a male consort, and however she created her children, she did so without male assistance. Having performed this function, she plays no further role, either in the mythology, theology, or functional religion of Ifaluk.

Legobub's three children were her son, Aluilap, whom she ordained as ruler of the sky; Solal, another son, ordained as ruler of the nether world; and Autran, a daughter,

who was later to create the people of the Caroline Islands. (1).

The natives have no term which corresponds to our words, universe, or cosmos, which would unite in one term the oceans, land, heavens etc. These are but so many discrete entities in their minds, and the concept for earth, as opposed to the heavens. There is land (falu), and there is ocean (tat), but again, there is no uniting of these two discrete entities into one conceptual term. Their term bwanifalu, which literally means, all the lands, is their most inclusive geomorphic frame of reference and is a descriptive, rather than a conceptual term. It means what it literally says, and refers to the fact that they recognise other lands besides their own. Bereft of maps, however, it is obvious that their knowledge of other lands is mere recognition, of their existence. Before contact, their knowledge of the world was limited to the Carolines, and this knowledge was more than mere recognition of the existence of other islands. It included a well defined spatial orientation, which enabled them to locate islands as distant as four hundred miles. With contact their quantitative information has been increased, but not their conceptual knowledge. Europe, which is their generic term for all the 'civilised' countries they have heard of, exists outside of the Carolines, but they haven't the slightest idea where.

"1. [See following sheet for footnote 1.]"

28: Spiro--45-46 (1947-48) 1949 Woleaians-3
116, 772, 184 Ifalik

"1. [Footnote 1, pp. 45-46] Arogeligar, the priest-doctor, with whom I discussed these problems at great length, gave me an entirely different version. Here we have a problem, in what Herskovits has called, the question of 'ethnographic truth', in a most extreme form. For we have here not one informant differing from another, thus indicating variability, but we have the two only sources in the entire culture differing fundamentally --the political and the religious, both of whom profess to competence in these matters. Tom realised this difficulty, too, and solved it by saying that the chief's account was the authentic, whilst the other was spurious. In any event, the ignorance of the [46] people, the disagreement between chiefs and priest-shaman, and the lack of assurance with which the chiefs approached these matters--all indicate the unimportance of these matters and the people's lack of concern with them.

Arogeligar's creation story is as follows: At one time there was neither land nor water, nor sky. The sky was made by four brothers (sic)--Aluelap, Solan, Autran (Autran is a woman in the chiefs' account) and Metha (absent in the chiefs' account). Arogeligar did not know how these brothers came into being. After making the sky, Aluelap made the land and the oceans, first creating the high islands, (including 'Europe', by which the natives understand a vague 'island', including Japan, Germany, Spain, America, and other countries they may have heard of) and then the low islands. After creating the islands, he then created people to inhabit them.

The brothers then decided that Aluelap would remain in the sky, Solan would reside under the oceans, Autran would inhabit the atmosphere, and Metha would be in the speech of the people, for Metha is the native term for 'what.'"

The Carolines are called Iligalifalu, literally, 'the lands that are here', and as has already been indicated, (2) the natives are well oriented spatially within this area."

"2. Falu means land, but it is synonymous with island, since the only land the natives know is an island. My attempt to describe a land mass as large as the United States, evoked expresssions of incredibility and amazement. Taroman, one of the chiefs, finally concluded that Ifaluk was as a grain of sand, compared to America, which actually isn't far from wrong."

28: Spiro--46 (1947-48) 1949 Wolcaians
116, 821, 177, 804 Ifalik

"The sky, is a physical object, in the shape of a dome, which meets the oceans at its extremities. The surface of the earth--land and ocean--is flat, and is bounded by the sky at its limits.

Though the world is bounded and the sky is a material, impermeable object, no native has reached these points. The chiefs asked me whether any American had ever reached north or south. That is, these terms do not serve merely as directional indicators, as they do for us, but they are actual physical places, which one reaches if one travels far enough. They also wished to know if any American airplane had ever flown to the sky. The Japanese had told them that they (the Japanese) had done so."

The sun, moon, and stars, are fixed to the sky, and move along it, much as a train moves on its tracks, so that the sun, for example, has its ial, its path, which it follows every day. The people assign the same function to the sun as they do to the moon and stars--to provide light. Were there no heavenly bodies, people would die, say the natives, because they would have no light by which to work. [47]

The causes and functions of other cosmic phenomena such as rain, wind, thunder, lightning, are unknown. It is not realised that rain is necessary for the growth of vegetation, nor should this be surprising, since there is no period of growth nor its concommitant destruction of crops which would indicate such a relationship."

28: Spiro--47-48 (1947-48) 1949 Woleaians-1 -4
116, 773, 775 Ifalik

"Autran, the daughter of Legobub, created man, that is the Caroline people. The natives have as yet not explained the creation of the other peoples whom they have met since contact. Her method of creation is unknown though she is referred to as the mother of the people. The chiefs say that only the chiefs of Gachepar in Yap, and the chiefs of Mogmog in Ulithi know the details of the creation. The Ifaluk chiefs do know, however, that the people of Yap were created first, after which Autran created the Ulithians and then the Ifalukians, which is why Yap is the first ranking island in the Western Carolines After creating man, Autran retired to the atmosphere, where she now lives, though her house, Lamoru, still remains in Gachepar, and the tribute that is offered to Yap, is brought to her house, and is really for her, though it is given to the chiefs. (3)

Man originally was immortal, and only later became mortal, (And here we have the chief's version of the story told above by Arogeligar). After Autran had created the Caroline people, Legbrielnialel and Ligesges were assigned to guard the path taken by the souls of the dead as they ascended to the sky. When the soul arrived Legubrielnialel would say: 'He dies, dies, he dies like the moon'. (Imaiam imalia lualang.) That is, man does not really die, but merely waxes and wanes like the phases of the moon. Upon

---

"3. [See following sheet for footnote 3]"

"3. [Footnote p. 47] Arogeligar told me a different Creation myth. It is not a different version, but an entirely different story. This myth was told him by his maternal grandmother. The significance of the myth in terms of acculturation will be obvious.

After creating the land, Aluelap descended to the earth, --exactly where, he does not know--and from one of his own ribs, created one man and one woman. After a time, they had some children, and soon the various islands were populated. These early people ate no food, wore no clothes, nor did any kind of work. However, 'by'n by, Aluelap say, "what's the matter, I give that my rib, I no give chow? by'n by no more people' (that is they will die of starvation). He give them chow; they chow. No have lavalava, they am very ashamed. Aluelap give them chow, they savvy everything--how to make lavalava, chow, work, everything. Aluelap tell that snake: "You go on tree, you call man and woman, they come to chow. I make people, they no savvy work, shame, chow. More better you call that people, they eat that fruit, they savvy. "They eat two piece that fruit; they see they have no clothes; they see that penis and that vagina. They am very ashamed, they run between tree.'

This is obviously the Genesis myth. It most probably was learned by one of the natives on Yap, from a missionary, or perhaps on Guam, from which it was diffused through various channels, coming to Arogeligar's mother. He presented it, of course, as a

native story, which in his mind was preliminary to a native myth he proceeded to tell, but which turned out to be a variant of a myth I later collected from the chiefs, and which, in their version was not a creation myth at all. It is to be noted that though Aluelap had already created mortals, and they had populated the world, Ifaluk was as yet uninhabited. Aluelap told two of the women inhabitants of the sky, Legubrielnialel and Ligesges, to descend to Ifaluk. The former was very wise ('she savvy everything') while the latter was stupid ('she fool fellow'). Aluelap had given Legubrielnialel the power to have anything she wished for. Thus she had only to wish for a house, or cooked food, and it was hers. One day she wished for two men, and they appeared. The men and the two women copulated and populated the island. The people had no need for industries of any kind, since their wants were provided for by Legbuielnialel. One day, however, the women had a quarrel, and Legubrielnialel in her anger departed from Ifaluk and traveled to 'Europe' where she settled. Thus 'Europe' benefited by her wisdom, and soon became as wise as she, whereas Ifaluk was left with the stupid Ligesges, and remained in ignorance, knowing neither taro, breadfruit, or fish, nor fire. They did have clothes however, and they ate coconuts.

It is quite obvious that part of this story, at any rate, originated after contact or was reinterpreted as an ex post facto explanation of 'Europe's technological superiority over Ifaluk." [48]

hearing this, the soul would return to the earth, and mankind remained immortal.

However, at the same time that Legubrielnialel was declaring man's immorality, Ligesges would address the soul with these words: 'He dies, he really dies' (Imaima manigesges). Eventually the souls of the dead believed her words and did not attempt to return to the earth, and thus death became permanent. (3)" [sic]

"3. After Arogeligar had told me his version of the creation story, I asked him the cause of the quarrel of Legubrielnialel and Ligesges and he told me the above story of the chiefs, except that in his version the rival conceptions of death were the cause of a quarrel these two women had had while living on Ifaluk, and did not have the profound consequences for mankind that the chiefs' version has.

Arogeligar explains mortality much more prosaically. Aluelap had created man immortal. But after a time an inhabitant of the sky pointed out to him: 'Very bad that. People no die. By'n by no enough chow, for too many people. More better people die.' Aluelap saw the the wisdom of this insight and created death. Thus Malthus' theory of the disproportionate rate of increase of food and population was discovered--independently by a 'stone-age savage.'"

28: Spiro--48 (1947-48) 1949 Woleaians
116, 773, 618 Ifalik

"Autran is not only the creator goddess, she is culture hero as well. After creating man she taught him the use of fire, the preparation of food, and the construction of canoes, fish nets and houses. She also instituted the incest taboos, taught the people a sense of sexual shame and gave them lavalavas, and instituted the various clans. (4) Construction work was first taught her by Aluelap, after which she taught this skill to the people."

"4. The chiefs pointed out that the institution of the clans was a great boon. For if she had not created the various clans (ailang), 'all people belong to one ailang, then no one copulate.' This is very interesting reasoning and is an excellent example of how deeply rooted are cultural institutions. The concept of the clan is so deeply rooted that the chiefs cannot conceive of society without clans. Thus, if there were no clans, it would be necessarily follow, in their minds, that there would be one clan; and since every person would belong to the same clan, there could be no intercourse, given the taboo of clan endogamy."

"Having created man and instituted his culture, Autran retired to the atmosphere, which was to remain her dwelling. Aluelap, it will be recalled, was assigned to the sky, (iang) which he still inhabits, as the chief of the sky-gods, with his wife, Metha (5) his son Lugeiling, and the latter's wife and sons. The name of their dwelling is Tatuma which is at the zenith of the sky.

In a vague and nebulour sense, Aluelap and his family may be designated as the protector deities. They 'look out for people', providing them with food, and protecting them from harm. But this is true, I repeat, only very vaguely. Arogeligar and the chiefs are the only persons who are at all conversant with theological matters, and they could provide no coherent or detailed descriptions of the activities of these deities.

"5. It will be recalled that Arogeligar related Metha to Aluelap as his brother. But both chiefs and Arogeligar agree that Metha has nofunction other than to be on the tongues of people, asking metha, (what) when they wish to know something.

The chiefs also differ from Arogeligar and Saafert, the latter two agreeing that Aluelaps eyes are closed, (for he is in a constant sleep) so that if someone [49] must speak with him, his son, Lugeiling, opens his eyes with a pole as large as a coconut tree. The chiefs disagree with this version, saying that at one time Aluelap was blind, but he gained his eyesight and now he can see."

Lugeiling makes a daily tour of the islands and reports to Aluelap on the activities of the people. Should the people misbehave--the entire society, that is, not a particular individual--Aluelap orders Lolal to inflict them with a typhoon and/or a tidal wave. (6).

This land in the sky, inhabited by Aluelap and his family, is a duplicate of the terrestial earth, having islands, ocean, trees, and so forth. But the conceptualization of this pantheon of 'high gods' is vague indeed. To such questions as to whether they were corporeal, whether they are, copulated, or manifested other physical and behavioral characteristics, the answer invariably was, 'I don't know--from before, before.' The mythology, on the other hand, definitely portrays them as anthropomorphic in all ways."

"6. According to Arogeligar, Aluelap also implants the soil in the Loetus. The chiefs deny this, though other people affirmed it."

"These sky gods are known as Alusiang. The word, Alus, is the generic term for supernatural, of which, as we shall see, there are two kinds--benevolent and malevolent. The benevolent supernaturals are called Alusemar, of which there are two categories; the alusisalup (literally, the alus of the earth) who, as we shall see, are the benevolent dead, and the Alusiang, (literally, the alus of the sky), who are this royal, family the pantheon of high gods.

Solan, the third child of Legobub, and the brother of Autran and Aluelap was assigned, it will be remembered, to the nether-world, Ilal, where he lives in his house, called Falisat. Ilal is inhabited by mortals, like those living on earth. It is all ocean, and enjoys neither sun, moon, nor stars. The people seem to live in water-proof houses. Solan, in some vague way, controls the fish supply. He is especially angry at men who catch fish immediately following sexual intercourse, for they 'stink', and punishes them with illness. (7)

"7. Solan is a very vague being in the minds of both the chiefs and of Arogeligar, neither of them remembering any details about him. This follows from the negligible role he plays in their lives and thought. Solal, too, does not fit into either of the two categories of alusemar, though in terms of the creation myth, he belongs to the pantheon of high gods."

Solan and Aluelap, according to the chiefs, cause death, the consent of both being necessary. If one of the two wishes a person to die, he informs the other. If the latter agrees, the person dies; if not, he continues to live. (8). [50]

These high gods, the alusiang, are not clearly defined conceptually because they are relatively unimportant functionally. If the chiefs and Arogeligar are vague about these supernaturals, the people are almost entirely ignorant of them. Invariably I would be told by men and women, adults and youths, that though they had heard of the name of

---

"8. Again confusion reigns. The malevolent dead, as we shall soon see are universally accepted as the agents of death, rather than Solal and Aluelap. Furthermore, within this theory, Arogeligar, who is the specialist in matters of death has a variant interpretation. Aluelap decides when a person is to die. He informs Lolal of his intention, and Solal informs Metha, who then removes the person's soul, thus causing his death."

Aluelap or Solan, or Autran, they did not know what they did, where they lived, or exactly whom they were, other than the fact that they were alus. The one exception is the alus, Tilitr. But Tilitr, strictly speaking, is not an alusiang, but rather the Ifaluk patron deity, and we shall discuss his role shortly."

28: Spiro--50 (1947-48) 1949 Woleaians-1-2
116, 776 Ifalik

"The Alusisalup comprise the second category of alusemar, and these are the functionally important benevolent supernaturals. Every person becomes an alus at death. If a person is evil or malevolent on earth, he becomes an evil or malevolent alus at death; that is, his immortal character is but a continuation of his mortal character. If a person is good or benevolent on earth, he becomes a good or benevolent alus at death, his immortal character being a persistence in time of his mortal character. (9) Now

---

"9. Actually, immortal, is a better rendering of alus than supernatural. Supernatural has been understood in western culture to mean an ontological realm of being, in contrast to and absolutely separated from, the natural realm, or nature. The dichotomy between the natural and supernatural orders is absolute and unqualified, so that only by an act of divine revelation can the two realms ever meet. Now this dichotomy of the universe into the natural and supernatural violates the native conons of thinking in Ifaluk. There is but one ontological order which comprises the 'Great Society.' of aramat inhabitants of the earth, and alus, inhabitants of the sky. There is constant interraction between them, and they are alike in most respects, except that the former are mortal and the latter, immortal."

it should be clearly understood that the western concept of supernatural reward and punishment is completely absent from Ifaluk thought. The Alusengau, the malevolent alus, is not such because he is punished for his immoral behavior on earth. Nor is the moral person rewarded at death by becoming an alusisalup. Both good and evil persons ascend at death to the sky as they were on earth. When a man dies, his soul (ngas) ascends to the sky on a special path. At the end of the path there stands a guard (10), who directs the souls to their respective habitations."

"10. This guard is named, but none of the chiefs could remember it, and inquiry about the village produced only negative results."

"The souls of the good are directed to Langalian, the abode of the alusisalup, which is at the zenith, near Fatima, the home of the alusiang. (11) The souls of the bad are directed to Pungulon or Langalgezepelach, the names given by the chiefs and by Arogeligar, respectively.

Though it is the soul that ascends to the sky, and the body is buried in the ocean, the alus are corporeal, though it is not clear at all whether they resume their earthly bodies, or acquire different ones. But it is known that they are corporeal because people have seen the alusengau on their visits to Ifaluk, and those people possessed by the aluisalap have perceived them in human form.

Both alus, the good and the bad alike, lead lives in the sky that parallel their lives on earth, with the one difference that biological families do not remain together (even

---

"11. The alusisalu also have an abode in the nether-world of Solan, called Gelangas, but this need not detain us, since no one, not even the chiefs, knows anything about this abode, except the name."

assuming that all the members of the family become one or other of the two kinds of alus) but each repairs to the special abode of his clan, each clan having its own habitation. Spouses are not rejoined at death, but marry another person. Otherwise, their lives are the same, performing their same functions--they work, eat, copulate, and so forth."

28: Spiro--51 (1947-48) 1949 Woleaians
116, 776, 261, 151 Ifalik

"Food, as we shall see, is a focal value in Ifaluk, so that I was interested to know the food of the alus. The chiefs confessed that they did not know. Arogeligar, on the other hand, said that the alusisalup have two kinds of food--flowers and wot, both of which they obtain in the sky. The people on earth wear flower leis (parmar) because they know that the gods are fond of them, and will smell their fragrant odor, should they descend. They like the odor of flowers, and they abhor 'any stink.'"

28: Spiro--51 [2] (1947-48) 1949 Woleaians
116, 776, 262, 252 Ifalik

"Wot is a species of taro, much rarer than the other two kinds of Ifaluk, and is prised very highly. Its value is apparently recognized by the alus as well, since it is the only other food eaten by them. When a person on earth is ill, wot is prepared for him, at the behest of the alus (that is, at the behest of Arogeligar), because of its presumed medicinal value. (12)"

"12. Wot is prepared differently from other kinds of taro. It is prepared differently from other kinds of taro. It is placed directly on the fire, and is removed after much charcoal formed. It is then ground fine, grated coconut meat is ground in with it, after which ground leaves of the warung and angorik plants are mixed in."

"Both kinds of alus live identical lives in the sky, the only difference being that the alusengau have 'very bad stomach', that is, they are evil. Langalian, the abode of the alusisalup, is constantly beautiful. Pungulon, on the other hand, the abode of the alusengau fluctuates between extreme beauty and extreme ugliness, but when it is beautiful, it is even more beautiful than Langalian. [WPM: p. 52 is missing from original text.] [53]

Though the alusisalup live in the sky, some of them descend to earth, appear to a person, and possess him. These alus do not possess any one indiscriminately, but possess only persons in their own matrilineal lineage. Thus, the alus is inherited matrilineally, so that a man and his son have different alus. Each lineage house has some alus --Arogeligar said, three or four--that are its special alus, and they function as parental protectors and mentors of the lineage. The alus may possess any person in the lineage, but particularly the walialus (literally, the canoe of alus), of which there is one in every lineage. The walialus is recognised by his frequency of possession. The alus 'come on top' the possessed person, and the latter, then, is conceived of as a canoe which the alus rides.

The alus possesses the walialus for several reasons. He may be lonesome for his mortal kin, or he may wish to admonish them to be good, and to shun evil. The lineage knows the names of its alus, as the latter tell their names to the walialus. These names

are different from their earthly names, since they are given new names by Aluelap, when they ascend to the sky. Whether the possessee recognises the exact kinship relationship of the alus is not clear. Some say that the alus informs the possessee of his name, but not of his relationship. Others, including Arogeligar, say that he reveals his exact relationship. In the pidgin English of Tom, the alus descends on a person, and asks: 'you savvy me?'. If the person does not recognise him, the alus says, 'I your father', or whatever the relationship may be. He then tells him, 'No do bad, no talk bad (against) alus and people. You make good. By'm by you have sick, I give you medicine.'

This last phrase, 'I give you medicine' is the most important function of the alus. As we shall see the alusengau cause disease, and it is the alusisalup that provide the medicine to cure the victim. The exact nature of healing will be examined later, but here it must be stressed that aside from acting as the benevolent patron of the lineage, the sole function of the alusisalup is to cure the ill."

"Possession is called alusemar bwuter, literally, the benevolent alus has arrived. It is marked by a kind of convulsive seizure, called zagogo or chato alus, in which there seems to be a high degree of dissociation, which may last for quite a long time.

Possession can occur in both men and women. It is a relatively infrequent phenomenon, however, and occurs only at night. In our seven month stay on Ifaluk, there were only several possessions. Almost invariably, the person possessed, some other member of his household, or perhaps Arogeligar announces the possession by blowing shrill blasts on a whistle (obtained from the Japanese and Americans). At the sound of the whistle, other people may assemble in the courtyard of the one possessed. At other times, the possession may become infectuous so that others become possessed, in a minor sense. The become 'happy' and the entire group joins in the singing of a chapeng, a religious song, or hymn, and then the young men may walk through the village singing.

I do not mean to examine the causes of possession at this time, but merely wish to point to two relevant factors, cultural and physiological. The few possessions that we witnessed followed imeediately upon a major religious ceremony, their occurence at that time being, therefore no 'accident'. In other words, the influence of the ceremony, at which the alus are evoked, acted as a strong stimulant, in which suggestion played a major role. Secondly, possession occurs only at night, after the people have consumed

large quantities of toddy. The toddy, particularly the fermented kind, is a strong stimulant, and induces a state of mind corresponding to what we call being 'high'. The persons possessed were all 'high', and very obviously under the influence of the toddy, as we shall see in a moment."

"In contrast to the general infrequency of possession is the frequency with which Arogeligar is possessed. Unfortunately I did not record the number of times he was possessed, but hardly a week passed without his being possessed at least once. And invariably he would blow blasts on his whistle and walk through the village hoping to induce others to follow him. Often these possessions occured late at night after most people were asleep. Unlike the others, who are possessed by the alusisalup, Arogeligar is possessed by an Alusiang, the Ifaluk patron diety, Tilitr. This possession is known as 'abwuter aluseuelaush', our father has come.'

We may now look at two cases of possession that I witnessed. The first happened two nights after a two day ceremony. We were sitting in our tenst when we heard singing and the shrill blows of a whistle, and I went out to see what was happening. The people of the house closest to our tent were seated in the courtyard, singing what was obviously a chapeng, but this in itself did not mean a possession since the singing of chapengs in the evening is not at all unusual. I was then attracted by a much louder singing proceeding from another house much further from our tent. When I arrived, I noticed that there were about 20 people seated in front of the house, singing a chapeng, and that a few showed minor degrees of possession, by euphoric smiles on their faces, the quality of the singing, and the movement of their arms and bodies. Arogeligar was leading the

singing, and was obviously 'high.' Normally he would greet me with a smile, and with the native greeting of mauwas. That night, however, and indeed on all nights that he was possessed or high--and usually it was both--he would greet me with one of the few English phrases he had picked up--'good morning'--in a shrill voice, accompanied by a sharp jerk of his arm in my direction. By this time Dr. Burrows had arrived, as well, and he offered us both a wreath. It was evident that he had been possessed before we had arrived, and had come out of the possession, but was still influenced by it, and this impression was later confirmed when our boy, Talimera, informed me that the alus had come to Arogeligar. After about half an hour of singing, he announced that he was going to the home of Paluelimar, the third ranking chief, and invited us to accompany him. The women remained behind, and he was accompanied by the young men, all singing as they walked up the path, whilst he was blowing his whistle. Talimera had just been possessed, too, as he informed me the next day. At Paluelimar's there was more singing, and at Arogeligar's request, Paluelimar placed tobacco on the shrine in his courtyard. After about twenty minutes, the entire group left Paluelimar to go to Tom's house. Arogeligar asked Tom to tell us that he and the boys were going to continue their walking through the woods, and that it would be better if we returned, which, of course, we did. I heard singing and whistling until late into the night, when I finally fell asleep.

The next day, Talimera informed me that a woman had been bathing in the channel

between Felarik and Falalap in the early evening, and an alusengau had frightened her by throwing stones at her, and by rustling the water. Just about the same time Arogeligar was possessed, and he frightened the alusengau, so that it had separated.

On the evening of Octoger fifth, I was scoring the day's Rorschach records when I heard chapeng singing coming from a near-by house. I went to investigate, followed later by Dr. Burrows. Arogeligar was just leaving the courtyard of the house, as we approached. This time he recited his 'good morning' again, but instead of jerking his arm as a form of greeting, he seized the hand of Dr. Burrows and kissed it.

As we came to the house, we saw the members of the family seated, singing a chapeng, but we could not make out their movements, since it was a coal-black night there being no moon. We sat down, and the husband of one of the women of the house brought us a mat, and also a small fire, and explained that the alus had arrived.

With the aid of the light, we could now make out the two women, Levagoman and [55] Tavelear who were seated in front of the doorway, and the other members of the household who were seated in the courtyard. The former was was a widow, in her late thirties, and the latter, her 'sister', a very beautiful woman in her early thirties, whose husband whom she had not seen for a year, had just returned from Woleae the previous day. Tavelear was obviously possessed. She was singing the chapeng in a tremulous

voice, with a pronounced trebel, clapping her thighs to the rhythm of the music, and intermittently breaking into laughter and hysterical giggles. Her voice was quite hoarse, and at times was scarcely audible, so that she would sing in a falsetto. Throughout she was gay and 'happy', in a strange way. There is little doubt but that her behavior was hysterical. I had known her very well, having spent much time in her house observing her baby, and it was difficult for me to realize that this was Taveliar. Normally she is quiet, taciturn, not given to exaggerated movements of any kind. The contrast was glaring. This hysterical seizure lasted about fifteen minutes, after which, she passed out of it, singing along with the rest, but in her normal voice, and patently exhausted. (13)"

"13. [See following sheet for footnote 13.]"

"13. [Footnote 13, p. 55] It is interesting to speculate on the reasons for her posession. Her husband had just returned the day before from Woleae, where he had been living quite a long time. She had a suckling baby that could not yet walk, and intercourse is prohibited until the baby can walk. Now Tavelear has the reputation of being a sensuous woman, and Tom often remarked how difficult it had been to satisfy her sexually when he had had an affair with her. Now her husband had returned, she had been with him for two days, and could not yet have intercourse, which for her constituted a severe frustration. Her aroused sexual feelings that could not find a normal expression, were 'converted' or canalized into the hysterical seizure. This, of course, is in agreement with the psychoanalytic interpretation of conversion hysteria in general.

The dance she performed during the seizure lends credence to this interpretation. It was a most sensuous dance--her hips and thighs rolling and swaying to the weaving of her arms, in perfect sensuous rhythm. The atmosphere, Dr. Burrows and I agreed, seemed laden with sex."

116, 776 Ifalik

"The alusengau, we have already observed, also live in the sky, at its southern extremity. They are the malevolent alus, and according to all informants, they are much more numerous than the benevolent alus. As far as I could determine there are no alusengau that correspond to the Alusiang, the high gods, who existed before the creation of man. Now since the alusengau are wicked, it follows that had there been no evil people there would be no alusengau. This means that the only alusengau are those who formerly were mortals. All natives agree that there are many more alusengau than alusemar, the implication being that there are more evil people than good, a point to which we shall have occasion to address ourselves later. It is also universally agreed that the incidence of women alusengau is much higher than that of men, and they are not only more numerous, but they are the most viscious.

Not all the alusengau, however, inhabit the sky. Some evil souls are directed to live in the ocean, about the reef, and these are known as alusetat, literally the alus of the ocean. The alusetat are, it is agreed, more evil than those who inhabit the sky. (14)"

"14. According to Freudian symbolism that the ocean, or water in general, is a female symbol, particularly a mother symbol. It is interesting to observe, therefore, that the female alus and the ocean alus are universally accepted as the most evil."

"There is a third category of alusengau, whose conceptualization is a point of disagreement between the chiefs and Arogeligar. Both agree that these are not the malevolent souls of the dead, that they originated independently, but that their creation is unknown. Arogeligar calls them alusefalu, literally, the alus of the ground or of the earth, who may take the form of pigs, dogs, or sparks. (15) The chiefs, on the other hand, termed them alusliol, and say that they inhabit the trees in the bush. Alusefalu, they claim, is the name of the chief of these alusliol. They also claim that should a person disobey the chiefs, or evade participation in communal work by remaining in the bush, these alus will cause him to become ill.

Aside from this minor disagreement, everyone agrees that all these alusengau have one primary aim--to cause illness. The alusengau are intrinsically evil, and delight in going bad, in causing illness. They cause illness indiscriminately, so that both the good and the evil suffer from their malevolence. These alus have a chief (16) who

"15. Since neither pigs nor dogs are indigenous animals, this conception must be very recent.

16. His name is unknown, and it is well that it is. For if the people knew his name, they might call upon him unwittingly for medicine (confusing him with an alusemar) and instead of sending medicine he would send illness."

constantly incites his malevolent cohorts to make the people ill--for 'he only like bad', not that the others need his incitations, since they are all vicious, evil creatures, whose sole delight is in harming people by making them ill.

But the alusengau not only cause illness, they also 'give people bad', that is, they give people fight, steal, gossip. If no alus, people no do bad.' In other words, people are intrinsically good, and do evil only because of an external principle, a power or force outside of their own characters and personalities, who, as it were, controls them and leads them to evil deeds. Now, it is patent that we have a contradiction at this point. All evil is caused by the alusengau, since people themselves are intrinsically good. But at the creation of man there were no alusengau, and if the people are basically good, how did evil arise in the first place, since there were no alusengau in existence to incite it? This contradiction was answered by Arogeligar by referring to his story of Ligesges and Legubrielnialel. When the latter departed from Ifaluk, Ligesges no longer followed in her good ways, but began to do evil, and others followed her example. This, however,

is an ad hoc interpretation, for actually these internal contradictions do not disturb the natives. They are not interested in Systematic Theology. (17)

There is another major contradiction inherent in this scheme, which serves to indicate how powerful the alusengau are taken to be. It is Aluelap who decides when a man is to die, with the agreement, according to one version of Solan. Yet the illness caused by the alusengau is usually fatal, and the victim dies, though not with the agreement of Aluelap, thus the alusengau are seen to be more powerful [57] than the high god himself. Arogeligar to whom I put this question answered by use of analogy. Just as some humans disobey the cheifs, so the alusengau may disobey Aluelap, a weak argument indeed. Again, however, I am not interested at this in the logic of the view, but in indicating how malicious and powerful these alus are conceived to be by the natives.

"17. The linguist will be interested in a bit of folk etymology. Tom pointed out, in the midst of this discussion, that the rat (ges) is named after Ligesges, because the rat steals food, which is the first crime she perpetrated."

It is to be remembered that nowhere in this system is there the western belief in reward and punishment. Life in the sky is but a persistence of this life, and the infliction of illness by an alus falls indiscriminately on good and bad alike. The concept of retribution is entirely foreign to native thought, so that when I asked why a man should do good since the alus will destroy both the good and the bad, my question was incomprehensible. Communication had ceased at that point, since the implied conclusion of my question was a complete non sequitir to the natives."

"A culture that asserts the existence of imaginary beings will inevitably produce people who actually perceive those beings. Arogeligar has seen many alusenagau. I have already alluded to the woman who claimed that an alusengau threw stones at her. Tom, who is the most acculturated and most sophisticated of the natives, and who, as we shall see, expressed skepticism concerning the power of the alusemar, has no doubt that people see the alusengau. One morning, for example, he came to inform me that the night before, while he had been with me, his wife and adult son had heard an alus. They first heard his cane being dragged across the roof of their house, and later they heard someone walking about the house, and then spit. Though they were both very frightened, when they heard the steps again, they looked out, but the alus (for that is what they thought it was) was gone. I asked Tom if he had something (some medicine) to keep the alus away, and he had none. He wanted to know if I could protect myself if an alus should want to attack me, and I said I had. He asked me if I would give him my medicine, but I explained that only Americans could use it, and that if the alus should appear again, he should call me, and I would scare him away with my flashlight, since the alus, I told him, were frightened of the flashlights. In the late afternoon Tom came to our tent to remind me of my promise. The next morning when Tom came to see us I asked if the alus had come the night before, and he said it had not come, because it had heard him discussing the matter with me, and had been scared away.

Another time I noticed that Tom had moved into an uninhabited house in his courtyard. When I asked the reason he explained that he had dreamt of being chased by an alus, and therefore moved to the other house, as a precautionary measure. This, indeed, indicates strong fear in view of the fact that dreams are usually not interpreted as omens of the future, or as having any other significance."

116, 776, 753 Ifalik

"The fear of the alus is indicated by abundant evidence. Linguistically it is of interest to note that the term alus, by itself, always refers to the alusengau, unless the context indicates a benevolent variety. The alus usually attack only at night, so that no one will venture out at night into the bush. The people remain within the village, and preferably within the courtyard, and if they must go out for some reason, they light a coconut torch, for they believe that the alus will shun the light. Furthermore, they cover their doorways with mats to keep out the devil."

"Formerly the unmarried young men slept in the club houses or canoe houses. When I asked why this custom has been abandoned, they explained that there are only a few young men now, and that they are afraid of being attacked by the alus. [58]

One evening I was sitting in a canoe house with the young men, and I asked Talimera to bring some cigarettes for the boys from my tent. He was afraid to go alone because of the alus, and would consent to go only if I gave him my flashlight (which I had explained to him, too, was a prophylactic against the alus.)"

28: Spiro--58

"Another important indication of the people's preoccupation with the alus, is the evidence from native phantasy life. The incidence of perception of alus in the Rorschach and TAT is very high, and the perception of the alus in the blots and pictures, is of course, sheer projection. The frequency of the alus in the children's drawings makes it one of the most favorite categories. Indeed it was the drawing of the alus by the children-the small children--that aroused my curiosity about the alus and their meaning to the people. Finally a large percentage of the dreams I collected were nightmares, in which an alus was about to attack the dreamer, at which point he awoke. The dreaming of the alus indicates as strongly as possible how deeply into the unconscious of the people the belief in, and fear of, the alus has struck.

On a more conscious level is the fear of the alus expressed in the Stewart Emotional Response Test. A significantly high percentage of people responded with alus, when asked to tell what arouses fear in them."

28: Spiro--58-59 (1947-48) 1949 Woleaians-1 -2
116, 753, 776, 184, 789 Ifalik

"It is believed that babies are especially vulnerable to the alus, so that they are liable to their attacks even in the daylight. Hence, a baby taken from its home will be covered with a cloth, so that an alus should not see it.

It is obvious from this discussion that we are dealing here with a profoundly significant belief in Ifaluk culture and personality alike. For no matter how conceptualized every person, without exception, lives in great fear of the alus, one ever expressed any skepticism concerning either their existence or their power. [sic] Now this lack of skepticism cannot be attributed solely to conditioning factors, or to the culture pattern, or the determinism of the collective representations, from which the savage cannot extricate himself, to employ the jargon of three alternative schools of thought. For if these factors were primarily responsible for the firmness of this belief, then the same lack of skepticism should prevail in the belief in the benevolent alus, the alusemar, and such is not the case, for here, the natives are entirely pragmatic in their approach, their belief being contingent upon the objective evidence of the aluseman's power. The only objective documentation I have for this assertion comes from Tom. Now it might be argued that his higher degree of acculturation accounts for his skepticism. But this is untenable for this acculturation did not induce any skepticism as regards the alusengau, and furthermore, despite his acculturation, Tom accepts without qualification the entire pattern of natives beliefs, practices, and attitudes.

Tom, in discussing the alusemar with me, remarked that, 'If god talk lie, people throw away.' That is should the alusemar promise to restore a man's health and not succeed he is discarded in favor of another.

On another occasion, we were waiting for the diagnosis and prognosis of the illness Paluelimar, the third ranking chief, by Arogeligar. After it was given, Tom said to me, 'I don't know; maybe that god talk true, maybe talk lie.'

Another point worth recording at this point is the natives' refusal to assign alus causality to events that are amenable to naturalistic interpretation. (18)"

"18. Malinowski's point made long ago (Science, Magic and Religion) that magical or supernatural techniques are employed by natives only in situations which are unpredictable, and which they cannot control applies in full on Ifaluk. Only where [59] naturalistic interpretations are unknown, or where risks are great, are supernatural techniques used, at biological crises, ocean voyages, tec. The paucity of magic on Ifaluk is in part explainable, therefore, by a relatively predicitable environment, so that not even in gardening, for example, are magical techniques used."

"For example, the chiefs at one time were perplexed by the disappearance of a dish of rat poison given them by the navy, which they had set in a canoe house. I suggested that perhaps an alus had absconded with it. They all dismissed this interpretation as unlikely, and agreed with Tom that probably a dog or cat was responsible.

This brings us to the native classifications of disease, which we must describe before we can continue with our discussion of religion, since religion and medicine, as should be obvious now, are inextricable. There are three categories if illness (tamai): (1). Tamai-le-alusengau, illness caused by the alus. (2) Mesilipik or Mesen, diseases caused Mesilipik. (3) Luwegoba, diseases caused by the land."

28: Spiro--59 [2] (1947-48) 1949 Woleaians-1-2
116, 755, 164 Ifalik

"We shall examine the diseases, classified under tamai-le-alusengau and give a short description of the therapy employed. It should be remembered that in all these cases it is believed that the patient is a victim of an attack by the alusengau, in the form of a spirit possession, and the therapy consists of exorcising this alus.

(1). Maliel: This is an infrequent, but fatal illness. It is characterized by dizziness in the head. The patient is given medicine (19) after which his face is covered with a taro leaf, a small flame is held over the leaf, and a chapeng is sung. (20)

(2) Tamai-le-tagurul: This is frequent, but not fatal. It is a very sore back, preventing the person from rising. Medicine of herbs is heated very hot, and is held over his

---

"19. All medicine consists of herbs or leaves of specified plants, which are stirred into water or coconut juice, and consumed by the patient. Unfortunately, I did not collect the names of these plants.

20. The chapengs for all the illnesses will follow the complete catalogue of disease."

back. This treatment is given morning and afternoon, and is preceeded by a chapeng.

(3). Metageserae: This is relatively frequent and fatal. It consists of pains in the stomach. (21) The patient is given medicine to drink, and a chapeng is sung, while the healer waves a cocopalm over the patient.

(4) Imailolo: Continuous vomiting. This is neither frequent nor fatal, and is cured by the consumption of medicine.

(5) Metageleperei: This is a sore leg, which is neither frequent nor fatal, and is treated by placing medicine on the leg.

(6) Mesatat: This is relatively frequent, (about the same as 3), and is fatal. It is a form of sea-sickness. The patient is given medicine to drink, a chapeng is sung, while the healer waves a coconut palm over the patient."

"21. Stomach pains cover a multitude of disease entities, and unquestionably include ruptured appendix, from which two of the four deaths we witnessed were caused."

28: Spiro--60 (1947-48) 1949 Woleaians
116, 753, 164 Ifalik

"In the category of diseases caused by the alus are three others, but they are classified separately from the six enumerated above, for these six are fatal, and the others are not. That is, my indication of fatality means that despite treatment a high percentage of the patients will die, though some are cured by the therapy. Were the healer not to perform the cure, they would all die. The others caused by the alus are not fatal, even if the cure were not to be applied. These are a broken bone (ebung), which is set, and a cut (kopitok) on which I have no information. While we were on Ifaluk, all bruises and cuts--and there were many--were brought to us."

(1947-48) 1949

Woleaians
Ifalik

"Finally, the alus are responsible for an incurable disease, the malebush, which includes both abnormal and subnormal mentalfunctioning. There were four cases of feeble-mindedness--all in children--and three of abnormality, both schizophrenics-- one paranoid, and one simplex, and a neurotic suffering from agorophobia. Aside from the classification of both the mentally-ill and the mentally-deficient together, it is of interest that the natives classified these cases as aberrant types. The feeble-minded children and the paranoid schizophrenic were possessed by an alusetat, whereas the simple schizophrenic was possessed by the alusefalu. Finally, the agorophobic was possessed by one of the sky alusengau. Unlike the other cases, malebush has no cure."

"The second category of disease comprises those caused by Meselipik. Now Meselipik is a difficult concept to delineate. I don't know whether to refer to Meselipik is 'all same cold', so that those illnesses characterized by chills or fevers are caused by Meselipik. As far as I can determine Meselipik is the personification of chills. His origin or creation is unknown, but he is conceived as subsisting between the islands, and carries illness from other islands to Ifaluk on the winds. He is responsible for four illnesses, all of them infrequent, and all fatal. These are:

(1). Ikolevo: Severe chills, cured by the drinking of medicine.

(2) Izamezelibwex: Intense fever, cured by the drinking of medicine.

(3). Mazetra: Blood in the faeces, probably amoebic dysentary. He is cured by the consumption of medicine, and the singing of the chapeng, while the coconut palm is waved over him.

(4). Gilicha: This characterized by red spots covering the body, cured by the consumption of medicine.

The third category of disease is Luegoba, in which are subsumed all skin diseases, yaws, gangosa, leprosy, which are not fatal, and for which there is no cure. These

are caused by the land, that is, by dirt. (22)

The chapeng for the various diseases follow. These chapeng can best be translated by incantation, as opposed to some others, which are hymns."

"22. A question of great importance, on which the record seems quite clear, is sorcery. Sorcery does not exist, the very concept being foreign to the people. Why should a person desire another's death, and even if he did, how could he achieve his ends? The natives were baffled. Yet, Tom told me that in the past, men could invoke the aid of an alus to bring about someone's death. These were 'very bad man. Plenty house no more people now. (that is, their death's were caused by these sorcerers.). Now, no man savvy.' This may have been a personal belief of Tom's that he had picked up in his travels, and I am inclined to think so, since no amount of research elicited anything but incredulity concerning sorcery."

28: Spiro--60-61 (1947-48) 1949 Woleaians
116, 157, 761 Ifalik

"On the other hand death wishes do exist, as the TAT reveals. A great number of people perceived the human figures in the pictures as dead. This of course, is not [61] the only possible interpretation of such perception. Dead people may not only be hostile death wishes, but may be personal identifications of the people with innert, lifeless, people, as projections of their own inner psychic life. This will bear much scrutiny before a final conclusion is drawn. Apriori, I suspect, that both are operative here, depending upon the person.

In either event it would be important to know whether the people harbor death wishes against others. My field work, on this point, was sloppy, indeed. I have one notation in my field notes, dated one month after our arrival, in which Tom had informed me that if a man harbors death wishes against another, a benevolent alus will punish him by retaliating in kind. This note was tucked away in the corpus of field notes, and forgotten. I have no idea, therefore, whether this is a personal or a cultural belief, nor what the incidence of such phantasies are, nor, if this is a cultural belief, how many deaths are attributed to this fact."

28: Spiro--61 (1947-48) 1949 Woleaians
116, 756 Ifalik

"Where therapeutic care is indicated, the procedure is as follows. Usually Arogeligar is called to diagnose the illness and its cause and to prescribe the cure. He then performs the healing. If his cure is not efficacious, others will attempt to cure the victim by means of medicine they learned in their family. Arogeligar, though the chief healer is not the only one who can perform the healing ceremonies. If others know the technique, they are permitted to do so, though they are few in number, so that in the case of the illness of Navor, her mother's brother, Mariligar, the second ranking chief, performed the ceremony."

But before continuing the theoretical discussion, it may be well to describe one or two concrete cases. Paluelimar, the third ranking chief, had been ill for about a month, and from the symptoms, it seemed like amoebic dysentary to us. Arogeligar and others brought him medicine, but to no avail, from which it was inferred that this was a serious illness, that required a chapeng and special medicine. (23)

Later that afternoon, as I was walking towards the house of Paluelimar to bring him some medicine, I met Arogeligar. He said he would perform a ceremony that evening for Paluelimar, and invited me to witness it. (24)

"23. A few days before the ceremony Arogeligar had met Dr. Burrows, and asked him if we had any medicine to give to Paluelimar. This, of course, is significant--the chief healer asking the strangers for medicine. It indicates among other things the unsureness, even on the part of the expert, concerning the efficacy of the alusemar, and their curing powers.

24. All medicine ceremonies are held in the evening. The natives explain that it is taboo to do any work immediately after the ceremony, so that if it were held in the day, the participants would have to remain inactive for the rest of the day. But this strikes me as a feeble attempt to offer a rational explanation for an irrational phenomenon, though I cannot suggest a better one."

After the men had collected their toddy, the ceremony began. Paluelimar is a chief, so that the entire courtyard was filled with people, sitting around the house. The entire district of Felarik, with few exceptions, and all his kin from the other districts were in attendance. In the center of the stage were Arogeligar and two male assistants. Arogeligar had a marmar on his head, a women's belt across one shoulder, extending in front of his chest, a cotton ball in his hair, in which were placed two white chicken feathers, and a tria comb in his hair. On his right wrist was a coconut leaf strip, and of course, his face was painted. [62]

A mat was set just outside the doorway, for Paluelimar to sit on, and Arogeligar thrust some coconut branches into this mat prior to the exit of Paluelimar.

When Paluelimar came out, he sat on the mat, and Arogeligar placed four coconuts all clinging to one stem in front of him. There was no talking of any kind, and a hush had fallen over the people. Arogeligar picked up a long coconut palm, and approached Paluelimar, reciting a chapeng in muted tones, while alternately striking the four coconuts, and bringing the palm back over his shoulder. When the chapeng was completed, he swept the palm horizontally from one shoulder blade to the other in rapid succession several times. He then picked one coconut from the stem, and holding it over the head

of Paluelimar, cut an incision in it with a wooden knife (25), and after several strokes of the incision, he plunged the knife into the coconut with a deft movement of the wrist. The coconut water spilled on to Paluelimar's head, and as it was falling Arogeligar sprinkled it over the heads of those sitting in the immediate vicinity. This 'medicine' has not only a therapeutic value, but a prophylactic one as well, so that parents sat with young infants in their arms, close to Paluelimar so that the infants could receive it. When the coconut was dry, he held it in his left hand, and cast it over his right shoulder,

---

"25. The natives all have steel knives, and never use wooden knives, nor had I ever seen a wooden knife previously. This is an interesting point for the student of acculturation with respect to differentials in the degree of acceptance and resistance of foreign objects. Despite the greater physical efficiency of the steel knife, the wooden one is used for this ceremony, and the small shell, rather than a steel knife, is still used to sever the baby's umbilicus. In other words, those areas of culture which are imbued with mysterious connotations, in which the element of danger and unpredictability are strong, are most resistant to acculturation. Whether this is a valid generalization for other cultures, I don't know, but there is no question of its applicability to Ifaluk."

leaving it lay where it fell, without watching to see where it landed. The identical proceedure was repeated with a second coconut.

Arogeligar then took a small twig of a palm branch, smoothed back the hair of Paluelimar, which was dripping with the coconut water, after which Paluelimar reentered the house. Tobacco, belonging to Paluelimar, was then passed among the people, while Arogeligar rubbed paint into the incisions in the coconuts, which remained where they had fallen, and were not moved. He then went into the house to sing a chapeng, and the people were informed to return the following morning for the conclusion of the ceremony.

The people assembled the following morning at dawn. Arogeligar repeated the coconut ceremony with the two remaining nuts. He then could make his diagnosis, which follows from the configurations of the paint in the incisions. After reading these configurations he announced his diagnosis. The illness was caused by two alus. An alusengau of Paluelimar's parental home (Vwenau) (26), was the main cause, with [63] the

"26. Unlike the alusemar, each house does not have its own alusengau, for the latter attack indiscriminately. However, there are cases, in which a great number of people of one household suddenly [sic], in which case it is inferred that the deaths are caused by the alusengau of this lineage, and the people abandon the house and build a new one. Now this happened to be the case here. Paluelimar's lineage house (Vwenau) had been abandoned because of the sudden deaths of a number of its members, so that it is known that alusengau of his lineage are particularly vicious."

assistance of an alusetat.

This ceremony, like all ceremonies, was followed in the late afternoon by a feast, partially provided by Paluelimar, most of it brought by the assembled people, each household eating its own food.

Thus we see that the diagnosis of the illness is simple, merely being an identification of the symptoms. The diagnosis of the cause, however, involves the ceremony just described. But this ceremony is not only of diagnostic value, but is therapeutic as well, the coconut juice becoming medicine after the chapeng recited by Arogeligar.

All those who had participated in the ceremony were under the taboo of not working. The taboo is removed by the partaking of food at the feast.

The members of the lineage, however, may not work for four days."

"In case of a protracted illness, the members of the person's immediate family do not cut their hair. The person, himself, may not have his food cooked from the family fire, but has it cooked on a separate fire. It is taboo, also, for a person who is well, to eat food prepared on the fire of a sick person.

The patient is visited every day by various kin who come to talk, to bring food or to help around the house. The women gather at the house in the day, but in the evening the men and children join them, and they merely sit about, talking in modulated tones, but offering no consolation or commiseration with the victim. If the person is seriously ill, and there is a strong possibility of death, the kind alternate in sleeping in the house of the victim, or in the house adjacent to it. The natives say that they do this to keep abreast of the condition of the one who is sick. Whatever the reason, the practice was followed every night after the medicine ceremony for Paluelimar, and again for the person, whose ceremony is to be described below.

Navor, the daughter of a deceased chief, a married woman, and mother of five children, complained of pains in her stomach, which were diagnosed as metageserai and which, in this case, was probably a ruptured appendix. Various people brought her medicine, Arogeligar recited the proper chapeng, all to no avail. She was then moved from her house to the house of kin on the other island. This is a common proceedure. It is

believed that the alus might depart if the patient is moved from his own house. But her condition did not improve, and a number of ceremonies were conducted for her. She was then moved to another house, and a four day ceremony was held, the same kind that was later performed and which I witnessed. Later, when her condition was thought to be very grave, she was moved to her own house, the custom being that a person should die in his own lineage house. A few days after her return home, the ceremony for metageserai was performed, in which Maroligar officiated. The ceremony was repeated on four successive nights. It is held inside the house, and all the kin of the person and the kin of the spouse are in attendance, at least on one of the four nights. The immediate family participates on all nights. Maroligar wore a strip of green coconut branch about his neck, and a cotton headdress in his hair. In his right hand, he held the medicine, which was comprised of herbs enclosed in coconut bark, attached to a coconut branch. Before beginning the chapeng, he dipped medicine in some water, and had Navor drink from it as he squeezed it into her mouth. He then began the chapeng, assisted by the assembled people, while he waved the medicine bundle over the patient, who lay prostrate before him. The motion is really a throwing motion, as if he were to throw a spear. He clasps the medicine over his shoulder, and then shoots it out over the patient, circling it constantly over for the duration of a line of the chapeng, then he returns it over his shoulder, and shoots it out again for a new line. At the end of each stanza, he

dipped it into the water, sprinkled some on the chest of the patient, and then began the next stanza, repeating the same movements. When the chapeng was finished, there was an intermission of about fifteen minutes, and then it was repeated in its entirety. At the [64] completion Maroligar distributed tobacco to all present, and then they sang some general chapengs.

These ceremonies are very eerie, solemn, and profoundly impressive in a weird sense. The house is illuminated by a single flame of a candle, casting its shadows in fantastic forms about the house, while the atonal music, and the words of the chapeng cast a never-to-be-forgotten spell on the observer. The people were all solemn, no one talking or laughing, and the mood of the adults permeated to the children, for they were quiet throughout the entire proceedings, which is rare indeed for them.

After the ceremony there is talking and laughing, though in subdued tones.

The reaction of the patient to this ceremony is not known, but one could venture the guess that it does not improve her morale, to say the least. The chapeng reminds her of her possible death, the severity of her illness, and of her possession by an alus, the latter being a terrifying thought."

"The afternoon following this ceremony was the occasion for the usual feast. The men went fishing in the morning and the women prepared taro, and again each family brought its own food, consuming it at the house of Navor. Of course, only those who had participated in the ceremonies came to the feast. The people were dressed in their finest--the women wore their new lavalavas, and the men and women both had painted faces. Every one was solemn and very quiet and talk was hushed and low. This insistence on silence at these feasts results in the only attempt I know of to curb the free expression of children. A mother will slap her child's hand, or put her hand over its mouth if he should persist in speaking loudly. This training apparently is quite effective, since the adults conform to this practice of silence without exception. After completing their meals, the people departed one by one, though not before Arogeligar had distributed the cigarettes that we had brought to Maroligar, and had made a humorous speech."

"Aside from these important curing ceremonies, there are medicine ceremonies for the ill, in which only the lineage participates. They are held in the house of the sick person, and the house is taboo to any one but the participants.

There are other taboos associated with the making or consumption of medicine. After making medicine from herbs, there are periods of isolation, ranging from a day to a month--depending upon the nature of the medicine--during which time the person neither sleeps in his house, nor eats of its food.

The consumption of a certain medicine creates the taboo on eating food cooked on a fire of breadfruit wood, or taking a light from a breadfruit-punk fire."

"This association of religion and medicine is found not only in the healing of individuals but also in the group or public ceremonies and rituals. The public ceremonies are all medicine ceremonies, in which medicine is made and consumed immediately as a prophylactic against future illness, and in which the alusemar are invoked to protect the people from illness. Though other Alus are involved, it is Tilitr that plays the important role in these ceremonies. Tilitr is difficult to conceptualize in terms of our two categories of alusemar, for he is really intermediate in rank between them, being neither in the pantheon, nor having ever been mortal. He lives in Fatuma, with the royal family of alus, but descends to Ifaluk frequently, particularly at the public ceremonies when he is invoked, and then returns to Aluelap to report to him. Tilitr, as has already

been indicated, is the patron saint of Ifaluk, protecting them from evil and from illness. (27)" [65]

"27. Tilitr predicted an American victory in the war. The natives, of course, knew of the war because of the airplanes which flew over-head, because the Japanese had told them of the war, and because Ifaluk young men had been on Yap during the American bombardment of the island. During the war Tilitr had told Arogeligar that the Americans would win, and that he (Tilitr) would assist them. He also had told him that the Americans were a fine people, that they had 'very fine head, very fine stomach,' and that the Ifaluk head and stomach were small, by comparison."

"Though Tilitr dwells in Fatuma, he and his sons have shrines on Ifaluk, to which they often descend. Of the eight shrines, seven are for Tilitr or his sons. (28)"

"28. [See following sheet for footnote 28.]"

"28. [Footnote p. 65] There is one shrine in Felarik, Bwutaliwenol, in the lineage house of Nuteitei for the son of Tilitr, Wuluaro. In Rauau, there are two shrines: Bwuter Tilitr, the shrine of Tilitr, which is inside the public house, the fanap of Atelu, and Bwuter Tiliwetan, the shrine of Tiliwetan, a son of Tilitr, that is in the courtyard of the lineage of the Uelepi house. There are four shrines in Falalap: Bwuter Talewearo, a son of Solal, and Bwuter Tilitr. Except for two of these, the shrines are merely circular mounds of white, smooth sand, surrounded on its circumference by rocks, with a medicine plant or two in the center. In case of illness, tobacco or even lavalavas may be offered to the alus to help exorice the alusengau. The shrines are made of sand because Tilitr does not like place 'all same wet and stink', which is the earth. He likes only dry and clean places.

The main shrine is Bwuter Tiltitr in Falalap, for here all the major ceremonies are held. It, too, is a shrine of sand, but in addition has four upright sticks, which represent Aluelap; Lugeiligg, his son; Olophat, his grandson; and Tilitr.

Bwuter Tilitr in Rauau is in the fanap, and is a platform, with sides about a foot high, on which are placed tobacco, and from its upright poles always hang offerings of lavalavs.

In Falalap one shrine is a small model house, in which hang offerings of lavalavas."

"Having neither calendars, nor formal reckoning of time, religious ceremonies are not held at regularly defined intervals, but are called by the chief at the suggestion of Arogeligar, when he feels the time is propitious."

28: Spiro--65-66 (1947-48) 1949 Woleaians-1
116, 755 Ifalik

"The first ceremony we witnessed, a medicine making ceremony, is called only at the command of Tilitr himself. (The chiefs say, Lugeiling.) An inhabitant of the dwelling in whose courtyard is the Bwuter Tilitr on Falalap is possessed by Tilitr, who informs him that the ceremony should be held. In this case a very old man, completely disabled, was possessed, and the two day ceremony was called and held on September 19-20.

The ceremony started in mid-morning, and as we approached the Bwuter Tiltr, men and women were seated around the sand shrine, singing a chapeng, and pulling a rope of grass back and forth around the circumference of the sand. From the house, in whose courtyard the ceremony was to take place, the old man who had been possessed was still uttering unintelligible sounds, and at times would burst into song with the people outside.

At the same time other people were assembling, and on one side of the court, [66] a number of young men were husking huge quantities of coconuts. When all the people had arrived, the ceremony began. It is to be understood, of course, that every one attends these ceremonies, so that the entire population was congregated within the courtyard, sitting about the shrine, facing it, men and women sitting apart. The people were 'dressed up' in their lion cloths and skirts. They were all quiet during the ceremony some exhibiting a very profound reverence. Even the children were quiet desisting from the usual horseplay. Arogeligar, the officiating priest, then gave orders to make the medicine and the young men, who had husked the coconuts, opened them, permitting

their juice to run into two large metal vats. When this was completed, the angorik and warung (or maybe other plants, I'm not sure) were mixed into the coconut juice to form the medicine. Arogeligar then sprinkled this medicine on the people, in all four directions. The young men, then passed out coconut shells to the people, filled with the medicine, which they drank. The medicine had a very pleasant ginger taste, given it by the plant.

When the medicine had been consumed, a young man, one of Arogeligar's assistants, stood in the midst of the assembly, and sang a chapeng, while waving two of the medicine plants to and fro. He then sat down, took a branch of the same plant, dipped it in the medicine, and as people gathered about him, he sang the next verse of the chapeng, while circling the branch around his head, continuing this until the verse was completed; whereupon he dipped the branch in the medicine once again, and went on to the next verse.

When the chapeng was completed, the ceremony was over. Now the people all joined in the farewell to the alus, which ends all religious ceremonies. It is shouted in a shrill kind of stocatto, rising to a crescendo at the tayokidis at the end, and ending with a trilled whistle."

"The chapeng chanted at the ceremony [WPM: see p. 65] was taught to Arogeligar by Tilitr, who in turn taught it to the people. The farewell chant was taught to Arogeligar by Aluelap. The vocabulary as well as construction is unusual, the people understanding very little of it, so that Tom had to ask Arogeligar to interpret the words to him, before he could translate them for me."

"The following chapeng is the song sung at the ceremony that we witnessed in September, the two day affair. It is in the nature of an invocation. The text was collected by Dr. Burrows and the translation is his.

I

Nite-it is nite now.
Today when morning comes
the god Tilitc will talk to us all.
Hearken, people of high or low degree!
I was sent to listen to your talk.
I have come and found that all is well.
First I was sent down
to the chief of the nether world
to learn his bidding and ask his help.
He will look after you,
so will my son Tilital.

The coming of the god delights the people,
they gather to see the man he possessed.

First the god speaks from the housetop,
calls to the people to wake. [67]
They all rise from their mats when day is dawning,
when the sky is growing bright
Eager to hear what the god has to say.
All long to hear the words of the god.
When the sun is past the zenith
all the women gather flowers
Bring ritri flowers to the shrine.
If any fail in this they may sicken,
All will suffer unless they come.
Tilitc and Tilital.

Pelele and Laliaro did
not heed the god's words and fell sick;
He cured them by giving them new names.
He wants an end of all evil talk.

II

We are all weary waiting for the god.
'What nite is he going to come?
He has not yet appeared.
As they sing to him, the people grow afraid.

Tilitc and his son are like the wind.
When any of our people are lost at sea,
Rain or shine they go to find them,
Search the seas for the canoe.
If they do not find it in one direction they try another.
At last they find the castaways.

He comes down from Lengilialo
Back from his search comes the god.
The men want to sing for him;
All rejoice at his coming
Down from Lengilialo.

He tells the women to dance for him.
All the people rejoice together.

III

He leaves his home in the sky
To come to us here on earth,
Coming along the road of the gods.
He finds us obedient to his commands.
He sees a fire, hears someone singing to him in the nite.
His son Tilalo comes with him.

Listen all you people!
If you do not heed what the god says
Sauteti and Saurek will come after you!
The god comes to frighten them away.
When he appears they scurry off.
The god's sister, Leurulalo, asks him to help us.

'You have my word,' he told her.

IV

Our chief remembers well what the god said,
When he appeared before all the people. [68]
The chief praises Tilitc,
In words well pleasing to the god.
Praises him and divine family.
The chief thanks the god and bids him farewell.
Now we will experience happy days.

He roams over all the islands,
All the length of the Carolines.
He visits Truk and Yap
To see that people behave as they should.
He watches over our boys working (for the Japanese) at Yap.
And all the length of the Carolines,
He gazes about as through a telescope.

He can see everywhere.
He has not come back from his voyage.

He goes to visit Europe,
Goes all about that continent.
Long he looks about their [sic]
like a curious traveler
To see what they are doing, what the fighting is about.
Then he leaves that land and comes back to us.
'The war will soon be over now.
'The end of the fighting is near.
'Do not be afraid any more
'Soon the Americans will come.
'All you women and children who brought me flowers,
Fear no more.

V

The god is resting in Langiliolu
At his house Ngiligejap.

The people want to invoke him,
how many moons before he comes?
They come to his earthly house
All the people of this island,
Waiting to hear his word.
If he comes, he will summon them.
A woman brings flowers
To bedeck the rod on his shrine.
The long leafy branch of aro
is dipped and twirled in time to the song,
The aro that gives health.

The god came down from Langiliolu
To tell us to make medicine
So that nobody would be sick.
He said, 'Since you heed me, you will thrive this month.
All are healthy and wise while he is here.
They heed well his words.

The flower for the god is the warong
Tilitc give us your benediciton.
He goes to find a blessing for us,
Finds some gift to bring us.
Far and wide he roams in search of a blessing.
Some do not understand,
Do you know what a gift he will bring.
Whatever is good in distant lands he will bring us. [69]
He travels like a wind.
He goes to find all lost mariners.
He has little time to linger here.
He must travel about like a wind,
The wind that blows on lost sailors,
The wind that blows them home.
He watches over sailors far from home.

Like a great sea bird
He flies over the canoemen

(1947-48) 1949

Ramale and Tilvwemeau.

'Do you know where your course lies?
'You are going astray, you will drift off.'
They thank him for coming to save them,
Iletigi and Ilearo. (the women in the canoe with the men above).

The farewell is to Aluelap, Lugeiling, Wolphat, Solal and Tilitr.

Good-by now, good-morning my chief, good-morning my chief.
(addressed to Solal)
Good-by, oh my chief, who dwells in the heavens.
(addressed to Aluelpa)
Good-by, good-by,
I return, and the people depart, good-by, good-by, good-by.
(this spoken by Tilitr, who continues)
I am lonesome for my chief (Aluelpa), for he is my mentor,
my protector.
Depart. Your chief is weary, he has descended to the earth,

But no mortal has come.

(Tilior to Tilitr)

Descend, you descended to Ifaluk, and protect its people
and its chiefs, (Aluelap to Tilitr)
Protect them from the arms of the Americans and of the
Japanese,
Instruct your people to make flower garlands, and to
place them on your alter.

It is finished,
It is finished."

28: Spiro--69-70 (1947-4[illegible] 1949 Woleaians
116, 755 Ifalik

"With the farewell, the morning ceremony was over [WPM: see p. 65] and the people returned to their homes. In the afternoon, they reassembled, the sexes again sitting apart. Arogeligar's assistants each took a plant, soaked it in the coconut juice remaining from the morning, and then squeezed it out into individual coconut shells, to be consumed shortly. They then jerked their arms over their heads in a precipitate movement, so that the juice was sprinkled onto the people sitting around them.

One of the officiators then dipped a branch of the plant into the medicine, and accompanied by two other officiators, he chanted a chapeng while revolving the branch about his head in a clockwise direction. He then dipped the branch into the medicine, and revolved it in a counter-clockwise direction. When he finished, the farewell hymn was sung, ending the ceremony proper. [70]

The medicine was then distributed among the people, first giving some to Dr. Burrows and myself, and then to the natives. The medicine had an oily texture, and tasted like a western laxative.

While this medicine was being distributed, Arogeligar lighted four cigarettes, and placed them in the sand of the shrine, as offerings to the alus. He then sat immersed in meditation, looking up towards the sky at intervals.

When the medicine was consumed, tobacco was distributed among the people, and Arogeligar made a speech exhorting the people to obey the chiefs, and to obey Dr. Burrows and me."

28: Spiro--70 (1947-48) 1949 Woleaians
116, 755, 784, 462, 778 Ifalik

"The people returned to their homes, work and sexual relations being taboo. The next day there was to be a feast, and that night the men went fishing after the appearance of the moon. The next morning the men resumed their fishing, while the women prepared taro and breadfruit. (Dr. Burrows and I contributed two tines of beef). It was not until late afternoon that we started for Falalap. As we approached we saw the women sitting around the shrine singing, while making garlands. The possessed man was still semi-delirious and would break into song at unpredicable intervals.

The shrine was then completely encircled by garlands, after which others were distributed among all the people assembled. Arogeligar announced that the alus had informed him that the American visitors were very fine men, and that they should receive garlands.

The chiefs then gave their permission to begin eating. This time, the sexes were not spearated, because the people sat in family groups, except for the chiefs who ate together with the ethnographers. At the conclusion of the meal, the people disbanded and returned to their homes."

"Shortly after this ceremony, Arogeligar announced a forthcoming medicine-dance. Tilitr had possessed him and informed him that a medicine dance should be held, for if it were not, illness would descend on the people. After a two week preparation the dance was held on October 9. Like the other religious ceremonies devoted to health, this one has a dual function; it serves to protect the healthy from disease, and it has therapeutic effect on those who are ill. The dance was held at Bwuter Tilitr, on Falalap, and the people were decorously dressed with flower wreaths, painted faces, and headdresses of cotton batton in which were fastened white chicken feathers. The dance was in two parts, one of the men, and one of the women. In either case, the dancers sat in a row facing the onlookers.

The men assumed quasi-feminine garb for this occasion. They wore skirts made of coconut branches, over their loin cloths, and they wore the shell belts worn by the women. Arogeligar, of course, was in charge of this dance, whose participants--young men and boys--had been practicing almost two weeks.

The dance is performed sitting, the dancers accompanying themselves with songs. The dance involves only the movement of the arms and of the torso, in which the arms are extended in front of the body at face level, the hands are weaved and saved, then the arms are flexed and the hands gesture towards the body in an enfolding movement, culminating in a clapping of the biceps as arms corss. Both the men's and women's dances were

the same, the women taking over when the men finished.

An interesting sidelight in both dances was the little 'game' played by Wolpatau, the first ranking chief. He walked behind the dancers cigarettes in hand, and held [71] some cigarettes over the head of a dancer while blowing his whistle. Any member of the dancer's lineage could seize the cigarettes from his hand. This produced much laughter and excitement, which contrasted with the seriousness of the dance and its serious intent.

When the dancing was completed, the usual distribution of coconuts by household [sic] followed. Following the consumption of the coconuts, Taroman presented Tilitr with a new lavalava, which was placed on the shrine. Speeches by Arogeligar, Taroman, and Wolptau followed, all stressing the same points, to obey the chiefs and to be good. The chiefs then distributed their tobacco to the people, again by households.

On a whole the ceremony gave the impression of lethargy. It seemed to lack energy, interest, or vitality. The men showed greater animation than the women, but they had the volatile Arogeligar to provide them with stimulus."

28: Spiro--71

(1947-48) 1949

Woleaians
Ifalik

"No ceremony was held for over a month and a half. On November 27, a minor ceremony was held in the late morning, but only the people of the Felarik district were in attendance. It was held, as usual, at bwuter Tilitr. When we arrived, we saw the alter surrounded by red and white colored maramar, which were distributed among the people, each receiving at least one of each color. Arogeligar then made a speech addressed to the chiefs telling them that they must ensure better care of the shrine. He then announced a medicine making ceremony for the following day, and told the women to prepare the times, which we shall explain below. The people then gathered about the shrine to say the traditional farewell.

The women retired to prepare the times. The times are coconut mats, made of young coconut branches, which the young men hang on trees along the shores, encircling both islands. Before they are hung on the trees, five men sing a ritual song over them. The words of the song cling to the Times, and as they sway in the breeze the words are automatically repeated over and over again. The people, of course, cannot hear the words, but the alus and illness can, and when they attempt to enter the islands and cause illness, they are frightened by the song, and do not enter. Times, therefore, may very well be a contraction of itoae mas, 'not die'."

28: Spiro--71-72 (1947-48) 1949 Woleaians-1-3
116, 539 Ifalik

"The name of this song is Aluselitimes, and is traditional.

Sickness and devils: Depart, depart
Depart from this island of Ifaluk,
Depart.
Cease! all illness that comes to these shores.
Depart Maselepi and Tria. (Maselepi seems to be the common cold.
Do not enter, Nesuaregeruch, Tria is a slight illness that comes to
Oh you mighty devil. those who do not excuse themselves when
If you come, be you thwarted. they walk above those who are sitting.)
If you bring illness, may it
be turned away. (nesuaregeruch is a devil).
Depart Nesuaregeruch, Mesuanepelap. (Two devils)
May illness visit us not in the future.
If, you come, you will surely die.
Come not, you cough,
for if you come, the tarewa will devour you. (Tarewa is a big fish)
Oh you illness, come not directly, but be deflected from your
course, as a drunken man.
If you come, Times will rise, and you will be thrust aside.

Come not on top of our houses.
If the devil comes, he will surely stumble.
If illness comes, Times will surely protect us.
The mouth of Maselipik shall not open. (to eat people, or give them illness).
If illness comes, I hover over the men, and the illness will depart [72]
I turn to the gods, I sing their song, they will surely remove the illness.
Oh, wave, and remove the illness.
People will not die, they will not be cast into the ocean.

(When a man is ill, Arogeligar drives out the illness by waving a coconut leaf over him. The Times serves this function for the entire population).

The ill will not die. They will remain here as does the ground.
If illness comes, it cannot prevail.
If illness comes, my song will encircle me, and protect me.
(the song is like a magic circle, protecting those inside it)
If I take ill, the god will come to me.

Myriads of illnesses will not enter me.
Many illnesses will not prevail against me, for my song protects me.
If a man should fall sick, he shall not succumb.
The god will protect me.
He will protect me as a barricade against the illness.
Go! (says the god to the illness)
Illness will not see you.
Do not enter that man.
Do not enter. Do not enter.
You are not powerful.
You, you, you (to the devil)
enter not, enter not.
Enter and die. (The song of the times will kill the devil).
These people will not die, nor will they ascend to the heavens."

"The following day, after the times had been hung by the young men, the ceremony was held. This time it was not held at bwuter Tilitr, but near the small club-house in Falalap across the channel from Felarik. Coconut juice was poured into the cauldron, as before, and angorik was added to it. This medicine was then passed among the people in coconut shells, after which the young men gathered about the cauldron, and chanted the following chapeng, which ended the ceremony.

My arm has made this medicine, hot as fire, to ward off illness
My medicine is hot as fire, those who drink will not fall ill
My arm is hot as fire.
My medicine is hot. Illness will not come.
My medicine is very hot. It descends into the oceans. It is very hot.
My medicine is very hot, it descends into the waters, it ascends into the heavens.
(the point being that Aluelap finally puts it into the cauldron).
Drink of this medicine, and be well.
Drink, and live.
This is the medicine of Tilitc. (At this point it is stirred)
Tilewetan has given it its healing powers.
Depart, you devils,

Depart and sleep under the sands.
Depart, Depart!
Depart, Depart!
Depart, you devils of the reef,
Depart you devils of the reef.
Depart, depart!
Sleep!
This is a traditional song, called Sisitenitavei--lit., 'place medicine in the cauldron and sing'"

"The person, who has figured so prominently in these ceremonies, Arogeligar, is the tamon alusuia, leader for (matters concerning) the alus. The tamon alusuia is the religio-medical specialist, but like the other specialists he devotes only part of his time to his specialty, since he assumes the same economic responsibilities as the other men. The office of tamon alusuia is inherited patrilineally, it being passed on from the incumbent to any male relative in his patrilineal line, so that Arogeligar succeeded his father's brother to the office. But descent is not sufficient, for a successor must be designated by Tilitr in a state of possession for the office. The incumbent in the office appoints a male relative as his successor upon the request of the latter, and instructs his in the lore and knowledge of the position. At the death of the tamon, his designated successor seeks possession or a vision, not unlike the Plains Indians vision. Arogeligar, for example, brought Tilitr gifts of food and flowers to his shrine. He ate and slept very little, if at all, and asked Tilitr to appear to him. Finally Tilitr did appear, in late afternoon, and Arogeligar remained possessed for four days. Tilitr appeared in the form of a man, rested heavily on Arogeligar's shoulders, and spoke to him in Ifalukian. Tilitr taught him how to call upon him for medicine, and he instructed him to 'look out good this place, the people and the chief for this place. If you don't, you very bad man.' This experience, then, made Arogeligar a full-fledged tamon alusuia.

Since that initial possession, Tilitr has possessed Arogeligar many times, either to inform him of some event, as when he told him of the impending American victory over

the Japanese, or to give him medicine, that is, to inform him what kind of medicine, that is, to inform him what kind of medicine to employ in a certain illness. For after Arogeligar diagnoses any illness, he then goes to bwuter Tilitr, and asks Tilitr if he should apply medicine to the victim, and what kind. Tilitr then answers him, instructing him how to obtain the medicine. Arogeligar informed me that he is usually possessed at least twice a week, and sometimes more often. When Arogeligar talks to Tilitr, asking for medicine, his request has the same name as a conversation with a mortal, 'Meliali'. There is no term corresponding to our term, prayer, for there really is no concept of prayer. The chapeng are really incantations. When Tilitr possesses Arogeligar, he uses him as the mouthpiece through which he speaks, so that it is Tilitr and not Arogeligar who is speaking. This is called Arogeligar le'Tilitr.

Unlike the other people who are possessed only by the alus of their lineage, Arogeligar is possessed only by [sic] and by Tilikong, an alus who does the bidding of Tilitr. The tamon alusuia assumes the name of our alus when he takes office. Arogeligar is Tilievo. His successor has chosen Talevearo.

It is apparent that though the possession and induction into the office of tamon alusuia involves a personal, psychological experience, it is one that is completely culturally patterned. Only certain individuals can inherit the office; they prepare for it by formal

training, and by psychological conditioning, so that it is not strange that the sought-for vision should materialize."

28: Spiro--73-74 (1947-48) 1949 Woleaians
116, 756, 868

"The incumbent in the office [WPM: of Tamon Alusuia. See p. 73, paragraph 1] trains not only his successor, but also a number of others who act as minor functionaries in the public ceremonies and in the curing ceremonies. Arogeligar, for example, is now training twenty-three individuals, ten males, and thirteen females. These assistants gather herbs for medicine, assist in the public ceremonies, and at times, when Arogeligar finds that a victim is possessed by a very powerful alus, for whose exorcism his medicine is not sufficient, he asks them to bring medicine they know, or that they learned from their parents.

When he is called in to heal, it is with the understanding that he is to be payed if his healing is successful, but he received nothing if the victim should die. His payment consists of lavalava, or rope, but there is no stipulated amount. [74]

The tamon alusuia not only receives payment for healing he also receives payment for teaching his songs to his assistants. This, Dr. Burrows suggested to me, might imply a concept of ownership in the songs. When I questioned him on this point, Arogeligar was firm in insisting that the songs were owned by Tilitr and not by him, and the payment he received was for his time, so that he is payed approximately the amount of rope or fish or lavalava that he might have been expected to manufacture in the time devoted to the instruction."

28: Spiro--74 (1947-48) 1949 Woleaians
116, 776 Ifalik

"Aside from the alusemar already described, there are special alusemar for the different economic specialities, so that the alusezenap, are the alus for the carpenters, and the alusepalu are the alus for the navigators. These alus are members of the same family and dwell in the sky, near the abode of Aluelap. Aluluei is the father of this illustrious family, and is the chief navigator in the sky, as well as the patron saint of the navigators on earth. One son, Paluelap is also a navigator, Selangli is the master canoe carpenter, Alulemas is the repairer of houses and canoes, and Faravai is the weather expert. Each of these sons is proficient only in his own specialty, and is completely dependent upon the others for assistance in theirs.

The specialists on earth turn to these alus for assistance and aid in their undertakings, and the requisite rituals are part of the instruction that the specialist imparts to the apprentice during his training period. These alus are the recipients of a token-sacrifice known as io-io. (29)"

"29. Sarfert incorrectly calls these banewan. The banewan is any gift a person gives to another, whereas the io-io is a token gift offering to the alus."

28: Spiro--74 [2] (1947-48) 1949 Woleaians
116, 776 Ifalik

"There are four alusto whom io-io are offered, three of the four being offered to the specialist alus. Lugeiling is the other alus who receives a io-io. The person who brings medicine to a sick man, whether he be Arogeligar or any other person, offers a io-io of coconuts to Lugeiling, asking him at the same time to ensure the efficacy of the medicine. A short time later he offers a io-io of food, which is placed in a special dish, and later thrown away."

28: Spiro--74 [3]
116, 776, 782, 335

(1947-48) 1949

Woleaians
Ifalik

"Alulumas, the patron saint of the house carpenters, receives a io-io at the completion of any construction job. He, too, receives two io-io, one of coconut and one of food. When the men drink the coconuts that are distributed after each construction work, the juice that squirts out of the nut as it is opened is accounted as a io-io, and the chief carpenter on the job asks, Alulemes that if 'I fix another one, no fall down on me. Now I finish one, I give you this coconut.'

When the men gather again for the customary feast, one or two days after the completion of the work, a portion of fish and taro is wrapped in a leaf, and placed in the ocean as a io-io to Alulemes, and the same words or words to that effect are uttered."

28: Spiro--74 [4] (1947-48) 1949 Woleaians
116, 776, 782, 396 Ifalik

"For a canoe construction it is Selang-i the patron saint of canoe carpenters, who receives the io-io. His too, is the dual offering of coconut and food. At the completion of the canoe the head carpenter places a coconut along side of the canoe, and says, 'I give you this coconut; suppose I make another canoe, (assist me so that it will be) very fine.' Again when the men gather for their feast, the head carpenter expresses the same sentiments, and discards food from his plate, as a io-io to Selang-i."

28: Spiro--74-75

"Aluluei is the recipient of the io-io when an ocean voyage is undertaken. As [75] the canoe leaves the lagoon and enters the ocean two coconuts are dropped overboard for Aluluei, and the navigator says, 'Look out my canoe, no drift away; wind and rain no take off.' But also offered to him are breadfruit, taro, and a new lavalava. These, however, are only symbolic offerings, since the food is consumed when the destination is reached, and the lavalava is brought back with the canoe, to be worn.

The io-io for a canoe journey is not the only ritual performed. Before boarding a canoe for an overseas trip, one of the sailors beats the water with a coconut leaf, so that it will remain calm. Then, the captain takes a coconut, and while asking Paluelpa for a safe trip, he strikes the prow of the canoe on all sides with the coconut."

28: Spiro--75 (1947-48) 1949 Woleaians-1-2
116, 788, 241, 342, 396 Ifalik

"It is of note that Malinowski's observation that ritual is used in those areas of life in which the degree of control and predictability is slight, is borne out on Ifaluk. There is no garden ritual of any kind that I could discover. The taro grows regularly, only weeding and transplanting with fertilization being required. There has never been a crop failure, or drowth or any other unforeseen contingency that has effected the supply. Breadfruit and coconuts grow without any tending. Thus in these matters there is no ritual. There are a number of taboos, the violation of which will adversely effect the food supply, but that is a different matter.

But in hazardous undertakings, such as house construction, in which there is the chance of men being crushed to death; or ocean voyages, in which storms may sink the canoe or drive it off its course; or canoe construction, in which a faulty job will endanger lives, ritual is used. Not only are the io-io offered, but there are other rituals performed as well. After the canoe is completed and before it is painted it is sailed inside the lagoon to find out whether and where it may leak or may be faulty otherwise. When it is brought back on land, one of the carpenters sits astride the canoe and recites certain set formulae while waving a coconut branch over it. Unfortunately I did not record the texts but

it asks that the canoe be speedy, that it not drift away when on a journey, and that it not be shattered. (30)"

"30. This ritual is known as the gavaiven. I chanced to see Taroman performing the ritual, and I asked Tom what it was. He became quite sheepish, and said, 'I don't know, another place, another color', which means for reasons, I have never been able to understand, that every society has its own customs, which is a charming way of stating the position of cultural relativism. He proceeded to describe a ship-christening he had witnessed in Manilla, which was, to his way of thinking, the western analogue to the Ifaluk custom."

"We have already described in detail the rituals employed in healing. But divination is also used in healing, as well as in predicting the weather. Divination, called trip or bweng, is practiced by means of coconut strips, the configuration of the knots being interpreted as a predictive mechanism. (31)"

"31. [See following sheet for footnote 31.]"

"31. [Footnote pp. 75-76] One afternoon I saw Maroliger divining for a sick woman. I asked Tom what he was doing, and he replied that this was 'Katt', that is, he was playing cards. I didn't press the issue any further, assuming that Tom was reluctant to speak about the matter, and making a note to ask him about it at a later time. It was entirely accidental that I later learned what he had meant. In the latter part of November we had a few days of heavy wind, that the natives called a minor typhoon. Trees were blown down, the waves were coming on shore. Since there was little I could do, I spent a part of one afternoon playing 'solitaire.' While playing, Tom came to see how we were weathering the storm, and found me playing cards. Now previously Maroligar had seen Dr. Burrows playing, and after each hand Dr. Burrows would say, 'Good', or 'bad' [76] depending upon whether or not he had won, and Maroligar had interpreted this evaluation to mean that Dr. Burrows was divining for something. When Tom came that day, he told me that the people were very disturbed about the storm, and that he too was worried, and would be unable to sleep that night. But he insisted that I finish my game so that I could tell him whether the storm would continue or would abate. Wishing to put his mind at rest, I told him that the storm would stop. He sighed with relief, and was most happy, because Maroligar's divining by means of the coconut strips had predicted the same thing."

"With regard to the weather, however, its course is not only predicted, it is controlled. If the divination indicates continued storm, then an incantation is recited which can control the weather. Only the navigators, know the technique. The person sits on one of the stone piers, and blows a conch horn. He then points it into the storm, and recites the appropriate verses. One of them collected by Dr. Burrows follows:

Incantation to drive away a storm

Dark clouds, the horn!
My god-invoking horn!
My talk goes to the clouds like fire.

Don't come near dark clouds!
Stay far away!
No more, no more, no more!

Turn aside, wind and cloud!
Bad weather turn aside!
Die away,
Move away!

Depart bad weather!
Come good weather!
Fair and bright.
Let there be fine days!
Cloudless the sky.

There are also incantations to clear the weather, (involving the breaking of the rainbow, which they think causes the storm), to drive off rain, to bring a departing canoe safely home, to keep a canoe afloat. I quote this one because it is typical. They are all attempts to control the elements by magic--that is words and gestures. It will be noticed that the bad weather is not caused by a supernatural agency but is conceived as an autonomous entity."

28: Spiro--76 [2] (1947-48) 1949 Woleaians-1-2
116, 784 Ifalik

"Part of any people's Belief System is a number of taboos, the violation of which results in some undesirable consequence. As far as I was able to determine, the consequences of taboo violation are automatic. The alus do not punish the people for taboo violation though it was they who instituted the taboos, Aluelap ordaining all taboos except the incest taboos, which were ordained by Autran. It seems rather that some inherent causal relationship inheres between the taboo and its consequences, so that none of the natives I spoke with attempted more than a feeble attempt at a rational explanation.

The native term is etap. I have already referred to a number of taboos in the course of the text, and will have occasion to refer to others. But at this point I should like

here to underscore the observation made above, that ritual multiplies in those areas of culture that are relatively uncontrolled or are held in great value. (32)"

"32. It is obvious, of course, that the listing of these taboos in catalogue fashion does not imply that they were obtained that way. It is of methodological interest that if a native is asked to name as many taboos as he can, he will name two or three at the most, and no probing will aid him in recalling any others. For example, in discussing food habits I asked the four men with whom I was speaking, whether Ifaluk observes fasts, and I received a negative reply. But that very afternoon, I observed that the men were working on the hull of a canoe, and could not eat, as food was taboo. Almost all the taboos recorded in this manuscript were obtained by actually observing them in the course of my stay on the island."

28: Spiro--77 (1947-48) 1949 Woleaians-1-2
116, 784 Ifalik

"In our entire stay I discovered only one taboo that involved the idea of holiness or sanctity per se, rather than being connected with a very pragmatic activity. That is, the plot of ground, known as Atelu, which belongs to the chiefs, and on which the fanap is located, is considered sacred ground, and one portion of it, directly behind our tent, is so sacred that no one is supposed to tread on it. The violation of this taboo results in rain and even typhoons. We discovered this purely accidentally. The trade winds had set in, and still the rains, which usually cease with the onset of the Trades continued, and both the natives and the anthropologists were very surprised. One afternoon, I observed the natives moving an old over-water-head to the beach directly in front of our tent. When they had finished their work, Tom came to us and said that this little hut was to be for our use, that we had been using part of Atelu as our private lavatory, and that perhaps that is why the rain continued, since it is taboo to walk on that ground, and the penalty for the violation of the taboo is rain. (33)

"33. That afternoon, I walked into our new lavatory, the rain stopped, and the sun appeared. The native view emerged triumphant! It is this kind of vindication, of course, if only once in a thousand times, that confrims the validity of the taboo for the natives."

All the other taboos are concerned either with illness, or with construction work; or the food quest, particularly fishing; or with dangerous physiological processes, such as birth and menstruation."

28: Spiro--77 [2] (1947-48) 1949 Woleaians
116, 538 Ifalik

"The arts: The arts on Ifaluk are sparse.
Oral literature is negligible. The myths and legends are few, (34) and are known only by the chiefs and by Arogeligar. There is no taboo on their public knowledge, but the people seem to show little interest in them. There are no invented folk tales, all narative being real or true, so that there is no category of fiction, of stories invented and told for amusement. Nor are there any riddles, proverbs, or sayings, that we generally classify as part of a people's folklore."

"34. The collection of myths and legends will be published separately."

28: Spiro--77-78 (1947-48) 1949 Woleaians
116, 533, 831 Ifalik

"Songs are abundant. Dr. Burrows collected over two-hundred songs, which are of three kinds. The bwarux are the love songs, which formed the largest category. These are composed by the women and are traditionally sung by the women to their sweethearts as a prelude to love-making, while they perform a love-dance. They are also sung and danced, as we have already seen, during fishing expeditions. [78]

These songs, are quite candid in their treatment of sexual organs and processes and sexual practices, which stands in marked contrast to the customary avoidance of any sexual allusion in daily life."

28: Spiro--78
116, 533, 562

(1947-48) 1949

Woleaians
Ifalik

"Though composed by women to be sung at specified occasions, the men know the bwarux and sing them often. In the evening when the young men congregate in the canoe houses, one of the favorite activities is the singing of some bwarux, which affords them great amusement, and whose words elicit the same undercurrent of tittering that the corresponding activity evokes in our culture. Women too, sing bwarux when working together in the house or in the malum, that children, both boys and girls, are exposed to them at an early date."

28: Spiro--78 [2] (1947-48) 1949 Woleaians
116, 533 Ifalik

"The aruaru is the second category of songs. This is a miscellaneous category that includes lamentations for the dead, songs of praise for good chiefs or skilled fishermen, shanties, fishing and construction songs, and others. These do not seem to be very popular as they are not sung as freely as the bwarux or the chapengapeng."

28: Spiro--78 [3] (1947-48) 1949 Woleaians
116, 533 Ifalik

"The chapengapeng (usually shorten to chapeng), including all religious songs, whether they be the incantations for the ill, or the hymns sung at the medicine ceremonies. These are popular, for they are not only sung on the appropriate functional occasion, but like the bwarux, are sung by individuals sitting around their homes in the evening or in the canoe-houses.

The music to which these songs are sung is simple. The scale has only two notes, and there is rarely more than a half-note interval between notes. Furthermore, it seems that all songs in any of the three categories are sung quite similarly, that is there is no tune appropriate to any one song, but rather, all songs are improvised within the traditional two note scale, so that no song is ever sung twice identically."

28: Spiro--78-79

(1947-48) 1949

Woleaians-1-2
Ifalik

"We have already described the dancing performed at the medicine-dance in our discussion of religion. There is another dance, the Ur, which is also a religious dance, which is performed standing, and is not performed as part of a ceremony. Its purpose is unknown, as the natives say it was borrowed from Ulithi and Woleae.

We witnessed this dance at the request of Dr. Burrows. At one of the public meetings, the chiefs announced that an Ur was to be held in the not-too-distant future, and that the men should begin rehearsing for it. The rehearsals took place every night for at least two weeks before the dance. Each district held its own rehearsals, and at the formal dance itself, they danced by districts. Each district has at least one man that is recognized as an especially good choreagrapher, or as knowing the dances especially well, and it was he who led the rehearsals.

As in the medicine-dance, the men wore skirts of coconut leaves while dancing, and here, also, the same reason was given for this practice-- 'from before, before.' (musuwe, musuwe). Only the young and middle-aged men took part in the dances, since some of the movements are strenuous, and an older man could not last long in the pace. I shall make no attempt to describe the dance, since Dr. Burrows is making a special study of this, as well as the other arts, except to tell its general nature. The men stand in a row, facing the audience, though there are movements which require them to kneel.

But even the standing dances, involve no mobility, all the foot movement being a kind of intricate pivoting, and a simultaneous movement of body and arms. The men themselves sing a vocal accompaniment to their dancing.

The rehearsals are great fun for the participants as well as for the 'galery.' [79] They are held in front of the main canoe houses in all three districts, and the women and children, as well as the older men, assemble to watch the dances, praising, or criticising a dance or dancer, as the case might be, or making wisecracks. The young girls are kept busy tending the fire, since the coconut branch fuel is consumed rapidly."

28: Spiro--79 (1947-48) 1949 Woleaians
116, 535, 152, 183 Ifalik

"Towards the end of the rehearsal period the dances would assume the character of dress rehearsals, the men being highly decorated and ornamented, as they later were at the dance. On these dress rehearsals, a strange and interesting custom took place. The women would prepare marmar, and certain women would be designated to present the marmar to the men while they were dancing. The chosen women would appear, their entire bodies and heads being covered with cloths and blankets, so that their identity was not disclosed, and while the dance was in process, they would walk behind the dancers, and place marmars on their heads or necks. They would then disappear, so that the men did not know who they were. The reason for this custom is unknown. (35)"

"35. When I asked Tom for the reason, he replied that if the identity of the women were known, a woman who gave a wreath to some man would arouse her husband's anger or jealousy. This was specious reasoning, however, since all the men receive wreaths during the course of the evening, so that no favoritism is displayed. In other words, here, as in so many other occasions, we reached a point in explanation, where traditional explanations were really lacking, and gave way to personal speculation, as Malinowski has pointed out. When I pointed this out to Tom, he fell back to the well-worked musuwe, musuwe.[WPM: From before, from before]"

28: Spiro--79 [2] (1947-48) 1949 Woleaians
116, 535 Ifalik

"When the chiefs were satisfied that the dancers were adequately prepared, they announced that the women should prepare food the next day, and on the following day the dance would be held. The dance [WPM: The Ur, see pp. 77-78] was held in Rauau by the central canoe house. The dancers were dressed very elaborately. They wore the coconut leaf skirts, of course, as well as the women's belts. Their faces were painted, ankles and arms were decorated with coconut strips, and around the necks were coconut leaf necklaces. A ball of cotton was attached to their hair combs, and in the cotton were inserted two white chicken feathers. The entire body was smeared with turmeric. The only two colors used were red and white, though there are other colors available. Certain individuals added other decorations of a personal nature, which included anything gaudy or garish they might have possessed.

The Felarik men danced first, followed by the Rauau men. After the dance, the food which was brought by each household was distributed by the chiefs, as was tobacco that the chiefs had contributed. (36)"

"36. As usual, we contributed beef, tobacco, and perfume."

28: Spiro--79-80 (1947-48) 1949 Woleaians
116, 535 Ifalik

"Another dance is the laura dance that is performed with bamboo sticks, though the scarcity of bamboo on Ifaluk dictates the use of sticks of any hard wood. This, too, was performed at the request of Dr. Burrows, but unlike the ur, was performed without rehearsal, and has no religious significance. It is a young-man's dance, and the one we witnessed was performed only by the young men of Rauau and, Falalap, those of Felarik not participating. The la-ura is performed in a standing position, again to the accompaniment of their own singing. The men stand in two rows, each having a partner, and strike their poles against the poles of their partners in complicated gestures, while moving their feet and bodies in the patterned formations. [80]

The la-ura was performed very informally, and without any great interest. Neither the observers nor the dancers seemed to display any real enthousiasm, and the dancing began before the arrival of the chiefs, something which is never done for something important. After the dance, coconuts and tobacco were distributed as usual."

(1947-48) 1949

Woleaians
Ifalik

"Ifaluk has practically no plastic or graphic arts in the strict sense of the term. Since contact the people have been encouraged to carve wooden statuettes, which are traded for western trade goods. They are called lios, and are made by the young men. They are distinguished by their almost monotonous similarity, all the men making the identical figures, with only minor variations. All these figures have disproportionately, large flat heads, and flexed knees. Practically all the figures are male. But those figures have no native use, and the people look upon them as just another Western eccentricity.

The only native carving, of a representative value, is the wooden phallus attached to the front pillar of the fanap.

Native graphic art is lacking, as well. In some of the canoe houses, there are painted figures of men and fish, but these have been made by the young men who had returned from the Japanese school in Yap, where they had received some training."

28: Spiro--80 [2] (1947-48) 1949 Woleaians
116, 531 Ifalik

"Though there are no 'fine arts' in the atoll, there are, of course, industrial arts, as we have seen, and some of these display very fine decorative art. The canoes are painted with fixed color and design patterns. And it is this fixity that is most impressive. Not only is every canoe made the same, according to the same design, but every canoe is painted identically the same as every other canoe. No one diverges from the cultural pattern. This design, it is of interest to observe, is universal in the Western Carolines, as is the actual structure of the canoe."

28: Spiro--80 [3] (1947-48) 1949 Woleaians
116, 291, 286 Ifalik

"To be noted finally, are the women's skirts. These are woven on a true loom, though the origin of the loom is unknown, as far as I know. The threads are colored by natural dyes, coral being immersed in water, and the natural color of the coral dissolving in the water to form the dyes. The basic pattern of the skirts is the same, alternating bands of two basic colors."

28: Spiro--81 (1947-48) 1949 Woleaians
116, 842 Ifalik

"Physiological paternity, though vague and ill-defined, is recognized in Ifaluk. Pregnancy is the resultant of two causes--sexual intercourse and the intervention of Aluelap. If the couple are in love ('like too much'), then Aluelap will intervene when the semen enters the womb, and he will 'give baby.' On the other hand, if the couple are not in love, then despite sexual intercourse, and despite the fact the the semen may enter the womb, the woman will not become pregnant because Aluelap will not intervene. Thus we see that sexual intercourse is a necessary, but not a sufficient cause of pregnancy. Sexual intercourse is necessary in native birth theory, however, is indubitable. Every adult with whom I spoke, without exception, maintained that without intercourse, there could be no pregnancy. The additional factor--the intervention of Aluelap--helps explain why some women are barren, or why not every act of intercourse results in pregnancy. It further explains why a casual relationship will not result in conception, for any non-institutionalized sexual relationship--either in marriage or in the institution known as the gamar, will not produce children, because Aluelap will not intervene."

28: Spiro--81 [2] (1947-48) 1949 Woleaians
116, 842, 855 Ifalik

"With the birth of the first child another factor appears that may effect any future pregnancy. If the parents had mistreated their first child, had not satisfied its needs, Aluelap deems them incapable of raising children, and will not give them any more."

28: Spiro--81 [3] (1947-48) 1949 Woleaians
116, 626, 848, 581 Ifalik

"Aside from the offspring of incestuous unions, there is no native concept of illegitimacy. The children of unmarried sweethearts (gamar) are evaluated no differently from those of married couples. The natives point out that they desire babies, that they love them, that they are necessary to replenish the population, and what difference, therefore, does it make whether they are born to married couples or to sweethearts. Thus the native name for an infant, sauwau for a girl, ligau for a boy, is the same whether its parents be married or unmarried.

It is expected, however, that a man will marry his sweetheart should she become pregnant. This is not compulsory, but should he refuse he would be scorned and called a 'very bad man' by all the people."

28: Spiro--81 [4] (1947-48) 1949 Woleaians
116, 842 Ifalik

"Assuming that Aluelap is favorably disposed, conception begins when the semen mixes with the mother's vaginal blood. The baby being thought of as a mass of water and blood. By the end of the third month, the head is formed, and soon after, the body begins to assume shape. The natives recognize a nine month pregnancy, and could remember no case of a premature birth. Since a two month cease of the menstrual flow is taken as a sign of pregnancy, it is a simple matter for them to know of the nine month period of gestation."

28: Spiro--81 [5] (1947-48) 1949 Woleaians
116, 842 Ifalik

"Babies are preeminently desired, probably more than any other single thing, so that a couple that does not have children is greatly pitied. But it is not only pity, but sadness which the people feel towards a barren woman (ulut) -- 'all people very sad, for no have baby, by'mby no more people.'"

"Babies are desired both for themselves, and as a form of old age insurance. That is, babies are constantly being handled, kissed, hugged, played with, etc. The people have an inordinate desire to fondle babies, and babies are always the center of attention and of attraction in every home, and in every gathering. Babies are wanted, therefore, because of the pleasure they afford. Caring for the baby is never considered a bother or a chore. I have never seen a mother or any other person express resentment over, or anger towards, a baby because of the care and attention she must give it. It is no exaggeration to say that the adult's care [82] of the infant is a labor of love, and we might even question the very use of the term, 'labor.' I have never heard a mother complain of the restrictions on her behavior caused by the infant. A baby knows only smiling and laughing faces, soft arms and soft words. No baby is ever handled roughly, no baby is scowled at or spoken to with bitterness. To repeat, I have never heard an adult utter one word of complaint about the additional burdens caused by a new infant."

"This great love of infants and the ardent desire to have babies may account for the relative absence of psychosomatic disturbances on the part of the pregnant mother. Neither my informants nor my direct questioning of pregnant women revealed any minor physical inconvenience, nor feelings of nausea."

28: Spiro--82 [2] (1947-48) 1949 Woleaians
116, 854, 593 Ifalik

"Adults not only want children because of their great love for infants, but also for a very practical reason, as providers for them in their old age. 'Suppose baby he grew up, he take fish, chow, coconut, he give mama and pappa.'"

28: Spiro--82 [3] (1947-48) 1949 Woleaians
116, 843, 784 Ifalik

"The parents observe few taboos during pregnancy. They may not cut their hair, nor can they eat any food cooked over a fire made of driftwood. The husband may not begin a canoe during his wife's pregnancy. If these taboos are violated the parents would become ill.

Sexual intercourse is taboo for the first three months of pregnancy, after which it is desirable. The reason for this differentiation is that for the first three months the baby is but blood and water, and should the parents have intercourse they would kill the infant. After the third month, the baby begins to be formed, and intercourse can no longer harm the baby, but it can expand the walls of the vagina, and thus expedite the delivery.

The same logic applies to the relative amount of work performed by a pregnant woman. For the first seven months she performs only light labor, because the baby is weak. But in the last two months, she works hard, working even in the taro patches, as it is believed that manual activity will facilitate a rapid delivery."

Woleaians-1-2
Ifalik

"It is during the period of gestation that the foetus acquires its soul. (ngas) It is the ngas that differentiates the dead from the living, so that before the entrance of the ngas, the infant is not yet alive, and when it departs the person dies. The ngas, whose size is unknown, resides in the 'stomach', and is conceived of as a vaporous substance. ('all same wind'). But its actual formation and derivation is a matter of speculation. Arogeligar maintained that Aluelap gives the baby its ngas in the eighth month of pregnancy. Others said that the soul enters the embryo through the umbilical cord. (1) The chiefs, on the other hand, maintained that the soul evolves in the baby in the course of its development, like any other organ, though the nature and time if its growth is unknown.

But the foetus not only receives its ngas during the period of gestation, it also receives its blood. Both blood (tra) and food, which the foetus requires to keep alive, are received by means of the umbilicus. Blood is necessary for life. If a person has much blood, he will be strong; if he has little, he will be weak; and if he has none, he will die.

But though the foetus receives its blood from its mother, all questions concerning

---

"1. Thus deriving from the mother, which would explain matrilineal descent."

[83] 'blood relationship' elicited negative replies. All blood is the same, there being no differences between individuals or people, and the concept of relationship through blood is completely foreign to them. (2)"

"2. Again it is possible that matrilineal descent is related to the fact of the infant's receiving of his blood from his mother. But questions of this kind, as well as other similar questions sent my informants into peels of laughter. How should they, or any one else know the answers to these questions, and who but an idiot would bother about them. Auelimar, one of my best informants expressed the concensus of the group when he exclaimed, 'who can savvy that?'"

28: Spiro--83 (1947-48) 1949 Wóleaians
116, 843 Ifalik

"The natives claim to be able to determine the sex of the embryo. If the mother has a craving for coconut water, and if she feels the embryo moving in the womb, it is a boy. If, on the other hand, she has no craving for coconut water, and if the embryo's movement is slight, it is a girl."

"As between boys and girls, the latter are preferable. At first my informants said that there was no preference, but then qualified this equality by saying that 'boy more down,' expressing relative value in spatial terms, as they are wont to do. They all agreed that 'boy more down' because the girls can have babies (when they become mature, of course) but the boys cannot, and this was the decisive factor. When discussing the relative status of men and women the same response was given by still other informants. Women are more important than men because they can bear children. This emphasized, again, the great importance and value of children. (3)"

"3. [See following sheet for footnote 3.]"

"3. [Footnote p. 83] One can also question the native's actual knowledge of physiological paternity from this statement. For though it is true that only the women bear the children, the men play an equally important role in conception, which they seem to completely overlook in this regard. In a discussion of the relative status of the sexes with still other informants, I pointed out that the child-bearing role of women is paralleled, by their own theories, by the procreative powers of the men. They all looked surprised, as if the thought had not occured to them, and finally Arogeirox exclaimed, 'You talk true', and they then changed their evaluation, and said that men are more important. The next day my informants returned to this point, and praised me for my--to them--very acute observation.

But this disregard of the man's role in procreation in the context of this stiuation is not the only reason that leads one to question their fundamental knowledge of physiological paternity. In the mythology, it will be recalled that Legobub, the primordial goddess, gave birth to three children, without having a male consort. This 'virgin birth' is not interpreted as a miracle, a prerogative of the supernaturals, but rather accepted without question.

It is possible that their knowledge of physiological paternity has been borrowed since contact, and has not become integrated into the indigenous belief. But this theory is entirely speculative, there being no way to establish it."

28: Spiro--83-84 (1947-48) 1949 Woleaians-1-3
116, 844 Ifalik

"When the mother first begins to feel labor pains she retires to the house in Falalap, called Weluar, which is close to the birth-hut, Emelipen. When the pains become acute she goes to Emdipen, itself, accompanied by her mother and mother's sister. Emedipen is the only birth hut in Ifaluk. It is strictly tabooed to any male, who may not walk within 50 feet of it. Should he violate this taboo, all food would rot, and a famine would ensue.

If she is still in labor at night her relatives and the relatives of her husband hold a sial for her. That is, they assemble in Weluar, where they remain awake all night, keeping watch over her, and offering her herbs to drink should the birth be difficult. (4)

"4. The necessity of actual observation, as opposed to the exclusive use of informant was brought out very clearly in obtaining this information. I did not know whether I would have the opportunity to observe a childbirth, so I organized a committee of informants, consisting of two men and two women, from whom I hoped to obtain the information. After a great number of exhaustive sessions I was sure my information was completed. Some time after these sessions, I observed a group of young men leaving in the evening for Falalap. I asked them what they were up to, and all I could make out was the word Sial, which I had never heard of. After a number of unsuccessful attempts to explain its meaning to me, they suggested that I ask Tom. Later in the evening, I saw Tom, who explained what the sial is. I immediately departed for Falalap, but I was too late. The birth had already taken place."

[84] While in labor, the mother kneels on a mat, catching the baby in her arms when it emerges. The length of labor varies considerably, but it was impossible to receive any estimate, other than the general statement that, 'some very quick, some very slow.' Though the mother is accompanied by her mother and her mother's sister, they do not serve as midwifes, except in the event of a difficult delivery, in which case they will extract the baby from the womb. Ordinarily, however, the mother delivers her own baby. She is, moreover, not to indicate her pain by any overt manifestations. Should she cry out, she would shame both her mother and herself.

After the baby is born, the mother's mother takes it, holding it in her arms until the afterbirth (bei) is discharged. She then severs the umbilical cord (buch) with a small ocean shell, wraps it in a new lavalava cloth, and buries it at the side of Emelipen. The afterbirth is disposed of in the same fashion. Should either not be buried, and should the

mother see them, she would become ill. (5)

Should the baby be born prematurely, before the mother could get to Emilipen, the mother proceeds there immediately following the birth. Should she remain in her own home with the baby, all vegetation would die."

"5. The small shell used to cut the umbilicus is called a giligin. It is very tiny and white, and is sought by the mother in her ninth month, who then keeps it in her basket containing lavalava thread until she retires to the birth-hut. Again, this is interesting in terms of the selective nature of the acculturative process. The natives have plenty of knives, of many sizes, which they esteem very highly, and use exclusively for all purposes. But in the matter of the birth, which is an act of danger, one of the rites du passage, the older shell is retained. One apparently doesn't tempt the fates, even at the gain of greater efficiency."

28: Spiro--84 (1947-48) 1949 Woleaians
116, 845,764 Ifalik

"Still births occur, though I could obtain no information on their frequency. The mother's mother will massage its head, arms, and legs, and often this will vivify the infant. If this is of no avail, it is wrapped in a lavalava, tied with a fishline, and after a brief wailing by the family, it is buried at the side of the birth-hut. The reason for burying it on land, rather than in the ocean, as is the practice with adults, is that the new-born is 'no people, only something,' that is it is still not looked upon as human."

28: Spiro--84 [2] (1947-48) 1949 Woleaians
116, 845 Ifalik

"Twins (nipwe) occur, though infrequently. At present there is one pair of twins--two middle aged women. Triplets have never occured, and the natives were amazed to learn that they do occur in other societies. There is no magical idea associated with twins, though if one should die the other is killed."

28: Spiro--85 (1947-48) 1949 Woleaians
116, 844 Ifalik

"After the burial of the afterbirth, women of her own and of her husband's family bring the mother food--coconuts, taro, and breadfruit. While she is eating her mother takes the baby to the ocean to wash it, whether the weather and the ocean be hot or cold. When she returns she feeds the baby some water, followed by some ripe coconut oil. This is the infant's first feeding. The baby is then handed to it's mother who gives it the breast, more as a gesture than as nourishment, for as yet she has no milk, and usually has none until the fourth day."

28: Spiro--85 [2] (1947-48) 1949 Woleaians
116, 846, 854 Ifalik

"The baby is then [WPM: after first nursing], for the first time, allowed to rest. It is placed in its 'bed' (giagi), a pandanus mat placed on the floor, over which is placed some cloth, either the cotton cloth introduced by the Japanese, or the native cloth. The baby itself is wrapped in cloth, as a kind of diaper, and is then covered completely with another cloth. This last 'blanket' is used invariably no matter how hot it may be, so as to facilitate perspiration, for if the infant does not perspire freely, its growth will be retarded. Of course, when the baby soils itself, the diaper is replaced with a clean one, the excrements are carried to the ocean, and the soiled diaper is washed.

The infant and mother remain in Emelipen [WPM: see pp. 83-84] for ten days after the birth. During that time her behavior and treatment of the baby are strictly institutionalized. The mother and her attendant (her mother, mother's sister, or husband's mother) take the baby to the channel between the two islands to be washed three times a day--morning, noon, and afternoon. It is not washed in the evening lest an ălusengau make it sick."

28: Spiro--85 [3] (1947-48) 1949 Woleaians
116, 846, 853 Ifalik

"For its first four days the infant is fed water and coconut oil, and whatever milk the mother may have. The infant is fed whenever it cries and when the mother and her attendant think it proper. That is, if the infant should sleep for an extended period, the mother will wake it in order to feed it.

On the fifth day, the mother's milk is usually sufficient, and the breast replaces the coconut oil. But the feeding follows the same pattern--in which first water is given the infant, and then the breast. Again, it is fed whenever it cries, and whenever its mother sees that its stomach is flat or not swollen. If the stomach is swollen, it is assumed that it is not hungry."

28: Spiro--85 [4] (1947-48) 1949 Woleaians
116, 846, 854 Ifalik

"What must be stressed is the constant attention the infant receives. The mother and her attendant are at the constant service of the baby. One of them is always awake while the other sleeps to ensure that the infant's wants are immediately satisfied.

While the mother and infant are confined to the birth-hut, her family and that of her husband are busy. The men of both families go fishing every day, and their women-folk bring the fish to the mother, since fish will make her milk flow abundantly."

28: Spiro--85 [5] (1947-48) 1949 Woleaians
116, 846 Ifalik

"No male, of course, can go near the birth-hut, neither her husband, son, brother, or stranger. When the mother takes the infant to the channel to wash it, the male relatives may stand on the other side of the channel and thus catch a glimpse of the baby. Any woman, however is allowed free access to the birth-hut. They bring the fish to the mother, as well as the other vegetable foods. However, even they cannot handle the baby, this privilege being restricted to the mother and her attendant. Nor can they remain in Emelipen overnight. They must return to their own homes to sleep."

28: Spiro--86 (1947-48) 1949 Woleaians
116, 846, 352 Ifalik

"The infant's father has one additional responsibility. He must build a cradle (ulol) for the infant. The Ulol has four sides, made of wood, which are fastened together as the bottom with plaited rope, to form the bottom, on which the baby is to lie. Rope is then attached to the four corners, and to the rafters of the roof, so that the cradle is suspended from the rafters, and can be rocked or swung. Eventually, when the baby is brought home, a pandanus mat is placed in the cradle, and the baby is placed on the mat, and then covered with cloth."

"At the end of the ten-day confinement, the baby is brought home, at which time there is a minor celebration. The baby and mother leave for home at dawn, accompanied by the female relatives. The latter also bring food they had previously prepared, and they gather in the house of the mother, where they eat. Men are not allowed in the house at this time, though the taboo is not too severe, because I was permitted to enter. The women merely sit quietly, conversing in subdued tones, offering a suggestion at intervals to the mother, but otherwise remaining inactive and contained, which is very unusual behavior for them. The mother and infant are the centers of attraction, and all eyes are on them.

The mother sits on a pandanus sleep mat, and does not leave the mat, except when she retires to the lagoon for ablutions. The baby lies on a small pandanus mat, which in turn, is placed on a large pandanus mat, which in turn is placed on a large coconut mat. The baby wears cloth swaddling clothes, and when he sleeps he is covered with a very stiff cloth, which acts as a head rest when the mother nurses him, so that his head does not fall back. Covering the cloth is a small pandanus mat, and this is then covered with a blanket, which completely covers the infant. Breathing under these conditions is probably difficult, but, as pointed out above, this facilitates the infant's perspiring, which is deemed so important by the natives.

At the baby's head is the same kind of fire that burns in the birth hut. A small pit is

dug in the house prior to the mother's return, in which is buried the bonito head, and on top of which burns the fire for the duration of the mother's confinement. As already explained, this fire prevents the infant from becoming ill. The fire is sacred in that it may not be used for any secular or profane purpose, except by the mother and her attendant. My attempt to light a cigarette from one of its embers elicited a chorus of sharp etaps. The women remain with the mother till the end of the day, after which they return home, and the mother and child are left to themselves, except for the usual degree of daily visiting.

The father has not as yet entered the house, and it is only after the first day has elapsed that he may do so. However, neither he nor any other person, male or female may touch the baby, or even approach it beyond the mat on which it lies, with the exception of the mother and her attendant. To do so is strictly taboo as I, again, learned from my own behavior. On the fifth day, he is allowed to hold the infant, but he may not yet pick it up by itself, since he cannot approach its mat until the end of the mother's confinement, so that the mother must hand him the infant, if she grants him permission to hold it. If he should take the infant himself, the baby would take sick. At the end of the

mother's three month confinement, she prepares a new mat, the old one is discarded, and the baby can then be directly approached. (6)"

"6. This avoidance taboo is very interesting in light of the theories of paternal sibling hostility towards the new-born. Both paternal and sibling hatred are shorn of the possibility of over expression by this taboo. One can also interpret the exclusion of the father from the birth-hut in the same manner."

28: Spiro--87 (1947-48) 1949 Woleaians-1-4
116, 846, 784, 854 Ifalik

"Though the father sleeps in the house with his wife, after the second day of her return [WPM: from the birth-hut], parental intercourse is strictly taboo for two rag (approximately one atronomical year). Violation of the taboo will result in the baby's death. Though it is difficult to check on the observance of this taboo directly, there is indirect reason to believe that it is observed. In the first place there are no children whose closest siblings are within an age period that would indicate a conception within the tabooed period. Secondly, at least two fathers left the island after the birth of a child, may well have been motivated by the desire to avoid temptation. And finally, infant mortality is sufficiently high that few would wish to risk the imputation by themselves, as well as by others, of having killed their child by lack of sexual restraint.

The mother and her attendant are confined to their home for three months. They are in constant attendance upon the infant, and may leave the house only for bathing and the performance of their ablutions. But one of them must remain in the house, when the other leaves. The mother is not permitted to do any work that may distract her attention from her baby, so that the only activity permitted her is the making of lavalavas.

Except for this constant attention to the child, which monopolizes her time, there seems to be no indication of differential status or role on the part of the new mother. The only avoidance pattern is the sexual one just described. I discovered only one indication of a slight change of status. While talking with a group of people one evening, I had passed

cigarettes around the group, lit the cigarette of one of the women, and having no more matches, used her cigarette to light the others. Tom refused to take a light, explaining that the woman had just had a baby, and that if he, a captain, should make use of her fire (of any kind), he would drift off his course while on an ocean voyage."

28: Spiro--87 [2] (1947-48) 1949 Woleaians
116, 854, 776 Ifalik

"After the first day at home, the infant may be placed either in the Ulol or on its bed-mat, the giagi. At night, however, it always sleeps on its mat, between its parents. This is to protect it from the alusengau, since infants are most vulnerable to their attacks. If an alus wishes to make it sick, it is protected by its parents on either side of it, so that one of them will become ill, and not the infant.

The baby, of course sleeps often during the day, and while it sleeps the members of the household make no attempt to modulate their voices, or to control the obstreperousness of the children. The children come into the house, shouting and laughing, and usually the babies sleep through it all. And even if he should wake and be fed, the women do not attempt to inhibit the shouting and playing of the children."

28: Spiro--87-88 (1947-48) 1949 Woleaians
116, 853, 862, 826 Ifalik

"Feeding at home is, at first, like the feeding in the birth-hut, the nourishment consisting of the breast-milk and water, the latter always preceeding the former. But the water is more than water; it is 'medicine' as well. That is the water-feeder is a sack-like piece of coconut bark, in which is wrapped the leaves of the angorik, and is called walewa. The walewa is immersed in a coconut shell containing water, and when the mother feeds water to the infant she squeezes the walewa which has absorbed the water, so that the water streams into the infant's mouth. This practice often is disturbing to the baby, because the flow of water cannot be readily controlled, and I have seen many babies gagging on an overflow. Besides, if the infant is genuinely thirsty, he is frustrated by his own inability to swallow the water as rapidly as its streams into his mouth, so that he gasps and gurgles and chokes while trying to swallow. [88]

As is the practice in the birth-hut, the infant is fed whenever it cries, or whenever it turns.

The breast, then, serves not only as a source of nourishment, but as a pacifier as well. That the breast assumes the function of pacifier is indicated by the almost reflexive turn of the child to the mother's breast in time of distress. When I first made my appearance on the island, and the babies were still frightened of me, many would either clutch at the breast, or else place it in their mouths."

28: Spiro--88 (1947-48) 1949 Woleaians-1-Q
116, 853, 157, 862 Ifalik

"It has been claimed by many observers that in cultures in which there is no oral frustration, in which the breast is always available, that children will not suck their thumbs. The great majority of children on Ifaluk are thumb suckers, not only those who have been weaned, but those who are still being suckled. Some mothers discourage thumb-sucking, while others are unconcerned about it. Those opposed to the practice say that it weakens the thumb and kills the child's appetite.

Thumb sucking, then, is not only a function of oral frustration. It may be a simple satisfaction of the sucking reflex. Or, in older children, it may be a regression to the oral level of mastery. This would be particularly true on Ifaluk, in which the older child is, relatively speaking, neglected, so that the thumb sucking is a return to the security and emotional gratification of the nursing infant.

When the mother feeds her baby, she lifts it from its bed or cradle, returning it to its place, when she is finished. Always care is taken to support the infant's head, so that it does not fall back. At first the stiff cloth is used which prevents the head from falling. Later the cloth is discarded, but the mother supports the head with her hand. This support continues whenever the baby is held, until it begins to crawl. Again, I learned this the hard way, by violation of the practice, and being taught the correct way by the father of the infant I had 'maltreated'.

Only the mother may feed the baby during its first three months. If she should die, a wet nurse will be found, but not if her milk is scarce. In the latter case, coconut juice will be added to the diet."

"Besides water and milk, the infant is fed some special medicine twice a day--morning and night--for the first three months. This medicine is a concoction of water in which are mixed the leaves of the ragnz, galua, and karavwan trees. This medicine is given to make the baby's 'stomach very fine.'"

"My informants said that unlike the ten days in the birth-hut, the baby is not wakened to be fed. My own observations, however, did not confirm this statement, which was probably a statement of a cultural norm, rather than an empirical description. For at least the first month, the mother will feed the infant often, and will wake it in order to do so. The baby is wakened by the stream of water in its mouth. Often, however, this does not wake the baby, and the mother will ease her nipple into its mouth, which automatically induces the sucking reflex, though to all appearances, the baby is still sleeping."

28: Spiro--88-89 (1947-48; 1949 Woleaians
116, 854, 827, 865 Ifalik

"During this early infancy, I seldom heard an infant cry, there being but two occasions which evoke a crying response. It is believed that an infant which lies still in its cradle, without moving, will not grow. It is also believed that it is bad for the infant to lie on its stomach, but that it is good to lie on its side. The mother constantly watches the infant to see that it moves or does not lie on its stomach. If it does not move or does lie on its stomach, she will turn him on [89] its side, and this occurs, not infrequently. The infant often cries at this disturbance, whereupon the mother will lift it out of the cradle and nurse it."

"This crying, however, is mild, and usually lasts but a few seconds, until the infant feels the nipple in its mouth. It is the early morning washing that produces intense crying and screaming. As we have seen, the infant is first washed in the channel, at birth, by its mother's attendant. After that both the mother and her attendant together wash the infant until the end of its second month. It is washed three times a day--morning, noon and afternoon. It is the morning bath in particular that elicits the crying response, and understandably so. In the early dawn, when the infant is washed, the lagoon is extremely cold, as I can testify from personal experience. The infant is usually wakened from its sleep, taken from its overly-warm 'bed' in which it is covered with many cloths and a blanket, and is immersed completely in the water, with only its head above water. The result is always bitter crying on the infant's part, and understandably so, for this is, indeed, a traumatic experience. Either the mother or her attendant washed the infant, after which, while still standing in the water, the mother nurses it. His screaming has been dissipated by this time, and the breast seems to be very welcome. (7)"

"7. The natives are not unaware of the pain this bathing ritual inflicts on the infant. But the mothers explain it by the refrain of musuwe, musuwe."

28: Spiro--89 [2] (1947-48) 1949 Woleaians
116, 853, 862, 262 Ifalik

"In its third month, the infant's diet is increased, and in a sense, this is the beginning of its weaning, though the natives do not view it as such. The mother begins to give the infant taro and fish, which she first masticates and then introduces it into the infant's mouth with her fingers. At this time, also, the infant is introduced to the palm-toddy. Only the fresh toddy that had just been collected is given to the infant, and even it is first diluted with water before it is given to the baby. If the infant does not like the solid food, it is not forced to take it, but its mother will continue to offer it these foods at frequent intervals, until it gets to like them."

"As we have already observed, the infant is constantly and continously watched over by its mother and her attendant for the first two months. If it cries, it is picked up, nursed, rocked in their arms, or rocked in the cradle. After this two month period, there is no restriction on the people who can attend to its needs, so that its father, or siblings, or any stranger may and does pick it up, rock it, or attempt to cajole it if it cries.

Already at this age, the infant is exposed to the faces and arms of many people. For the westerner, the amount of handling the infant receives is almost fantastic. The infant, particularly after it can crawl, is never allowed to remain in the arms of one person. In the course of a half hour conversation, the baby might change hands ten times, being passed from one person to another. This transference of the infant is not due to the fatigue of the person who is holding it at the time, but is done at the request of the others. The adults, as well as the older children, love to fondle the babies and to play with them, with the result that the infant does not stay with one person very long. This means, of course, that the baby gets to know the faces of many people, and learns to appreciate the love and protection that an adult can and does give it, be he a relative or stranger. This intimacy of contact with strangers at an early age, which establishes a freedom of relationship with non-relatives at a later age, increases the uneasiness the

[90] babies might normally have towards strangers. Every person in the district, at least, is part of the infant's in-group, and is known to him from earliest infancy. The stranger, therefore, is really a stranger, whose behavior is entirely unpredictable, since he is entirely unknown. With few exceptions, therefore, the young children were very shy and in many cases downright afraid of me for a long time, until they got to know me. (and the candy I gave to every child I met was not a minor factor in establishing initial rapport with the children.)"

"A universal feature in picking up a baby is to smell it. Whether the mother picks the baby from its cradle, or a 'stranger' takes the baby from the arms of another, she will first place her face in its belly, and its genital region, nuzzling it, and smell it with deep and long draughts. The same behavior can be no more articulated than the reasons for our kissing babies. It is a sign of affection, both the form (smelling) and the region (genital) being culturally determined. It should be remarked here, though we shall have occasion to return to this point, that the olfactory sense is very important in this culture, the natives loving highly scented odors, such as cheap perfume, and abominating any offensive odor. ('it stink too much'.) (8)"

"8. Olfactory values of course, are in part universal, and in part culturally conditioned. As a whole the natives and I agreed on those odors we considered offensive. There were two exceptions. Their preserved breadfruit emitted a rancid odor that I found very repugnant, whereas our mild American cheese repelled the natives."

"The infant wears swaddling clothes until it has learned to crawl. The wearing of these clothes--a cloth--is a function of desire for cleanliness, rather than modesty, for the moment the infant begins to crawl, the cloth drops off. When an adult holds an infant on his lap, he will usually hold the cloth under it, so that he should not be soiled should the infant choose to defecate or urinate. This precaution is necessary because sphincter control is not taught the child until it can walk and talk, that is, not until he can understand the demand and has mastered the motor behavior to carry it out. The infant's faeces are disposed of in the lagoon, whereas its urine is merely wiped up. Not only is there no attempt made to toilet-train the infant, but the adults do not convey to the infant by means of facial expressions or gestures any exaggerated abhorence for excrement. Adults themselves are ashamed of excretory processes, but do not view excrement as dangerous or harmful, or as material with which to work evil magic. And this attitude, of course, is reflected in their reaction to the excretory behavior of their infants. For example, while I was sitting in a house with a young man and his infant daughter, the daughter defecated on the bare thigh of her father. He gave absolutely no overt indications of disgust or anger, but laughingly called his wife to remove the faeces

from his thigh. The infant, by this time, was having great fun, and with real glee (9) defecated once again, with the same parental consequences."

"9. I appreciate the anthropomorphism involved in this description. And yet, the behavioral constellation was what in an adult one would call, glee--sparkling and laughing eyes, cooing, and exaggerated movement of arms and legs."

(1947-48) 1949

"Despite the lack of any exaggerated distaste towards faeces, which the infant may learn from his parents, it soon learns that the adults have peculiar attitudes towards faeces and defecation. For example, many babies play with their faeces, smear them on their hands and face, and sometimes eat them. Again, the parents show their usual restraint in dealing with this behavior, but they do deal with it. They prevent the infant from cultivating this pastime. The infant is not punished, however, because he knows no better. ('Bout baby! He no savvy nothing.') [91]

Once he learns to walk and to talk, however, he is only trained in sphincter control, but he learns that his parents are concerned about his bowel movements. He is taught to defecate in the lagoon, not in the house or on land. If he does not readily learn to use the lagoon he is reprimanded and shamed, though not beaten. Any person, parent and stranger alike, will rebuke a child for polluting the ground or the house. The parents often invoke the authority of the chiefs in chastizing the child. 'Somebody come this place (that is, to our house), very bad this place. (because of the excrement). Chief some, he angry to this place. You no afraid chief?'

My observations indicate that few, if any children rebel against this training, and I observed none who did not observe the practice of repairing to the lagoon, after they had been taught. The attitude towards urine is much more lax. Children who do not as yet wear clothes urinate on the ground with impunity, but not in the house.

But the parents are not only concerned that the children defecate in the right place, they are also concerned that they defecate regularly. Parents often ask their children if they have defecated, and are alarmed by constipation, so that if the child should not defecate for a few days, he is deemed sick, and is given 'medicine', water and herbs, which ostensibly have a cathartic value. Despite the occurance of constipation, however, the parents themselves are confident that children did not deliberately withhold their faeces as a form of obstinacy."

28: Spiro--91 (1947-48) 1949 Woleaians
116, 551, 851, 183 Ifalik

"The child is given a name at the age of three months. And, here, once again we face the 'problem of ethnographic truth'. First of all, we may point out the agreements. The name is given around the third month. There is no ceremony connected with the naming nor any magical or mystical associations with respect to names, either children or adult, with one exception: a sick person given a new name in order to hasten the departure of the illness, though the natives do not know why name changing should have this result. Names are sex-linked, so that a boy will never be given a girl's name, and vice versa. Names have no etymological significance or meaning. So much for the agreement. The disagreement enters with reference to who actually gives the name. My committee on infant development informed me that the maternal grandparents name the child usually after a dead kinsman. The chiefs maintained that the parents name the child, and that it is not named after any one. Finally, an actual experience sustained neither. In giving a Rorschach to a young married woman, I asked her the name of her baby, and she replied that the baby had not been named as yet. Saying that I should wait a few minutes, she entered her house, had a brief conversation with the people inside, and came back, saying they had just named the baby, so-and-so. The genealogies reveal that practically every person living and dead has a unique name, though there is some overlapping, and that these names are derived from combinations and permutations of a number of prefixes and suffixes that can produce a vast number of names."

"Weaning, as we have seen, is begun in the third month, the infant being fed some toddy and fish as part of its regular diet. As soon as it begins to crawl, breadfruit and taro are added to the diet morning, noon, and afternoon. However, the breast is still given the child even to the age of three and after that age should the child desire the breast, the mother will prevent him from suckling, shaming him, by telling him that the other children will laugh at him. Should a new birth occur, however, the child is immediately deprived of the breast, the mother claiming that they do not have enough milk for two sucklings. The advent of a new baby, then may cause decided oral frustration for the older sibling. [92]

This oral deprivation is unquestionably one source of a sibling rivalry that is apparent in all stages of the child's development. This rivalry is as apparent to the natives as it is to the ethnographer. The older sibling, the natives agree, does not like the younger. The parents tell him that the infant is his sibling and that he should love him and be kind to him. The child, so the natives claim, takes this preachment to heart, so that 'he savvy, he like.' But in reality, the problem is not so simple. It is rare that 'he savvy, he like.' The natives themselves pointed out that following the birth of an infant, the older sibling becomes 'ill.' Often he cannot eat or sleep, and then a special medicine is prepared for him. In many cases the older sibling actually strikes the infant. The natives attribute this 'sickness' of the child to the lonesomeness it had felt for its mother

during her ten day confinement in the birth-hut, which persists for a time even after her ten day confinement in the birth-hut, which persists for a time even after her return. But, they all agreed that it does not last very long, and the sibling rivalry is soon dissipated. This is not in accord with the facts, however, for it continues throughout childhood, as we shall soon see. (10)"

"10. That the natives should deny the persistence of sibling rivalry should not occasion any surprise. Until Freud, western peoples refused to 'see' this phenomenon."

"At the completion of the weaning, the child eats the same food as the adults. Eating problems do occur, however, and the parents are indulgent with the child. If he does not care for the food already prepared, they will attempt to give him other food. If nothing appeals to him, he is 'sick', and medicine is prepared for him."

28: Spiro--92 [2] (1947-48) 1949 Woleaians
116, 846, 854 Ifalik

"As pointed out above the mother does not leave her home for the first three months after the birth. At the end of the three month period, she may go about her work, but the infant is not taken with her. It is left in the care of another adult (or adults), and is never left alone, even when it sleeps. It is never left in the care of a child, but may be cared for by an older boy or girl, sibling or non-relative. Though she is permitted to leave her home, the mother does not remain away for a long period, while the infant is still nursing. If she remains away from her baby too long, her nipples feel sore, from which she understands that the baby wants to fed. It should be remembered, moreover, that the mother is never more than twenty minutes from her baby at any point of the island."

"It may be asked whether the infant observes parental intercourse. Theoretically, the answer is no, since the parents are prohibited from having intercourse till the baby can walk. Whether this taboo is observed is, as has already been indicated, a moot point. However, there are a number of other people sleeping in the same house, and though it is pitch dark in the house, particularly within the mosquito netting, it is possible that the infant might observe the copulation of other members of the household, or at least hear the sounds from within a particular net, but this is a point on which I have no evidence. There is abundant tertiary evidence, however, which indicates that the infants (and children) do not observe intercourse. It is to be emphasized that the Ifaluk are a very puritanical people, and react with horror at the thought of having their genitals exposed in the presence of members of the same sex. When emerging from the lagoon after bathing, for example, the men cover their genitalia with their hands, though they are remote from any women. Parents do not permit children to see them nude, whether their own children or others. They do not conceal their nakedness from tiny infants, however, since the infant is still [93] a 'fool boy.'

The shame of physical exposure is not intensified in the case of any practice. The shame of being observed in the act of copulation would be almost too great to bear. Should an adult inadvertently see a couple having intercourse, the man will pledge him to silence with an offer of a gift. ('I give you a present; you no tell people, bout ashamed

too much.'). And this fear of exposure extends to infants as well. Should an infant observe a person in the act of intercourse, he would be as ashamed, as if it were an adult. When I asked if the shame extended to the parent's own infant, the immediate reply was that this was a purely hypothetical problem since the taboo on parental intercourse during the infancy of the child would automatically prevent this eventuality."

(1947-48) 1949

Woleaians
Ifalik

"Infants are not only greatly desired, as we have already seen, but they are given the greatest care and indulgence possible. The infant is idealized to the point that its over-indulgence and pampering become phantasties from the standpoint of Western standards. We have seen that no infant is ever left alone, day or night, asleep or awake, until it can walk. To isolate a baby would be to commit a major atrocity, for if a baby is left alone, 'by and by dies, no more people.'

Should an infant cry, it is immediately picked up in an adult's arms, coddled, consoled or fed. Thus the baby is in a state of almost complete dependence on the adults about it. This oversolicitude extends to the two and three year olds as well, assuming that another baby has not entered the household. Should the baby fall, and begin to cry, he is immediately picked up."

28: Spiro--93-94 (1947-48) 1949 Woleaians-1-3
116, 858, 159 Ifalik

"To claim that the infant is king in Ifaluk is not to exaggerate the situation at all. The infant is always in control of a social situation, and easily dominates the adults, bending them to his will. Two examples from my field notes will serve to illustrate this point. Talimera, the young man who became my interpreter, and I were interviewing Nautrimar, the mother of a baby about eighteen months old. Now Nautrimar and I were very close friends, and she was always eager to be of help to me, so that the obstreperous conduct of her baby daughter was not to her liking. The baby was running about the yard constantly, shouting, and generally creating a disturbance that made it all but impossible to continue with our interview. She would catch the baby, holding it in her arms, but it would soon leave her arms to run about. Talimera would pursue her, and hold her for a while, but she would soon leave him, so that her mother would have to chase her again, and pick her up. When the infant wanted to leave her mother's lap, however, she was not restrained, and would again run away, this time, being caught by her mother's sister. This little comedy act continued for the better part of an hour. All were mildly irritated by the child's behavior, but none made the slightest attempt to restrain her, verbally or physically. The baby was in complete control of the situation.

Another example is even more telling. Tiovis, a 15 month old boy, was brought to the canoe house by his maternal grandfather Auelimar.

During the half hour I remained in the canoe house, he perpetrated the following deeds, without the slightest display of anger on the part of the adults, or the smallest attempt to restrain him. Tiovis began by pushing his hands into the face of Auelimar, pulling his beard, and then shoving his hands under Auelimar's chin, so that the latter had to strain his neck upward. He then grabbed a pole and began to strike Mawaulimar, an olderly man, who saved himself by removing himself from the scene, sitting behind a canoe. Tiovis then began to play with the rope fibre that Auelimar had in his basket. It requires much time and patience to sort out the fibres, which are to be twisted into rope. Yet when Tiovis began to mess them up so that they became gnarled, Auelimar merely resorted them, and replaced them in the basket. Ramen, a youpg married man came into [94] the canoe house, and took Tiovis in his arms, whereupon the latter did to him what he had done to his grandfather--push his hands in his face, etc.

All this while, Tiovis is the center of attention, the men laughing at his antics, and having a merry time observing them. The theory behind this almost fantastic indulgence is that the baby is completely innocent, and is not responsible for its behavior. ('no savvy nothing.'). This theory is consistent with the lack of punishment of the child, but surely it need not prevent the adults from restraining some of the infant's behavior

which is both irritating and destructive. (11)"

"11. The same theory is employed to explain the indulgence of the whims and aggressions of the abnormal children. The latter often throw stones at others, which may seriously bruise someone, yet no attempt is made to restrain them, since they 'no savvy nothing.'"

28: Spiro--94 [2] (1947-48) 1949 Woleaians
116, 858, 865 Ifalik

"The generally accepted adult view of infants, therefore, has it that the infant is a powerless, innocent, creature, who must neither be restrained nor punished. The resultant adult behavior is one of indulgence, and little attempt is made to train the child until he can walk and/or talk."

28: Spiro--94
116, 123, 858, 831

(1947-48) 1949

Woleaians
Ifalik

"It is to be expected that this pattern of indulgence induces a low threshold of frustration tolerance, so that if the infant is inhibited it reacts violently. One example, from many, will illustrate this point. As I entered a courtyard one day, a baby boy about two years old, came over to sit on my lap. He soon discovered the pencil in my pocket, and began to play with it. (12) After a time I took the pencil from him. This minor frustration caused him great grief. He shook his body and head violently, and then began to scream--a genuine temper tantrum. But the moment I returned the pencil the crying ceased, and he became all smiles. Yet again when I stood up to leave, he screamed violently, and would not be pacified."

"12. His play is irrelevant in this connection, but is of psychoanalytic interest. He repeatedly removed the pencil from my pocket and reinserted it. He would then place it between his thighs, and then stick either himself or me with it. This sequence continued for some time. It was obvious also, that he was 'playing for the gallery', since he would look to see if the people were observing him, and if he noticed that I was unattentive, he would give a shout of rage."

28: Spiro--94 [3] (1947-48) 1949 Woleaians
116, 863 Ifalik

"We have already described the tiolet training. The infant is not expected to control his sphincters until he can walk. It is then that his parents train him to retire to the lagoon to defecate, and apparently there is no problem involved in this training, since neither my observations, nor the reports of my informants indicated any."

28: Spiro--94-95 (1947-48) 1949 Woleaians
116, 864 Ifalik

"When the infant passes the 'no savvy nothing stage' its parents are concerned about his sexual behavior. Adults insist that infants engage in no sexual activity. However, I have often observed infants masturbating, or at least manipulating their genitals. (13) [95] Apparently, however, the adult's view of children does not permit them to accept the fact of infantile sexuality. Once the infant reaches the age of understanding, sexual activity is strictly interdicted. Heterosexual behavior does not occur, at least I observed none. But masturbation does occur, and is strongly disapproved of. Masturbation, it is believed, stunts the child's growth, and/or to cause illness, and a child persisting in it is beaten."

"13. Adults, do not masturbate children, and are both shocked and amused at the suggestion of the possibility. However, the adult practice of smelling the genitals may provide an erotic stimulation for the infant."

28: Spiro--95
116, 291, 864

(1947-48) 1949

Woleaians
Ifalik

"This prohibition of sexual behavior does not extend to adult patterns of sexual modesty, however. The little children, both male and female, are completely nude, and the adults make no attempt to inculcate modesty with respect to clothes. The children are not given clothes to wear until they 'savvy shame.' The inception of the sense of shame reveals a sharp sexual difference, however. Boys are nude until the ages of seven or eight, but girls begin to wear skirts at about the age of three or four."

28: Spiro--95 [3] (1947-48) 1949 Woleaians
116, 866, 515 Ifalik

"Dependency training has its inception at this time as well. The child who can walk is expected to wash himself, for example. Often, if the child is very dirty, it will be washed by an older sibling or adult, even at the age of eight or nine."

28: Spiro--95 [2] (1947-48) 1949 Woleaians
116, 865 Ifalik

"Inhibition of aggression is demanded of children at an early age. Fighting of any kind, even in jest, is prohibited by adults. Fighting is invariably punished by beating, being thrown into the lagoon, and other forms of punishment. The same holds true for lying or stealing. The training is effective. I have never seen children above the ages of eight or nine fighting."

"Talking is stimulated by the parents. When the baby shows signs of talking, they encourage him to acquire a vocabulary. For reason, which I could not ascertain, they first teach them to count. (14)

Parents take great pleasure in their children's speech, and are praised by others for the progress their child makes."

"14. The children learn not only how to count, but the motor behavior associated with it. That is, the people often count the number of persons in a house by pointing with their lips. The children soon pick up this motor behavior.

It may be pointed out, incidentally, that lip pointing is also a sign of agreement or affirmation. The women, who were quite shy at first, would answer questions in the affirmative by pointing their lips."

28: Spiro--95 [5] (1947-48) 1949 Woleaians
116, 856, 593 Ifalik

"Parents and other adults encourage children to walk, when they first show signs of walking, but they do not stimulate them to walk prematurely. As they take the child to the lagoon in the morning, they may hold his hand, permitting him to walk, rather than be carried. (15) The baby's walking is facilitated by a wicker-work structure, built like a play-pen. It has a narrow base, and the sides fan out as they extend from the base to the top. The infant is placed in it at certain times, and his standing is supposed to strengthen his legs. (16)"

"15. With reference to sibling rivalry, it is of interest to note that older siblings have been observed knocking down their younger siblings when the latter begin to walk.

16. This structure presents a minor light on the form-function controversy in anthropology, and illustrates the danger of interpreting a culture trait on formal grounds [96] only. Its form looks like a play-pen, and I was confident that it was. Later as I came to know the culture, I was perplexed: why should a play-pen be used in a culture in which small children are never left alone. It was not till a number of months had passed, and I had actually seen one used, that my question was finally answered."

28: Spiro--96

"The younger children have no regular sleeping habits, nor are they compelled to sleep at designated times by their parents. None are required to take afternoon naps, sleeping when they are tired, and they are not required to retire at an earlier hour than the adults. However, they cannot stay out after dark, because the parents warn them of the alus that may be abroad at night. Sleep, generally, is viewed as a completely natural phenomenon, induced by fatigue. And it is thus explained to children, if they ask."

28: Spiro--96 [2] (1947-48) 1949 Woleaians
116, 842, 864, 857 Ifalik

"Children begin to ask questions about this time, and the parents or adults usually answer them realistically, there being no body of knowledge that is concealed from them. Questions concerning the mystery of birth, either their own or of others, occur, according to some informants, but not according to others. In a study of all children in the island, it was revealed that none had any conscious conception of childbirth and conception, and none had ever asked their parents. This survey was substantiated by a number of adult informants who insisted that their children had never asked. On the other hand, at least one man claimed that his children did ask, and that he had explained to them the processes of conception and childbirth. The adult informants who claimed that their children had not inquired into human parenthood, asserted that they did inquire into animal parenthood, in which case the parents were evasive. When the child asked where a dog, for example had come from, they would answer that it had come from Rauau or Felarik, (naming various districts in the island.) If this answer did not satisfy the child, and he attempted to probe further, he was rebuked, and told to stop inquiring further into the matter. ('What you talk about to me? You stop. You no talk about that.')

On all other questions however, the children are given the available information, if there is information. On the other hand, if the parents don't know, they discourage the child from probing. For example, children who ask about the creation or function of heavenly bodies, or other natural phenomena, such as the wind: 'You ask me? Me savvy? Very bad talk, I no savvy.'"

"Children ask the meaning or purpose of various reflexes, and are answered in accord with the traditional body of knowledge. Sneezing (mozie) is inexplicable. However, protracted sneezing is a portend of illness, and should an adult be seized with a sneezing fit at night, he will go to sleep in another house.

Yawning (maulagtel) results from fatigue.

A hiccough (alowei) is caused by food being stuck in the throat. If it continues there is no known remedy. I have seen men hiccough for a long time, without attempting to do anything to stop it."

"As the child grows older and becomes aware of the world about him, he also becomes aware of the patternings of relationship and of interraction between himself and others about him. Before examining the pattern of those relationships, it may be well to point out two facts of general consideration. Though the family is the most important institution in defining patterns of interraction, the family is not as crucial a group here as it is in other cultures for two reasons. In the first place, the family is seldom together at one time. The father is in the canoe house, the mother in the taro patch, the children are playing, the young people are about their activities. There are few meals at which the entire family is present, or required to be present, people eating when and where they choose. On the other hand, there is little distinction between one's own relatives and 'strangers.' Every one knows every one else in the village, so that the child moves in a world in which there are no strange faces or strange people towards whom one's behavior must be different. All individuals look alike and all treat him alike. If he is hungry any of them give him food; if he needs something anyone will try to satisfy his need. Every house is open to him and he never has to learn that some houses are different from others; he can walk into any house (without knocking) at any time of the day or night.

These two facts add up to one general point of psychological significance. Children grow up in an atmosphere of at-homeness with many people, but there are no deep ties

with a particular group of people, known as the family. There is a more intimate relationship between the child and his household than with other people. But, except for infants, there is no greater intimacy between the individual and his primary family than between him and his household."

"We may now examine some of these patterned kin interractions. But the reader should bear in mind that interractions recorded here are empirical observations and/or generalizations. Any attempt to elicit ideal patterns of interraction from informants was futile.

Mother--child: once the mother has weaned her child, her major responsibility has been discharged. She has socialization functions, to be sure, but aside from these there is little that distinguishes her relationship to the child from that of others. The mother seems to have a more intimate relationship with her daughter than with her son. This may be a function of her responsibility to induct the daughter into female economic life. The girl, we shall see, assumes greater economic responsibility than the boy, and it is the mother that is her most important mentor. Generally, the mother's relationship to the young children is a very permissive one, so that here authority is not always readily accepted. She then may either use physical force, or perhaps acquiesce in the child's demands. For example, the mother of little two year old Velaut (male) called for him to come home while he was sitting with a group of children and myself. He refused. She then came over to where we were sitting, and he still refused. Whereupon, she lifted him bodily from the ground and carried him home. On another occasion the mothers of the children with whom I was playing asked the children to come home to eat. They refused, and the mothers could not cope with the situation. I came to their aid by

taking the children home. At times the child's disobedience provokes her into anger and punishment. As I was sitting in one house, two young boys (parallel cousins), about four and five respectively, came in while we were eating some taro. They were urged by their mothers to eat, and after refusing, one was persuaded to eat something. The other refused, and when the women urged him to eat he raised his voice and shouted, no. As his mother [98] continued to encourage him to eat, he began to imitate her behavior. At this she lost her temper, seized a coconut leaf, and was going to beat him, but he jumped up and out of the house, with his mother following. He eluded her, and she returned to the house, her temper gone, all-smiles."

"Father--child: Though the father is kept from intimate contact with the infant for some time, when he can begin to hold and play with it, his interest is as great as the mother's. After the infant is weaned, the children probably spend more time with their fathers than with their mothers. The father takes the young child to the canoe house with him, and keeps him with him for the better part of the day. The father plays with the child and even feeds him if the mother is away in the taro patch. My impression, is that the father or men in general, make a much greater fuss over the young children than do the mothers. If a child needed medication, almost invariably the father, not the mother, would bring him to me, and would ask what could be done. When a young girl would come to draw for me, the father would accompany her. During a stiff blow in the middle of November, I met Taraveliman, a young father of three children. He was very concerned and worried about his children, saying that if the storm were to drive the family out of the house it would create a real problem since one child was a baby, and another had a wounded leg. Furthermore, the third had been adopted by a family in Felarik, and he did not know how he was faring, so that, when I met him on the path, he was on his way to see the latter. Interest of parents in children is by no means confined to their childhood. Parents take great pride in the activities of their older children. Dr. Burrows collected many songs, in which the mother praises her son for some accomplishment. During the dances, we observed, Tom was very proud of his sons and would take every opportunity to point out some feature of their dancing. Before one of the

dances, we observed, Tom was very proud of his sons and would take every opportunity to point out some feature of their dancing. Before one of the dances, Wotriliwok, a lad of about twenty was being decorated by his mother. She was making a great fuss over him, but when he saw that I was observing them he told her to stop. Parents become lonesome for their grown sons and daughters who have gone on a trip or moved to another island, and the latter become lonesome for their parents. One of the most important reasons for inter-island travel is to visit with one's departed family. Tom called his dog by a native name, which means 'You have been absent for a long time', in memory of his son who was in Yap and had not returned for a long time."

"Grandmother--grandchild: The grandmother, both maternal and paternal plays an intimate role in the life of the child, being little different from that of the mother. The grandmother feeds, clothes, washes, and trains the child. In the house, either mother or grandmother will attend to the baby's needs. The grandmother (or grandfather) will watch the young child when he plays, to prevent it from getting into mischief. She will carry it about with her. If he is ill, the grandmother is often more concerned than the parents. In the three cases of serious children's illness that occured while we were on the island (17) it was the grandmother who seemed to be in charge of the situation. She held the child, fed it, took care of it, etc. The grandmother also helps to train the child in the group values. Talemelemar, about five, refused to share food he was eating with Taraveligar, a boy of about seven. His grandmother rebuked him, saying that the latter was the elder of the two, and hence entitled to greater respect.

At the same time, the grandmother's relationship to the child is a very permissive one. Iliakong, about four, wished to have some object, which her grandmother [99] refused her. She then became angry and began to hit her grandmother on her legs, and her chest, after which she began to pull her nipple quite hard. The grandmother accepted this in good grace, and did nothing, except to exclaim 'yok', and jokingly called her a 'male-bush.' Another example, taken directly from my field notes, will illustrate this point. I was playing with Iliakong and Talemelemar when Iliakong's grandmother came

"17. Iliakong's epileptic seizure; Arivelibung's attack by a dog; Talavusman's deeply cut knee."

out and said she wanted to wash her. When she refused, her grandmother asked me if I could influence her, but even my prestige was of no avail this time, and she continued her play. Her grandmother began to plead with her, as she had already grated the coconut, which is used for soap, but her pleading was in vain. In the meantime Iliakong had found a button, and came to her grandmother to show it to her. Talemelemar came up behind her and knocked it out of her hand, whereupon she fell to the ground, in a terrific tantrum, screaming, kicking, swinging her arms. She then picked up some sand, and was about to throw it at me, when she saw her grandmother, and threw it at her instead. This proved to be the turning point, for she then got up laughing and singing, and meekly followed her grandmother to the lagoon to be washed. And all of this elicited no scolding or punishment."

"Mother's sister--child: The mother's sister, again, plays almost the same role as the mother. She feeds the child, plays with it, cares for it, etc. At time, if one did not know the actual genetic tie, it would be difficult to infer from behavior who the actual mother was. If the mother had two young children, it is often her sister who meets the emotional needs of the elder. One day, for example, a number of people were sitting in the home of Talavusman, playing with his baby brother. He was completely ignored, and looked very downcast. His maternal aunt, observing his dejection, called him to her, painted his face, and immediately he was all smiles again."

"In the same generation the older siblings, particularly the girls, function as protectors and guardians of the younger. When the babies are able to walk they play under the surveilance of the older girls--six or seven to eleven or twelve. Usually, two or three older girls will be in charge of a group of younger children, not only their own siblings, but the other children in the neighborhood. The smaller children can and do attach themselves to older boys, as well. But generally speaking, it is the specific task of the girls to care for them. This gives the elder sibling somewhat of a position of power over the younger, who at times resents it. I have, however, observed no cases of the usurpation of this power, though there are many cases of the opposite, that is, the refusal of the younger child to obey the older. Often an older sister would come to take a younger sibling home, and the latter would refuse. The older sibling often functions as a mother-surrogate, feeding and carrying the younger. It is a bit ludicrous to observe a young seven or eight year old girl carrying a three year old brother or sister. It is also amusing to observe the older ones trying to initiate the younger ones into the cultural values. While playing on the beach, one afternoon, the older girls tried frantically to get the younger children off the beach. When I asked for the reason, they explained that the men were coming in from fishing and that it was taboo for children to witness the bringing in of the fish. The young children refused to obey the girls, but I prevailed upon them to do so."

"Not only the older sibling but any older boy or girl may play the role, of protector or guardian, as well as enforce the cultural values. One afternoon, Iliakong and Legasugabuk were doing a bwarux dance on the beach. Woromai, a lad of about 19 saw them from his canoe. He immediately shouted at them to stop the dance, which [100] they did.

There seems to be little question but that the men and older boys exercise greater authority over the children than do the women and older girls."

"The relationship between siblings, indicated evidence of sibling rivalry, though the evidence is not complete. Sibling rivalry can be expressed in many ways, directly and indirectly, overtly and symbolically. There is little question in my mind that much of the play of the children is an expression of this rivalry. Here I only want to record one of two instances of overt attempts of an older child to compete with a younger sibling for his mother's love. While sitting with a group of people, a young mother was sitting nursing a few-month's old baby. Her four year old son came out, stood behind her with his arms about her neck. After a time, he took his mother's breast from the mouth of his baby brother. His mother sent him away. In another case Lautrimar, a woman of about 35 was holding her baby daughter. Talemelemar, her five old son, walked over to her, put his arms about her waist, and began to fondle her breasts. She rebuffed him at first, but finally picked him up, and carried them both. A final example: Talavusman's father was playing with the young baby, and the Talemememar was looking on very enviously. He left them to sit on the lap of his mother, but in a short time she told him to get off. He at once grabbed a stick, and threatened his little parallel cousin with it. (This, of course, is an obvious displacement of aggression). He then took a cloth, covering his penis very ostentatiously, at which everyone laughed. Since the two younger babies in the house were girls, and they received all the attention, this little bit of behavior was probably an attempt to be a girl, so that he too could receive attention of the adults.

This latter incident brings us to crucial point in the emotional development of the child. As we have emphasized repeatedly the baby is king in Ifaluk. Not only are babies desired, not only are their every wants fulfilled, but they are the constant center of attention. They are always the focal point of the household. This orientation, moreover, remains constant. The adult eyes are always focused on the babies, so that once the baby grows older he is out of focus, so to speak, and a new baby is now in focus. There is little eye accommodation, which would enable both the infant and the growing baby to be in focus. In other words, the king is dethroned. His place of centrality is now usurped by a younger infant. From the position of extreme overt love and attention he now finds himself ignored. Adults are still concerned about him, but they leave him to shift for himself. He is free to come and go when he wants, to eat where he wants, as long as he is not too far from sight. But what is even more important, the constant overt affection displayed towards them when young, is now withdrawn. I have seldom seen a child four or five years old being held in an adult's arms, kissed, hugged, or in general receive over, physical affection. From a state of infancy--overabundant love--they pass directly to a state of adulthood, as far as the diaplay of affection is concerned. The result of this differential treatment is a child starving for affection. And much of child behavior--agressive behavior towards adults and children, rivalry, is certainly a result of this age differential treatment.

This behavioral fact, though it is patent, did not assume significance for me for some time. I had attributed the fondness of the children for me as gratitude for the candy I gave them and as the novel experience of knowing a person of different physical type. And, though these factors played some role, I later realized that they were by no means the major factor. The fact is that I was the only adult in their world that showed genuine interest in them, that played with them, that displayed overt affection for them. In other words, I was playing the role vis a vis [101] them that their parents and other adults had played when they were babies. I was filling a deep emotional need in their lives. This first began to dawn on me as I was sitting in a canoe house watching the men doing a repair job. Talemelemar, who is definitely a 'problem child', aggressive, uncooperative, disobedient, etc., came in and sat down next to me. He was strangely quiet and unboisterous--abnormal behavior for him--so I kept one eye on him and one on the men at work. After many abortive attempts he snuggled against me, resting his head on my arm. I put my arm around him, drawing him to me, whereupon he nestled against me, sinking his head into my lap. And for the duration of the afternoon he lay on my lap with a look of peace and serenity that I had thought he was incapable of. The bully and devil were completely gone. This was, for me, and impressive and crucial experience. For the first time I gained some insight into Talemelemar, and through him into the other children. I had done something that no other adult had done since he had been a baby. I had

shown some affection for him, had not rejected him, and had not, when later some babies came into the canoe house, discarded him in favor of them Later, this impression was confirmed in many other individual cases of children who were withdrawn and terribly insecure, but who warmed up to me when I gave them the same kind of affection."

"But what is even more impressive than this adult absorption with the infant, which results, in the ignoring of the emotional needs of the child (unwitting rejection), is the conscious ignoring and rejection of the child. The minutest frustration of the infant is attended to immediately, whereas even larger frustrations of the child are not only ignored, but often provoke amusement. A few examples may illuminate this point. One afternoon as I was resting in our tent I heard a tremendous outcry coming from the household behind us. It sounded like Talemelemar or Iliakong crying, and after it continued for a long time I became very irritated and went to discover the source of the trouble. As I approached the house, I saw that the disturber was neither of the two younger children, but rather Lemalialok, a girl of about seven. She was sitting on the ground, outside of her house, wailing at the top of her lungs. The wails seemed to be of frustration rather than of pain, and I remained to observe her, though she did not see me. Very soon, members of the household, some of whom were sitting in the house and some outside of the doorway, saw me and told Lemalialok that I was watching her. All this time, it is to be emphasized, the adults did nothing at all to appease her feelings, permitting her to lie on the ground, screaming to the point of exhaustion. When she was informed that I was watching her, she turned around, looked at me, and continued with her screaming. I walked towards her, and asked her why she was crying, and she answered that Leangteisai,

a sister a few years older than herself, had taken a knife from her. After talking to her, and giving her some candy, she finally stopped her crying. If I had not intervened she might have persisted in her behavior for an hour, and no one would have intervened. (18)

Another time I had been typing and was disturbed by crying coming from a house near us, crying which continued for a minimum of twenty minutes, after which I decided to investigate the trouble. It was three year old Lepiemar. It seems that her mother was holding her (the mother's) grandchild, and Lepiemar wanted her to hold her, but her mother refused, and shoved her away. Here is the rejection of the child and an obvious (to the child) preference for the younger baby. She sobbed and wailed, but her mother made absolutely no attempt to appease her. (19)

"18. When she stopped crying I called to Leangteisai, and asked her the cause of the difficulty. She gave me the same reason, but she told me the story with a smirk and a look of superiority on her face, --another of many examples of sibling rivalry.

19. The frustration stimulus may seem slight. But we have already indicated that infantile over-indulgence has created a low-threshold of frustration tolerance."

[102] On another occasion, four year old Lezabung, was the culprit. Again I heard a long protracted crying before I went to investigate the cause. Her mother, older sister, and four women were all sitting outside the house, but none made any gesture to help her. When she saw me, she came running to me, and wept bitter tears on my shoulder. Unfortunately, I did not ascertain the cause of her misery, as my linguistic ability, poor at the best, could not cope with the sounds of the crying girl."

(1947-48) 1949

"The children in this group--between the latency period and pre-puberty are, unquestionably, the least favored group. The infants are pampered and overindulged. The pre-puberty children, though not indulged, have a favorable position. They are economic assets, and hence have the respect of their parents and adults. They enjoy many adult prerogatives, such as assistance in adult work, free mobility, and, in the case of the boys, a position of equality in the canoe houses, where they may lounge or work as of right, and not by sufferance. The intermediate group has none of these privileges. Furthermore, having been dethroned by the infant, they find themselves subservient to the older children. The latter order them around, have them fetch objects for them, etc.

This means that they have no visible means of ego support. The older children receive their emotional response from their peers, looking to them for esteem and affection, and together can pit themselves, if necessary, against the adult world. The younger children do not have that source. Having experienced a traumatic rejection they have not yet learned to establish genuine interractional patterns with their peers. Furthermore, they are still attempting to ingratiate themselves with their parents, and view their peers as possible threats to such attempts. Thus, as we shall soon see, there is much rivalry between the children for the attention of the adult, and aggression between

themselves. Since, children are instructed from the time they can speak that aggression is the most heinous offence, and they are punished should they fight, there would probably be much more of it were it allowed fuller expression."

28: Spiro--102 [2] (1947-48) 1949 Woleaians-1-2
116, 865, 857, 578 Ifalik

"Some simple examples of aggression may be described. Five year old Talavusman had cut his leg, and as I applied merthiolate to the cut, he began to cry. Iliakong and Lezabung, who were sitting with us, began to make fun of him, laughed at him, and imitated his crying.

Lemalialok told Talavusman to sit down. He refused and spit in her face. Talemelemar, who was present, then spit in Talavusman's face.

A group of children were digging for some roots. Talemelemar tried to dig for the root of some girl. She pushed him aside, and he fell on his face, crying. While digging, Iliakong smeared dirt all over Talavusman, who withdrew from the scene.

Often, the aggression is minor, but the reaction is severe. The children fight over the possession of the most trifling object, and the loser weeps bitter tears, usually falling to the ground screaming. When playing, the children are constantly frustrating each other, and they then burst into sham screaming. I say sham, because the tears and

cries disappear the moment the frustration is removed. (20)"

"20. This pattern of crying at the slightest provocation can, probably be traced to the infancy situation, where it was a mastery technique. Crying would always relieve the frustration. These children still attempt to master their reality situation with a technique that no longer works. It is typical regressive behavior, an attempt to cope with a problem on a lower level of integration. It is only after they realize that crying is of no avail that they abandon it."

116, 855, 123

(1947-48) 1949

Woleaians-1-2
Ifalik

"Rivalry between children for the attention of the adults is very obvious, and I shall restrict my examples to those in which I was the object of the rivalry. One evening, sitting in one of the houses, I saw Iliakong, but she ignored me. I began to play with one of the little girls, and immediately the former came over, laughing at me, sat on my lap, forcing her attention upon me.

Lezabung wanted some candy, and I gave her some. She asked me to carry her to her home where the other children were playing. As we walked, I asked her why she didn't eat her candy, but she only smiled coyly. The reason soon became evident. When we came to her home, she proudly showed off her candy to the other children. The whole point of my giving her the candy and carrying her home, was to show off to the others.

Almost every day, the children would fight with each other over who was to sit on my lap, and the problem could be solved only by permitting two and even three to do so simultaneously.

Walking down the path, Talavusman and Talemelmar were fighting as to which would hold my hand. The latter struck the former with a coconut leaf, who fell to the ground crying. (An older girl picked him up and consoled him).

Two children were playing with a tennis ball, competing with each other to see who would throw it at me. When one threw it at one, the other would fall crying to the ground, and vice versa.

What they want, in all of these antics, is the adult's exclusive attention, and they are unwilling to share it with the others. If I held one in my arms, the others would try to intrude, and if I would not hold them as well, they would try to pull the first one off. If one can't have the desired object, the other cannot, either. One day, this would not work, and they tried other techniques. They tried to draw my attention from the child in my arms to themselves, by an exhibitionistic performance. Talemelemar rolled a record disk on its side. Velaut threw a stone in the air. Lezabung asked me to look at a sore on her leg. The others showed me sham sores, asking that I put medicine on them. Talavusman showed me two or three, and I refused to put on medicine as they were slight scratches. Talememar then grabbed Talavusman's penis, saying I should look at it."

"Just as the other children try to distract the adult's attention from the child [WPM: see p. 103, paragraph 1-5.] he is with, so the latter tries to distract his attention from the other children. If, while holding Iliakong, I would turn to give some attention to other children, she would twist her face into mine, laugh and smile at me, put her lips on mine--all to keep my attention exclusively on her. Once, after I deliberately shunned her in favor of the others, she bent down, with her buttocks close to my face, and made a flatulation sound with her mouth--a favorite form of aggressive behavior.

At times, the patterns of aggression interfere with those of cooperation. As we came into a canoe house, a man offered us some taro. Talemelemar took some, and offered a piece to Iliakong, bringing it to her. She placed it on the ground, stood up, and hit him on the head.

Much of the children's aggression, of course, is sublimated in their games, which we shall describe shortly, or is displaced onto dogs. The children, as well as the adults, mistreat the dogs. A three year old was bitten by a dog, but not until he had beaten it for no reason at all with a heavy pole. Uveli, a young lad, held a dog's head on the ground, its ears squeezed together, while the children laughed with great zest. When the dog managed to escape, Uveli kicked it. Children often kick the dogs, pull their tails, and in general maltreat them."

28: Spiro--104

Woleaians
Ifalik

"Explicit patterns of solicitude and mutual helpfulness in the young children are not too frequent. Naturally, since they play together all day, their interractional patterns are more cooperative than antagonistic. But the number of overt gestures of care and concern are not many. At times, if I gave candy to one child, he would not keep it, but would pass it on to another, and then ask for another piece for himself. At times, if two children are fighting, and one falls to the ground, a third child will pick him up. One afternoon Talavusmhan and Talemelemar had a battle royal, the former screaming with fear, rage, frustration, and pain all in one. Later in the afternoon, he came to have his leg rebandaged, Talemelemar came with him, and displayed great concern for his welfare. He brought him a mat on which to sit, told him how to hold his leg, and was most solicitous and sweet. But these occasions are infrequent."

"We may now examine the broader aspects of the interraction of children with their peers. From infancy through the latency period boys and girls play together, and comprise play groups. These groups are usually comprised of all the children of one district, though may at times include children from the other district of the island, as well. But rarely will a child from one island play with the children of another island, and never will he be a regular member of their play group. This does not mean that the play groups are formalized or structuralized, because they are not. It means that children of one district play together because of the factor of geographic contiguity, and thus patterns of interraction are created between them in terms of dominance, subordination, etc. But it is not only contiguity that creates the formation of these children's play groups. The adults deliberately restrict their mobility. A child under 9 or 10 is not permitted free access to the entire village, and never does he go from his district to another, unless accompanied by an older boy or girl, or an adult. This means that only children who establish intimate contacts with children outside of their own district are the aevam, adopted outside of their district who spend time both in their biological and foster parental homes. The other children see little of each other except at public gatherings--economic, political, religious. When adults are asked for the reasons for these restrictions on mobility, they give two answers. First, the parents want the children near them so that

they can instruct them in certain skills, whereas if the children were constantly away, they would never learn. Second, the children might break something belonging to a stranger in another district.

This restriction on mobility is carried through into adult life. It is on rare occasions that inhabitants of one island visit the other, or even another district. Except for the women of Felarik to Falalap to work the taro patch, or the men in either island collecting their toddy from their inherited trees which may be in another island, they remain in their own districts. And, as we shall see, this pattern is reflected in the choice of a mate, who is usually chosen from one's own island."

28: Spiro--104 [3]

(1947-48) 1949

Woleaians
Ifalik

"This pattern of district or island social isolation [WPM: see p. 104, paragraphs 2-3.] is broken at one point--the adolescent males. The girl's mobility, as she grows older is progressively restricted, rather than expanded. As a little girl, she has the range of her district. As she grows older, she is restricted more and more to her home, because of her growing economic and social responsibilities. The boy has little such responsibilities, so that as he gets older, his mobility is not restricted, and he may not only frequent another island or district, but may form close friendships or ties in them. But when he reaches the adult married state, he again remains in his own district."

28: Spiro--104-105 (1947-48) 1949 Woleaians
116, 857, 573 Ifalik

"The play group is comprised of all the boys and girls of a district. The ages may range from two or three to eight or nine. Always, however, when a large number of children play together, they are supervised by one or two girls in the latter ages. That is, two or three children may play themselves, but if a number of children [105] play, they are accompanied by two or three of the nine or ten year old girls, who act as supervisors. This is part of the girls' social responsibilities that the older boys do not share. The latter by this time have formed groups of their own."

"A few general notes on children's play may be in order. Generally, one is impressed (after long and constant observation) with the egocentricity of the children's play. (21) Each child seems to be acting out his own private phantasies, in conjunction, to be sure, with other children, but with his own private meanings. There is no real integrated or meaningful interraction, in the sense of role taking, but each child is trying to serve his own ends, which may be served by playing with others. That this is true is demonstrated by the fact that the child, if he is dissatisfied with the way the others are playing, will drop out of the group, and play by himself. Another characteristic is the lack of consistency or constancy in their play over a sustained period of time. They precipitately change from one activity or game to another with no warning at all, or may drop all activity for no discernable reason. Another characteristic of the older children is the randomness and/or lack of goal directed activities. When I was still new to the culture, I would ask a group of boys what they were doing, and they would answer, 'tar', nothing. When I got to know them intimately, I began to understand the truth of the remark. At the same time, their behavior may be completely random--throwing of stones, not at any target, or goal, just throwing of stones.

This randomness of behavior is even more marked in the younger children, but one would expect it in them, since they are still in an exploratory state, and at the same

---

"21. Susan Isaacs states this as a general characteristic of the play of children."

time their behavior is more egocentric. Theirs is isolated play, in which the contact is geographical, not interractional. For example, two little boys, about two years old, were playing near the cook-shed, in which the women were preparing food. As I walked up, one was sitting, sucking on a blade of grass, laughing to himself, as he chewed it. The other one just sat and stared at me, after which he put his hand in his mouth, sucked it, and then kicked the dirt with his feet. He then rose, smiling, and walked from the shed. One of the women (not his mother) brought him back. He sat down, sucking his finger, then sucked a twig. Meanwhile the other boy was endlessly winding a piece of grass around and around the twig to which it was attached. The other boy began to play with his toes. This went on for a long time, each child turning from one activity to another, completely ignoring the other one."

28: Spiro--105 [2] (1947-48) 1949 Woleaians
116, 857, 526 Ifalik

Another characteristic on all levels of child play is the absence of competitive sports, or any other competitive activity involving physical skill or prowess. One might expect to find fighting or wrestling matches, tree climbing contest, canoe races, etc., but they are completely absent."

"The number of games the children play is quite limited. Boys play a game, called kat, which is similar to checkers, and which was unquestionably brought from the Japanese on Yap by the young men who had worked there. The game is played by both boys and men, often a boy playing a man. A board is ruled into horizontal and vertical lines, about nine vertical and twelve horizontal. Each player has twelve pieces of coral or coconut midribs, with which he tries to 'capture' those of his opponent, by 'jumping'. One may jump in either direction, and the 'king' may traverse as great a distance as he wants. The winner, of course, is the one who captures all of his opponent's pieces. This game, it should be noted, is the only game in which there is a 'winner', and it is not native. The boys and young men play it with avidity, [106] often with great enthousiasm. This is true, also, of the card games that the young and old men, but not children play. Adults have no competitive games or sports either. The Japanese had taught them some card games, but they had no cards. We gave them a deck, and they played the game with great relish, often spending hours at a time at it. What is significant, of course, is that the culture provides no competitive games, in which one child is victorious over another."

"On windy days, the boys make human-like figures from coconut leafs (karigeli), with long legs', and when they are placed in the wind, they 'walk' for some distance.

The older boys make kites from coconut leafs, which they fly on windy days. They also make model canoes, and sail them in the lagoon on windy days.

Some of the boys made a wagon, which I saw used only once. They used four wooden disks, as wheels, used long poles as the body proper, and pulled each other around, having great fun.

A frequent activity of the boys is the spinning of tops. A coconut stem is inserted into a coconut bud, which when twirled in the hand and released on the ground, will spin very well.

The younger children, both boys and girls, play with these tops, but do not spin them too well. Usually they merely throw them into the air, retrieving them when they fall, repeating this pattern incessantly. This retrieving pattern is a favorite one. They roll plates on the ground, balls and other objects, running after them to retrieve them. Or else they play 'catch' with some object, throwing it, or batting it, back and forth."

"A game played by two children involved rolling a bottle-cap on the ground, which the other child, would pick up, and return to the other. But the formal structure of the game is always accompanied by personal behavior and symbolism. For example, Iliakong and Talavusman were playing this game when the latter had a sore knee so that if she over-threw the mark, she would have to retrieve the cap, since he could not run. Each time she ran for the cap, she would bend her head to the ground, put her hand between her buttocks, and giggle, and he would laugh with her.

Another game, a variant of this, is rolling a ball (made of coconutleaves) on the ground, while a model windbreak is standing near one of them. The windbreak is not touched, but it fell over in the course of the play, the participants and observers would break out into peals of laughter. Instead of windbreak, they would set up a coconut fan against a stick, with the purpose of knocking it down with the ball, and if they succeeded, they would again break into great laughter. (22)

"22. From the intense excitement and the 'obscene' nature of the laughter, one could probably infer that the knocking over of the stick with a ball is an unconscious coitus phantasy, shared by all."

Another favorite game is the play-wearing of clothes. Both the little boys and girls (nude) would wrap cloth about them, and parade about the house or courtyard. Or they would wrap themselves in blankets, parading around the house, and then lie down together under the blanket."

28: Spiro--106-107 (1947-48) 1949 Woleaians
116, 857, 524 Ifalik

"Another game was a semi-wheelbarrow game, in which one child would hold the leg of another, the latter thus attempting to walk on one leg. [107]

The children also had a game of 'it.' Two children would stand opposite each other at about a distance of thirty feet, and another child would be 'it' in the center. The two on the outside would attempt to hit him with a coconut leaf 'ball', and the one who succeeeded would then take his place in the center.

Playing 'house', I observed only once. Two pre-pubertal girls had erected a house of coconut leaves, and had spread mats on the floor inside. They sat outside the house, like two Ifaluk matrons, making wreaths, while a number of younger children were playing in the house, and were treated as the children of the two girls."

"Much of the play and games occurs on the beach or in the water. One favorite was jumping head first into the lagoon from the run-way that led from the shore to the over-water-head. Another was just swimming or splashing in the water, or playing tag in the water. On the beach, many kinds of activities were indulged in. A few examples might be of interest. One afternoon some children dug holes in the sand, trying to build bridges between the holes. The boys became weary and lay down, and the girls covered them completely with sand, and then ran off leaving them. The younger children would often build and destroy one sand pile after another. The following description is a complete account of the sand play of an entire afternoon. Talemelemar (boy) and Iliakong (girl) were kneeling in the sand on the beach, piling sand on their legs and thighs until the laps were covered. After tiring of this, they each filled a basket with sand, filled it with water, and threw the mixture into the air. Iliakong threw a basket of sand at Talemelmar who became angry, and retaliated by throwing some at her. They, both seem to enjoy this, so they continued throwing baskets of sand at each other, enjoying the entire proceedure immensely. They suddenly tired of this and returned to the task of filling their baskets. When hers was filled, Iliakong threatened to throw it at Talemelmar. He screamed and ran into the ocean. He then returned and played in the sand about fifty feet from Iliakong. She knelt by me, playing in the sand, then came over and tried to

look up my shorts. Failing in this, she returned to her play in the sand, this time making a ball from the sand, and kept patting it, and shifting it from hand to hand--singing at the same time, oblivious of everything and everyone. Suddenly she jumped up, threw the ball of sand into the air, then tried to walk on her hands, failed, and returned to her play in the sand, Talemelemar saw her trying to walk on her hands, and attempted to imitate her. They both decided to do it together, and insisted that I watch them. They soon tired of this play, and Talemelemar ran off by himself, while Iliakong reverted to the making of balls. Soon Talemelemar came running back insisting that I watch him as he jumped up and down in the shallow water. When Iliakong finished making her balls she ran to the ocean and threw them into the air. She then returned to pile sand on her legs, as Talemelemar began to make balls. Iliakong too returned to the ball-making, and both of them continued, almost monotonously, to shift the ball from one hand to the other, patting them as they did so. Iliakong accompanied this activity with song, coordinating her singing and patting in perfect rhythm. She made three sand balls and put them beside her basket. I touched one and accidentally broke it, at which she shouted at me, threatened to throw sand at me, and ended by burying the other two in the sand. In the meantime, Telemelemar had built a little hillock out of sand, scraping sand away from it, so that it was separated from the sand surrounding it. He then picked it up and placed it beside the ball he had made. He then made another ball and buried it too in the

sand. Then, taking the other two balls on shore, he began to pack them with great care with mud. At that point, Iliakong ran to him and deliberately broke one of the balls, but he said nothing. She tries to kick the other from his hand, but he pulled it away. The ball she was carrying fell accidentally to the ground, and broke, at which they both laughed uproariously. She then threw sand at him, which he dodged. At this point it began to rain, and we all sought shelter in the canoe house."

"The children would play other games at various times. They would attempt to climb a tree or a stump, but if seen by adults, they would be stopped. They would [108] jump into the air, trying to touch their feet before they landed on the ground. They also had a game of tag, in which they would chase each other endlessly around an imaginary circle, screaming with pleasure until they would fall exhausted to the ground.

Another game was to stand facing each other, with the palms of their hands pushing against the palms of another, and then attempt to push the other from his spot. Singing and dancing were favorite pastimes, performed individually and in groups. We shall have more to say about the dancing in another connection. Their songs and dances were imitations of the adult songs and dances, there being none which are specifically for children. The children love to sing and were eager to learn the songs that I sung. Their favorite American song was 'Patsie Orie Arie Aye' which they (and the adults, too) asked me to sing whenever they saw me. Eventually they learned the tune and the chorus, so that they would sing it by themselves.

Both boys and girls would often play in the canoes, just climbing around them, or attempt to paddle them when they were in the water."

"There are no dolls for the girls to play with. The Germans, as we have pointed out elsewhere, induced the people to make dolls for export. But no one thought of using them as dolls to be played with. Apparently the play of the children with actual babies takes the place of play dolls. However, I did observe play with dolls once during our stay. Two little girls were playing with a half coconut shell. When I asked them what it was, they said it was a cat. Later they said it was a baby. They held it in their arms, and sung to it, as a mother would to a child. They then put it in a 'cradle' (a basket leaf), and swung it from the roof pillars. They played with this cradle interminably, constantly taking it down, and putting it back again, tying and untying the string. But this is the only doll play I had seen in our entire stay."

"Children are seldom alone, or out of the sight or ears of the adults. Usually the locale of their play is a courtyard, in view of the women, or in front of a canoe house, in view of the men. Often sit around the canoe houses with the men, doing nothing in particular merely engaging in random movement or rest. The children are not separated from the adults by age differences, and are permitted access to adult groups and activities, so that in the canoe houses they are accepted without protest by the men, and no attempt is made to create bars, or barriers. Though children and adults have differenential [sic] interests, and though there is little question as to which group is dominant and which submissive, there is no marked dichotomy between the children's and the adults' worlds. They both live and interract in the same world, though they play differential roles. It is natural, therefore, that they should play in the canoe houses, or enter them as equals of the men. The little girls may do so as well, something which the adult women may not do, for once a woman has reached puberty she may not enter a canoe house, except with the permission of the men.

A brief quotation from my field notes may illustrate this point. The behavior here described is typical of the daily routine in the canoe houses. As I entered the canoe house, three young men were making rope, as was one of the older boys. A man in his middle twenties was just sitting, while an older man was holding his baby granddaughter

on his lap, and another young married man was lying with his baby son on his stomach. Three young children were lying about. I lay down on a mat, and one of the little girls came over to lie down beside me, putting her arms about me. The baby girl began to mess up the rope of one of the young men, who only laughed, picked her up, and began to play with her. She was then taken by another of the young men, who passed her on to another, until she made the round.

One of the young boys began to make rope, the other watching him. In a little while the latter attempted to wrest the rope from the former, whereupon he became [109] angry, threw the rope at him, and ran out of the canoe house. The baby boy left his father's lap to sit on a board, and began to chew on sugar cane, part of which he offered me. One of the young men called him over, and had him puff on his cigarette. He enjoyed this tremendously, jumping up and down, and clapping his hands with glee. Another man came in, and shortly after his step-daughter came in, and sat on his lap. One of the boys now tried to pull the penis of one of the young men, but the latter rebuffed him. He attempted the same on some of the others but met the same reaction. He lay down, chewing on a twig. The little girl was singing to herself. Suddenly one of the children left the canoe house, and called to another and together they began to throw their tops in to the air. Soon the third child joined them, and they were at their games again."

"As in all cultures, Ifaluk too inculcates its values in its children, and it does a very good job, since the behaviors not sanctioned by the culture all of which are found in the children, are extinguished in the adults. [sic] In order to have as complete and valid information as possible on the socialization process--both the kinds of behavior sanctioned and not sanctioned and the techniques used, both rewards and punishments. I used three checks. I employed adult informants to tell me what is done, I interviewed all the children, and I recorded my own observations. The second technique lent itself to statistical recording, which I shall produce here. The amazing thing (to me) was the identical results obtained by the three methods. All three techniques show that the non-sanctioned behaviors are: theft, disobedience, aggression (including stone throwing at people, fighting, and aggression against parents), standing and talking in the presence of adults. There is one contribution each by the adults and children that the other did not make. The adults said that children are told that they should not be lazy, but should acquire economic skill, lest they have no food. But this is a general admonition for the future, not a child's possible dereliction for which he is punished. The children added a misdemeanor for which they are punished that the adults did not mention--playing away from home, and not returning to eat.

Table 1

Total Number of Children From About 3 to 25

Total subjects: 42 Male: 25 Female: 17

Misdeed	No. of subjects	% of subjects	Male %	Female %
Fighting	21	50	56	41
Disobedience	18	43	40	47
Stone Throwing	11	26	36	12
Theft	10	23	32	11
Standing and talking in the presence of of adults (in canoe house)	10	23	40	0
Playing without returning home to eat.	7	16	16	23
Physical aggression against parents	3	17	0	17
Miscellaneous	14	33	28	41

Table one is the record of the misdeeds for which the children said they were punished. The figures speak for themselves, and no comment is necessary except to point out

practically all punishable behavior fall in the category of aggression.

Some of the sex differences may be commented upon, however. It will be seen that boys do more stealing and stone throwing than the girls, for reasons difficult to answer. The greater incidence of stealing among boys may be accounted for by the fact that most stolen objects are stolen from the canoe houses, and only the boys have completely free access to canoe houses. That girls do not violate the injunction against standing and talking in the presence of men can be accounted for on the same grounds. The category in which there are no male offenders is probably a result of the greater economic responsibility thrust on the young girl, which she resents, and for which she vents her aggressions. The fact that it is the mother, rather than the father, that is the brunt of the aggression is a further indication of this fact, since it is the mother that has the girl work at home.

Before we examine the techniques of enforcing these values, I may say that they are admirably successful. Though fighting occurs frequently among the children, I have seen children above the ages of ten fighting, and this pattern extends into adult life [sic] The same holds true of the other non-sanctioned behavior listed above. Of [111] course, some children learn to inhibit these culturally defined anti-social impulses before others. But it may be stated dogmatically that no child, after the age of ten, is guilty of any of them. And, what is of even greater importance, no adult is ever guilty of commiting them."

"Social scientists have recently stressed the fact that imitation alone does not explain social and cultural learning, that such learning involves a system of rewards and punishments, the former serving to reinforce positive responses, and the latter serving to extinguish the wrong responses. On Ifaluk the punishments are quite definite and tangible, whereas the rewards are diffuse and mostly psychological in nature. In other words, rewards are seldom in the nature of 'Presents.' The simple cultural fact is that there is little possibility for the concept of 'present.' In a culture in which each family is an economic unit, almost entirely self-sufficient, each such family manufactures what every other family has so that there is no division of labor which results in exchange of goods. The child, therefore, cannot be offered something which the family does not already possess, and what it does possess are his for use anyway. Presents in the form of material goods would merely be an addition of something the child already has--some extra food, a larger basket, a new loin cloth--important, but not important enough so as to act as a dynamic agent in the learning process.

This leaves two other rewarding factors operating--praise and privilege. Privilege, too, is an unimportant factor, for again, given the cultural and geographical facts--the reality situation--there is little in the way of special privilege that the child can receive for good behavior. Any cultural goods the society has to offer are received automatically by the child as he matures. Such privileges as being able to listen to the

radio, to see the movie, to go for an automobile ride, etc. do not exist. Others, such as being able to stay up late at night, to go with his parents to a party or to the home of a relative are not special privileges. They are his as of right. No Ifaluk parent ever bribes his child, therefore, with the promise, that if you do such-and-such, I will permit you to do so-and-so. The pattern of reward and/or privilege following a meritorious deed is therefore, absent from this culture.

The only category remaining under reward is praise, and this is employed. The child who conforms to the social expectations, or who does something particularly meritorious, or who acquires a skill, is praised not only by his parents, but by all adults. The positive dynamics in learning, therefore, is the desire to be praised, the desire for the euphoria that accompanies the feeling of being accepted, the emotional security that comes from having pleased one's elders and merited their praise.

But this, apparently is not enough. There are negative sanctions that are even more important than the positive, though, to be sure, they may be viewed as the obverse side of the motivational coin. If one desires praise and security, one avoids blame, rejection, and ridicule. Ridicule and its resultant feeling of shame is probably the strongest factor operative in the Ifaluk learning pattern. There are, as we shall soon see, six specific punishments with which children are inflicted--almost all of which elicit shame and rejection responses rather than physical pain. Positively, then, it is the knowledge of being loved for doing the right thing--emotional security--that motivated good

behavior. Negatively, it is the feeling of being rejected, of not being loved--emotional insecurity--that soon eliminates bad behavior. 'If you do that', or 'if you no savvy that, you all same dog or pig' is the kind of ridicule that both shames the child and makes him aware of his implicity rejection by his parents. But this is not enough. There are six negative sanctions that are employed to punish the recalcitrant child, all of which, according to the children's confession, are distasteful, and should be avoided. These are being beaten,[112] spat upon, thrown in the lagoon, confined to the house, threatened with an alus, and scolded.

The child is beaten with a coconut-leaf, never with the naked hand. The actual physical pain involved, as I can testify, is slight. Being spat upon, of course, involves no physical pain at all. Being thrown into the ocean is not physically painful, though it might induce fear--fear of octopus or shark or an alus of the sea. There is no fear of drowning, since he is thrown in shallow water. Being scolded involves no physical pain, nor does being threatened with an alus, though the latter does elicit fear, for the alus, it will be remembered, causes illness. Confinement involves no physical pain, but is extremely frustrating. The children have complete mobility within their district, and being shut-in works a greater handicap on them than it would for an American child. It is the psychological experiencing of the punishment, as rejection, shame, frustration,

that is the dynamic force behind the punishments.

The following table is a statistical tabulation of the punishments reported by the children, giving the number of children who named any one punishment. Some named many, some none.

Table II

Number of subjects: 42
Male : 25
Female : 17

Punishment	No. of subj.	% of subj.	% of M.	% of F.
Beating	35	83	88	76
Spitting	22	52	56	47
Thrown in ocean	18	43	56	23
Confinement	18	43	44	41
Threatened with Alus	17	40	56	18
Scolding	14	33	24	47"

"The next table expresses statistically, the severity of the punishment, as experienced by the child. That is, I asked each child which punishment he disliked the most. The number of children included in this table is not the entire child population, as are the first two. Some children said that none were experienced as severe. Others said that all were equally severe. And some I neglected to ask.

Table III

Number of subjects: 24
Male : 17
Female : 7

Punishment	No. of subjects	% of subjects	M%	F%
Beating	10	41	41	43
Confinement	5	20	23	14
Spitting	4	17	6	41
Ocean	3	12	17	0
Alus	2	8	11	0
Scolding	0	0	0	0

[113] The small number of female subjects permits no interpretive results to be drawn from the differential sexual responses."

"Socialization involves not only the introjection of the values of the culture, it means also learning to participate in the institutionalized activities of the culture. From the moment the child is taken from the confines of his home, there is no cultural activity he may not witness; and, indeed, he is taken to them all. Whether it be a political meeting, a religious ceremony, a dance, an economic activity, the child, from infancy on, is a witness to the proceedings, for he is carried by his parents, when an infant, and walks himself, when he can do so. In short, there is no institutionalized facet of his culture that, in principle, is barred to the child. He begins to observe adults behavior, therefore, much before he begins to participate in the activities himself. This means, that in many instances, all that is lacking for his participation is the skill or strength, not the knowledge or information. His culture, therefore, is not a strange mystery from which he is excluded. He is never made to feel, except in the case of sex, that there are adult activities that, for inexplicable reasons, he may not share. He may and does share them, but full participation must await greater maturity. And when he does begin to participate actively in his culture, it is not as a sudden transition from one discrete category to another, a precipitate change from child to adult, an abandonment of one and an entry into a new and entirely different world. His cultural, as well as biological growth, is continuous, for his cultural participation increases concommittently with his biological maturation."

28: Spiro--113 [2] (1947-48) 1949 Woleaians
116, 858, 535, 868 Ifalik

"Though the children are passive participants in almost all aspects of the culture, they do not become active participants until they can engage in the activity with some degree of competence. One of the first activities in which they engage is the dance. Boys and girls attend the dance rehearsals with their parents, and not only observe the dancers, but imitate them. The small tots are encouraged by the women to imitate the men dancers and they even actively induce them into the dance by guiding their arm and leg movement in the proper fashion. The boys, from about four or five years of age and up, participate in the dance itself, they are bedecked ornamentally as the men, and though their participation is not important for the performance, it does afford them an opportunity to engage in an adult activity. This means, of course, that it is unnecessary to teach the growing children the dance, because they first learn it by imitation and by actual participation as children, so that by the time they are ready to take their places as full-fledged members, they have mastered the technique."

"In economic life, the children have certain responsibilities, though here there is an important sexual differential. The little girls begin to assume domestic responsibilities much before the boys, so that the boys of seven or eight may be seen playing in their gangs, while the girls at that age are at home, helping their mothers with the cooking, caring for a younger sibling, collecting flowers for garlands, etc. When a girl reaches the age that she wears a grass skirt, she becomes a mother surrogate to the younger children. She carries them with her, watches over their play, washes them, feeds them, and in general supervises their activities. A boy may, if he likes, perform any of these tasks, but a girl is delegated these responsibilities. The girl assists her mother in household work, helping her to clean the house, and helping in the cooking. By the time she is seven or eight, she is making threads for skirts. She actually does not begin to make or even assist in the making of skirts until after puberty, but she does tie the strips of bark into thread.

The boys this age have no definite economic responsibility, though they may and do assume some on their own initiative. For example, when the men prepare to go [114] fishing, the young four and five year old boys will assist in minor tasks, such as gathering coconut-midribs to be used as skids for the canoes, or to fetch some article which the men wish to use. As the boys get older, they begin to act on their own initiative, particularly with regard to fishing. Boys from the seventh or eighth years may be seen

going surf fishing with their fishing poles, or accompanying an older youth in lagoon fishing in canoes. The older pre-pubertal lads and young adolescents practically have a monopoly on one kind of fishing, the shore trap fishing for the small fish. There are certain seasons of the year when fish, the size of a sardine comes into the lagoon, which the natives catch in a stone trap, or in coconut traps, which they place in the water. Every morning, and some afternoons, the lads mentioned above are busy at work catching these fish. And, it is to be stressed, this is done without adult pressure or orders, but on their own initiative."

"The children not only engage in economic activities, but they also assume adult social responsibilities. For example, if I were to enter a courtyard, the young girls offer me food, or the young boys would offer me part of the fish they had caught. But their culturally learned cooperative behavior extends to the more subtle aspects of the culture as well. One afternoon I was playing with the children, and the skies became overcast. The older girls became very concerned about me. If it should begin to rain, would I have some place to go? Perhaps I had better leave now before it begins to rain. Finally they had to go, but only after I reassured them that if it did rain I would seek shelter. These young girls were displaying a very important cultural value, concern for the welfare of the guest."

"This assumption of adult values and behaviors carries over into the freedom granted the child, the patterns of dependency in which he is trained. Children are not forced to go to sleep at an early time, but can stay up as long as the adults. They may even sleep away from home, if they have their parent's permission. But even the young men and women may not do so without permission. If a young man or woman is not home by nightfall, the parents are very concerned. This is understandable, since in a small island, someone is bound to see them at some time, and if they do not return and no one can tell of their whereabouts, chances are something has happened to them. But with permission, young and old children, alike, may sleep away from home."

116, 562, 573 Ifalik

"As the children grow older, the sexes begin to separate. The boys form all-boy gangs, ranging in age from boys ten or eleven years old, through the very young married men. These gangs, completely informal and uninstitutionalized, are definitely local groups. On the island of Felarik, for example, there are two such gangs, one in Rauau, and one in Felarik. The younger members are part of the group, but occupy an inferior status, obeying the older ones. Each gang has a canoe-house in which it spends its time, doing nothing in particular, but sitting around, talking, playing checkers or cards and making rope. At night they assemble in the canoe houses or along the beach, where they remain until it gets dark, returning home or going to meet their lovers. In the past the boys and the young men of the district used to sleep together in the men's club-houses, but no longer do so, because of the fear of the alus, as we have already indicated. However, the young men in the Rauau gang do sleep together, at least during the trade wind season in one of the canoe houses. These young men are together constantly."

"The young men are accepted members of the society, doing any activity which their experience permits them to do. All toddy gathering is the job of the young man of the household. Like the men, they make rope. They participate in all communal fishing, and often fish on their own intitiative, particularly fishing in the lagoon. [115] In all construction work the young men are most conspicuous, for though they do not plan or direct the activity, they do most of the heavy work. If a roof needs to be relaid, it is the young men who are on the roof, and the older men hand them the material from the ground. In the making of canoes, the young men and boys have their share of the work, though it is usually the less-skilled work. One of the older young men might make his own canoe, and though he is assisted by an older man, the responsibility is his.

The young men also take social or economic responsibility on their own initiative. If the canoes are outside the canoe-houses, and it begins to rain, they will themselves remove the canoes from the rain without being told to do so by the older men. The point that is being stressed here is that the young men feel themselves integral members of the culture, and assume responsibility for the perpetuation of the group and its culture."

116, 827, 864, 834, 522 Ifalik

"Sexual activity of any kind is completely taboo until puberty. Should a child engage in masturbation or intercourse, his growth would be stunted and he would become ill. However, I have often seen babies masturbating, or, at least, fingering their genitals, and never once have I seen any adult suppress this activity.

In young children I have not observed actual masturbation, though I have often observed children playing with, or fingering their genitals, with no comment at all from the adults. Some of the young boys, about four or five years of age, would persist for long periods of time in handling their penis, thus maintaining a constant erection. The older boys or men would laugh at this, but not reprimand them. Except for three or four boys, the entire child population asserted that they did not know if others masturbated, and, yet, Talimera drew a picture of a masturbating boy, which elicited peals of laughter from the other boys.

Whether children engage in overt heterosexual activity is a question I cannot answer. Both adults and children profess to know of no such behavior, and I myself never observed any."

Woleaians
Ifalik

"It is to be emphasized that the young children wear no clothes, so that the sexual differences between boys and girls is obvious to them. They do not wear clothes until they themselves feel a sense of shame in their nudity, and this, we have already pointed out, shows a sex difference. The little girls put on clothes earlier than the boys, all girls wearing grass skirts by the time they are five, whereas the boys may not wear loin-cloths till they are eight or nine. This results in sexual exhibitionism, as well as play. For example, in the midst of a number of playmates, Taurilus, three year old girl, urinated while standing, holding a large coconut midrib, which touched the ground, in her hand. The others smirked at her, and she stood with a look of enjoyment on her face, enjoying the exhibition. Lezabung, a four year old, stood in front of me, while I was sitting in a house, then bent backwards so that her genitalia were practically in my face, and began to laugh and giggle. Talemelemar would often walk around with a piece of paper or some other object on his penis, and strut about showing it to others."

28: Spiro--116 [3]
116, 864, 827, 839

(1947-48) 1949

Woleaians
Ifalik

"This awareness of sexual anatomical differences is revealed by other facts. Talemelmar had a loin cloth for about a week. One evening he came out nude, and Iliakong pointed at his penis, and laughed, whereupon he pointed to her vagina, and scornfully said, 'tingi'--vagina. He then went into the house, and came out wearing a loin cloth."

28: Spiro--116-117 (1947-48) 1949 Woleaians-1-2
116, 864, 827, 839 Ifalik

"On another occasion Talemelmar tried everything in his power to draw attention to his penis while in the group of seven other children calling their attention to it. He played with it with his hands. He walked with his back tilted so that his penis was in the air. He tied a coconut leaf strip around it, all of which succeeded in gaining his end-attention. Iliakong was becoming more and more resentful of his centrality, and tried to gain the attention of the others, but she could not compete with him. She began to roll on the ground, followed by Talemelemar, and then they began to play tag running around a circle. Suddenly she made a grab for his penis, but he repelled her. In what was a final gesture for attention, she suddenly got down on hands and knees, her buttocks in the air, and urinated with her back to the other children, anus and genitals in full view. This illustration, shows the awareness of both boys and girls of the superiority of the boy's genital over the girl's, and the latter's necessity of doing something drastic in order to compete with him. [117]

But the children do more than point to their genitals, they often try to grab them, particularly as a punishment for some wrong committed. Almost invariably, when a child frustrates another child of the opposite sex, the latter will grab for the genitals of the other. Often, however, this is done with no attempt at punishment. This mutual grabbing of the genitals is a very common occurrence.

28: Spiro--116-117 (1947-48) 1949 Woleaians-2
116, 864, 827, 839 Ifalik

The genitals are often the objects of aggression, though seldom the weapon of aggression. The anus is the 'sexual' weapon of aggression among children. Often if a child is frustrated he will bend to the ground with his anus in the air, and simulate a flatulation sound with his mouth. At least once, I observed this behavior as a game. The boys and girls would lie on the ground, whereupon one would approach another, 'flatulating' in his face, and this would evoke loud laughter from them all.

Though the genitals are seldom used as weapons of aggression, their names may be so used. Talavusman was angry at Talemelemar, and shouted 'tingi' at him. Iliakong was angry at a little girl, and said that she copulated. This evoked great laughter from all the children present."

28: Spiro--117 (1947-48) 1949 Woleaians
116, 123, 857, 839, 864 Ifalik

"The interest of the children in sexual differences led them to an interest in my sexual characteristics. There is one recurrent theme in my field notes, an entry that occurs almost every day--the attempt of the young children to either look up my shorts, or actually feel my penis. This behavior was characteristic of both the boys and the girls. They would lie or kneel beneath me looking up my shorts and giggling, or they would try to put their hands up my shorts. This was not just innocent children's behavior. They knew full well that this was tabooed behavior, for they would become embarrassed, and simulate other activity the moment I let them know that I knew what they were doing."

"I saw the children play only one game which was an obviously sexual game. A little boy and girl played a game in which they bent their heads between their legs, and then walked backwards towards each other, until they bumped buttocks. They would continue this for a number of times, either bumping buttocks or rubbing them together."

28: Spiro--117 [3] (1947-48) 1949 Woleaians
116, 535, 864, 522 Ifalik

"Another form of sexual activity is the children's imitation of the bwarux dance, the sexual dance which a girl performs for her lover. Usually an older person would rebuke them and force them to stop. But in the case of the very young children, the women would not only encourage them, but even instruct them in the motions, and would then go into peals of laughter."

28: Spiro--117 [4] (1947-48) 1949 Woleaians
116, 839, 864 Ifalik

"The women have little compunction about discussing sexual matters in the presence of the girls, and the men none in the presence of boys. Often, the men will engage in sexual 'horseplay' with the boys. For example, a young man or grown one, for that matter, may grab at the exposed penis of the boy, the latter invariably withdrawing with a mock-serious threat. Or a man may tickle the boy's penis with a twig. Talemelemar was the constant butt of men's jokes because the shape of his penis was bit different from that of the natives. One other person, Otilivok, a young man of about 18, had the same shaped-penis, a person might tease him by saying 'just like Talemelemar', that is, his penis is like Talemelemar's."

The adults do not explicitely threaten their children with castration, but they do so symbolically, by grabbing their penis'. (1)"

"1. I showed the boys and men a picture of a Melanesian circumcision ceremony, and they were all deeply shocked by the idea. That the idea is anxiety laden is shown by their reverting to it much later at certain time intervals, and asking me about it."

116, 593, 864 Ifalik

"Though boys and girls may have no sexual or physical contact, there is one relationship that permits of physical contact--siblings of the opposite sex. Adult siblings of the opposite sex can have no physical contact at all, but children may and do. They sit on each other's laps, lie together arm in arm, or with arms encircling each other. This occurs until about the age of ten. Usually, this behavior obtains between a girl and her younger brother."

28: Spiro--118 [3] (1947-48) 1949 Woleaians
116, 864, 857 Ifalik

"Whether children observe adult intercourse or not is a moot point, but they do observe and with great glee, the intercourse of dogs. The boys, young and old, leave everything when they are informed of dogs copulating. The girls, if they watch, do so surreptitiously. The boys usually stand behind a tree or a house, and watch them, laughing all the time. What is most amusing to the boys is the difficulty some of the dogs have in removing their penis from the bitch's vagina. The dogs would whine and yelp, and the boys would howl with glee."

"The children's ideas concerning birth and conception are either private phantasies, or they are ignorant of them completely. Children and young people both, seem to be ignorant of sexual matters, insisting that they have never asked their parents or other adults the answers to the two questions that I asked them. Some of them were embarassed by the questions, but most of them simply confessed their ignorance, and admitted to a lack of curiosity concerning the matters.

A poll of 40 children between the ages of four to sixteen or seventeen reveals the following results.

Table 4
Theories of Conception

Theory	No. of children
Intercourse	3
Food	3
Man	3
Chiefs	2
Good alus	2
Woman	2
Child	1
Ignorance	24

Their phantasies are most interesting, and we shall indicate them briefly. Of the three who attributed conception to intercourse, only one mentioned the semen. One said the woman's blood creates the baby, the other said that the mother's blood and the good alus create the baby. [119]

Of the three that said that the baby is created from food, one said that the husband gives his wife food to eat, from which the baby is created, whilst the others said that it is created from her own food, not mentioning the husband.

Of the two answering, man, one said the husband cuts his wife's stomach with a knife and places the baby inside. The other said that three men make a doll from a stick, which then becomes a baby.

Of the two answering, woman, one said that all women have babies inside their bodies, but they become alive only when they marry.

Most of the children, however, simply did not know how babies were made, nor were they curious to know. They had never asked anyone. The same is true of the baby's birth. Most were ignorant of the birth of a baby. There were some who had ideas, however, which are shown in table 5.

Table 5
Children's Birth Theories

Theory of Birth	No. of Subjects
Vagina	8
Anus	5

Ifalik

"When a girl's mother sees that her daughter's breasts are developing, she informs her to be prepared to menstruate. The fact of menstruation (taurang) is, of course, no secret to the girl. She has by that time witnessed a number of menstrual ceremonies and has observed all her life that menstrual women retire to the menstrual hut. The mother not only prepares her to expect the menstruation but informs her that it is of serious social implication for her. She points out that the girl is about to enter into adulthood and must prepare to assume adult responsibilities and to occupy an adult status. Her carefree days of play must come to an end, she is told, and she must remain in and near the house, observing her mother's activities, and learn to make skirts and become adept in the economic functions of women. Should she not take these responsibilities seriously, she is told, people will poke fun at her, and call her a 'fool fellow', which means that she will not obtain a husband. The mother cannot tell her the meaning and function of menstruation, since she does not know herself. Menstruation, like many other natural phenomena is inexplicable to the natives.

When the girl first sees flood she informs her mother, who in turn informs her husband and the members of her own family. Her husband informs the members of his family. Both families then repair to the girl's house, bringing red paint, beads, and a skirt. The father brings her a special gift of coconuts. Her entire body is smeared with paint, she is bedecked with beads, flowers, and the new skirt, and then the women sit

round her, while she stands in their midst, and sing the following song. If the song is not sung, it is believed, that rain will fall in torrents. [120]

The rat climbs up on the clouds
He drinks the rain so it won't come down
He drinks No more (shouted in crescendo)
Permit not the rain to come
Today it may fall
No more
Let the rain stop when it strikes the breadfruit pits
Away with the clouds
Not a cloud in the sky
Two babies, children of Liol
They paddle out and chase the clouds (from the north)
They paddle out and chase the clouds (from the south)
The foreskin, the foreskin
Back with it, back with it
Back with the foreskin (2)

"2. [See following sheet for footnote 2.]"

"2. [Footnote p. 120] The fanap, the townhall', is distinguished by, among other things, the huge carved phallus attached to the front pillar. But the pillar has other representational objects. On one side, carved in bold relief is a giant lizard. On the other side is painted a large fish. In front, under the phallus are painted small, stylized fish (the same kind as are tatooed on the natives' arms and legs), a rat, and flowers. Now, without claiming dogmatically the validity of a universal symbolism, this juxtaposition of objects, seemingly discrete and disparate, does make sense in terms of psychoanalytic symbolism. The fish, the lizard, and the rat are all phallic symbols, so that the rat and lizard phobia, revealed in the SERT can now be understood as penis phobias. Logically and culturally there is no explanation for their juxtaposition. Psychologically (in the unconscious) their juxtaposition is quite consistent, being symbols of the already obvious and consciously understood carved penis. And if a rat does symbolize the penis then the rat in this song may very well mean the same.

At the same time, the flower is a symbol of children in psychoanalytic symbolism, and again, from this point of view, it's presence here is not bizarre at all, but quite consistent. It represents the greatly desired product of the penis, children. This is given additional credence by the fact that in many songs a mother refers to her child as the flower of her ear. The ear is extremely interesting in view of the widely spread belief in conception through the ear, as in the case of Mary having conceived Jesus by being impregnated by the Holy Ghost through the ear."

This song is repeated a number of times, and while singing, the women perform a sitting dance, which involves the same lascivious movements of the arms and body that we have noted in the case of the bwaruch."

"At the end of this festivity [WPM: see p. 119], the girl retires to the menstrual hut, always the one of her father's homestead. She is accompanied by the entire group of women, who parade down the village path in great merriment, singing as they walk. The girl remains in the seclusion of the menstrual hut for four days, food being brought to her by members of her family. She is allowed to leave the hut in the morning in order to perform her morning ablutions in the lagoon. When she returns to the hut, she is re-painted with the red paint. No male, of course, is permitted to enter the hut. Her father goes fishing every day, and presents her with his catch. At the end of the four days, she returned to her normal routine. The skirt she has worn is removed, and she again wears the sivsiv, the grass and branch skirt.

It is to be noted that this entire ceremony is completely public. Every person in the village knows the onset of a girl's menstruation. There is neither fear nor [121] stigma attached to it, no attempt made to hide it. At the same time the public nature of the ceremony announces to all that the girl has become sexually mature and is now almost ready for marriage.

This public nature of menstruation obtains in adult life, as well. At the onset of her menstrual period the woman retires to the menstrual hut, and remains in it till its end (usually four days). She may sit outside the hut, but may not enter her own house or the house of any other person, nor may she even leave the confines of her own courtyard,

except for bathing and excretory purposes. Except for her husband and sons, no male is allowed in the menstrual hut.

However, should they or a woman, have eaten fish, they are not permitted to enter for that day. This taboo applies even to babies. Talimera and I were talking to Nautrimar, who was menstruating, and her 18 month old daughter was playing near by. The baby wanted to enter the menstrual hut, and Nautrimar interrupted our conversation at least every two minutes, to admonish the daughter with a loud, 'etap,' taboo. The daughter had eaten some fish that day.

The menstrual woman, herself, may not eat fresh fish, and she remains subject to the taboo until she has gone to the taro patch on four separate occasions.

The menstrual woman may engage only in that work which may be performed in the hut. She may not eat from the food prepared for the household, but must prepare her own food, in separate utensils, and over a separate fire, the house-fire being taboo. Her hasband and children, however, may eat the food that she prepares. Sexual intercourse is completely taboo during this period. Should the taboo be violated the woman would fall ill and perhaps die.

Unlike other aspects of sexual or bodily functioning, menstruation is not a tabooed subject for conversation, so that it is spoken of freely and openly. There is no sense of

shame or secrecy of any kind attached to it. Every one knows, of course, when a woman is menstruating because she is in the menstrual hut. When I would ask to see a woman, for example, her husband or children would state matter-of-factly that she was menstruating, and I could find her in the menstrual hut.

At the end of her period, the woman must bathe thoroughly, after which she resumes her normal routine."

"Despite the nonchalance with which menstruation is accepted the men are in fear of the menstrual blood. When asked the cause of the fear, they answer that some blood might fall in their food, or that some might fall on them. These are obviously transparent rationalizations for something which has deep-seated, emotional roots, of which they themselves are not consciously aware. At least one man, however, said that should menstrual blood fall on a man, his hair comes out, he receives a perpetual stomachache, and he becomes demented. Should a man enter the hut, all vegetation would be destroyed, and 'the chief am very angry at that man.'"

28: Spiro--121 [2] (1947-48) 1949 Woleaians
116, 821, 841 Ifalik

"Again, should the [WPM: menstruating] woman not remain in seclusion, fish would not enter the lagoon, as they fear the menstrual blood. In this case too, vegetation would die, and the 'chief am very angry at that lady.' Should she walk near the southern end of the island of Felarik, where the Rangona tree grows, a typhoon would ensue."

28: Spiro--121 [3] (1947-48) 1949 Woleaians
116, 881 Ifalik

"There is no ceremony marking the puberty of the boy. The distinction between a zari-man and a tari-man is not formally designated, and is a gradual, flexible difference, rather than an abrupt one."

28: Spiro--122 (1947-48) 1949 Woleaians
116, 805, 561 Ifalik

"The people, as we have seen, do not know their ages, since they do not count the passing of time. The exact knowledge of a person's age would be useless information in this culture. There are, however, five categories of age classes, which serve to classify people, but these classes are not age-grades, and the distinctions between them are not marked by abrupt discontinuities. They merge almost imperceptibly into each other, with the exception of the change from the state of zari-rauwut, girl, to that of tari-veivel, young woman, which is abrupt, being brought on by the first menstrual flow, and marked by the menstrual ceremony. These age classifications are:

Male	Female	Translation	
		M	F
ligau	sauwau	infant	infant
zari-man	tari-trauwut	boy	girl
Tari-man	Tari-veivel	young man	young woman
Mann	trauwut	man	woman
Tuvai-man	tuvai-trauwut	old man	old woman"

28: Spiro--122 [2] (1947-48) 1949 Woleaians
116, 881, 839 Ifalik

Unlike the girl's first menstruation, which is announced publically, the boy's first nocturnal emission is unannounced. He reveals it to no one lest he be shamed, for people would poke fun at him."

28: Spiro--122 [3] (1947-48) 1949 Woleaians
116, 881, 833, 513 Ifalik

"The lack of a male adolescent rite du passage renders the question of the age of permissive sexual intercourse a knotty one. Girls, as we have seen, may have intercourse after their third menstruation, and probably do. Boys, may not have intercourse after the first indication of their sexual virility. My male informant insisted that a young man of the age of Talimera, who is about 16, was not permitted to indulge in copulation. This statement was verified by my questioning of the young men in that age range. If this is true, then there is quite a sexual differential in the ages at which the sexes are permitted sexual activity.

Should a young man have intercourse with a girl before the sanctioned time, both the boy and girl are beaten by the girl's parents, and the chiefs reprimand the boy's parents for not having supervised their son's behavior carefully. The natives, however, know of no case of this kind, nor could I discover any in the course of our stay on the island. (3)"

"3. The sleeping arrangements of the household present a possible complication. The parents, as we have seen, sleep alone--or with their infant--in their mosquito nets. The single young men and young women sleep in unisexual groups, but the prepuberty children sleep in one net. It is difficult to believe that children sleeping in close proximity under one net don't engage in some type of sexual explorations. In the absence of any other evidence, however, we shall have to leave this point open, only indicating here the possibility of some sexual activity."

"After her third menstruation the girl may take a sweetheart (gamar). She must wait because her vagina is small prior to that time, and should she have intercourse, it might be damaged. A girl will usually refuse to have intercourse with a boy who is not her gamar. The gamar relationship is a formally recognized institution, so that it involves certain mutual rights and responsibilities, and might very well be [123] conceived as a kind of experimental engagement period, for marriage always follows one of the gamar relationships. The man gives his gamar presents of tobacco, fish, skirts, and other objects. Should he go on an overseas voyage, he will bring her a present. The girl may give the man gifts, as well, though she has little to offer him. Thus, the girl stands to gain by this relationship, whereas in a casual affair she receives nothing. Ideally, therefore, when a boy asks a girl to be his gamar and she agrees, she will not permit him to have intercourse with her for the first two nights they sleep together, so that she can be assured that he is sincere about wishing to make her his gamar, and is not looking for a casual affair. The man indicates the sincerity of his intentions by presenting her with presents. The girl will terminate the relationship, when the man ceases to provide her with gifts, for his behavior indicates that he no longer cares about her, but regards her merely as a sexual partner.

The couple in the gamar relationship reveal their secret to no one. Eventually, the

parents may notice the absence of their son or daughter at night, and may inquire, in which case they are told. But no one else is aware of the relationship. All courtship is completely clandestine, a man giving no indication at all that a particular girl is his gamar. Unmarried youth usually ignore each other should they meet on a public path, and the same pattern characterizes the behavior of the gamars, so that unless one actually saw the couple in the act of lovemaking, one would never guess who a boy's or girl's gamar is. Should either gamar reveal the identity of his gamar, the other would terminate the relationship. (4)

The boy visits his gamar only at night, after the adults are sleeping. Should the night be dark, he will crawl into the girl's mosquito netting, and remain with her until daybreak, when he returns to his home. If her house is overcrowded they retire to the bush, where they may sleep in a lean-to, or spread mats on the ground."

"4. The very word, gamar, is taboo in conversation in mixed company. From the attitude of the informants, I had the feeling that it is almost always the man who violates the trust, not the woman."

28: Spiro--123

"Sexual behavior of sweethearts and of married couples is the same. Often, both man and woman will bathe and annoint themselves with coconut oil, use perfume, and generally beautify themselves. As a prelude to love making, the woman may perform a bwarux, for her sweetheart or husband. The bwarux is a combined love song and dance, the lyrics of the song being composed by women only."

28: Spiro--123-125 (1947-48) 1949 Woleaians-1 75
116, 539, 833 Ifalik

"Bwarux-Love Songs--a selection

The following are two love songs, taken from the collection of Dr. Burrows. The bwarux is the largest single category of songs and it is interesting to note--and I chose these for the purpose--the candid language that the woman uses--in glaring contrast to the puritanical taboo on any reference to sex in mixed company. Many of these songs are well known, and are sung by the women when men aren't around and by the men and young men when women aren't around. [124]

Love and Parting

Flower of the sevang tree,
Ango that blooms in the taro swamp.

My sweetheart comes to me,
Stays close to me.
Our feelings are the same
I understand what he says.
He told me 'I'll never leave you.'
I asked 'Truly?', and he said, 'I would lie to you.'
He is like a vein in my body;

Grips me like breadfruit roots under ground.
He loves me too much to leave me.
Wherever he goes the thought of me is with him.
My love is meat and drink to him.
I am like the garland on his head
Like the feathers of the tropic bird
That flies without alighting.
His head is adorned with its plumes,
He makes a fine showing at the canoe house,
Or as he goes into the meeting house Atelu.
He cannot bear to stay long away from me;
He comes around by a back way,
Comes through the woods to find me
At my house in Felarik.
He rejoices at the sight of me,
Takes me in his arms.
We go into the woods together,
Find a pleasant clearing;

28: Spiro--123-125 (1947-48) 1949 Woleaians-3
116, 539, 833 Ifalik

There we lie down side by side,
Where the gavwu grows low about us.
I take off my skirt, spread my legs,
Show him my genitals.
He admires my thighs,
Caresses me (thighs or vagina) with his hand,
I adore his caresses.
We prepare a bed and lie down
Under the coconut leaves,
Out in the woods where nobody comes.
We lie face to face, or from behind
He clasps me tight.
If he leave me I will be in despair.
We go to the little islet
Called Arelau (formerly in the channel between Falalap and Felarik. Washed away in a typhoon)
Not too close to shore,
Separated from the main islands,
Where not every body can come.
In the midst of our joy comes a feeling of pain.
I tell him, 'You are like my little boy.'

People say, 'They are always together.'
He tells me he is going away,
Going to sail to a far land,
Going to take a canoe and go.
The canoe hoists her sails in the bay by our islet,
He gets aboard. [125]
Though he is far away I will not forget.
He has left his perfume behind;
Left it on my skirt,
Left it on my body;
For a long time it stays.
He has gone far away
To the island of Lamotrk.
As he lies down to sleep
In the canoe house there
He dreams of his sweetheart,
Dreams I am sleeping beside him,
That he is holding me like a child,

28: Spiro--123-125
116, 539, 833

(1947-48) 1949

Woleaians-5
Ifalik

That we are in the woods together,
In our favorite clearing.
Always he holds me tight.

He asks me, 'What do the people say?'
I tell him 'A man from Rauau
'Told me not to come to you.
'But I will not leave you,
I pay no attention to what they say.'

Flower in my ear,
Fragnant ango flower,
It is well."

Note: The songs emphasize much gossiping about the love affairs.

28: Spiro--125

Ifalik

"Sexual foreplay may include the kiss (tiluoal), the 'French' kiss (enguloa), kissing of the breast and nipple (etut), cunnilinguis (erangitingial, and felatio (erangai).

Lovers may employ culturally patterned words of endearment to express their love for each other. The generic term, Igatrux, (I like you, or love you) is employed to express any feeling of love or fondness existing between any two people, including sweethearts. The same is true of the superlative, Igatruxamesau, (I love you to death). There are at least two terms, however, that only lovers employ--Gamararangi (I love you very much), and Atimazei (You are my liver).

Intercourse is effected in three ways--with the woman lying on the ground, and the man squatting between her legs; the man lying on the ground, and the woman on top of him; or the man entering from the rear. Orgasm (zapash) is recognized in both men and women, though it was impossible to obtain information on the relative intensity of desire in men and women. The male informants did agree that there was a differential quantitative difference in the number of outlets males and females may enjoy. Men tire after two acts of intercourse, they maintained, but women do not tire. (5)"

"5. The men may merely be ignorant of the fact that women can have intercourse without desiring it."

"In either case it is agreed that the sex drive is very important, though not as important as the food drive, since the frustration of the latter results in death. Perhaps the intensity of their sex drive may be gaged by the statement of my informants that if middle aged married couples had intercourse every night, they would die."

28: Spiro--125-127 (1947-48) 1949 Woleaians
116, 838 Ifalik

"My informants knew of no cases of homosexuality or sexual perversions. (5) [127] [WPM: poem on p. 126 omitted here] Nor did I observe any. An interesting practice, however, that related to this problem is the very common practice of young men in their teens walking hand in hand. The young men are very affectionate with each other generally. They lie next to each other in the canoe houses, singing bwarux. They may stand together, their arms encircling the others waist. And almost universal is their practice of walking down the path, hand in hand. The fact that neither adult men or small children practice this habit leads one to assume that the homosexual component in these young men is quite high. Their libidinous drives are high, unlike the young children, but it finds no heterosexual outlet, unlike the men, so that it finds some outlet in these mild homosexual manifestations."

"5. Auelimar, an elderly man, said that there were some people that did not 'like' sex, whereupon the other men laughed at him, and called him 'tuvai.' (old man)."

"Bwarux-2
Fierce Lover

Here I stand in the woods of Ievang
In my favorite shady grove,
Happily waiting for my lover.
He sets out and walks the trails
Until he comes to my side.
(I tell people it is a hilly place to deceive them).

As he walks the sun shines on his face paint,
The perspiration gleams;
How handsome he is!
Fragrant with flowers on head and neck,
With rich perfume from Truk
In his hair
His great mane of long hair.

Seeing me, he cuts coconut leaves,

Spreads them on the ground
And says, 'Let's sit down here.'

He reaches for my skirt
To take it off;
Snatches it off with his hands.
'All right, whatever you like.'
He sees beneath my skirt and cries out with delight:
'I want to eat you like a beetle nut!'
He sees my tattooing (Ted[Burrow's] note: Women were tatooed mainly on
And says stand up; the inner side of the thighs, and about the genitals.)
I want to drink you like toddy.
He looks me all over,
Always wanting to drink me like toddy.
But I begin to fear
That someone might see us
And go and tell.

We look into each other's eyes
He is a man of Ievang.

'You are like that fierce fish
That strikes at breadfruit leaf.
'When you see me you seize me.
'Now that we are together, let's stay here!
'Tomorrow you can't come; it is too far.'
Still he wants me, his toddy.
It is like tobacco, too scarce to pass around,
But treasured in a little basket.
So I keep the treasure of my body
In a little basket for him."

28: Spiro--127 (1947-48) 1949 Woleaians
116, 839 Ifalik

"The only contact with animals I observed, and the natives do not interpret it sexually, is the suckling of infant pigs. The few times I observed this, the woman in question removed the pig from her breast, as if she was ashamed to be seen by me. On Yap, on the other hand, where this is a common practice, there was no shame at all."

28: Spiro--127 [2] (1947-48) 1949 Woleaians
116, 827, 832 Ifalik

"Standards of sexual beauty, of course, are culturally variable, but it was difficult to obtain the Ifaluk conception of sexual beauty, since they insisted on the great variability within the culture itself. Tom referred often to the small breasts of a woman in the TAT, which he admired greatly, and many men commented favorably on the 'big' (that is, thick) legs of another woman in the TAT. But all questioning this score produced only animated discussion and much laughter. Sarfert, in his discussion of sex says that the women remove their pubic hair because the men consider it unaesthetic. Inquiry did not bear out this contention. It is true that many women do remove their pubic hair, but for different reasons. Long pubic hair may injure the man's penis during intercourse. Second, the women bathe in the lagoon while wearing their skirts. The water on the pubic hairs may not dry when they emerge, and will thus be noticeable, much to their embarassment."

28: Spiro--127 [3] (1947-48) 1949 Woleaians
116, 837, 548 Ifalik

"As one might expect in a culture the size of Ifaluk, there is no prostitution. However, a woman might sell her favors. A man meeting a woman in the bush might offer her a present if she would have intercourse with him."

28: Spiro--127 [4] (1947-48) 1949 Woleaians
116, 203, 839, 684 Ifalik

"The concept of rape (garo) is known to the people, but as far as I know, it has never occured on Ifaluk. My informants did know of one case of rape that occured on Satawal, an atoll in the Central Carolines. (6) Eight men working on a canoe in the bush fell upon a lone woman and all had intercourse with her.

A variation of rape, ganou, is found on Ifaluk. A man will enter a house at night, and copulate with a woman while she is sleeping. Should she awake and object to his behavior she awakens the household. (7) Again, the incidence is negligible."

"6. This incident is of interest for it indicates that the people do not live a completely insular life, but that news and gossip from the other islands is diffused throughout the area.

7. It is of interest to note that the verbal taboo on sexual terms obtains even in this situation. The women does not say that a man is copulating with her, but states that a man is in the house."

28: Spiro--127-128 (1947-48) 1949 Wolcaians
116, 839, 864, 522 Ifalik

"Masturbation, azirzir, we have seen, is taboo for children. My informants, however, maintained that children violate the taboo. They also maintained that the [128] children indulge in mutual masturbation and that the women also engage in mutual cunnilinguis. The men do neither. (The informants were men.) However, they did recall two cases of male masturbation. A man in Farulep, one of the Central Caroline islands, was discovered by two women masturbating in a tree. They began to tease him, and he attempted to distract their attention by shouting that a ship was coming, and that he had climbed the tree to observe the ship. (8) The same man was mastrubating in a tree, and the branch on which he was sitting broke, so that he fell to the ground. A man on Rauas in Ifaluk had bored a small hole in the wall of his house, which he used as a masturbatory device, until one day he was observed by some women."

"8. This, and the following stories told with great laughter by the informants."

28: Spiro--128 (1947-48) 1949 Woleaians
116, 521, 533, 831, 562 Ifalik

"Sex is a favorite topic of conversation, among the men and women both, though it is completely taboo in mixed company. The men, young and old, sitting about in the canoe houses in the evening sing bwarux, though only the women are supposed to sing them. And there is the almost universally-found ribbing and kidding of others with respect to sex. My informants were very happy to talk to me about sexual relations, and were in constant good humor, kidding and ribbing each other and me throughout. As Aluelimar, the elderly informant put it: 'No can leave talk about women.'"

28: Spiro--128 [2] (1947-48) 1949 Woleaians
116, 831, 533, 177 Ifalik

"The young men were eager to learn of sexual practices in America, as were the adult informants. Women, when alone, are constantly singing bwarux. When the men make the statuettes which they sell to the ships, there is usually some kidding about the length of the penis. In one case Taualimen was carving a man with a long penis, and was about it every day. Otilivok one day, while this kidding was going on, went to a corner, and carved very diligently for a long time, finally coming back with a carved vagina, which he gave to Taualimen."

28: Spiro--128 [3] (1947-48) 1949 Woleaians
116, 291, 831, 827, 177 Ifalik

"Though the people are neither modest in dress nor in sexual practice, in terms of western standards, that is, they are actually quite puritanical. Any sexual reference or term, either anatomical or physiological, is completely taboo in mixed company.

As we have seen, a man does not even permit another man to see his genitals. And anyone would be horrified if a member of the opposite sex had seen him nude. (9)"

"9. The Japanese shocked the sensibilities of the Ifaluk by bathing in the nude. Women would run away if they saw the Japanese bathing, as they were shocked by their boldness."

"This is not true of pregnancy, however, which is not concealed, and which is not a tabooed topic for conversation; nor is it true of the exposure or reference to the female breast. (10)"

"10. Despite the exposure of the breast, it definitely has an erotic value, and is fondled and kissed in sexual foreplay. Furthermore, it is an object of sexual attraction, many men commenting, for example, on the attractive breasts of a woman in the TAT."

116, 831, 593, 115

(1947-48) 1949

Woleaians
Ifalik

"This puritanism goes great lengths. A man would never dream of kissing his wife goodbye, not because kissing does not constitute a form of displaying of affection, but because of the absolute shame of being seen engaging in a sexual activity. No man would even hold the hand of his wife in public for the same reason. Our adolescent pattern of hand-holding would shock any Ifalukian. Any overt form of sexual activity or display of fondness between the sexes is inhibited. The candid reference to the sexual anatomy and physiology in the love songs stands in glaring contrast to their public attitude of shame. This means that one never sees overt affection displayed between spouses. One might interpret this as lack of affection, but this would be an untenable interpretation. In the intimacy of their homes, affection is shown, and patently felt. A wife will serve her husband, with no expressed feeling of gratitude on his part in public. But in private this pattern is different. One afternoon, for example, Tom and I were administering a battery of tests, and his wife came up bringing us coconuts to drink. Tom was very pleased at this gesture, his face beamed with pleasure, and he exclaimed: 'My wife, my wife! Very good that my wife.' On another occasion, I was giving his wife one of the tests, and she did not respond very well. Tom became quite angry at her, so that her feelings were hurt. He was immediately sorry for his treatment of her, smiled at her, and all was forgiven."

28: Spiro--129 [2] (1947-48) 1949 Woleaians
116, 831, 514, 827 Ifalik

"This same puritanical attitude is displayed with reference to excretory behavior. All people perform their ablutions in the lagoon so that they are in public view. But they would be terribly ashamed if a person, even of their own sex were to see them urinating or defecating on land. If a man urinates, and other men are present, he will bend down on his haunches, so that his penis is concealed. A person in a group who must evacuate his bowels or bladder will not tell where he is going, when he leaves. He says, 'I am going over there.' Flatulation is in the same category. Should a person flatulate in public, people laugh at him, and he is greatly ashamed."

28: Spiro--129 [3] (1947-48) 1949 Woleaians
116, 831, 192 Ifalik

"Unlike our own culture, sexual and excretory words are not employed as obscenities, with one exception. There are only two 'swear words' on Ifaluk: Go copulate with your mother (or father). And ganizin, literally, 'I (give food) to my mother'. This is obscene, say the natives, because you invoke the name of your mother in vain, which is bad. But I am inclined to interpret the phrase in psychoanalytic symbolism. The fact that the only tabooed words are sexual and excretory, and the fact that the other 'swear word' is a commission of incest, I think it not unlikely that the frequently found equation of eating with sexual intercourse applies here, and the seemingly innocuous phrase (unconsciously) means intercourse.

The former, go copulate with your mother (father)' is used by the children when taunting one another. The latter, ganizin, is used often, and is equivalent to our dammit.' That is, if one hits his fingers with a hammer, or a fish escapes, or a flint will not give a spark, the person will often express his anger or frustration, by muttering, ganizin. In other words, it is a means of 'letting off steam.'"

28: Spiro--129-130
116, 192, 831

(1947-48) 1949

Woleaians
Ifalik

"All obscene words are called 'kapat engau', literally, 'bad talk.' It is of interest to note that though there are many forms of bad talk, culturally defined, such as lying, gossiping, etc., it is only obscene conversation that is literally designated as 'bad talk.' The young men and boys have devised a special sexual vocabulary which enables them to talk about sex, without betraying that fact to others. They employ one term, chagiach, which, as far as I could determine, was a universal generic term referring to any aspect of sexual anatomy or physiology, the meaning of which depends upon the context. Aside from this generic term, there [130] are two specific terms. The native words for penis and vagina (gai and tingi, respectively) which are completely taboo, are replaced by the terms, tamoneliman, and tamolelitrauwut, in which the root tamon means 'chief,' and the roots man and trauwut mean man and woman, respectively.

Now neither of the above substitutions corresponds to our distinctions between polite and obscene forms of words. The distinction does not exist here, all sexual terms being taboo. On the other hand, there is one term which does have a socially acceptible polite term, as well as one which is taboo. Gamar, the word for lover, is tabooed. However, if the occasion calls for the mention of the concept, a circumlocution is used--tralia-mukakat. (11)"

"11. My knowledge of the language is inadequate to break this down into its component roots. The boys insisted that it was merely a nonsense term. On the other hand, tral means water, and kapat means to speak."

Woleaians
Ifalik

"This same verbal taboo applies as well to excretory references. No mention may be made of them in mixed company, not even one's own wife. For example, Tom's brother-in-law was ill, and I brought him some medicine. I wanted to know whether his bowel movement was regular, and asked Tom to ask him. Tom tried but he stuttered and blurted out nothing. Finally, he asked his wife, who was sitting with us, to leave the room. When she left, he could then address my question to his brother-in-law."

28: Spiro--130 [2] (1947-48) 1949 Woleaians
116, 522, 831, 562 Ifalik

"This taboo on overt sexual verbal or physical behavior does not apply in the case of adults and children. During an interview with Lesaligesia, a 12 year old girl, Tom fondled her breasts throughout the interview. She sat through it impassively. He then took from his basket a tube of lipstick I had given him, and pushing the lipstick itself through the tube, he told her that she should show it to the women, and that they would laugh because it resembles a penis. The next day, while we were interviewing her sister, she came into the canoe house. Tom told her that she should go to the lagoon to bathe so that she would have her first menstrual flow, and then she could get married. Lesaligesia became sulky at this jibe, while Tom and her sister went into peals of laughter, thinking this very funny.

Another day we were interviewing Tavelegia, a young girl quite mature, but who had not yet menstruated. Tom asked her if she wanted a husband, and she said, no. He then said that she should marry a dog. Later, while we were still talking, he told her to put her finger up his anus. And still later, when she said she would have to leave to 'make a skirt,' he said to her that she should 'make my faeces.'"

28: Spiro--130 [3] (1947-48) 1949 Woleaians
116, 831, 533, 522 Ifalik

"Sexual verbal taboos between different age groups within the sex do not exist at all. For example, women will sing bwarux, with their candid sexual references, in the presence of boys of any age. There is no age 'discontinuity' at all. After having administered my TAT's I showed pictures of other primitives to a group of males, including all age groups, as well as the chiefs, and told them stories about them, involving ribald sexual humor, to test their reactions. All ages thought them very funny, laughing uproariously, none attempting to conceal their lively interest in the matter because of the presence of persons much older or younger than themselves."

28: Spiro-131 (1947-48) 1949 Woleaians
116, 226, 834, 768 Ifalik

"Though sexual mores are liberal, there are periods in which any sexual activity is taboo. Should a school of fish enter the lagoon during the day, and the men spread their nets in the passage, leaving them over night, no sexual activity is permitted that night. Should a man violate the taboo, his spear, directed at the fish, would enter his own body. During the season of night, torch-light fishing, which lasts for about three months, the men sleep in the canoe houses, and may have no social or sexual intercourse with the women. The men bring fish and toddy to their families, but leave them at the door of the house, and may not enter. The taboo extends for one month after the end of the period making a total of four months. Should a person violate the taboo, a shark or sword-fish will kill him, or an alus of the sea will make him ill. At the death of a spouse there is a one month taboo on intercourse (and on remarriage)."

28: Spiro- 131 [2] (1947-48) 1949 Woleaians
116, 789, 831 Ifalik

"Despite the importance of sex, there are no supernatural techniques of obtaining love or sexual favors, no love magic. The natives said that love magic is found on Truk, but no one had brought it from Truk, since all the people would fear it."

28: Spiro--131 [3] (1947-48) 1949 Woleaians
116, 584, 848, 837 Ifalik

"Unmarried lovers either marry after an indeterminate period, or else terminate their affair. Should the girl become pregnant, they will usually marry at the onset of her pregnancy. There is no concept of illegitimacy on Ifaluk, children being eminently desired, whether obtained in marriage or out of it. However, the problem seldom arises since the girl's lover will almost inevitably marry her. (12)"

"12. The problem is complicated, however, if the father of the child is already married. It is seldom that he would leave his wife and family to marry his lover, so that the child is called Sevuliwaliwuliwud, literally, 'from the root of a tree'. That is, the child has no social father, but has come from the tree. Unfortunately, I could get no statistics on its incidence."

"In choosing a spouse, both the man and woman (ideally) weigh the economic skills of the future mate. A man who is a poor fisherman or otherwise economically unskilled, a woman who can not cook well or is not adept at making skirts, would be considered a very poor marriage prospect. There is at least one woman in Ifaluk who has never been married because the natives insist she is a 'fool fellow', that is, domestically unskilled, and there have been two cases of divorce for the same reason.

The two desirable features that a person looks for, therefore, is economic skill and sexual attractiveness. But it seems that both desiderata are fairly universally found among all the people for an ecological study of the island of Felarik reveals an interesting phenomenon: Of the sixty-six marriages in the genealogies (the total number of marriages on this island), fifty-five, or more than eighty-three percent were consumated between individuals living in the island. Only eleven individuals married a person from the island of Falalap. And of the fifty-five, sixty-three percent of the total chose mates from within their own districts. This high percentage of local endogamy means that a high percentage of the people marry the girl who lives next door. This has two important implications: It means that all the people of one district are close relatives, either through birth or marriage, partly explains the degree of intimacy, and cooperation that exists between them. And it also means that your spouse may have been your childhood playmate, with whom you have grown up, or a young girl whom you had seen grow from

infancy, whose every character and personality trait you know well, so that you enter into marriage with an intimate knowledge of your mate.

I said above that your spouse is a woman whom you observed grow from infancy, for study reveals that the ages of the mates are often widely separated. When we first arrived in the island, I was struck by the great discrepancy between the number of [132] young men as contrasted to young women.

There were a considerable number of single men, but practically no single women their age, and when I asked Talimera to bring me some tari-veivel to draw for me, he replied that there were none. It was not until many months had passed that I realized my error. I had incorrectly guessed at the ages of the young married women. When I got to know the people, and had obtained information on relative chronological ages, I discovered that the young women, who corresponded in age to the young single men, were all married. Most of the young women marry in early adolescence, whereas the boys do not marry until their early twenties. This means that the girls marry older, often men one generation removed from them. (13)"

"13. This also indicates the precocious maturation of the girl, as compared to the boy. Girls that I had thought were in their early twenties, I later found out to be younger sisters of the young men that I spent my time with. This early maturation continues into old age. Women age much more rapidly than men. Middle aged women look like old women, as compared to their husbands who maintain a very youthful appearance."

"If possible, the men claimed that they prefer to marry a virgin, but virginity is obviously very rare, so that what is preferred is a woman who has not had too many affairs. The reason for this preference is that a man would be shamed by the taunts of her former lovers, who would point out that he had married a woman with whom all of them had had sexual relations."

28: Spiro--132 [2] (1947-48) 1949 Woleaians
116, 582, 835, 198 Ifalik

"In choosing a spouse, of course, one must not violate the incest taboos, (was) which includes marriage within the patrilineal lineage, as well as the matrilineal clan. The tabooed individuals are parents and siblings, real and classificatory, as well as clan members. His classificatory sisters would include his mother's brothers' daughters, his father's sisters' daughters, and his father's brother's daughters, as well as his mother's sisters' daughters. Incest, my informants insist, does not occur. They remembered one case of incest in the past, and the man was seized by the people, and thrown into the ocean to drown. The reasons for incest being 'very, very bad' are unknown. Should a man commit incest, 'all people and chief say,' very bad man"', because 'all people afraid of it.'

The incest taboo extends to behavior that might be interpreted symbolically as incest. I had the habit of whistling a tune as I walked through the village, and at times noticed an implicit disapproval on the part of some people. One day I asked if the people did not whistle, and it was explained that whistling was taboo in the presence of women, because a man calls his lover at night by whistling for her. Thus whistling has a sexual conotation, and should a man whistle publically his sister might hear it, and might interpret it as a sexual advance. Furthermore, since the whistle has this sexual connotation, and since all sexual references are prohibited, whistling is tabooed in the presence of any women."

Woleaians-1-2
Ifalik

"When a couple decides to marry, each party tells his own parents of his decision. The parents may object, but the young people may choose to ignore their objections. The only consequence of their objection, therefore, is that the couple will not live in the girl's parental home, should her parents object. The incidence of parental objection, however, is negligible. On a day decided in advance, there is an exchange of gifts between the two families. The girl's mother brings food, usually cooked taro and breadfruit to the boy's family, after which the boy's family offers coconuts to the girl's family. The boy himself brings gifts of rope toddy and fish to the parents of the girl. The food brought to the house of the boy is distributed to members of his clan. (14) [133] However, there is no public ceremony or gathering, or religious rite, the exchange of food constituting the consummation of the marriage. Should either family feel that it had given less food than the other, it will add to its gift the following day. The first night of their marriage the couple sleeps in the house of the boy's parents. They may remain longer, if they choose,

---

"14. In the event that the girl is widowed, the boy's family bring gifts of food and skirts to the family of her deceased husband."

but after some lapse of time, they move to the home of the girl's parents, where they take up residence, though matrilicality is not the invariable rule.

Of sixty-six marriages studies in the genealogies in the island of Felarik (which includes the two districts of Rauau and Felarik), forty-two, or sixty-three percent, were matrilocal. The remaining twenty-four were patrilocal, autolocal, or aevam local.

The newly-weds resume their normal routine after marriage, there being no analogue to the western honeymoon. (15)"

"15. The informants were intrigued by the description of the American honeymoon, and indicated their approval by profuse 'erats' (very good), 'one week, only chow, only copulate.)"

"There are two other ways of obtaining a wife, both known as the gavato. One is child betrothal. A young man may fall in love with a young girl, who has not yet reached puberty, and wish to marry her. Being ashamed to speak to her parents of the matter, he commissions his parents to make the overtures. His mother informs the girl's mother of her son's desire, and the latter responds inthe culturally patterned etiquette, that her daughter is 'a fool fellow, no savvy nothing.' The girl's mother replies that this should be no obstacle because she will take the girl into her household and train her in the domestic arts. Should the girl's parents agree, she goes to live in the boy's house, and is treated as an aevam in the house. She may refuse to accept this arrangement, in which case she is not compelled to. Should she agree, the two households become closely knit, and periodically exchange food until she has had her third menstruation, after which she and the boy are considered married. The girl may consent to the arrangement, but after attaining puberty, she may change her mind. Her parents exert tremendous influence on her, however, by claiming that they would be shamed if she did not comply, 'Every day and every year that boy give you and me chow, you no ashamed? I ashamed. Suppose you no take for husband, I go away.' This argument usually suffices to convince her.

The other method of obtaining a spouse, called gavato as well, is infant betrothal.

Should two women give birth to babies in the Birth Hut at the same time, they may agree (if the babies are of opposite sex) that their children, when grown, should marry each other. The children, as soon as they can talk, are informed of their mothers' compact. However, when they reach their seniority they may demur from the parental agreement.

The incidence of either of the gavato marriages is slight."

"When I asked my informants why people marry, I provoked great laughter. The men looked at me with amazement, as if I were incredibly naive, and then Auelimar, [134] the oldest of the men raised his hands towards me, and forming a circle with the forefinger and thumb of his left hand, thrust the forefinger of his left hand into it[sic]--an obvious symbol of intercourse. When the laughter had died away, I pointed out that men and women could have sexual relations without marriage, so there must be other reasons as well for marrying. They replied that if a person did not marry, people would talk about him, implying that the unmarried state is not quite normal. And all would ask him, 'Who will give you chow?' This is a recurrent theme, in the case of both males and females--a spouse is necessary in order to obtain food. In a culture which has a strict sexual division of labor with respect to the production and preparing of food, this factor does assume importance. Yet there seems little doubt that sex is the preeminent reason for marriage, other factors being equal. This is indicated further by the response of my informants to the question as to whether the institution of marriage to inanimate objects is practiced.' Suppose she no alive, what he copulate?', was the immediate response, rather than, 'suppose she no alive who cook for him?'"

"Divorce, zamotalax though its incidence is small, there being only eleven cases of 66 marriages studied in the geneologies, is very easy. The dissatisfied partner merely informs his spouse of his decision. There is no ceremony or legal proceedure involved, nor any property settlement. The children, of course, remain with the mother. Though divorce is easy, the culture recognizes certain basic causes. [1]. The spouse does not provide his/her parents-in-law with food. [2]. One spouse has a lover, and refuses to leave him/her. [3]. Either spouse is economically unskilled. The man is a poor provider. The woman is a poor cook, so that when visitors arrive from other islands, her husband does not offer them food, and is consequently ashamed. [4]. One of the spouses is sexually attracted to another person. If he is still young, his parents will exert pressure on him not to abandon his spouse. 'No. You chow fine face, fine body? Your wife look out for me. She (his new love) look out?' An actual analysis of the eleven cases of divorce reveals that four were instituted by women, eight by men, and in two of the three cases they were motivated by the husband's becoming psychotic, (malebush). Thus the man almost always divorces the woman. The actual reasons given for the divorces were as follows:

Desire for different spouse: four cases (2 men, 2 women)
Infidelity: three cases
Mental illness: two cases

Domestic ineptitude: one case (a woman)
Unknown: one case

Divorced couples are very cordial to each other, as are old and new mates of the same man and woman. They fish together, work together, care for each other's children, even in cases in which a man has divorced his wife for infidelity, the relationship between him and the man who seduced his wife, and who married her after her divorce, are warm and friendly. Both men are equally concerned about the children the woman bore the first husband, both take care of them and raise them.

From the above discussion it is apparent that marital infidelity does occur. As a matter of fact, its incidence is quite high. My informants insisted that almost every person--man and woman--has a lover. Now they may have been wrong, since all sexual activity is concealed, as we have seen, and they may have been guilty of a personal projection.

Now, whether they do or do not have lovers is, of course, important, but even if they do not, the statement of the informants is of great psychological importance, since it shows that they think it is true. That infidelity does occur, and that the people are disturbed by it, and become unhappy is indicated by a number of songs [135] collected by Dr. Burrows, in which a woman laments the infidelity of her husband. The motivations

of infidelity are not too clear. Tom, for example, was married to a woman, much younger than himself, and very attractive. He was much in love with her, praised her highly, and was generally very affectionate towards her. One evening I met him walking from his home, his hair combed, and his body perfumed. When I asked him where he was going, he became sheepish, and would not say. But he asked me not to walk past his own home, lest I see his wife. I asked why he did not wish me to see her, and he finally confessed that he was on his way to a liaison with a woman, and had told his wife that he was going out to see me. (16)

There seems little doubt then that married people do have affairs. Its incidence, however, is in doubt, but it does seem to be taken for granted by the people that everyone, including one's own spouse, is having an affair with another person. And this knowledge

---

"16. Later that evening, he came to our tent, very disappointed. The woman had not appeared. He was indignant, because she had lied to him. She had promised him that she would meet him, but did not. He had waited in the bush for her, and finally left, because it was getting dark, and he was afraid of the alus."

creates no apparent jealousy or anxiety. If the person is indiscreet, however, and his affair becomes known, his spouse will then insist that he terminate the affair, not because of jealousy, but because of shame. Infidelity constitutes an illicit aspersion on his sexual ability and attractiveness, and it is a blow to his ego that others should know. But the theoretical knowledge of infidelity is not disturbing, the philosophy being, apparently, that what you don't know won't hurt you."

"Consciously, there seems to be no 'battle of the sexes.' The men told me that women are more important than men ('more high'), because they 'give people', that is, they give birth to children. 'No have woman, no have people. (Therefore), man take talk for woman.' (that is a man will obey the woman.) But this statement seemed to contradict some of the overt practices. For example, a woman who passes a group of men, lowers her head, in the same fashion that all people do when they pass the fanap. When a woman walks from one end of the village to another, she takes the back path, whereas men take the front one. When men gather to eat, women may not join them. Women are not permitted in the canoe-houses."

28: Spiro--135-136 (1947-48) 1949 Woleaians-1-2
116, 562, 593, 796, 462 Ifalik

"If a husband and wife should walk through the village together, the wife always follows behind him, never preceeds him. But what was most impressive with respect to this differential treatment of the sexes was the following treatment, which I observed at each religious ceremony. The religious ceremonies are usually held on Falalap. A channel of about 30 yards separates the two islands. Ordinarily the people walk across the channel, since the water at its highest point only reaches to their chest. Now the people 'dress-up' for the ceremonies--new skirts or loin cloths, painted faces, flower garlands, feather head-dresses, etc. It is understandable that they do not wish to get wet. Consequently what amounts to a ferry service is set up. The young men paddling canoes back and forth across the channel bearing passengers. But the passengers are almost invariably men! Since time is short, and there are not too many canoes, the men ride across, but the women wade through the water, despite the fact that the men would dry off sooner than the women, since they wear only loin cloths. Their answer to this differential treatment was that the men do the hard and dangerous work, whereas women's work is light. 'Man work strong. Woman no can work, for too hard. He work on canoe and house for woman. Very hard work that man. Woman-work more down. Man work on tree, maybe he fall down. [136] He catch fish, maybe shark cut him.' This is most interesting in view of the fact that women actually work much harder and longer than

men. Women almost always have work to perform, whereas the men spend hours just sitting about in the canoe houses. Men's work may theoretically be more dangerous, but no one has ever fallen from a tree, and the men know of only one case in which a man was attacked by a shark. These reasons, therefore, are patent rationalizations."

(1947-48) 1949

"Women are 'more high' because they bear children. The day following this discussion with the informants, I was struck by the idea that the stress on the woman's role as the bearer of children might have further implications for the problem of physiological paternity. I asked them, therefore, if the reason they gave for woman's superiority is valid, since they had all told me that man has a share in the procreation of children, as well. This question made them all sit up. They were completely taken aback, and answered as a man: 'You talk true, we talk lie. Man more high. You throw away that paper for yesterday. You put in book, man more high.'

This sudden reversal was quite interesting. So the next day, I assembled a number of women to get their evaluation of relative sexual status. There was a brief pause for reflection, after which they answered that men enjoy greater status as indicated by the fact that a woman must obey her brother. Though there is no full-blown avunculate here, as we have seen, the brother's relationship to his sister and her children is an intimate one, and apparently an authoritative one, as indicated by their answer, and the women's subservience to her brother in this sense emphasized for them the male superiority.

This answer was doubly interesting because a few months later, in discussing this

same matter with the chiefs, they said that men are 'more high,' (17) for the same reason, a man can give orders to his sister, but she cannot give orders to him."

"17. It is of interest to note the conceptualization of social status in spatial terms, which is identical with the usage in English, for example."

"By this time I had become intimate enough with the chiefs, to be able to point up difficulties or problems in their interpretations. I asked whether the two factors of matrilineal descent and matrilocal residence did not indicate female superiority. This, they responded triumphantly, proves the superiority of men. For if there were only women in the house, they would live miserable lives. The houses would be small and there would be no fish to eat, since canoe and house construction, as well as fishing, is man's work. Thus if there were no matrilocal residence, the women would only 'chowchow, but no chow fish.'

The fallacy in the argument is obvious, but I admitted its validity, and then pointed out that they had answered only the matrilocal, not the matrilineal objection. To this they looked quite chagrined, and finally said, 'you talk true.' They were then silent for a long time, as if they were all meditating. Finally, Wolpatau, the highest ranking chief, came forth with a new argument, which we all accepted as incontrovertible. Men are superior to women because only men are chiefs, and women cannot be chiefs (unless there are no men in the chiefly lineages)."

28: Spiro--136 a [2] (1947-48) 1949 Woleaians
116, 562, 828, 764 Ifalik

"Both men and women recognize differential sexual reactions, (temperaments), and numerous men and women I questioned agreed completely, without exception on the following facts. A woman is more sensitive than a man, and is hurt much more readily, so that her feeling of sorrow at the loss of a relative is much greater. This accounts, they say, for her behavior at funerals, tearing her face and hair. (18)

A woman loves her children more intensely than does the man. (19) The man is more prone to anger than the woman, and his anger is more intense. His anger cannot be appeased by his wife, whereas the wife's anger can be assuaged by her husband. A man is braver than a woman, so that the latter fears such dangers as typhoons, sharks, airplanes, etc. more than the man. The woman succumbs to illness more readily than the man. She will take to her bed at small provocation, whereas the men will go about his work."

"18. This funeral behavior is culturally patterned, so that it is interesting to note the use made of a culturally expected behavior pattern being employed to indicate a factor of feminine character.

19. This shown in the songs collected by Dr. Burrows, many of which are mother's lamentation for their dead children or praise of them."

"As far as I can determine age brings neither greater nor less prestige. It is true that the old are not as economically useful as the young but it seems that the subsistence is plentiful enough so that their relative economic inactivity is not viewed as a drag on the economy. On the other hand, their greater age is not, ipso facto, an indication of greater wisdom. A wise person retains his wisdom as he ages. A mediocre person is no wiser because of age. Formally, therefore, there seems to be little if any cultural evaluation placed on old age. It must be remembered, furthermore, that this is an egalitarian society, in which general statuses are about equal, and in which only specific statuses differ. This is, the status of a navigator or carpenter, or fisherman is higher than others, which are about equal. Differential status, therefore, is almost always a function of achievement in a specific activity. This being the case, the status continues into old age.

At no time did I see the slightest indication of resentment against an older person because of inability to perform certain tasks.

On the other hand, though the culture does not evaluate age in terms of any invidious distinctions, the aging person may very well experience the process of aging as more or less pleasant than youth. In speaking with the men, they said that the reactions to old age are not the same. An old man usually cannot marry a young girl, he cannot engage in many kinds of work, the Japanese would not hire him for labor, and thus he could make no money. On the other hand, the old man has prestige and respect, and young people will turn to them for advice, since they 'savvy many thing.'"

"Though old age is experience differentially, there is no dispute about death. Death is not welcomed, despite the native eschatology, which assures every one of continued life after death. Any attempt to obtain direct attitudes on death are, of course, a waste of time, since the responses would reveal only superficial, rational attitudes, rather than the deep seated, emotional feelings. The few individuals to whom I put the question, however, responded with: people are afraid to die, because they no longer remain in Ifaluk, and are consequently separated from their families."

116, 763, 755, 533 Ifalik

"If a person is seriously ill, his relatives, both matrilineal and patrilineal, assemble in his home--or in the home in which he happens to be (1), for public wailing. They sing many chapeng, which are the religious songs, directed to the alus. When he is close to death, they sing a bwaruch--a love song--and, interestingly enough, with the same bodily movements that are normally employed. It is also interesting that this is the only time in which a bwarux is sung in the presence of both sexes. When he is dead, they sing a Garuaru le'zari, a lament for the loss of a child."

"1. We have already seen that if a person has a prolonged illness, he is moved from his own home to the home of another person, it being believed that the changing of his domicile will aid in his recovery."

28: Spiro--137-138 (1947-48) 1949 Woleaians-1-3
116, 763 Ifalik

"This period of wailing continues [WPM: see p. 137, paragraph 4] every evening until the person either recovers or dies. The people go about their normal tasks during the day, showing no indication of sorrow, but return again at night, to participate in the rite. The wailing scene is perhaps the most impressive and weirdest experience I have ever witnessed. Throughout my stay on the island, I was impressed with the natives' lack of 'primitiveness'. These were people like any people I knew 'back home.' The only intimation I had of the stereotype of the 'savage', was this experience of wailing. From a distance, both physical and psychological, from which I now write these lines, it is [138] difficult to rescucitate the wailing scene in my imagination, so that I shall quote directly from my field notes, for August 25.

'We have just come from one of the most depressing sights I have ever seen. The " "sick man" has been mourned regularly, every night, for one week. During the day, however, there has been no indication of sorrow, the family going about its daily routine with no apparent concern. This evening Tom came to inform us that the man was very ill and the people would be wailing tonight, as he was not expected to live. In fact a new loin cloth had been prepared, in which he would be wrapped, should he die. After eating our dinner, we hastened to the scene of the wailing. As we approached the house, there was no one in the courtyard, except for Tom who had been waiting for us, but the sound

of wierd and mournful wailing met our ears. The melody seems to be in a minor key and is very monotonous in its pattern, the same them repeated over and over again. But what it lacks in complexity and variation, it makes up in total effect. It is tragedy itself, penetrating to the very soul. It is almost death personified in all its tragedy and sorrow.

As we entered the courtyard we were met by Tom, who brought us to the doorway, from which we could view the scene. The house, illuminated by a single, flickering candle, was filled with wailers, who were seated about the sick man. He was lying in the center of the room, with a flower garland on his head. The song being sung was a bwaruch, and as they sang, their bodies and arms would weave with the rhythm of the song, as in the love scene for which the song was originally composed. Each phrase would end with a loud, mournful, sob. At regular intervals the women would beat their chests with great force. The mother was particularly violent, tearing at her face with her finger nails.

This behavior is, of course, patterned, and it is difficult to tell whether the grief is genuine psychological grief, or merely stylized wailing. (2)

"2. Babies and infants are brought to these wailing ceremonies. Whether they are stylized or not is immaterial as far as the effect on the children must be. The abrupt change from the ever friendly, smiling and laughing adults, to the wailing, sad, ones must leave a deep impression on the children."

When the people are sure that a sick person is about to die his female relatives assemble to make a pandanus mat, in which he is wrapped at death. In the meantime, a new lavalava is brought, and as soon as the death is announced, the male relatives bring huge quantities of rope, in which the body will be tied."

28: Spiro--138 (1947-48) 1949 Woleaians
116, 761 Ifalik

"There are five physical signs, which the natives employ as symptoms of death. The eyes do not blink; when opened, only the whites of the eyes are seen, the pupils having receeded under the eyelids; absence of movement in the belly which indicates lack of breathing; the mouth hangs opened, but the teeth are clenched tight; the body exudes excreta."

28: Spiro--138 [2] (1947-48) 1949 Woleaians
116, 775 Ifalik

"At death the soul leaves the body through the mouth, and becomes an alus."

"When the person is pronounced dead, the wailers now mourn over the corpse with the singing of arueru. The following is an example of one:

Lament for Death of a Son
(the kind of Arueru lezari that is sung at the wailing sessions at a man's death)

Flower of the aro
And the wut, that grow by the house [139]
Near the gable end..
What if he should get worse?
Why should this sickness come to him?
I am afraid he may die..
He lies there and cannot get up.

Oh, now he lies dead!
I rush out beside the lagoon
Searching everywhere for him
But he is nowhere to be seen.
He will not come to the house as he used to,

If he were alive he would be here
Making everybody laugh with his jokes.
His mouth had a charming curve
As he talked and laughed merrily.
A fine beard he had
And beautiful eyebrows.

Missing him is like a fire
That burns my heart and eyes.
I am worn with sorrow.
No one can see my beautiful boy.

What a fine man he was.
Expert in all many [sic] crafts.
He worked hard in his plantation
Clearing out the weeds.
His place was over on the seaward side.
I remember what pride he took in it.

Go there now and what a difference.
The wind comes against my face
And blows on my body.
What if that wind were my boy come back to me.
I go along the shore
Walking in the sunlight
To the bay where he used to go
And around to the other side.
I sit down and there I see him
As if in a dream.
I know it is he before my very eyes.
He is not dead, he is alive.
He sits down beside me,
I think, what can I give him?
I call out come to me, it has been so long.
Tumeric from Truk, with its rare red
And the white paint I give him.

He puts it on his hands, then rubs it on his face.
On his beautiful face and body.
What a lovely youth.
Flower about my neck,
Fragrant aro flower.
Anoint yourselves."

"If the person dies in the early part of the day, the mourning is brief, and he is buried the same day. However, should he die in the late afternoon or evening, he is not buried until the next day, in which case the mourning lasts all night.

While the mourning is in process, friends and relatives are busy with the burial preparations. The corpse is painted red, and it is dressed in a new lavalava. The men who have brought rope are engaged in making a long rope-net, in which the body is to be wrapped.

The contrasting behavior of the mourners and of the others is very interesting. The mourners wail throughout this entire proceedings, and often get into a state of complete frenzy. This is praticularly true of the person's mothers and spouse. In the case of the man's death, mentioned above, the mother and wife beat their breasts and scratched their faces with such ferocity that they had to be restrained by some of the other women, who forcibly held their arms behind their backs. The others, however, seem little effected by the scene. It is true that the children are not permitted the usual run of the yard, and the young men inhibit their usual horseplay, but the solemnity that marks an American funeral, for example, is completely lacking. The men working on the rope-net seem quite gay, and joke as they work. The young children of the deceased seem unaware of the death of their parent, and continue to play and laugh, though the adults will periodically attempt to restrain any undue boisterousness.

This raises a serious psychological problem. Is the intense mourning of the immediate adult family of the deceased a genuine experience, or is it all 'culturally patterned'? Since I observed only three funerals, and the pattern in all three was the same, I tentatively adopted the hypothesis that both factors entered into the behavior, and my questioning of the people as well as other evidence seemed to indicate that the hypothesis had some degree of validity. My informants stated that all women, for example, express their mourning by tearing at their faces and breasts. Furthermore, if a woman did not do so, she would be criticized by the people as not showing sufficient love for the deceased. This would seem to indicate that the overt behavior itself is learned. But how about the private emotions of the mourners? The feeling, not the behavior, is the variable factor. There is evidence that indicates that the feeling, in some cases at least, is very intense. When Navor, died, her husband could not perform the culturally patterned wailing. He broke down completely and sobbed like a baby. Here we see complete personal disorganization so that the behavior becomes a pure expression of personal feeling, rather than becoming channeled in the cultural mode. In another instance, Arivimae, a young married man in his late twenties, burned the house of his dead mother, the day after her funeral, as an expression of his heated feelings. Unfortunately I did not observe his behavior during the funeral itself. But whether it was then culturally or

personally expressive, this extreme display of emotion indicates quite clearly the intensity of his feeling, since the practice of burning the house of the deceased is not practiced in this culture."

28: Spiro--140-141 (1947-48) 1949 Woleaians
116, 764 Ifalik

"Another even more important psychological problem arises from the behavior exhibited in the aftermath of the funeral; but first let us take up our ethnographic story. [WPM: See p. 140, paragraph 2 and 3] When the rope-net is in readiness, the body is wrapped in it, and over it is wrapped the pandanus mat, and it is then tied with thick cord. The corpse is carried to the canoe, which will carry the body out to sea, by male kin of the deceased, while the mourners inside the house follow the procession to the canoe. The body is then wrapped in what seems like endless yards of rope, and is weighted down with stone, prior to burying it in the ocean. The female mourners, in the meantime, have entered the lagoon and continue their wailing, but the men do not continue theirs. While the body is being tied, some members of the family break the utensils used by the deceased during his illness. [141]

When all is in readiness, the sail is raised, and the body is taken out to sea, where it receives an ocean burial. The women continue their wailing in the water until the canoe has disappeared from sight. The canoe used for this purpose may not be put back into the canoe house, but must remain outside for four days, and may not be used."

28: Spiro--141

(1947-48) 1949

Woleaians
Ifalik

"Ocean burial is not the rule in the Central Carolines. On the contrary, Ifaluk is the only culture that practices it, the others burying their dead in the ground. The natives say that there are two reasons for this practice. If the corpse is not removed from the island, a typhoon will destroy the idland. If the corpse is buried in the ground, its body fluids will mix with the soil, causing the vegetation to die. (3)"

"3. It should be noted that the fear of the presence of the dead is related to two of the people's most severe anxieties--the lack of food, and typhoons."

28: Spiro--141 [2] (1947-48) 1949 Woleaians
116, 764, 801 Ifalik

"After the burial, a number of taboos and practices are observed by the family of the deceased. The 'pall bearers' may not sleep in their own homes, but must sleep in the house of the deceased for four days. (4) Their food is prepared on a separate fire, and they may neither take from nor give another a light. Talemera, for example, would not share the cigarettes I had given him with Woromai, after it had been lit, because the latter had been a pall bearer. This taboo on the sharing of fire seems to be true of members of the family as well. Tom refused to light the cigarette of Novogopok, the mother of the man who had died, during the mourning period: 'I am afraid dead man,' for he might make him ill."

"4. Four is the sacred number in Ifaluk. Almost all abstention taboos, as well as any other acts of supernatural import involve the number 4."

28: Spiro--141 [3] (1947-48) 1949 Woleaians
116, 765 Ifalik

"The immediate family of the deceased does not work for ten days, and for four days it prepares no food, but is brought food by friends and relatives. The males may not climb coconut trees to obtain either coconuts or toddy. After the four day taboo in cooking and tree climbing, the male kin of the deceased bring baskets of coconuts to his household. The immediate family shave their heads, as a sign of mourning, and the mother continues to wail for the deceased every morning and evening for four days. The mourning is completely patterned, taking place in the lagoon, and consisting of the wailing recital of an arueru."

"A general taboo, which lasts not only for the four days of mourning, is the mentioning of the name of the dead. The immediate family may not ever mention it, nor may a stranger mention it in their presence. I saw a little child receive a beating from its mother for repeatedly using the name of its dead father, after she had warned him not to."

28: Spiro--141 [5] (1947-48) 1949 Woleaians
116, 765, 784 Ifalik

"Finally, I accidentally discovered a taboo which applies to certain specific people, and which lasts during the four day mourning period. Lautrilus, a girl in her early teens, was eating some coconut meat, and I asked her for a piece. She extended her hand, but Tom, who was with us, would not permit her to give it to me. It seems that should any living person have had the same illness from which the deceased dies, he may not share his food, for the four days of mourning, with others."

"Taboos on working and cooking are much more stringent should the death occur in [142] a chiefly lineage. The immediate family may not work for one month, the clan may not work for ten days, and the entire village must refrain from working for four days. However, the men may fish, which is what they did after the death of Navor, who was a member of a lineage of chiefs. The canoes houses, however, are empty and the women merely sit idly. The men may climb the coconut trees, though they may not climb trees along the beach where they can be seen, but must go into the bush."

"The behavior of the people following the burial is extremely interesting because of a seeming paradox. The paradox was obvious from the first death that I witnessed, and the same pattern was repeated in the other four deaths, and in each case my field notes remark on the phenomenon, though with different possible interpretations. I refer to the great discrepancy between the intense wailing prior to, and immediately following death, and the apparent lack of mourning and seeming forgetting of the person after death. The same person who indulges in the intense wailing, scratching of face and chest, and indulging in what seems like almost pure hysterical behavior, will, after the burial, revert to his normal personality, smiling, laughing and joking with no signs of bereavement. One would superficially say that this shows that the people do not really love their kin, and the wailing at the funeral is entirely formal and stylized. But this answer would be far from the truth. Despite the patterned nature of the mourning, the feelings felt are genuine. There is no question about the intense feelings of Arivimae, who burned his mother's house, or of Navor's husband. Yet, despite their acute suffering, they too showed no evidence of mourning or acute suffering even a couple of days after the burial. After the four day mourning period, they were in the canoe houses, laughing and joking, interested in the daily events, and eating heartily. The men had returned from fishing, and Navor's husband was intensely interested in the fish he was about to eat, displaying

a remarkable appetite for a man in sorrow.

But the problem goes even deeper. The people are vitally concerned about the recovery of an ill person. They will, and do, sacrifice energy, time, wealth, to ensure his recovery. Maroligar, and Wetriliar, for example, the maternal uncle and brother-in law, respectively, of Navor, did everything in their powers to save her when she was ill. They conducted rituals, they made medicine, they literally devoted their entire day for a period of at least a month, when she was critically ill, to her service. When they saw that she could not be helped and that she was going to die, they were deeply crushed. Their mental suffering was obvious to anyone. But immediately after the burial, the very same day, they were laughing and smiling, giving no evidence of any mourning. It is as if the deceased is completely forgotten, as if he never existed, and life goes on. In fact during the official mourning period, Maroligar spent his days playing cards with the young men.

Now to us this may seem callous. This is another indication, some might say, of the primitive' lack of sensibility. But, such an interpretation would be false and merely display a narrow ethnocentrism. That the people love each other deeply is shown throughout this entire monograph. It is true, of course, that the love applies only to the living not to the dead. And in a small society, such as Ifaluk, reality dictates the necessity of such behavior. Since all the people interract with great intimacy, and the relationship

between them is very close, the culture would collapse if mourning were long and protracted, and the people let themselves be overwhelmed by death. Intense suffering would incapacitate them, they could not do their work, and the results would be disastrous. Instead, the mourning is brief, but intensely acute, a real catharsis is experienced, and then life continues.

But the reality situation alone cannot explain this phenomenon. People do not or cannot always adjust to the demands of reality. Furthermore, what must be explained here is not the overt behavior but the psychological experience. The people could conceivably return to their normal living, but still suffer. What accounts for the seeming abrupt end of the psychological mourning? As far as I can see, there [143] are only two conceivable reasons. First, there is the belief in the continued existence of the soul. The person is not extinguished, his existence continues, but in another form, and there is some communication with him. This answer, however, is not adequate since the same belief obtains in other societies, and the reaction to death is not the same. Another answer suggests itself, which we shall point to only briefly here, and examine its implications and ramifications in the section on personality. The growing child, it will be remembered, forms no exclusive emotional attachments. He is surrounded by many adults, many of whom play as important roles in his life as his own parents. This means that the emotional cathexis of the individual are not intense, but are distributed over a number of

people. This means that though the indivdual feels a loss at the death of a loved one, this loss is not as a severe drainage of one's own ego since there are numerous other individuals for whom the individual feels similar attachments. In a society in which individuals form exclusive emotional cathesis, death means a serious drainage of one's own narcisstic supplies, since the identification has been intense, and the other's extinction is felt as one's own. But there the cathexis are diffuse, the loss of one is not severe, since the person has established many other identifications and they continue after the death of any one. This means, to employ a figure that though one psychological tentacle has lost its object, the others still cling to theirs."

116, 512, 264 Ifalik

"People do not eat immediately upon rising; indeed it would be difficult to indicate any general pattern of regularity of meals. People may or may not eat, as they please, when they awaken. And they eat whatever happens to be at hand-- a coconut, or leftover food from the day before. The women of the household may prepare some food in the morning, which may then be eaten about 9:00 by anyone who happens to be present."

"Though the daily routine varies seasonally, and even daily and though it varies from individual to individual, and according to age and sex, certain over-all patterns may be described.

Usually the entire population is up at dawn. The first to get up are the mothers with infants, for they must take their babies to be washed in the lagoon. If a woman has decided to work in the taro patch that day, she rises with the crowing of the cocks. Men and women wash in the lagoon upon waking in the morning, unless the woman is going to the taro patch, in which case she waits until her return. The young men and women do not usually wash until the afternoon. For upon rising the young men usually have the responsibility of getting toddy, and the young women go in the bush for flowers, or may prepare food."

28: Spiro--144 [3] (1947-48) 1949 Woleaians
116, 512, 272 Ifalik

"Everyone has his toddy in the morning. A person could no more begin his day without toddy than the average American can begin his without coffee. But toddy in Ifaluk is more than the 'national drink.' There is almost an aura of sanctity surrounding it, and it becomes almost a moral duty to make it. Should a man not make toddy, he is accused of violating one of the important marital and familial obligations. Since the toddy is one of the few sources of concentrated sweet or sugary foods the people have, the emphasis placed on it might be explained on this rational basis. But this rational consideration, I do not believe is a sufficient explanation. The attitude towards it is much too reverential to be explained on purely utilitarian grounds. Men sacrifice for toddy certain conveniences they would sacrifice for nothing else. For example, rainy and damp days are abhorred by the natives, and all activity practically ceases. But one activity that continues, however, no matter how bad the weather, is the collection of toddy. The first thing the men did after the big blow, which the natives called a minor typhoon, was to collect their toddy."

"There is no family noon meal either. There is usually some cooked food in the house by noontime, which the members of the family may consume together. If the men have no special economic activity which keeps them busy, they may return to their homes to eat. On the other hand, if they are occupied in some communal work, they do not eat at all until they complete the job, and then will eat in the canoe houses, the food having been prepared by the women. If engaging in ordinary sustained work, such as construction of a canoe, the men will eat about noon, but again they will eat in the canoe houses-coconuts, small fish caught in the traps, and/or prepared taro or breadfruit brought by the women. The boys, young and old, may eat with the men, if they are helping in the work, they may go home to eat, or, if they had caught some small fish, or crabs, they prepare them themselves, and eat along the beaches, rather than take them home. This means that the women and girls are the only ones at home at noon, and they usually eat together."

28: Spiro--144-145 (1947-48) 1949 Woleaians
116, 827, 264 Ifalik

"After eating the people may belch with impunity. Belching is simply not considered indecent, as it is in our society, nor is it an indication of having enjoyed the meal, as it is in other societies. It is just a neutral physiological act. [145]

The same is true, incidentally, of picking one's nose. People do this in public without any sense of shame."

28: Spiro--145

(1947-48) 1949

Woleaians
Ifalik

"Though, again there is much variation, the evening meal is usually a cooked meal, and is usually a family meal. The time of eating varies anywhere from about 5:00 to 8:00. However, except for the women, there is no regularity about the other members of the family coming home for dinner. They may eat at other homes, or they may not feel like eating at all. The food is prepared, however, if they want it. But no one is important enough that the family cannot eat until he returns. This need not surprise us. Ifaluk, being so small, the members of the family are always in close proximity to the home. A person may return to his house a dozen or more times a day. The evening meal, therefore, is not the only opportunity that members of the family have to see each other. They are always near each other, so that closeness--both physical and psychological--is always felt, without the institution of the family meal."

28: Spiro--145 [2] (1947-48) 1949 Woleaians
116, 512, 261 Ifalik

"Furthermore, with respect to the sheer physical fact of eating, there is no compulsive ritual about eating in Ifaluk. People eat when hungry, there being no compulsion to eat at certain regular intervals or times. As already mentioned, any person is offered food whenever he enters a courtyard. This is true of children, as well. Ordinarily, therefore, people are not famished when 6:00 comes around. Furthermore, since no one has pressing appointments, it is not necessary that everyone eat at the same time, so as to enable the individual members of the family may get away on time for an evening engagement. There is nothing that cannot wait."

28: Spiro--145 [3] (1947-48) 1949 Woleaians
116, 264, 343 Ifalik

"Food is seldom eaten in the house itself. It is prepared in the malum, the cookshed, and eaten outside the house. Only on a cold or rainy day will it be eaten inside. The natives explain their outdoor eating by claiming that this keeps scraps of food from remaining in the house. Whether there is a deeper psychological significance, I do not know."

28: Spiro--145 [4] (1947-48) 1949 Woleaians
116, 264, 782 Ifalik

"Usually, when the meal is prepared, a dish of food is set aside for the benevolent alus of the household, and the chief of the household recites a few words of thanksgiving, thanking the alus for protecting the members of the household. On the other hand, if the alus were a poor protector, and illness had befallen some of the people, no food is offered him. This offering is called either agai-l'alus or maipi-l'alus."

"Unless there is something special the men are doing in the way of communal construction or communal fishing, their average day involves no special committments. Usually they go to the canoe houses, where they may make rope, or may just sit around talking, (5) gossiping, and smoking (6) or perhaps take a nap. Rope making is [146] probably the activity that consumes most of a man's time. While making rope, of course, the men continue their conversations. Often, however, they just sit in the canoe-houses,

---

"5. The people rarely, if ever, sit on the bare ground. They always sit on a mat, and if there is none around, they will sit on a coconut husk, or any other object that happens to be about. At first I thought that sitting on the bare ground is tabooed behavior, perhaps the soil is holy. Upon inquiring I discovered the real reason is much more prosaic. The natives simply do not like the feeling of the damp ground. I must have seemed boorish to the people when I first came, because I would sit on the ground without bothering about a mat or a coconut husk.

6. [See following sheet for footnote 6.]"

"6. [Footnote p. 146] Smoking is a cooperative enterprise. When a person lights a cigarette, he invariably passes it to the person near him, after he has smoked a short time. That person, in turn, passes it on, so that it might change hands five or six times until it is consumed. When we first arrived on the island, I not only did not pass on my cigarette, but I would put out my cigarette butt, rather than pass it on. I soon noticed the questioning look on the faces of the people at this anti-social behavior. It was not till a few weeks had passed that I learned the native pattern, and conformed to it."

engaging in no activity at all, not even talking. This is quite strange from a western perspective, where a congregation of people always leads to conversation. The Ifaluk men, however, may sit for long periods of time, just staring into space. In any event, the canoe house is the place where men spend a great deal of their waking hours. It is really, as we have already indicated, the men's club house, as well as the locale for most economic activity. That the canoe-house serves a basic social need is indicated by the fact that men never make rope at home. The twisting of rope involves no great activity nor is it messy, and could very well be done at home, either in the house or alongside it. The reason for going to the canoe-house, therefore, is entirely for the purpose of conviviality."

28: Spiro--146 (1947-48) 1949 Woleaians
116, 512, 462, 517 Ifalik

"The women spend their days in various activities. If they work in the taro patches, they remain the entire morning and part of the afternoon. Otherwise, they may cook or work on a skirt, or look after the house. Like the men, the women do not like to work alone, and usually gather in groups for their work, at which time conversation and gossip, as well as singing, are all part of the day's activity. Some of the work, like cooking is enhanced by the women working in groups. But usually, the work itself is entirely individualistic, the gathering together, being entirely for reasons of sociability and conversation."

28: Spiro--146 [2] (1947-48) 1949 Woleaians
116, 561, 868 Ifalik

"In both the case of men and of women, age differences imply no social differences. An older woman might be requested by a younger woman to examine the skirt she is making if she has a difficulty. A younger man may ask an older man for help on a fine point in the making of a fish trap. But, in all cases, there seems to be no social differentials based on age."

28: Spiro--146 [3] (1947-48) 1949 Woleaians
116, 854 Ifalik

"Both men and women may take charge of the children. The older children, of course, play by themselves. The infants are cared for by their mothers. But those intermediate may be taken to the canoe-houses by the men, or by the women."

"In the late afternoon the young men again collect their toddy. And at the same time, they take their afternoon bath. Everyone bathes in the late afternoon. The women bathe in the lagoon directly in front of their houses, walking into the water, wearing their skirts. The men usually bathe in a secluded beach far from habitation, and change loin cloths, which they keep in the canoe houses. Both sexes use grated coconut meat as soap."

28: Spiro--147 [3] (1947-48) 1949 Woleaians
116, 562, 883, 573 Ifalik

"The young women do not, as we have already pointed out, associate in gangs, as the young men do. Young women, in their late adolescence are already married, and, like the older women, remain near or about the homes. This means that the young women are integrated earlier into the adult female world, than are the young men into the adult male world."

28: Spiro--147 [4] (1947-48) 1949 Woleaians
116, 512 Ifalik

"There is little activity after bathing. [WPM: in late afternoon] The people retire to their own homes, or to the homes of someone else. The canoe-houses and beaches are empty."

28: Spiro--147 [5] (1947-48) 1949 Woleaians
116, 576 Ifalik

"The generic form of greeting, when meeting someone is mauas, which could be roughly translated as, 'greetings.' On the other hand, it is also a term of gratitude. You thank a person for a gift or a courtesy by mauas. Mauas also has the connotation of reverence or respect. For example, when you take your departure, you say, hosamen, which has the meaning of, remain where you are. He reciprocates with hosaelox, meaning, you are going. But when taking leave of a person whom you respect highly, you add mauas to your farewell--hosamen mauas.

A person sitting in his home or canoe house, who sees another person approaching, greets him with ebwutog meia, literally, from whence are you coming? Now this not only has the figurative force of a greeting, but it retains its original literal meaning, so that the person addressed tells him where he has come from. At times it is almost humorous to hear a man shouting, ebwutog meia at a person who is quite far away. What makes this greeting so interesting to the outsider is the fact of the smallness of the atoll, which leaves little lattitude in answering the question."

28: Spiro--147 [6] (1947-48) 1949 Woleaians
116, 512, 517 Ifalik

"After dinner, activity again breaks down into sex and age categories. The families sit about, talking, drinking toddy, smoking, and exchanging news of the day. Often, a couple visits its in-laws. Some families may sing a chapeng until they retire, others may visit the home of a sick person. During the dark of the moon, the family usually retires to the interior of the house when it gets dark, and go to sleep shortly after. The children usually going to sleep at the same time as the parents.

On moonlit nights, the people do not retire until much later. They remain out-of-doors, with seemingly great spirits, and laughter may be heard ringing out from many courtyards."

28: Spiro--147 [7] (1947-48) 1949 Woleaians
116, 512, 517, 533, 123 Ifalik

"After dinner the young men rarely remain at home, but return again to the canoe-house, or in the case of a moonlit night to the beaches. Like the adults they talk about the events of the day, or of some projected plan, or just small talk. They often sing songs, mostly bwaruch, though chapengs are also sung. If I were with them, they were eager that I tell them of America or teach them some English. On a dark night they return to their homes at dark, but on a moonlit night they may fish from the beach, and often they would along the reef in their canoes.

The young women never leave their homes after dinner, except in the company of their parents, again the boys enjoying greater freedom than the girls."

28: Spiro--147 [8] (1947-48) 1949 Woleaians
116, 836 Ifalik

"Sweethearts do not meet until after dark, when the others are already asleep."

28: Spiro--148 (1947-48) 1949 Woleaians
116, 513 Ifalik

"Formerly all unmarried males slept in the club houses. This no longer obtains. But after the trade winds set in, the young unmarried men of Rauaua slept in one of the canoe houses. They would retire to the canoe-house after dark, and sing and talk for a long time before going to sleep. Before long, everyone is sleeping."

29: Spiro--189 (1947-48) 1950 Woleaians
116, 121 Ifalik-1 - 4

"THE QUESTION of the incidence and kinds of mental illness found among primitive peoples has resulted in a respectable literature and has occasioned heated discussions. (1) It is not the purpose of this paper to enter into these many controversies or to discuss the problem of clinical versus cultural criteria of abnormality. Its nature is much less ambitious, being an account of just one abnormal personality in one primitive culture. It is the writer's hope that this paper will serve to re-emphasize what a number of writers have previously emphasized--the lack of concrete data on the nature of --

---

"1. For an excellent survey of the literature, summary of divergent opinions, and an original interpretation--though one the writer does not entirely subscribe to--see Erwin H. Ackerknecht, 'Psychopathology, Primitive Medicine and Primitive Culture,' Bull. Hist. Med. (1943) 14:30-67."

psychopathology among primitive peoples. (2) With almost pathetic regularity, anthropological discussions of the nature of abnormality have been characterized by the absence of any intensive study of, or reference to, concrete individuals. (3) This lack of detailed

---

"2. See Ackerknecht, reference footnote 1; A. I. Hallowell, 'Culture and Mental Disorders,' J. Abnormal and Social Psychol. (1934) 29:1-9; J. M. Cooper, 'Mental Disease Situations in Certain Cultures,' J. Abnormal and Social Psychol. (1934) 29:10-18; R. E. L. Faris, 'Some Observations on the Incidence of Schizophrenia in Primitive Societies,' J. Abnormal and Social Psychol. (1935) 29:30-31; J. P. Foley, 'The Criterion of Abnormality,' J. Abnormal and Social Psychol. (1935) 30:279-291; N. J. Demerath, 'Schizophrenia among Primitives,' Amer. J. Psychiatry (1942) 98:203-207. All these writers, as well as many others, point out the dire need for concrete cases of mental disorder among primitive peoples, if future discussions of this problem are to be fruitful.

3. The only exception, to the writer's knowledge, is found in A. I. Hallowell, 'Shabwan: A Dissocial Indian Girl,' Amer. J. Orthopsychiatry (1938) 8:329-340."

information, while in itself of no great consequence, becomes gravely serious when this very lack of information becomes the basis for building theories of the nature of abnormality from a cross-cultural perspective. It seems obvious that all theoretical formulations based on ethnographic data will remain mere verbal exercises until we shall have collected a large number of concrete cases in the field which can be subjected to scientific analysis. Impressionistic observations of an ethnographer, however competent he be, do not in themselves constitute objective evidence; and yet they are used by otherwise careful scholars as proof of or documentation for their theories. (4) "

" 4. Ackerknecht, whose scholarship is otherwise impeccable, accepts ethnographic generalizations unquestioningly. He quotes, without reservation, for example, Warner's evaluation of a Murngin magician as being 'perfectly normal in his behavior,' and in whom 'there was nothing sinister, peculiar or psychopathic....' Reference footnote 1; p. 52 (quoting from W. L. Warner, A Black Civilization; p. 210). One need not impugn Warner's competence as an observer to ask for the evidence for this statement. Generalizations on this level of abstraction constitute the bulk of the ethnographic 'evidence' in discussions of this problem. "

29: Spiro--189 (1947-48) 1950 Woleaians
116, 121 Ifalik-4

This paper, then, is an attempt to begin to fill in this lacuna in our knowledge. The case to be presented is chosen because of its incontrovertible character. Tareveliman, the subject, is looked upon as abnormal by the members of his society, by the two anthropologists--Dr. E. G. Burrows and the writer--who studied the society, and by Tarev himself."

29: Spiro--189-190 (1947-48) 1950 Woleaians
116, 159, 753 Ifalik

"Tarev--the native contraction of his name--is one of 250 natives of Ifaluk, an atoll in the Central Carolines in Micronesia. Though the Carolines, as a group, have been in contact with 'civilization' for three centuries, Ifaluk remains a rela- [190] tively unacculturated society, so that the aboriginal culture, with minor exceptions, is completely functioning. (5) According to native disease theory, illness is caused by ghost possession. All souls are immortal, repairing to the Sky at death where they become alus, the generic term for ghosts. Good souls become benevolent alus, curing disease; whereas bad souls become malevolent alus, causing disease. One of the nine classifications of disease is that of malebush, a generic term for all behavior that seems queer or deviant from the native point of view. One of these malebush is Tarev."

"5. For a complete ethnographic report see the writer's 'Ifaluk, a South Sea Culture,' on file with the Pacific Science Board of the National Research Council."

29: Spiro--190 (1947-48) 1950 Woleaians
116, 159, 177 Ifalik-1 ~3

"Tarev is a man in his early forties, an only child of parents who are dead. He had not only had a normal childhood, but his early adulthood, too, had been most exemplary. He had been both a good husband and a good father. He had been industrious in his work and cooperative and generous--highly esteemed values in Ifaluk--in his normal social interaction. Furthermore he had been acclaimed as an expert fisherman and was recognized as a skilled carpenter. In short, Tarev had enjoyed a position of respect and prestige in his society. The onset of his disease was not insidious, but was most precipitate. Shortly before the outbreak of war in the Pacific he had been inducted by the Japanese into a labor gang on Yap, and after his return the natives became aware of drastic changes in his behavior. He would not work but would spend many hours in isolation, engaging in private and seemingly meaningless conversations, songs, and dances. At other times, however, he would become violent, accusing people of wanting to kill him, and would resort to violent means of defending himself against these putative attackers. In short, his behavior exhibited the characteristics of the paranoid schizophrenic. These sporadic outbursts became so frequent that his wife and her family were afraid to live with him--residence in Ifaluk is matrilocal--and Tarev was moved to his maternal home where, it was thought, his own family would have greater control over him. This was

the situation when we arrived in Ifaluk in July 1947. (6)

Exactly what the experiences of the natives in the labor gangs were we do not know. One thing is fairly certain, however; the natives were not treated with great respect. On the contrary! Their treatment was often harsh and brutal. Some of the men informed me that the Japanese overseers did not hesitate to employ physical punishment, such as whipping, to enforce their demands. This characteristic of Japanese behavior left a deep impression on the natives, and they experienced it from the very beginning of their induction. The Japanese patrol would come to the island and demand a certain number of adult males from the chiefs. Their arrogant manner in dealing with the chiefs--speaking from raised platforms, shouting at them, and even beating them if they did not respond with alacrity--evoked both hatred and anxiety from the people. The men who were inducted were exposed to this treatment for the duration of their work-period. For people who had lived all their lives in a culture in which nonaggression was a

---

"6. The writer and Dr. Burrows studied this culture from July 1947 to February 1948, under a grant from the Pacific Science Board of the National Research Council, as members of the CIMA expedition (Coordinated Investigation of Micronesian Anthropology). Funds were made available by the Navy Department."

supreme value and in which the greatest emphasis is placed on 'good talk,' meaning kindliness in speech, the behavior of the Japanese constituted a profoundly disturbing experience. The natives know of no instance of this kind of malebush prior to the Japanese occupation; and since the occupation, the only cases of this type have been two men who had worked in the labor gangs--Tarev and one other. To the knowledge of the people no person who had not had this Japanese experience has ever become a victim of this disorder."

116, 159, 123 Ifalik-1 -2

"I should now like to turn to the actual examination of Tarev himself. Though we arrived in Ifaluk on July 27, there is no [191] entry in my field notes concerning Tarev until September 20. This may be explained by three factors: my own preoccupation with other ethnographic matters, Tarev's relative quiescence for long periods of time, and the reluctance of the natives to inform us about him. I first saw Tarev when I was administering a Rorschach in a house close to his. I mentioned to our interpreter that we would proceed next to his house, but he replied that the man in the next house was a 'fool fella,' and we would best leave him alone. When I questioned him about this man, it became evident that he was reluctant to talk about him. This reluctance characterized the other people as well. It was only when it became apparent that I could somehow control Tarev's aggressive behavior rather effectively that the people gave me information about him and no longer attempted to conceal his behavior from me.

The following description will follow my own chronological experiences with Tarev, and the materials recorded are taken directly from my field notes:

September 20, 1947. The 'fool fella' from Falalap [one of the two inhabited islands in the atoll] came up to Ted [Dr. E.G. Burrows] and me, as we arrived for the ceremonies, and asked to hold our hands. When we gave him our hands, he took them in his own and smelled them. Later in the day, he came to us and asked us to go with him, but the chiefs asked us not to comply with his wishes. Still later, when we returned to Ifaluk

[the other of the two inhabited islands; the one on which we lived], we found Tarev speaking to Maroligar [Tarev's uncle, one of the five chiefs] and telling him that he would like to return to his wife or else marry another woman. Maroligar told him that he could not remarry yet, and that it was our wish that he not do so. (7)

September 24, 1947. Tarev has caused quite a disturbance today. He wished to go to Falalap to see his wife, but the men told him not to go. When he persisted, they had to restrain him by force."

"7. From the very beginning, therefore, the ethnographers were involved in Tarev's activities. This is important to bear in mind with reference to the transference which later developed between Tarev and me."

"October 15, 1947. This morning Maroligar asked if he could use our [WPM: the author's] canoe. I, of course, gave him permission. When he returned, he explained that Tarev had tried to commit suicide by drowning. He had tied a rope around his neck, weighted stones to his feet, and was about to jump from his canoe into the lagoon when Maroligar and two other men stopped him. (This occurred a few days after the death of his wife.) Apparently he had had a trying night the night before, since he spent the entire night shouting and talking to himself. Among other things he had insisted that he was superior to the other people and that he was really an American. (8)

I asked Maroligar if I could speak to Tarev, and he was eager that I do so. When we arrived at the courtyard of his house, I noticed that all the women in the immediate area had departed because of their fear of him. When I peered into the house, he saw me immediately, and his face brightened. When I asked him to come out, saying that I

"8. The American is a person of high prestige and authority in this South Sea culture. It is difficult to say whether Tarev's insistence that he is an American is an outright delusion or rather a conscious attempt to identify with a 'reference group' of high status (the term is M. Sherif's)."

would like to speak with him, he immediately complied with my request. I offered him a cigarette and asked him if he were happy. He replied that he was very sad because of the death of his wife. I asked him why he had tried to commit suicide, and he explained that all the people were speaking 'bad' (9) to him. Maroligar interrupted him to say that he was lying. My grasp of the language was inadequate to continue the interview without the aid of an interpreter, and I asked Maroligar to call Tom, our interpreter. I tried to talk with Tarev in Maroligar's absence, but he seemed in a kind of stupor, and I could not get through to him. He regained contact with reality when Tom arrived, and the following interview ensued.[192]

Q. Why did you try to kill yourself?

A. Because the people talk bad to me.

"9. At this point, I could obtain no exact reference for the word 'bad.'

29: Spiro--191-192 (1947-48) 1950 Woleaians
116, 159, 762, 115 Ifalik-3

"Q. What do they say?

A. My mother talks bad. [Actually his 'mother' is his maternal aunt, which, in this culture, is his classificatory mother. His biological parents are dead.]

Q. What does she say?

A. She says that my wife does not like her or her sister.

Q. Why?

A. [No answer.]

Q. Were you very sad today?

A. My wife died. I feel like smashing everything in the house, because my mother and her sister do not like my wife. My wife died and I am very sad. (10)

Q. But other men's wives die and they do not try to commit suicide. Why should you?

A. I don't like my mother or father or sister.

Q. Don't they feed you?

A. Yes, they give me good food, but they talk too much.

Q. What do they say?

A. The children listen to what my parents say about me, and they repeat it to me.

Q. What do they say about you?

A. My parents say that I am a chief.

"10. The native term for sad is eratu dipei, which literally translated means, my stomach feels bad."

Q. Don't you like that?

A. I don't like what the children say to me.

Q. Don't you like to be called a chief?

A. They say that tree [pointing to it] does not belong to you, it belongs to us. The adults tell them to say that. [At this point, Maroligar interrupted to say that Tarev had accused him and his parents of wishing to fight him. He insisted that everything Tarev was saying was a lie. It was, of course, impossible to explain to him that Tarev was not 'lying' but was a victim of his own delusions.]

Q. Is it true, as people have told me, that an alus has possessed you?

A. Yes, the alus in the moon has entered my head and my stomach. [This convinced Tom and Maroligar even more that he was lying, because there is no alus in the moon.]

Q. How do you know that he has possessed you?

A. He came to my father. He [his father is actually dead] lives in another place. When he possessed my father, he possessed me.

Q. Where is your father?

A. Those pictures you showed me [the Rorschach cards], I like them very much. The place in the North, that's the place I see now.

Q. What place?

A. There's another one in the Northeast. This place in the North is very light.

When I sit in my house, it's very dark; then, that North place, the one I like very much, comes on top of my head.

Q. How does it feel when it comes on top of your head?

A. I like it very much. When I pull up the blanket, I look underneath the sleeping mat, and smoke comes out. I then lower the mat and look underneath another one, and smoke comes out from it, too.

Q. What happens to you when the alus of the moon possesses you?

A. That man inside that padre book [the Bible that a missionary had shown him] and his mother come inside me.

Q. What does it feel like when they come inside you?

A. I don't know.

Q. Did they come inside you this morning, when you tried to commit suicide?

A. No.

Q. Did they come inside you last night?

A. The alus gave me something--something very fine.

Q. What did he give you?

A. Smoke. He put smoke inside my mouth, but it did not enter my stomach.

Q. You like that smoke?

A. I like it very much.

Q. Why?
A. [No answer.]
Q. Does your head hurt you now?
A. I went to Falalap to wail for my wife. I waved my arms, and when I came back, I continued to do so.
Q. Don't you like it here?
A. Yes, I would like to remain. But I would like an American doll. (11)
Q. Why would you like one?
A. Because the Americans know everything. The people here are stupid.
Q. Do you want a carving of a man or a woman or a child?
A. Any kind.
Q. Would you like to go to America?
A. If you go, I want to go with you. I want to go any place you go.

"11. The native men carve small statuettes, which they trade for cigarettes and other trade-goods. By an American doll or statuette, he meant a similar carving of an American."

29: Spiro--191-192 (1947-48) 1950 * Woleaians
116, 159, 762, 115 Ifalik-7

By this time Tom and Maroligar were completely impatient with this 'crazy lie talk' and insisted on terminating the interview. I told Tarev that I would be unhappy if he committed suicide, and that if he felt like doing it again, he should first come to see me. He replied that his wife had 'gone into the ocean [where she was buried] and I want to go too.' "

29: Spiro--192-193 (1947-48) 1950 Woleaians
116, 159, 125 Ifalik-1 -5

"October 19, 1947. Tarev has been cycloid in his behavior lately. He appears to be fairly adjusted for a few days and [193] then reverts to his fighting and delusions. Last night he took a long, heavy pole into his house, and worried everyone as to the use he would put it to. The women in his household had set out to take some prepared food to a family in mourning, but he would not permit them to go. Today, I attempted to give him some psychological tests. One of the tests was the Stewart Emotional Response in which the subject is asked what makes him happy, sad, angry, ashamed, and the like. The following is the result of the futile attempt.

Q. How have you been feeling lately?
A. I just had a dream of X [a chief who had recently died].
Q. Have you been feeling well?
A. I went to Tom's sister. She said I could not have the taro, since it belongs to someone else.
Q. Have you ever been happy?
A. I like what you say. When you talk, I am happy, for your talk is like my talk.
Q. Have you ever been very sad?
A. I like you because you like this place. You came here, though it is very small.
Q. Have you ever been very sad?
A. Some days, when I don't like what people say.

Q. Are you ever afraid?

A. When I walk around.

Q. Any other time?

A. When I want to walk around, someone always tells me to stay where I am and not to go away.

Q. Have you ever been angry?

A. When I want to go some place, and someone tells me that I can't go.

Q. Anything else?

A. I'm never angry.

Q. Have you ever been ashamed?

A. I don't talk to the women of this place because I am afraid.

Q. Yes, but have you ever been ashamed?

A. I took the wife of another man. Now I don't like that woman; I don't talk to her because I don't like her. I would like a woman to come to me, but only to talk to. I don't want to look beneath her skirt. I don't like the women of this island.

Q. Why?

A. My stomach does not like them.

Q. Would you like to have sexual intercourse with them?

A. No. One woman came to talk to me; I always remember her. I wanted to marry her, but Tom did not want me to.

Q. Why don't you like the women here?
A. My stomach doesn't like them.
Q. Why not?
A. She came to me; I talked to her. I wanted to see her genitals. God told all the people, a long time ago, to copulate. But I don't want to.
Q. Is there anything you want?
A. No.
Q. Is there anything you like?
A. No.
Q. Do you like Tom?
A. No.
Q. Do you like Maroligar?
A. When he talked bad to me, I did not like him. Now he talks good, I like him.
Q. Do you like the chiefs?
A. I am afraid of the chiefs.
Q. Do you like Arivimae [his son]?
A. Yes, very much.
Q. Do you like your mother?
A. Yes.

Q. What did you do with the pole you took last night?

A. Two men were talking and I was afraid. I took the pole and brought it into the house. If they come to fight me, I can fight them. Now somebody has stolen the pole.

Q. What did these men say?

A. Wasugu, waisuk. [These are nonsense syllables. Tom said it must be the speech of the alus.]

Q. Do you still see the smoke you told me about?

A. No.

Q. Is there anything you would like to tell me?

A. Yes.

Q. What?

A. If you want to tell me something, not to shout or to fight, I will listen to you. If anyone else goes someplace, the people do not talk bad to him, but they talk bad to me.

Q. Do you still think of that place in the North?

A. I like the North very much. A very fine place. When another man calls me, I go there.

Q. What man?

A. I don't know.

Q. When did he call you?

A. Yesterday. He came and called me. I walked around in circles, walked around and around, and then fell down. Then that man came and walked around me. I stood up, and I saw the North.

Q. What did you see?

A. Tom's brother came. He said, 'Don't go; stay here.' I was very angry.

Q. Why do you like the North?

A. I don't know. The alus possesses me; he knows that place.

This interview came to a close by the arrival of a number of men, and Tarev would not continue to talk."

29: Spiro--193-194 (1947-48) 1950 Woleaians
116, 159, 775

"October 22, 1947. Today, while Tom and I were conducting some research, Tarev came to me to complain about his prob-[194] lems. It seems that the previous night people had tried to fight with him and kill him. He did not know who they were. He then said that he hears voices from Woleae (an atoll about thirty miles to the west of Ifaluk). When I questioned him, he replied that the voices were those of his (dead) wife, who was complaining to the chiefs of Woleae that he (Tarev) was incompetent and unable to work. The chiefs in turn told Tarev that he should be good. He then said that he had not eaten for two days and had sustained himself by drinking coconut juice. He explained, when I asked, that there was an alus on his head who did not want him to eat. I asked him if the alus were still there, and he said that it had left him. Unfortunately, I had an appointment, so I had to take my leave. I told him to go home and eat, and he promised that he would."

29: Spiro--194-195 (1947-48) 1950 Woleaians
116, 159, 115 Ifalik-I -6

"November 4, 1947. Yesterday I saw Tarev running towards the public meeting hall (atelu). He touched the front pillar, clutched it as if he wanted to take something from it, and then ran back to his home. A short time later, I saw him running past my tent, heading towards Falalap, being pursued by a number of men. The men asked if I would stop him, since their efforts were futile. I was reluctant to do so, since I felt that interference by me would destroy the rapport I had established, but I could ill afford to refuse their request. I caught up to him and persuaded him to return to his home and promised that I would come to see him. Tom and I went to see him today. (12)

"12. Tarev still had the habit of seizing the hands of Dr. Burrows and myself and of smelling them deeply. Dr. Burrows informed me that on this same day, Tarev attempted to smell his hands, but could not do so since he was typing. Instead he smelled his feet."

29: Spiro--194-195 (1947-48) 1950 Woleaians
116, 159, 115 Ifalik-2

Q. Why did you go to the public meeting hall yesterday?

A. I was in my house and somebody told me to go there, because the chiefs are there holding a meeting.

Q. Where were you going when I saw you later?

A. I was afraid that a small alus was hiding near my house, so I left.

Q. Did you see the alus?

A. No, but I heard it moving inside the house.

Q. How are you feeling today?

A. My arm is very tired. When I walk, I feel that I am not walking on the ground. I feel as if my feet are walking on air.

Q. Why is that?

A. I don't know. When I attempt to walk, I fall down.

Q. Is anything bothering you today?

A. Wotrilitu [a relative by marriage] stole my wife.

Q. How do you know?

A. He stole her from me a long time ago.

Q. Are you angry with him for that?

A. I took care of his children, but he stole my wife.

Q. Are you feeling better today than the last time we spoke?

A. I feel happier. But I can't stay in my sleeping mat because it is always moving.

Q. So you didn't sleep last night?

A. A little bit. But many people came to see me.

Q. Who were the people?

A. All the people of Ifaluk.

Q. What did they say to you?

A. Many people came; they spoke. It was bad talk. They spoke lies and gossip. Someone said that you and Ted called me. I went to see, but you were not there. Now I know they lied to me.

Q. What else did they say to you?

A. They said that a certain woman is menstruating, and she should not stay here, but should go to one of the menstrual huts in Falalap. Someone else said that we should not take stones from here to make an um [underground cooking pit], but we should take them from over there.

Q. Did they say anything else?

A. There were four pieces of taro on the side of my house. Someone took them and went to a menstrual hut with them.

Q. What did he want with the taro?

A. All the women went to the menstrual hut. Mr. Mel and Mr. Ted ordered the fish to enter the lagoon, and many fish came.

Q. Then what?

A. Many fish entered the lagoon. No, Mr. Ted and Mr. Mel did not order the fish, an alus ordered the fish.

Q. Why did he order the fish?

A. Many fish came, many people ate. [A long pause.] Day and night they spoke. A man came. He said that the fish would come.

Q. Then what happened?

A. Somebody told me yesterday, 'You will not get sick; no typhoon. Go to Mr. Mel and Mr. Ted.'

Q. Why?

A. Now I understand. It was not you who asked me to come, but someone else asked me. I want to take my grandchild.

Q. Why do you want your grandchild?

A. [No answer.] [195]

Q. Are people still speaking bad things to you?

A. People lie to me because they know I am a malebush.

Q. What do they say?

A. They say, 'You are malebush,' 'You are a thief,' 'You are a bad man.'

Q. Is what they say true?

A. They lie. Somebody said my wife went to another man. Some man stole my wife.

Q. Have you gone to that place in the North lately?

A. No.

Q. Is there anything you would like, now?

A. I thought I was happy. And then I heard many voices, and I became unhappy. Yesterday I wanted to go to the ocean and swim away, for I can't stand all that talk.

Q. What talk?

A. That someone stole my wife from me.

Q. Did you dream last night?

A. No.

Q. Has the alus come to you lately?

A. He comes very often, day and night.

Q. What does he do?

A. [He said nothing, but clasped his hands together, as in Christian prayer, and pointed them at me. He then put his hand on my head and rumpled my hair. He then put his finger on my head, then my stomach, and finally on my leg. Apparently he was demonstrating to me what the alus does to him.]

Q. Are you afraid of the alus?

A. No.

Q. Is it a male or female alus?

A. It dances. It bends and sways. I like to see it. I see the alus dance. Then I imitate the alus, I dance too.

By this time, Tom had become disgusted with the entire interview, and insisted that he could not continue because Tarev 'talk lie, only talk lie.'"

29: Spiro--195
116, 159, 762

(1947-48) 1950

Woleaians
Ifalik

"November 7, 1947. Yesterday while the men had all gone on a fishing trip, Tarev made another suicide attempt. He paddled into the lagoon, tied a rope to his foot, and tied rocks to the other end. A young man, who had been left behind to guard him, followed him; and when Tarev jumped into the lagoon, the man pulled him out. By this time, Maroligar had returned from fishing and asked Tarev to return to land. The latter refused, saying that Maroligar wanted to kill him (sic!). He was finally persuaded to return. (I was told all this secondhand, since I was on the other side of the island at the time. Unfortunately I did not have an opportunity to speak to Tarev after the incident.)"

29: Spiro--195-196 (1947-48) 1950 Woleaians
116, 159, 177 Ifalik-17

"November 14, 1947. Maroligar woke me last night, very disturbed, saying that Tarev was 'tonight no good.' It seems that he had been doing some kind of private dance inside his house, and was disturbing others with the noise he was making. I proceeded with Maroligar to Tarev's house, pulled back the door mat, and saw that he was standing in the center of the house, his back to me, holding a large pole in his hand. When I called his name, he turned towards me, looked at me long, and then gave a sigh of relief--as if some heavy burden had been lifted from his shoulders. He ran towards me, as if he were a little boy, grabbed my hands in his, and smelled both palms deeply. He talked to me, but his speech was entirely unintelligible. I gave him a cigarette and told him to try to sleep. I waited outside his house for a half-hour and, satisfied that he was sleeping, returned to my tent. This morning, Maroligar informed me that after I had left last night, Tarev became aggressive and threw rocks at his 'mother.'

This morning I went to interview him. He looked very depressed and did not greet me with his usual warmth. Throughout the interview, he would put his face in his hands, as if he were trying to forget something. As the interview continued, he warmed up to the situation, but not with the same warmth and intensity that characterized the other interviews.

Q. Why did you dance last night?
A. I did nothing. I only held the pole.

Q. What did you do with the pole?
A. I took it for that white man.
Q. But why did you dance?
A. It was for the white man. He has something in his clothes.
Q. What does he have in his clothes?
A. Just as in the movies. [He had seen movies on Yap.]
Q. What?
A. I saw it in the movies and was imitating it.
Q. What did you see?
A. I saw it in the movies. Yesterday afternoon I made that pole.
Q. Why did you throw a stone at your mother?
A. Metagiso [her husband] had a knife and struck the stone with it. [196]
Q. Why did he do that?
A. I didn't like it. I was angry and threw the stone at my mother.
Q. Why didn't you like it?
A. He hit one knife on top of another.
Q. But why did you throw the stone?
A. I was afraid.
Q. Why?

A. I remember yesterday afternoon I took coconuts to drink, and Metagiso and my mother said they would kill me tonight. [He laughs.] Metagiso went fishing and the fire in the house had gone out. I went to Maroligar's house to get a light for my cigarette. [At this point Tom interrupted him, and they engaged in a heated argument, which I lost completely.] Someone called me and I woke up.

Q. Who called you?

A. No one. Metagiso came in in the late afternoon. Then something like fire came down, circled my house a few times, and finally settled on the tree.

Q. What was it?

A. It wasn't fire. It settled on the tree, then came to the ground and circled around.

Q. But what was it?

A. [He took a blade of grass, and showed me a piece about a quarter of an inch long.] It came inside the house, and the fire became larger, and then it became smaller--larger and smaller. Metagiso caught it in his fish net. He put it by the side of my house.

Q. Were you afraid of it?

A. No.

Q. Did you like it?

A. [He did not answer, but placed his hands in a prayer-like pose, and bent his head.]

Q. Did you like it?

A. No. I said to it, 'Good morning, master.'

Q. Where is it now?

A. I lifted the door mat and it went away. [He then pointed to swarms of small flying insects that were visible only in the rays of the sun shining through the doorway.] They were just like them--many, many.

Q. Did you dream last night?

A. No.

Q. Why did you do that dance?

A. The Americans danced in those clothes.

Q. What clothes?

A. People walked in those clothes.

Q. What kind of clothes were they? Like my clothes?

A. They were soldier clothes [uniforms]. What the soldiers did, I did.

Q. What did you do?

A. There were many soldiers. What they did, I did.

Q. Were you afraid of the soldiers?

A. I fought with one of the soldiers. He knifed me in my stomach and my head. I removed the knife. He gave me much money, but I did not keep it. I threw it away.

Q. But I don't see any wounds on you.

A. The knife came through my head and back. I pulled it through, rubbed the wound, and it disappeared.

Q. Where did the soldiers go?

A. The knife came through my head and back, so I pulled it out, rubbed the place, and the wound disappeared. Then another one came to fight me.

Q. Why did the soldiers want to fight you?

A. Because I was very bad. I drank wine, and then I began to shout and break things. So they came to fight me.

Q. Why did you drink so much and break things?

A. Those men did not like it. Four men came to fight me. They threw me to the ground and I began to bleed. Then they began to fight with me. They gave me money.

Q. What kind of soldiers were they?

A. American soldiers. I did an American dance.

Q. How do you feel now?

A. I am always happy, for a dance comes to me, just like the wind.

Q. Do you like the dance?

A. I like.

Q. Has the alus come to you lately?

A. He is in me now. He never goes away.

Q. Where is he in you?
A. In my stomach.
Q. Is it a male or female alus?
A. Male. Last night I dance. Last night I danced, and there was a typhoon, and a tidal wave. I wanted my mother to see.
Q. Really?
A. I was at the land of the alus when it came.
Q. Where is that place?
A. The ocean came on top of me in huge waves.
Q. Where is the land of the alus?
A. I saw that paper, and I understood. A man came to me; he did not talk bad to me, he talked good. So I did not go to the land of the alus.
Q. Where is the land of the alus?
A. It is like the movies. An American man came to me. He said, 'Do you have any copras?' 'I have no more.' 'Why?' 'We need the coconuts to eat here.' 'Then I'll kill you.' 'No, don't kill me.' 'I'm going to kill all the people here.' 'No, don't kill them.' 'I'll kill you.' So he killed me.
Q. Are you dead now?
A. No, he killed me, but I was revived. Four American men gave me some whiskey. I drank one glass, and then threw away the bottle. I finished four bottles. The men gave

me money, but I told my children, 'You take the money.'

As usual, we were interrupted. A school of fish was sighted, and the men called Tom to join them in launching the canoes."

"November 23, 1947. Maroligar came running to our tent to inform me that Tarev had just attempted to burn his house. His mother had discovered it in time and had beaten him for this act. I went to investigate the matter, and, by the time I arrived at his house, a number of men had gathered outside. As I was speaking to the men, Tarev came out of the house, seized my hand and smelled it. He was very agitated--perhaps in the worst condition I had seen him--and seemed to display a mixture of rage, anger, and fear. Tom was unavailable so that it was impossible to obtain a formal interview. I managed to gather from his incoherent and agitated speech that the people were again speaking 'bad' and wanted to kill him. I finally succeeded in allaying his fears, and he became fairly calm.

The men finally concluded that they must take some measure to prevent another outbreak, and asked me if they should tie him up. They said that Aneitin (the other schizophrenic) had been violent in the past, but after being tied for a couple of days, his violence disappeared permanently. Perhaps it would have the same effect on Tarev. I suggested that they wait a little, that I would have dinner and would return after dinner. If he became violent, they should then tie him. They predicted that as soon as I left he would again become violent, but when I returned later in the evening, he was still quite peaceful."

116, 159, 521 Ifalik-1 - 2.

"November 25, 1947. Yesterday as I was sitting in a canoe shed, near Tarev's house, I heard some of the weirdest sounds I have ever listened to. I could not identify them at all, but one of the men said that they were emitted by Tarev. I went to investigate, but his door mat was covering the entrance to the house. He was talking and 'singing' in a falsetto, the kind of falsetto these people employ when quoting another person. (13) It was as if he were another person or were talking in the tones of another person. I asked one of the men what he was saying, but he said that he did not have the slightest idea. It seemed to him that Tarev was speaking a foreign language. Tarev stopped this talking, but after a brief pause resumed--this time in a deep, masculine voice. I lifted the door mat and called to him. He was standing in the middle of the house, but seemed not to hear me. I called twice more, but he still did not respond. As I turned to leave, he came towards me. I asked what he had been doing. He said that he had been dancing,

---

"13. When a person in this society reports a conversation that he has had with someone, the report is always in the form of a direct, rather than an indirect, quotation. In quoting the remarks of the other person, the reporter resorts to a falsetto. Tarev's conversation was in the falsetto that is employed in such conversations."

and as he spoke his face was radiant and his whole attitude was completely euphoric. He said he enjoyed his dance immensely and when I asked how he was feeling, he said that he was very happy. I gave him a cigarette, and he seized my hand to smell it. (14)"

"14. The contrast between this manic state and the state of complete anguish that characterized him the previous day was most striking."

Ifalik-1-6

"November 27, 1947. Yesterday was the climax to a series of events involving Tarev. Maroligar came by in the afternoon, saying that he had some work in Falalap, but that when he returned, he was going to tie Tarev. When I asked why he had so decided, he said that Tarev had tried to strike him with a pole, and this was the end of his patience. When he returned in the afternoon, he called for me, and we proceeded to Tarev's house. On our way, a young man came running to inform Maroligar that Tarev had just attempted to set fire to his house, but had been caught just in time. As we approached the courtyard, we saw that it was surrounded by a host of people, most of whom were afraid to approach the house. Inside the house, Tarev was struggling with two men who were trying to drag him out of the house. They finally succeeded in doing so, and when Maroligar approached him with a rope, Tarev surrendered himself to him without a word. He voluntarily extended his hands, and Maroligar tied his hands and feet. After he was tied, the men attempted to take him into the house, but he fell to [198] the ground. He began to shout at Maroligar, calling him a wicked man, saying that he was no chief for him and that he would not obey him. (The previous day, Tarev had insisted that he himself was chief.) Two other men took him inside the house, where they spoke with him kindly and patiently, explaining that they did not at all like what they had done, but that they had no alternative, since the people were afraid of him. Further, they explained to him that the people were good and wished him no harm. They also made sure that the rope was not too tight and that it did not pain him. I, also, explained to him that no one wished

him harm, and that when he returned to his nonaggressive state, they would release him.

A group of men remained outside, and as we were talking we heard signs of disturbance inside the house. Maroligar went inside and found that Tarev had untied himself and accused Maroligar and the people of mistreating him. When Maroligar tried to retie him, Tarev would not permit him to do so, but said he would permit Letar (one of the other men) to do so. Letar tied him in my presence, but Maroligar had to leave the house, because the mere sight of him made Tarev violent. (Bothe Maroligar and Tom are Tarev's uncles.)

I returned to Tarev's house in the evening, and was told that he had been peaceful, though he had been talking to himself again. Later at night, however, Maroligar came to ask me if it would be all right if they tied Tarev's hands behind his back so that he could not untie the rope again. Otherwise the women would be afraid to sleep. I returned with Maroligar to Tarev's house. He seemed to be sleeping, and his mother was sitting by his side. It was obvious that he could break loose if he desired to do so, and I told Maroligar that if they wished to tie him, I would have no objections. Maroligar called two other men to help him. By this time, Tarev had awakened, but he became violent at the very sight of Maroligar and though he permitted him to untie his hands, he would not permit him to retie him. He offered his hands to one of the other men, but when the latter attempted to tie his hands behind his back, Tarev resisted. He appealed to me,

but I tried to explain to him that this man (Mageleisei) was only doing what was best for everybody and harbored no ill will against him; and I asked him to cooperate. At this, he became meek as a child, lost all his aggressiveness, and permitted himself to be tied. When we left him, he was smiling and wished us a goodnight.

Today I had an interview with Tarev, but it was quite brief, since Tom clearly did not find these interviews of any use and was entirely uncooperative.

Q. Why did you try to fight yesterday?

A. It was nothing. I just did not like the talk of Maroligar and my mother. She said to me, 'Everything is fine now. You no longer have a wife, so you can do anything you want.'

Q. Why did you hit Maroligar?

A. I don't like what my mother says. I want to put a rope around my neck.

Q. Why did you fight Maroligar?

A. I don't want to fight. I took the stick so Maroligar and my mother would be afraid of me.

Q. Why do you want them to be afraid of you?

A. I don't do anything. But Maroligar and my family talk bad to me--day and night.

Q. What do they say?

A. They talk bad. I became angry and tried to hit Maroligar and my mother.

Q. But what do they say?

A. Many days and nights, now, they've been speaking bad. They talk too much.

Q. What do they say?

A. Maroligar comes and asks, 'What is Tarev doing?' The family says, 'He is doing so-and-so.' I don't like it.

Q. Why don't you like it?

A. Maroligar told my mother, 'Talk bad to Tarev.' My mother told me, 'Maroligar said that I should talk bad to you.'

Q. Do you still think that you are chief?

A. I never said that.

Q. Why don't you like Maroligar?

A. Maroligar says, 'You can't take those coconuts. If you want coconuts you've got to go to Falalap.'

Q. Why did you try to burn your house?

A. I don't like their talk. I burned the house so there would no longer be a house.

Q. How do you feel about having your hands tied?

A. I don't know. It's like being a dog or a pig. [199]

Q. Is that alus you told me about still inside you?

A. No. Maroligar and Arogeligar [the priest] gave me an alus.

Q. Why did they do that?
A. They gave me one alus.
Q. You don't like that alus?
A. No. I like my own alus. My alus likes to dance. I like that.
Q. What does the other alus do?
A. If it's a good alus, I like it. If it's bad, I don't like it.
Q. What does the other alus do?
A. He always wants to talk. Much of my talk is not my talk, it is the alus talking in me. (15)
Q. Yesterday you said that Maroligar and some other men tried to beat you. When did this happen?
A. They beat me, and I died.

"15. This he picked up from Maroligar. Whenever Tarev becomes violent and accuses people of aggressive and malicious designs on him, Maroligar tells him that it is not he but the alus in him that is talking."

Q. When?
A. I don't know. They want to kill me.
Q. Why do they want to do that?
A. I don't like that talk. I want to die. I don't like that talk.

When I rose to leave, Tarev asked if I would remove his rope. I explained that I could not do so, since the decision had to be made by his family."

116, 159 Ifalik

"December 6, 1947. Tarev was violent again yesterday. He came to me in the morning complaining that he had wanted to work, but that the other men would not permit him. Later in the day he tried to beat his sister with a coconut branch, and this again aroused the fear of the women. Maroligar came to tell me that they would have to tie him again. In the evening some people told me to go see Tarev immediately. A group of people were standing around Tarev and he was shouting at them in angry tones. It seems that he had stolen the basket of Arogeligar, and when he was caught, he again accused the people of talking bad about him and wanting to harm him. But order was soon restored."

29: Spiro--199 (1947-48) 1950 Woleaians
116, 159, 198, 158 Ifalik

"November 28, 1947. As we were finishing dinner yesterday, we saw Tarev walking towards our tent. He had chewed off his rope (which the people knew), and had then come to us (which they did not know). He was quite meek, and when I asked him to return to his house with me, he readily agreed. He told me that Maroligar, Tom, and Mageleisei had tried to kill him the night before. I tried to persuade him that this was not true, but he would not be convinced.

As I passed his house later in the evening he was singing, talking, and shouting in a number of different tones. Again the men informed me that they did not know what he was saying, that it all was strange to them."

29: Spiro--199-200 (1947-48) 1950 Woleaians
116, 159, 123, 834 Ifalik-1 -4

"January 6, 1948. Tarev has been behaving very well since the last altercation. He moved, with everyone's consent, to an uninhabited house in an uncleared part of the island, and lived there without molesting anyone. He spent his time clearing the bush, walking about, and doing a lot of the 'ventriloquist' singing which has already been noted.

Towards me he has been like a little boy. His relationship is almost the classical 'transference' situation. He was constantly doing favors for Ted and me. He cleared the brush from our camp. He brought us fish and coconuts. He would go into the woods to bring me flowers and angorik (a cherished herb). Whenever he wished to go someplace or do something, he would come to ask for my permission (which I always gave him). I would praise him for his good behavior and reward him with a cigarette. And, of course, he would greet me and depart with the smell-of-the-hand routine.

The day before yesterday, however, his behavior changed completely. One of the young men was fishing in the lagoon in front of Tarev's house. Tarev told him to leave, and when he refused, Tarev began beating him with a coconut branch. A passer-by saw what was happening and called some men to help him subdue Tarev. By the time I arrived on the scene, the fight had ended. Tarev was having a heated argument with Arogeligar (the young man's father), and they were surrounded by a large group of people. Tarev began to threaten Arolgeligar, but the latter made no attempt to defend himself. At this point Tom arrived on the scene, his face livid with anger, and shouted at [200]

Tarev to desist from his activities. The latter lunged at Tom, trying to strike him, when I intervened. I took Tarev by the arm and asked him to come with me. He followed me without a word of protest, becoming as meek now as before he had been aggressive. As we sat in his house talking, some men came in to tie him. When he saw them, he ran out and refused to let them near him. They managed to surround him, and then one of the men untied his loin cloth. While he was occupied with keeping his loin cloth up, the men seized him, threw him to the ground and tied him. (16)

"16. Ifaluk exhibits a strong pattern of sexual puritanism. No form of sexual behavior is permitted in public, nor are sexual terms, either anatomical or physiological, ever spoken in the presence of members of both sexes. Though the men wear the briefest of loincloths and the women wear skirts, but are nude from the waist up, they have an inordinate sense of shame concerning the exposure of the genitalia. The men, for example, cover their genitals when bathing in the lagoon or when urinating, even if they are in the presence of men only. Should a person of the other sex see one's genitals, the sense of shame would be overwhelming. The seizing of Tarev's loincloth, therefore, was a shrewd tactic, designed to catch him off guard, and, of course, it was effective."

By this time the people were angrier than I had ever thought they could possibly become. Until now they had all been patient with him, exhibiting the greatest restraint in their treatment of him. But this, apparently, was the stimulus that evoked all their pent-up hostility. Tom was so angry that he slapped him in the face--an unheard-of act of aggression in this culture. Their anger was soon dissipated, however, and in the evening a number of people went to visit Tarev and asked if they could do anything for him. Tom told me that he was terribly sorry for what he had done and had invited Tarev to sleep in his house.

Yesterday I was busy and had no time to visit Tarev. Last night I was awakened by loud sobbing and wailing near our tent. Tarev had left his house and had come to ask me to remove the rope from his hands. The men followed him, however, and took him back to his house. This time they tied his legs as well.

This morning some boys came running to me to say that Tarev was coming to see me. His hands and feet were still tied so that he had had to inch his way to our tent, a distance of about three city blocks from his house. I untied his feet, took him home, and left him in the care of his uncle.

Later in the afternoon, as I was watching a canoe-launching ceremony, a young boy came to tell me that Tarev had taken a hunting knife from our tent. The entire village was alarmed, thinking that he was going to attack someone with it. We searched for him without success. Just as were returning from our search, we saw him carrying

three large bunches of coconuts to our tent. He had taken the knife in order to cut the coconuts. The nuts were heavy and his wrists and ankles were chafed from the rope, so I asked him to let me carry some of them, but he would not permit me to do so, saying that they were not heavy."

The seizing of Tarev's loincloth, therefore, was a shrewd tactic, designed to catch him off guard, and, of course, it was effective."

"January 18, 1948. Tarev comes to see me at least once a day. He smells my neck, now, as well as my hands, and at times includes my body and legs as well. He tells me, when he comes, that he has merely come for a walk, and after the smelling ritual, he returns to his house. The day before yesterday Tarev came to our tent, but I deliberately kept out of sight to see what he would do. A chair and table, used for typing, were still standing in front of the tent. He picked up the chair, and smelled the seat in deep draughts. Then, still holding the chair to his nose, he turned round and round, describing complete circles. He then place the chair on the ground, taking meticulous care to place it in the exact position it had formerly occupied, and then began to perform a kind of dance. This time he did not remain in the center of the circle, but rather described revolving spirals, which took him a distance of about fifty yards from whence he had begun. He then came to the canoe shed, from which his son and I were observing his behavior, and sat with us for a short time. Suddenly his face acquired a trance-like expression, and he left us to return to his dance, but with a much accelerated tempo. His spirals took him into the bush this time, and his son and I followed. I [201] called to him but he did not hear or see me, though he looked straight at me. His son was fearful lest Tarev injure himself, so I walked up to him and seized him by the shoulders. He was panting from sheer physical exhaustion, looked startled at seeing me, suddenly relaxed, smiled, and then began to laugh. I asked him what he had been doing, and his

answer was'tar,' nothing. I walked back to his house with him.
Yesterday, I had an interview with him.

Q. Did you dream last night?
A. Yes, but I don't remember it.
Q. What were you trying to do with the chair yesterday?
A. Nothing. I turned around with the chair, because the smoke came all over me.
Q. What smoke?
A. I turned the chair around because I saw the paper, and did what the paper said.
Q. But what smoke came to you?
A. I turned around with the chair; I saw something just like that [taking out an empty pack of cigarettes which I had thrown away, and pointing to the red seal with the name Lucky Strike on it].
Q. Do you like that?
A. Yes.
Q. Why?
A. I like that writing on it.
Q. What did that paper [the pack] tell you to do?

A. It is red, just like the torches used during night-fishing. (17)

Q. How are you feeling now?

A. I feel very good inside. Last night I began to shout, for I had something very bad inside me.

Q. What was it?

A. Somebody spoke bad to me, but I forget it now.

Q. Who spoke bad to you?

A. Teior [a man who is now dead; Teior had been married to a woman from Woleae]. He said, 'Let's you and me stay here.' He spoke bad. I did not like it, so I began to shout.

Q. What were the bad things he said?

A. He came to my wife's mother, and when I arrived, he left. Before I came, she gave him something to eat. He said to her, 'If I go to Woleae, I want you to remember the bad things that Tarev does.'

Q. What did you do about this?

A. Nothing.

"17. There is a three-month period in the spring in which the men fish every night. In this period the men live in the canoe sheds, and all sexual behavior is taboo."

Q. Does the alus still come to you?
A. He doesn't come anymore. Now I am very sad, and I cry.
Q. Why are you sad?
A. All kinds of voices come to me.
Q. Why do you live alone now [referring to the fact that he left his maternal home, to live in the formerly unoccupied house]?
A. Because I don't like the other people's conversations.
Q. Why not?
A. I speak bad things to my mother and sister. They don't like it, and then I become sad.
Q. Why do you say bad things?
A. When I'm around people, I say bad things. They don't like it, and then they become angry with me.
Q. What bad things do you say?
A. All the thoughts I have in my stomach. I remember those thoughts.
Q. Why don't you work like you used to do?
A. I don't like the work of this place. I like your work.
Q. What is my work?
A. You write on paper. You own things--chair and clothes.

Q. Aren't you ashamed that people see that you don't work?
A. No, because I want to do your work.
Q. Is there anything you'd like me to do for you?
A. I want to go with you. I don't want to stay here. I want to go with you to some other place.
Q. Why don't you want to stay here?
A. This place is a place for fools. All the people here are fools.
Q. Is Tom a fool?
A. No. If you leave here, I'll die.

At this point the men returned from fishing, and Tom wanted to get his fish, so we were forced to leave. But I first reassured Tarev that he would not die if I left."

29: Spiro--201-202 (1947-48) 1950 Woleaians
116, 159, 786 Ifalik-1-2

"January 22, 1948. Yesterday Tarev came to the tent and discovered our calendar hanging on the tent pole. He turned it page by page, looking at both the numbers and the pictures, with an almost beatific smile on his face, and singing all the time. Later in the day, while we were gone, he took the calendar to his home. Some of the others saw him and made him return it. When they asked why he took it, he said that I was his father and therefore he had a right to take things from me.

Last night, however, I witnessed one of the weirdest things I have seen him do. Just as I was falling asleep, I heard [202] his falsetto-- singing in front of our tent. He remained there for some time, alternately singing and stopping. Then he began to sing quite loudly and I decided to stop it and take him home. As I stepped out of the tent, I saw him, in the light of a full tropical moon, standing in front of the public meeting house. His hands were in the prayerful pose he often adopted in imitation, he said, of the padre, and he was singing to and bowing before the wooden phallus attached to the pillar. (18)

"18. This is quite a large carving of a penis, attached to the front pillar. Most of the people do not know what it represents, but the chiefs say it represents the penis of one of the earliest chiefs."

Intermittently, he would spit on it. He continued this for some time, alternately bowing to the phallus and spitting on it. This was a most impressive scene, and I stood watching it for a long time, until Tarev finally returned home."

29: Spiro--202 (1947-48) 1950 Woleaians
116, 159 Ifalik

"January 27, 1948. Tarev has been in a trance-like state for almost a week. It has been impossible to establish any contact with him. He is living in his own private phantasy world. Last night he came into our tent, while we were sleeping. I asked him what he wanted, but he was completely incoherent. He had a gleam in his eye I had never seen before--as if he were keeping something from me. I finally succeeded in getting him to return home.

Today, however, he has again gained contact with reality. The men were hauling in the fish nets from the beach, and he was helping. As I went to watch the activities, I praised him for his work. He smelled my hand and replied that he was working because he knew it would please me."

29: Spiro--202 (1947-48) 1950 Woleaians
116, 159, 762

"February 7, 1948 (aboard ship en route to Yap). The ship arrived yesterday to take us back. Tarev was the first to arrive at the tent to assist in the packing. He seemed calm though serious and slightly depressed, and kept constantly watching every movement I made. He asked if I were really leaving, and I said that I was. About half an hour later, a young boy shouted to me to come immediately to Tarev. He had gone to the lagoon and lay on his back in about two feet of water, refusing to allow the men to pull him out. By the time I arrived, he was half-drowned. I asked him to join me, which he did. I tried to reassure him that everything would be all right after I was gone, though he insisted that, now that I was leaving, the people would again try to kill him, and so on. He then smelled my hands and returned to his house in a deep depression. This is the last I saw of Tarev."

29: Spiro--202-203 (1947-48) 1950 Woleaians
116, 159, 121 Ifalik-1 3

"Since it was virtually impossible to obtain a case history on Tarev, we cannot get at the basic psychodynamics of this case. One aspect of his life emerges quite clearly, however, as of crucial significance--his Japanese interlude. It is our thesis that though this Japanese experience was not the sufficient cause of his psychosis, it was the necessary precipitating factor that served to elicit this particular syndrome. (19)

Regardless of the differences between the conflicting interpretations of the meaning of the abnormal--absolutist and clinical versus relativistic and statistical (cultural)--all interpretations will agree that the incidence of certain types of mental disease differs widely in different cultures. Comparative statistical data demonstrate this empirically, and, for the anthropologist, the explanation is not too hard to find. The psychological concepts of adjustment and maladjustment--like the biological concepts of adaptation and maladaptation--are not substantive, but rather relational terms. An organism is adapted or maladapted not in vacuo, but with reference to a particular environment. Any organism, as Dewey has put it so well, lives not 'in an environment,' but rather 'by means of its environment,' so that a change in either the organism or the environment destroys their dynamic equilibrium and results in maladaptation. (20)

"19. This analysis, with some modifications, was part of a paper read before the Central States Branch of the American Anthropological Association at its 1949 meetings in Bloomington, Indiana.

20. John Dewey, Logic: The Theory of Inquiry; New York, Henry Holt, 1938; p. 25."

So, too, human personality exists not so much in a culture as by means of [203] a culture. Each culture creates its own particular stresses and strains with which the personality must cope, but, at the same time, the culture also provides instrumentalities--institutionalized techniques--for the resolution of those stresses and strains. (21) Now those individuals who, for whatever the reasons--and the reasons are still very much obscure--cannot resolve these culturally-created stresses and strains by means of the instrumentalities that the culture itself provides must resolve them by means of personal instrumentalities, idiosyncratic ways known as neuroses or psychoses. However, since each culture creates its own unique psychic strains, the kinds of maladjustments and, consequently, the kinds of resolutions of those maladjustments--neuroses

---

"21. The high incidence of personality disturbances found in native cultures in acculturative situations, or in the rapidly changing American culture, may thus be explained by the fact that these cultures in transition create new tensions, but have not yet created those cultural channels necessary for the alleviation of the tensions. For a detailed analysis of this position and an attempt to resolve the conflicting interpretations of the abnormal, see the writer's 'A Cultural Interpretation of the Abnormal' (ms. in preparation)."

and psychoses--will vary from culture to culture. (22)

Ifaluk is no exception. Certain infancy and childhood traumata, which limitations of space do not permit description of, create certain tensions (frustration - aggression patterns) and needs (dependency-security patterns) which, if left unresolved could very well lead to severe personality disturbance. At the same time, however, the culture provides institutional techniques (primarily religious) which alleviate the tensions and satisfy the needs. These institutional devices obviate the necessity and preclude the occurrence of acute personality disturbances. Thus, the external culturo-dynamic equilibrium results in an internal psychodynamic equilibrium. This personality equilibrium, we have seen, was as characteristic of Tarev as of the other members of his society. Then an obtrusive element--cruel treatment at the hands of the Japanese--intruded into his sociocultural field so as to destroy the equilibrium."

"22. This analysis, of course, applies only to those disturbances that result from culturally-patterned events. It does not apply to those that result from unique or 'personal-social conditioning,' to use Kimball Young's term."

29: Spiro--203 (1947-48) 1950 Woleaians
116, 159, 121, 181, 865 Ifalik

"The Ifaluk ethos is characterized by the ethic of nonaggression in interpersonal relations. Peace, cooperation, mutual aid--positively--and the inhibition of all aggression --negatively--are the basic values of Ifaluk culture. Furthermore, this culture is so patterned as to evoke a minimum of, if any, aggressive, arrogant, or competitive behavior. Given its cultural values, its culture pattern, and the effectiveness of its socialization process--it is little cause for wonder that there has not been one case of theft, robbery, rape, homicide, suicide, or domestic strife in the society--at least in the memory of any of the natives. Nor did the ethnographers witness any during their seven-month study. Since the culture neither permits nor evokes hostile or aggressive behavior in interpersonal relationships, it has evolved no techniques by which an individual, finding himself in such a situation, could come to terms with it. Only aggressive experiences of childhood are provided with cultural responses. Furthermore, a culture pattern which, in effect, elicits little aggression in adult life, has, as one of its consequences, the creation of personalities marked by a low threshold of frustration-tolerance. (23)"

"23. See Saul Rosenzweig, 'An Outline of Frustration Theory'; in J. McV. Hunt, ed., Personality and the Behavior Disorders; New York, Ronald Press, 1944."

"Tarev's cruel treatment at the hands of the Japanese was the first hostile experience he had encountered in his adult life. This experience was not only intrinsically alarming and frustrating but--what is even more important--it served to remobilize childhood traumata, reviving the anxieties, frustrations, and insecurities that until then had found cultural resolution. The result was psychosis, for the situation became overwhelming. To the first meaning of the cruelty--physical hurt--he could make no response: first, because the Japanese were the masters of the situation; and, second, because as a member of Ifaluk culture he was forced to inhibit his own aggression. To the [204] second meaning of the cruelty--the remobilization of his childhood traumata--there was no possible realistic--that is, cultural--response at all; for his culture had not provided for such a contingency. Since he could no longer live by means of his culture--'in his culturally constituted world,' to use Hallowell's phrase--he could live only by means of his own phantasies--his privately constituted world.

This theoretical analysis is substantiated by the facts. (24) As I stated earlier, the

---

"24. Similarly, J. C. Carothers has shown that the incidence of 'mental derangement' among African natives is correlated with their living away from their native homes. See 'A Study of Mental Derangement in Africans, and an Attempt to Explain its Peculiarities, More Especially in Relation to the African Attitude to Life,' Psychiatry (1948) 11:47-85."

natives know of no instance of this kind of malebush prior to the Japanese occupation; and since the occupation, the only cases of this type have been two men who had worked in the labor gangs--Tarev and one other. To the knowledge of the people no person who had not had this Japanese experience has ever become a victim of this disorder. That other men did not break down under this pressure does not invalidate this analysis, for the same objection could be raised with respect to any population. All individuals in a given culture or subculture are exposed to the same or similar strains; certain of these personalities break down and others do not. The attempts to understand this differential threshold of frustration-tolerance has led investigators to the study of those biogenic and psychogenic factors that may be operative. What those factors might be in the case of Tarev and Aneitin are unknown since their case histories are unavailable."

"However, there are chiefs who favor consanguineous marriage as an aid in repopulating the island, and point to its success on Eauripik, a small isolated island east of Yap. There, they say, it worked.

So alien is this to most human experience, even among wild tribes, that I reserved a doubt on it until I could consult a recongnized authority on these islands, an old and respected Japanese trader, Miyashita, of Palau. During Spanish and German as well as Japanese times he has lived in the islands and is the only foreigner to have made his home for a year on Eauripik.

'I don't attempt to explain it,' he said, 'but it's true. The people of Eauripik are unusually big, strong, healthy people. They almost never become sick. Yet the entire population of 190 people is one family descended from one couple. All marriages are within the family. There is no mixture from the outside. Foreigners do not visit the island. It is off the usual trade routes. All the people look alike. Closest relatives marry. And yet the population is increasing slightly.'"

32: Brown--89-90 (1913) 1914 Woleaians-1-3
116, 212, 174 Woleai

"In July, 1913, I paid a visit to the small reef island, Oleai, or Uleai, or Wolea, of one of the most westerly of the Caroline group. One of the chiefs squatted, at the suggestion of Herr Runge, the only European on the islet, and wrote a sentence in the script of the island. A few week [sic] ago I received from Mr. Runge a full list of the characters written by the chief, Egilimar. There are fifty-one, and evidently each represents a syllable, as will be seen by the accompanying copy of the list. Alongside he has also written Runge, Brun, and Egilimar in the script; and it will be seen that two, if not three, of those employed to write the last name are not given in the list. It is manifestly a syllabary, as is the Katukana of Japan, and a script that was invented in Korea some centuries ago, but never drove out the Chinese ideographs. But none of the characters have any resemblance to these. Nor do they resemble in any respect any of the alphabets we know, European, Levantine, Arabic, or Devanagari. The only other script known in the groups or islands of the Pacific is that of the Easter Island tablets. But they are ideographic; many of them according to the interpretation of them supplied to Bishop Jaussen, of Tahiti, by one of the learned men of the Easter Islands, bear resemblance to the form of the thing they represent, though it is affirmed also that they were but mnemonic suggestions of the beginning of a word or line of the hymns or lyrics sung at the annual festivals. They are but one stage beyond the ideographic hieroglyphs on the one hand, and serve the same purpose as the knots in the quipus of ancient Peru and of

the Pelew Islands.

This Oleai syllabic script is one stage further on in development towards an alphabet. Most of the characters are highly conventionalised, but some retain a resemblance to the thing to which their name or sound corresponds. In the [90] second column, the seventh from the bottom, schrũ means in the language of the islet 'a fishbone,' and the character has manifestly originated in a representation of a fish; the fifth from the bottom, lõ, means 'a bottle,' and evidently the character retains something of the form of the coconut water-vessel. In the first column, the sixth, fifth, fourth, third, and second from the bottom have a hint of what their syllable indicates; ngã meaning 'bamboo,' boa 'ulcer,' warr 'canoe,' raa 'mast,' uh 'sail.' So in the third column, the first, rã, means 'a saw'; the second, lũh, 'a young coconut'; the third, sthah, 'a knife.' In a few others there might be found by stretching the imagination a hint of the thing indicated by the syllable. But the majority of the characters can be connected by no possibility with the meaning of the sound indicated.

The script is now known only to five men on the islet; but it is probably a relic of a wide usage in the archipelago. *There is no possibility of* any one of the five having invented it, and if invented by them since Europeans arrived it would have taken the forms either of the European alphabet or of the things bought or sold, of whose names and

numbers they wished to keep a record. If anyone wishes to compare this with such a script invented for commercial purposes, he should look up Furness's The Island of Stone Money; on page 138 is given a copy of an account kept by a native of Yap for trade purposes; and this native Fatamak, a sorcerer, I can personally testify, is a man of keen intelligence. A comparison will bring out the gulf that separates the two scripts. This Oleai script is manifestly the product of long ages for the use of the organisers of a highly-organised community of considerable size. In other words, it must have belonged to the ruling class of an empire of some extent, that needed constant record of the facts of intercourse and organisation."

116, 304, 609 Woleai

Kadou [LEM: the Caroline native] was much pleased with the Sandwich Islands [LEM: Hawaii], whose inhabitants reciprocated in their affection for him. The lobes of his ears, prodigiously elongated, drew their attention in a singular manner.

35: Choris (Iles Mariannes) --3 (1817) 1822 Woleaians
116, 484, 159 Woleai

Since Kadou had travelled considerably in the Carolines and the Pelew Islands, he was never surprised at the birds or animals that he saw, either here or in the Aleutians. He was enchanted at seeing so many large vessels gathered together. His resolution to accompany us on our voyage remained unbroken. The crew began to teach him to read, but he made only very slow progress. Although he learned quite readily to recognize the letters of the Russian alphabet, he seemed not to understand what these characters stood for. However, one day at dinner, hearing the word "water" mentioned in Russian, he cried out joyously, "ah! ah! v, o, d, a, voda ("water" in Russian)"; we hoped then that he had really profited from the lessons which he had received, but he refused to take more of them and appeared determined to know not what our books could be.

35: Choris (Iles Mariannes)--4 (1817) 1822 Woleaians
116, 159 Woleai

Kadou still intended to accompany us [LEM: from the Marshalls], especially as he knew that we planned to visit the Carolines, which gave him the hope of seeing his homeland again. But when he learned that his son, who was living on the isle of Aour, was often calling to him by name and regretted his absence, paternal tenderness overcame him. He immediately told us that it was his wish to remain in this archipelago.

This resolve disappointed us very much, because Kadou would have been very useful to us on our voyage to the Carolines. He was beginning to understand us quite well. He knew some words of all the languages spoken on board and he had taught us a great many of those which he spoke. We were thus hopeful of learning from him in the future a host of interesting things about the Carolines where he was born. On the other hand, it was no less important to him that he should remain in the archpelago where he now was.

35: Choris (Iles Radak)--17 (1817) 1822 Woleaians
116, 159, 177 Woleai

Kadou [LEM: A native of Woleai (Carolines) who had been shipwrecked on Aur] was not slow in getting used to us, and conducted himself like a true European. Being a natural mimic, he amused us a great deal. In a very little time he learned several Russian words, and as we had retained a large number of words from the Radak Islands, we came to understand each other.

He spoke a great deal about Oulea, his home-land, as well as adjacent islands, which we knew by the name of the Caroline Island archipelago. Kadou had travelled to all of them, even to the Pelew Islands. His accounts told us that his compatriots were hardy navigators, and often undertook long sea voyages.

35: Choris (Iles Radak)--17 (1817) 1822 Woleaians
116, 159, 502 Woleai

We were convinced that Kadou was well-versed in a knowledge of the stars, but he preferred our compasses because he saw that even in foggy and cloudy weather, one's course could be determined with this instrument, while the island inhabitants, having only the stars to guide them, are at a great disadvantage when they do not see them.

35: Choris (Iles Radak)--20 (1817) 1822 Woleaians
116, 159, 776 Woleai

For several weeks we tried in vain to ask Kadou concerning his ideas of God. He made every effort to understand us, but of no use. Finally, one day he succeeded; his face became animated, his whole body trembled. "Ah!" he cried, "you wish to know the name of that which we can neither see nor hear." At the same time he closed his eyes and covered his ears: "Its name is Taoutoup." Asked where he lived, Kadou pointed to the sky.

35: Choris (Iles Radak)--21 (1817) 1822 Woleaians
116, 159, 802 Woleai

When we took. . . [LEM: Kadou, the Caroliner] on board we told him that he would be at sea for two months without ever seeing land, and he did not appear frightened. But having spent several weeks without observing land, he put no more faith in our words. He believed that we, as well as he, had been driven by winds far from his country and that we searched for land in vain. However, having observed that we were at ease, and that nothing on board was amiss, his anxiety soon ended.

About his neck he vore a string on which he marked the time by knots. But his count lacked accuracy.

35: Choris (Iles Radak)--21-22 (1817) 1822 Woleaians
116, 159, 533 Woleai

During his first days on board...[LEM: Kadou's] curiosity was excessive. He wished to see all. Soon he regarded everything with indifference, becoming satiated with novelty, and finally he came to consider everything as possible. [22]

Kadou was gay, and he knew how to endear himself to the officers and the sailors. Often to us he sang all the songs that he knew. He was proud of having travelled so much. He particularly loved to sing a tune from the island of Eap, which greatly resembled another one from Radak. This tune has often rung from the summit of the snowy mountains of Ounalachka. Kadou sometimes spent hours repeating it and then the memory of his homeland and of his voyages moved him to tears.

Tune from the Carolines

37: Keiyosei--44 (1929-30) 1930 Woleaians
116, 175, 291, 304, 565 Woleai

Mereyon is the general name of more than 10 islands. We landed on the main island at 8:30 a. m. These islanders are the most primitive people of the Kanakas. They do not wear any clothes except G-strings for men and a sarong woven of banana fibres for women. Among old people, men have tattooing on the stomach and back and women have it on hands and breast districts. This island is a level coral reef. I drank coconut juice now and then. All the men and women like tobacco here.

I saw men sticking combs in their hair. They are so-called free people (high class), and those who do not wear combs are a low class people.

37: Keiyosei--45-46

The Okimoto Pearl Nursery is located between Korror and the isolated islands. The factory and residences of the supervisors are on Korror Island. The mother pearl nursery is at the Sedo (sand ground with shallow water) between the two islands. The Sedo is about 100 ken wide [JW: approx. 600 ft.], the water is clear, and water circulation is very good.

37: Keiyosei--47 (1929-30) 1930 Woleaians
116, 228 Woleai

According to Mr. Takeshima, the black pearl shell is collected at the same time as the Takase shell, and May is the regular season. It costs 10 sen for each one. Most of the shells are 6-7 inches wide. There are three suspended trays of mother pearls. Each one contains about 2, 072 mother pearls. The ratio of formation of pearls is about 80%, and the regular one is 2. 3 bun [JW: . 2737 inches] in diameter. According to Mr. Takeshima, it is not profitable economically, but it seems that it is able to maintain a balanced budget. Originally Mr. Kataoka and Mr. Watanabe obtained the permit for this pearl nursery, but finally it came to Mr. Okimoto through a capitalist in Osaka, Japan. There are many young shells near the nursery, but their shells are so thin that they cannot be used for the mother pearls.

38: Matsuoka--530 (No date) 1927 Woleaians
116, 342 Aurupik

In the Central Carolines they used to employ the Yap style of building as may still be seen. On Aurupik the houses were sometimes built on a stone platform raised six feet above the level of the ground, covering a space of 120 square yards; with high towering gable ends they were an imposing sight, (South Sea Topography, 117) it is said. But today they are mostly set directly on the ground.

Woleai

"At the time of the Rupak's visit to Oulleai, the [MR: influenza] epidemic above alluded to was raging. This, together with the scarcity of food, was making great havoc among the people, and Williams, the Englishman, stated that he did not expect more than half the natives would survive."

40: Robertson--50 (1875-76) 1877 Woleaians
116, 175 Woleai

"On the 28th March the schooner called at Ulleai, which is a group of low coral islands almost surrounded by reefs. There is an Englishman living on this group who informed those on board the schooner that a Spanish man-of-war had been there shortly before, the crew of which had cut down half the bread-fruit trees and a large number of cocoanut trees, and that the people were consequently starving and dying at the rate of five and six a day. The commander of the vessel also ordered Williams, the Englishman above referred to, to haul down a flag that he kept hoisted there, and on his refusing to do so a boat's crew was sent on shore to pull the flag down. The commander then gave the natives a Spanish flag and told them to allow no other to be hoisted, but on the departure of the vessel the natives killed the man who had piloted her in and burnt the Spanish flag."

40: Robertson--50
116, 142, 291, 262

Ifaluk

FOREWORD

IFALUK is a small dot on the map: a half a square mile of land can hardly show much detail on any scale used for Pacific distances. Further, it is spelled "Ifalik" on most maps, through some accident in the history of official spelling for place names. The people who live there call their island in a way that might be rendered "Eefahlook" in a sort of English phonetic spelling. We figure that the people who live there ought to have the final say about the name of their island: hence our divergence from the map makers.

Ifaluk is one of the Caroline Islands, which form part of Micronesia. It is some 700 miles north of New Guinea, some 400 miles south of Guam, and about 1200 miles east of the Philippines. It is a part of the Trust Territory of the Pacific Islands, administered by the government of the United States.

Ifaluk is an atoll: a roughly circular reef, built by corals and other lime-secreting organisms, marking off a quiet lagoon in the open ocean, the reef in places piled up to form islets emerging a few feet above the level of the sea. Mr. E. H. Bryan, Jr., of the Bishop Museum, in Honolulu, has compiled a list of the islands of the world that could be classed as "atolls." He finds 409: 136 in Polynesia, 92 in Micronesia, 66 in Melanesia, 15 in Indonesia, 5 northwest of Australia, 68 in the rest of the Indian Ocean, 26 in the Caribbean Sea, and only one in the Atlantic. Atoll formation, then, is primarily a phenomenon of the tropical Pacific: and the word "atoll" carries with it the connotations of warm sun, of white beaches backed by graceful palms, of friendly dark-skinned people, and of an idyllic way of life.

Ifaluk, for us, lived up to these connotations, and we found our life there a continuously rewarding experience: an experience which, in writing this book, we are trying to share.

We tested several ways of meeting the problem of joint authorship. We tried being "we" which had a nice regal sound and worked well enough when we agreed. But we have a great talent for disagreeing.

Ifaluk

114 128 despite the underlying similarity of our points of view. We tried writing in the third person—Marston did this or Don thought that—but wives, friends, editors, said this made pretty flat reading. Finally we decided to split the book: Marston Bates would write the account for the period he was on the atoll; then Donald Abbott would take over for the remaining two months. The reader can thus expect to do one mental somersault, where "I" changes from Bates to Abbott between Chapters IX and X: Bates and Ted Burrows sadly going off with the Trust Territory ship, leaving Abbott with new companions to finish the study.

It is, of course, extremely presumptuous of us—of Abbott and Bates—to write about a study that also involved five other people. But the problems of multiple authorship seem insurmountable in a non-technical book and we wanted, in any case, to write subjectively, to write about our own reactions and feelings as well as about the people and things that we observed. In a very real sense, however, all seven of us achieved a "team approach" in our study of the atoll so that, whether they like it or not, all members of the team must share some responsibility for both the observations and the thoughts that we have expressed here. And certainly there must be a total sharing of the credit for whatever good may have come out of the Ifaluk enterprise.

114 The Ifaluk team consisted of:

Donald P. Abbott, marine biologist, of the Hopkins Marine Station of Stanford University, on Ifaluk from June 22 to November 9, and leader of the expedition from September 12 to the end.

Theodore Arnow, geologist and hydrologist, of the U. S. Geological Survey, on Ifaluk June 22–24 and September 12–26.

Marston Bates, biologist, of the University of Michigan, on Ifaluk from June 22 to September 12.

Frederick M. Bayer, zoologist, of the U. S. National Museum, on Ifaluk from September 12 to November 9.

Edwin G. Burrows, anthropologist, of the University of Connecticut, on Ifaluk from June 22 to September 12, and leader during this time.

Robert R. Harry, ichthyologist, of the George Vanderbilt Foundation, on Ifaluk from September 12 to November 9.

OR21 Woleai OR21
Ifaluk

Joshua I. Tracey, geologist, of the U. S. Geological Survey, on Ifaluk from September 12 to 26.

We came curiously and quickly to have a feeling of "belonging" on Ifaluk, and we found ourselves much involved with the people of the island in everything that we did. Inevitably, however, we were more closely associated with some than with others, and it may be helpful to identify here the people with whom we were most concerned, whose names appear most frequently in our narrative:

Fagolier, the paramount chief of Ifaluk.

Maroligar, the number two chief, guardian of the Fan Nap, where we lived.

Toroman, the number three chief and the official divider of food.

Lavausrung, the number four chief; a lady.

Wolpaitik, the number five chief (and the heaviest man on the island).

Totogoeiti (Tom), Ted's interpreter, and top ranking navigator (palu) of the island.

Yaniseman (Yani), "schoolteacher" and constant companion and advisor.

Bakalimar (Bakal), initially assigned as our special helper in camp and field, working later with Harry's fishing gang.

Tachiwelimeng (Tachim), neighbor, friend, and later one of Harry's fishing crew.

Letaweriur, Yani's wife and a composer of dance chants.

Gavileisei, master craftsman and canoe builder.

Gauaisig, an old man, navigator and canoe builder.

Talimeira, houseboy of Burrows and Spiro in 1948, now one of the two local "doctors."

Arueligar, "high priest" or "medicine man."

The Ifaluk study was made under the auspices of the Pacific Science Board, with a grant from the Office of Naval Research. We are particularly indebted to the Director of the Pacific Science Board, Dr. Harold J. Coolidge, and to the secretary of the Washington office, Mrs. Lenore Smith, and the secretary in Honolulu, the late Ernestine Akers, for help of all sorts.

CHAPTER II

MOSTLY ABOUT PEOPLE

THURSDAY, the first day after the NETTLE left, was overcast, with occasional drizzling rains. This was probably just as well because it cut down on the temptation to wander; so we could concentrate on the organization of camp at the Fan Nap.

The Fan Nap—the "Men's House"—was a large structure, some forty feet long and twenty wide, with a high thatched roof that sloped steeply to within a couple of feet of the ground on the sides. The ends were closed with matting down to within four feet of the ground, which meant that any adult must crouch on entering or leaving. The main cross-beams inside were higher, but still low enough to be a constant hazard. I never did learn to use the proper inside-of-house crouch, and kept battering my head all summer. Ted and Don were more alert—or at least better at dodging.

The front part of the Fan Nap, nearest the lagoon, was used for sleeping quarters. Ted and Don had their cots at the sides, under the stringers—beams that had been hewn out of huge breadfruit logs. The logs looked precariously balanced on the heavy coral blocks that served as the corner posts of the house. Collapse of the house would have caused the occupants of the cots to be instantly crushed. The great beams, so close above, were thus at first something of a mental hazard. But they had withstood the gales of many years and were clearly solidly placed—and they were very convenient for hanging mosquito nets.

Tables and boxes were arranged in the central area to make working space. The equipment included carpenter's tools, and with these some

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

of the wooden packing boxes were converted into sets of shelves. The cases of food were piled along the sides in the back part of the house, which became the kitchen area, cozily walled with cartons of sliced peaches and spam.

There was an altar in the back part of the Fan Nap that was a constant mental hazard because we did not want to offend the local people by desecrating this shrine with profane objects. The altar was a ramshackle affair, contrasting strongly with the usual Ifalukian workmanship, and this may have indicated that it was not taken very seriously; but we wanted to run no risk of giving offense. There was a large chest there, too, which we judged to be a sort of depository for the appurtenances of government. Among other things, the American flag was stored in the chest, to be hauled out and attached to a pole on the lagoon shore when a ship was sighted.

There was another sacred touch to the Fan Nap—a phallus attached to the main front center post and pointing out across the lagoon. The phallus, which pointed westward toward Woleai, the nearest neighboring atoll, commemorated an event of Ifaluk legend—or history. The story was one of violence and conquest and seemed curiously anomalous in the Ifalukian folklore, contrasting as it did with the present completely non-aggressive and peaceful character of the people. Ted thought that it might reflect memories of an actual conquest by the people of Ifaluk of earlier inhabitants of the neighboring atolls. Maur, the main character in the legend, was certainly the "culture hero" of the people of the island.

The phallus did not seem to be the object of any special veneration or cult—it was just there. Once, later in the summer, when we were trying to explain the money system of the United States, we were questioned about the portrait heads on the coins. Don explained Washington and Lincoln as long-dead "chiefs" thus commemorated.

Yani got the idea at once. "Ifaluk have picture of dead chief, too," he said, grinning, as he pointed toward the phallus of Maur on the Fan Nap.

The weather continued to interfere with the starting of field work. Friday it rained almost continuously all day—and of course the rain

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

gauge wasn't unpacked and set up yet. A stiff wind came up in the afternoon and kept increasing in force. Late in the afternoon Tom came by with Maroligar, the number two chief. Tom pointed out across the lagoon to the west and said, "Maybe typhoon." Maroligar seemed somewhat worried as well. What the two wanted, apparently, was a weather prediction—from us newcomers to the tropical Pacific! It showed a touching and completely misplaced faith in the famous "American know-how." I was in charge of the meteorology department and I peered at the thermometer (79°F at 5:45 P.M.) and barometer (1005 millibars) but I was unable to draw any deductions from these helpful facts.

In the evening, quite a number of men gathered in back of the Fan Nap, clearly worried about the weather. Maroligar borrowed one of the big Navy battery flashlamps and learned how to turn it on and off. He wanted some sort of a light so that if the weather worsened during the night, he could round everyone up and lead them to some safer spot, perhaps the boulder ridge on the windward side of the island—the highest spot, some fifteen feet above sea level. The houses were mostly along the lagoon shore and Ted remembered that waves had reached to the Fan Nap on his previous stay, with a wind of considerably less than typhoon violence. Don and I read what there was on typhoons in the books we had brought along, and I tried to remember what I could about the characteristics of Caribbean hurricanes—but nothing helpful came out of this.

The wind settled down to a steady blow, and I comforted myself, going to sleep, by thinking that hurricanes struck suddenly, after a period of still, oppressive heat, so that this slow build-up of wind could hardly be dangerous—misinformation, but none-the-less comforting.

The next day, Saturday, started out cold, with a completely overcast sky. But the rain had let up, so we sallied forth to begin work. Our first project was to make a census of the people on the island. Ted had made a census on his 1948 visit and he wanted to get a record of the changes. For Don and me, the census would be an essential basis for our studies of "human ecology." Further, if we made the census our first item of business, it would give us an opportunity to meet all of the people on the island.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Ted, of course, was in charge of the census operation. Tom acted as interpreter. Fagolier, the paramount chief, and Maroligar, the number two chief, went along, giving the highest possible official sanction to the procedure. The party also included a young man named Bakalimar—shortened to Bakal for ordinary purposes—who had been assigned by the chiefs to work with us, acting as general handyman and, most importantly, as dishwasher. (We did our own cooking; or, perhaps more accurately, our own can-opening.)

We were also accompanied by Tony. Tony was from the atoll of Ulithi, some 375 miles northwest of Ifaluk. He was a young man of perhaps eighteen, and had come to Ifaluk with his younger brother on the trade ship, some months before our arrival, to visit relatives. The Coast Guard had a station on Ulithi, where Tony had worked, and where he had learned fluent English. He was of no use as an interpreter in the census operation, however, because of his lack of familiarity with the Ifaluk household and clan arrangements, and because his youth made the questioning seem almost impertinent. The job required the maturity, dignity and local knowledge possessed by Tom. Tony's name, Antonio, was official, because Ulithi had been converted by a Roman Catholic Mission some years earlier—a process that included the adoption of Christian names.

The houses of Ifaluk were all on the two largest islets of the atoll, Falalap and Falarik, which were separated by a shallow and rather narrow pass. The Fan Nap, near the southern end of Falarik, was roughly in the center of the inhabited area. We started the census with the southernmost houses of Falalap, with the idea of working gradually northward until the count, household by household, was finished.

Three households—twenty-six people—were catalogued that first morning. Tom and Ted would lead the way into a household area, going inside if it was drizzling, or sitting on mats in the open during dry intervals. The available people of the household would gather about—and the available people included all of the men, all of the children except those who got scared at the strange activity and ran away, and all of the women except those under temporary quarantine in a menstrual hut.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Menstruating women on Ifaluk, as in many cultures, were subject to a variety of taboos. There were four special houses on the atoll which served as menstrual huts for each of the four villages into which the households were grouped. A woman, at the onset of menstruation, retired to one of these, removed from the ordinary life of the community until her period was over.

The census-taking was not a rapid process. It took interminable palavering among Tom, the chiefs and the members of each household to get a list of names, with clan affiliations, marital status, and such-like lore dear to the anthropological heart. When the list was complete, Don supervised the weighing and taking of heights—the only physical measurements practical with the available equipment. The weights were taken on a set of ordinary bathroom scales that had been picked up in Guam. The measuring pole was less prosaic—made from a pole found in the Fan Nap and calibrated to the nearest quarter inch by marking with a ball-point pen. Maroligar officiated at the weighing and measuring; after he had watched the first two or three operations, he explained to each person where to put his feet on the scales, tried to persuade him to stand up straight for the measuring, and coaxed the shier women and children into cooperating.

In the meantime I would prowl around with the big Crown Graphic camera, snapping whatever caught my interest, and popping flash-bulbs to the delight of the children who had a new toy in the used bulbs.

There was plenty of time to look around while Ted was trying to get all of the names and relationships straight. We noticed that the houses were well built, with big posts stuck in the ground to which stringers and rafters were firmly lashed with stout coconut-fiber rope; the roofs were coconut thatch, and the walls were mats woven of coconut leaves. The houses were low, and people did not stand in them, but sat or sprawled on the floor, which was very clean and covered with plaited coconut mats. There were no windows as such, but each house had four to six doors, which could be closed with more coconut mats when desired. The interiors were dim—but there was no need for good reading light. There was little or no clutter on the floor, except for a few things propped against the walls. Most of the family posses-

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

sions were put in bags or boxes of various sorts and slung by ropes from the rafters, the whole upper part of the house thus being a sort of floorless attic.

The citizens of Ifaluk cooperated nicely in the census operation, though they seemed rather amused at such strange antics. Those who had been weighed and measured loved to stand around and watch the rest as they passed through the routine. It was hard to get some of the people, especially the women, to stand up straight enough for a proper height measurement. They had, in many cases, what seemed to be a permanent crouch, perhaps resulting from the low doorways and interiors, perhaps the product of a sort of chronic deference, since the women of Ifaluk knew their place—always bowing respectfully in the presence of the male animal. (Ted suspected that this show was superficial and that the women, there as everywhere, knew their power and how to use it; one of the five chiefs, it turned out, was a woman.)

There were no ideas of modesty associated with the breasts; and the ladies didn't seem to be bothered by the fact that their skirts gaped rather badly near the belt-line behind. But they were very modest about legs from the knee up and were careful never to expose an inch of thigh. Their preoccupation with keeping their skirts close about their legs was clear enough as they stepped on the scales. Don, impressed by their modest maneuvers as he tried to read the dial on the scales, remarked that they would really be shocked by an American bathing suit.

The people seemed to take wonderful care of the children, the men holding babies and comforting the young as often as the women. Ted and his colleague, Spiro, in their 1948 study, found that the kids were never spanked, and rarely yelled at—though it was said that they sometimes doused them in the lagoon if they got too obstreperous. At the movies on the NETTLE Don noticed one man gently ladling sea water on a bawling baby. The baby stopped crying quickly—and he made a mental note to try this on his own daughter when he got back home.

The smallest infants were in cradles. These were square boxes with low sides, fastened by a bridle of cords from the corners, and suspended a few inches above the floor by a rope from the rafters. The babies were tucked in with some old clothes, and seemed contented enough.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

were tucked in with some old clothes, and seemed contented enough.

In general, the people had fine physiques, and seemed very healthy. There was one woman who looked like an albino with freckles, and another old woman had her nose and upper lip completely eroded away, probably from yaws. Yaws was once prevalent in all of these islands, but it yields quickly to penicillin injections and during the post-war period of American control, the Navy medical service instituted an effective campaign of yaws control.

After the first three households had been completed, the party waded back across the shallow pass to "home" at the Fan Nap for lunch. The weather kept us in for the rest of the day. The sky had been completely overcast all morning, with occasional drizzling rains, but without strong wind. In the afternoon the wind became steadily stronger. It started to tear coconut fronds, even green ones, from the trees, and the coconuts themselves were being blown off in large numbers. Don noticed one coconut fall at an angle of about thirty degrees from the vertical in the wind, and he figured that the wind had the force of eight or nine on the Beaufort scale—gale force.

About four o'clock Maroligar and some other men came around to the Fan Nap and lashed poles and boards across the open western end, where it faced the lagoon. A tent that had been unpacked but not set up was dragged over and lashed to the poles, nicely cutting out the wind and rain and making the interior fairly snug and comfortable. But the noise of the wind and waves outside kept increasing. A typewriter could not be heard four feet away, even in this snug interior. (Ted was typing up his notes from the morning, impervious to typhoons.)

We kept worried eyes on the barometer and on the wildly swaying palms. Men everywhere were out battening down their house walls with matting, and running great ropes from the gables, making them fast to the bases of nearby palms. Maroligar, hovering about the Fan Nap with obvious concern about the guests on the island, made it clear that if things got much worse we should move in to one of the houses farther from the shore.

Then suddenly, about five o'clock, the worryings and speculations were disrupted by a wave of excitement. An airplane had been

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk
Ulithi OR20

sighted circling the atoll! Everyone rushed out to see. Don and I dashed back to the Fan Nap to get the walkie-talkies that had been provided for just this sort of a situation. The walkie-talkies had not been tested since being unpacked, but there was no time now. Don's seemed to transmit all right, but neither was very clear as a receiver, at least in the howling gale, so I ran back to the Fan Nap to tune the battery receiver-set there on the walkie-talkie wave length.

Don gave his position on the lagoon shore near the south end of the long island, and the plane must have heard because it turned and made a pass almost directly overhead. It was a weather observation plane from Guam. At the receiver set, with Ifaluk crowded around me, I could hear the whole conversation.

"Any damage there? Any damage there? Over."

"No damage, nobody hurt. Wind about Beaufort Nine. Is a typhoon coming? Over."

"Typhoon center already past now north of Ifaluk and moving northwest. Wind now at maximum velocity. We will report to Guam that you are all right . . ."

The plane disappeared into the mist over the north end of Falarik and out of radio range. Don lingered on the beach to make sure it would not make another circle, and I kept my ear at the radio for any further message, but only static came through. But we had heard enough. No more typhoon. Science said so. Western civilization had zoomed in from the sky to reassure us—and the relief was immense.

We relayed the information to the chiefs. Ifaluk was tremendously impressed with the whole business—the appearance of the plane, the conversation with the little boxes, and pick-up of the conversation on the Zenith radio in the Fan Nap. Goodness knows, we were impressed too.

Weeks later, when the trade ship of the Trust Territory Government stopped by Ifaluk, we found out that the storm had gained in force as it moved northwest and had hit the atoll of Ulithi squarely. Father William J. Walter, the missionary on Ulithi, described the damage in a letter to Don:

"A few hundred trees were uprooted and a few hundred more snapped in half. Paths were so strewn with debris that they were

obliterated completely. The ferocious wind scooped up the sea and hurled it over the island, ruining the fresh water in our rain catchments. The waves came up into the canoe houses and crumpled some of them. All canoes had previously been dragged inland into the villages and tied down between the houses. One of the women's club houses, which also served as maternity ward and hospital, began swaying under the impact of the storm. The women and children were removed to safety just before it disappeared in a spray of flying splinters. The waves piled up and crashed on the beach rolling water a hundred yards inland. The islands are only ten feet above sea level and the ocean threatened to inundate the land. All the coconuts and most of the fronds had been stripped from the trees. For nine months afterwards the people were on short rations and no copra could be produced."

The same trade ship brought news that another storm, about a month before, had hit Ulithi when a fleet of fishing canoes was out on the reef. Three canoes, with seven men, disappeared. The lost men included Tony's uncle, brother and nephew, and his niece lost her husband.

Ifaluk was too close to the equator to be often in the path of typhoons; it was in the area where these storms generally build up, gaining hurricane force as they move north. The island had not been struck by a major typhoon since 1907, but the storm of that year was a fearful one, and its mark was still on the island. From the lagoon, a few coconut palms stood out, much taller than the others; they were the survivors of the 1907 disaster. Great blocks of coral tossed up on the reef before Falalap were testimony enough to the unbelievable force of the sea.

The wind continued, but it could be ignored now that it held no threat of increased violence, and in the evening Don and I started seriously on our project of learning something about the language of Ifaluk. We had asked one of the young men, Yaniseman, to help with this, and he turned up with his good friend Tachiwelimeng.

This was the beginning of a close friendship and constant collaboration. Yaniseman was one of three young men from the island who had been sent to Yap for several months by the government of the Trust Territory to learn English and, on return, to serve as teachers for the island. The English that they could learn in this time was rudimentary,

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

but they were anxious to learn more. Don proposed a sort of trade with Yani of English lessons for Ifaluk lessons. This developed presently into a regular session, every second or third night, with about a dozen of the young men of the island in attendance. I soon dropped out. The English-Ifalukian exchange thus became Don's enterprise: he had a special interest, since he would be staying on after Ted and I left.

By next morning (Sunday) the wind had pretty much died down, and the census operation was continued. About noon, a Navy ship was sighted off Falarik. The walkie-talkies were again unlimbered and contact was established. It turned out to be a destroyer escort, calling by the island to check typhoon damage. They sent in a rubber landing boat with a half a dozen men who spent about an hour wandering around the island trading cigarettes for shells, and then took off. It began to look as though Ifaluk, instead of being isolated in the remote Pacific, was a busy crossroads.

Monday, Tuesday, Wednesday, and finally the census was completed —or at least the first draft of the census. We made out a detailed list of all of the people, household by household, with a copy for each of us, and we kept making small changes all summer, finally making a complete recheck at the end of the summer to be sure we had everything straight. When I think of the trouble we had keeping track of 260 people, I get a new insight into the problem of census operations in a country like the United States. "Census" will never again be just a word.

The Ifalukians did not count years, and consequently did not know exactly how old they were. They did, however, have a series of words for age groups: saugau for infant, sari for child, tarimwan for young man, liveirik for a girl past puberty, and so forth. Old men and old women were called tufai and there were a number of old people on the island: twenty-eight men and thirty women in the tufai class, to be exact, so that about a third of the population was in the old age group. Some of these, including Tom, were adults at the time of the 1907 typhoon, so that they must have been in their sixties at the time of our visit: but they were healthy, vigorous and obviously enjoying life.

Ted asked each woman of childbearing age how many children she had had, how many were still living, and—for those that had died—

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

whether they died in infancy (before they could walk) or later. The ninety-two women of childbearing age or older had had 255 children, of which 151 were still living. Of the 104 deaths, sixty were either stillbirths or infant deaths, which is a high infant mortality by modern Western standards, though probably lower than that of most of the crowded Oriental civilizations.

The menstrual history of every woman was public knowledge on Ifaluk because of the custom of retiring to the menstrual huts. Tufai for a woman, then, has the definite meaning that she has passed menopause, has completed her reproductive history. We got the reproductive history of twenty-eight of these elderly ladies. They had born a total of eighty children, or an average of 2.8 each. Eight of them had had no children; one of them had had ten; most had had two, three or four.

The Ifalukians, like most people who lack a written language or system of records, had amazing memories, and I think that our histories for these women are reasonably accurate. It is difficult to interpret them precisely, of course, because of our lack of data on movement to and away from the island, and the like. Clearly, however, the population is hardly maintaining itself. The Ifalukians loved children, seemed always to want children. I could not, however, get away from a suspicion that the low birth rate reflected some sort of deliberate contraceptive or control practice, beyond such conventional taboos as the prohibition of sexual intercourse during periods of fishing. The language problem, the delicacy of the subject and our reluctance to appear to be prying into personal matters, prevented us from getting any definite information.

The population question in the Pacific is a matter of general concern. All of the islands—Polynesian, Micronesian, Melanesian—showed a great decline in population through the 19th century. The islands had probably been almost free of contagious disease before the explorers, traders, whalers and other Westerners started roaming the Pacific, bringing smallpox, measles, venereal diseases, tuberculosis and the like along with them.

The consequences were devastating, and only in recent years have introduced medicine and sanitation started to counteract the effect of the introduced diseases. Until quite recently, I suspect that most cul-

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

tural changes brought by the West—changes in clothing, in housing, in diet, in customs—have tended to increase the disease problem rather than to alleviate it. But that is a pet peeve of mine.

The population history of Ifaluk itself is not clear. Counts by anthropologists during the period of German control showed populations of 281 in 1903 and 208 in 1909, with an estimate of 300 for 1914. The drop between the first two counts may be a result of the typhoon of 1907—not only direct mortality, but also emigration to other islands as a consequence of food shortage.

The older Ifalukians thought that more people had lived on the island formerly; and from their stories I got to thinking that the population might at some time have reached as much as 500. This was based on accounts of times when even coconuts were carefully shared and nothing was wasted. Abandoned household sites in the village areas might be evidence of some population decline and there were stories of an epidemic, soon after the Japanese appeared, when as many as a dozen people died in a day. This, clearly, was smallpox; and the Japanese started vaccination, which has been maintained by the American authorities.

The island, in 1953, was not overpopulated. The land surface of the atoll was about a half a square mile, so the population of 260 people would represent a density of about 520 persons per square mile: a rather dense population, but we must remember that the people of Ifaluk had also the resources of their lagoon and of the surrounding seas. Ifaluk seemed to me to represent an economy of abundance, and this probably in part explains the idyllic living conditions that prevailed. With more people, with the same resources and the same cultural equipment, life might have been more difficult and unpleasant.

The Ifalukians certainly seemed not only happy, but healthy. It is difficult to make exact comparisons between the Ifalukians and other people because of our uncertainty about precise ages, so that one is likely to be averaging fifteen-year-olds with thirty-year-olds. In general, however, the men seemed to be somewhat smaller and lighter than the American average. The tallest man of the island, Sepemal, was a half inch under six feet. The heaviest (Wolpaitig, the number

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

five chief) weighed 182 pounds with a height of 5′ 7½″. Wolpaitig came closest of any man on the island to having a paunch. 141 561

The women were considerably more under American averages for height or weight. They were generally only an inch or so over or under five feet, weighing not much over a hundred pounds. The heaviest, a matron named Ietili of the Garotrong household, weighed 150 pounds, and was 5′ 1½″ tall. Ted suspected that the small size and light weight of the women was a consequence of the fact that they carried out the regular toil of the island—the heavy gardening work of the taro swamps as well as the work around the houses. 141 562 [462]

The Ifalukians would be classed as Micronesians: but what that means is anybody's guess. "Micronesia" is a geographical term to cover the hundreds of "tiny islands" of the Marianas, the Carolines, the Marshalls and the Gilberts. The inhabitants of these island groups, the Micronesians, are hardly to be distinguished from the more famous Polynesians: a rapid survey of several anthropology texts shows that the two are more often classed together than not. The inhabitants of the various island groups of Micronesia are certainly more diverse, both culturally and physically, than the inhabitants of Polynesia: but the similarities among all of these light-skinned people of the Pacific are greater than their differences. And the problem of the origin and history of the Ifalukians, of the Caroline Islanders, of the Micronesians, cannot be separated from the much-discussed problem of the origin of the Polynesians. 101

I think part of the European fascination with Polynesia (which would apply equally to the people of the central Carolines) comes from the fact that these people look very much like ourselves. The features of the Ifalukians were very European, and I amused myself by noting resemblances in certain individuals, in features or apparent characters, to particular friends or acquaintances in the States. The people were not really dark-skinned: both Don and I acquired a skin color within a month that matched the Ifalukian average, as determined by frequent comparisons of arms placed side by side. A pair of naked legs walking by the Fan Nap, observed under the low over-hang of thatch, could not be identified as Ifalukian or American. The Ifalukians 142 [149]

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

were surely as mixed up racially as the Europeans (none of us can afford to be stuffy about purity of race) but the mixture in the Ifalukians must have contained some of the same elements as the European mixture. But how did they get so far away?

Most anthropologists believe that the Pacific islanders moved out from southeast Asia, perhaps around the beginning of the Christian era, when the inhabitants of southeast Asia may have had a larger "Caucasian" component in their racial mixture than now. Despite his daring feat with the Kon-Tiki, few experts have much faith in Thor Heyerdahl's theory of American origin: he certainly proved that cross-Pacific contact is possible, but the evidence of language, culture and race points overwhelmingly to a Malayasian origin. One of the more probable migration routes for the Polynesians is from southeast Asia to the Philippines and through the Caroline islands to the central and south Pacific.

One gets the feeling, in this Polynesian-Micronesian area, of dealing with cultures far more complex than the technology would indicate: of dealing with the remnants of a high culture, of a "civilization." One feels that these same people, with the resources of a continent, could have built Angkor Vat or Copan: and they did produce some spectacular carving and building in places like Ponape and Easter Island. It is easy to understand the lure of the search for some "lost civilization" to account for these cultures; to understand the desire to create a mid-Pacific "continent of Mu" after the fashion of Atlantis. Maybe there is a general human tendency to explain the fascinating with the fabulous. Certainly the Pacific islanders are fascinating enough; but they have given us very few clear clues to either their origin or their history, and the few clues that we have are in part conflicting. Probably we shall never arrive at a clear and unequivocal reconstruction of their past.

But we were absorbed with the Present on Ifaluk. We had not yet acquired a proper Ifalukian shade of brown when we finally managed to finish our census of the people: but even with our strange color, we had already begun to feel at home, to feel "Micronesian" ourselves, a part of the island.

Ifaluk

CHAPTER III

MAPPING THE BOONDOCKS

THE IDEA was to study the human ecology of Ifaluk: the interrelations of man, his culture, and the environment. For man and his culture there was the reservoir of information accumulated by Burrows and Spiro during their 1948 residence on the island: studies which Ted planned to continue during his second visit. Don and I, with the enthusiasm of amateurs, wanted to help in this anthropological work. But there was also the environment to be studied—the land, the reef, the lagoon, the sea, the plants and animals. This "simple" situation—260 people living on half of a square mile of coral rock and sand—was incredibly complex.

When we had finished the counting, weighing and measuring of *Homo sapiens*, the next step seemed to be a start with the environment. The logical first move here was a map, a topographic survey of the situation.

The map problem was greatly simplified by the fact that a little previously a Navy reconnaissance plane had made a series of vertical and oblique aerial photographs of the whole atoll. The Ifalukians were fascinated by these photographs. They seemed to have no trouble at all in grasping the significance of either the vertical or oblique shots, and most people easily recognized the major landmarks, even locating their particular family dwellings. They knew the atoll thoroughly, and the aerial photographs gave them a chance to stand off and look at the whole thing at once, for the first time.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

126 Don and I spent one morning drawing a base map for the island of Falarik from a mosaic of the vertical air photographs. With this outline, the next problem was to fill in details of trails, households and vegetation. We thought we would start by mapping the principal trails.

Both of us were rank amateurs at sketch mapping. We had a Brompton compass lent by Ted Arnow and a triangular ruler marked with conventional scales, but no measuring tape more than six feet long and no plane table.

We first tried improvising a tape by tying knots at two-yard intervals in 100 yards of cod-line. When we had finished this tedious job, we discovered the darn thing stretched and tangled too easily to be of any use. I then dedicated myself to trying to learn to pace accurately, and soon managed a pace that fitted nicely when used on the base map with the 1:2500 scale of the triangular rule. This "Bates pace" was a purely arbitrary unit, but it worked well enough for our purpose. I learned to make nice adjustments in scrambling over coral [131] boulders and around breadfruit trees and through fern thickets so that I could come out with the proper count. In crossing the island, plotting the course on the outline map made from the air photos, we generally found an error of five or ten feet (it was about 900 feet across Falarik). This would probably have been disgraceful for an engineer but it pleased us immensely.

First we tried noting compass directions and number of paces for the quirks in the paths with the idea of plotting these on the map later. But this didn't work—too many mistakes. So I tried making a plane table by sinking a German camera adapter-screw into a board so that it could be fastened to an American camera tripod. The resulting contraption could not be called sturdy, but I was very proud of the improvisation.

We quickly worked out an effective system for dealing with trails. The mapping team consisted of Don, Bakal, Tony and me. Don handled the plane table, equipped with the triangular rule, the compass and a towel for switching away flies. Bakal toted things. Tony scouted ahead on the winding trails. I would keep an eye on Tony and when he seemed about to disappear on a trail, would call out to him to wait

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

and then pace directly toward him. Don would sight on Tony (or me on arrival) to get the direction, and I would call back the paces so that Don could draw directly on the base map.

The main trail of Falarik, which I got in the habit of calling "the broad highway," or sometimes "el camino real," ran through the coconut grove parallel to the lagoon shore, generally twenty or thirty yards in from the water. It was about two yards wide, and neatly marked on each side by a row of moss-covered coral rocks. This broad highway ran between the Fan Nap and the lagoon, and passed directly in front of five of the big canoe houses that faced the lagoon along the Falarik shore. The sixth canoe house on Falarik was away from the trail on the point of land that jutted toward Falalap. There were also two canoe houses on Falalap, one facing the lagoon, and the other facing the pass between the two islands.

The canoe houses, clearly distinguishable on the aerial photographs, were convenient reference points in mapping. They served not only for the storage of canoes, nets, lines and other gear, but also as social centers for the men of the atoll. Groups gathered there to talk, or rest, or weave nets, or carry on the never-ending job of making twine or rope from sennit, coconut fiber. A big sea-going canoe was being built in the Falepenach canoe house, near the Fan Nap, during the summer of 1953. This provided me with a convenient and continuing subject for photography.

The broad highway ran for almost a mile along the lagoon shore of Falarik, extending considerably beyond the last habitation, toward the north end of the island, ending abruptly in the middle of nowhere. This northern tip of the island, beyond the end of the trail, was a wild tangle of vegetation, relatively little visited and little used. Except for this northwest tip, the whole of the lagoon margin of the island was a park-like coconut grove, kept clear of weeds or shrubs with almost no other kind of tree—only an occasional breadfruit tree near the household areas, and a few other things like the big *Barringtonia* by the Sabolap canoe house.

The entire course of the broad highway was thus through the open coconut grove. The habitations were mostly set at some distance back from the highway, near the "boondock line."

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifáluk

We picked up that word "boondock" in Guam, and very useful it proved to be. It became an important part of the Abbott-Bates vocabulary, and may well have also infected the Ifalukian speech. In Guam, it was used to refer to the wild tangle of miscellaneous vegetation that had taken over so much of the island after the disruption of the war.

The boondocks on Ifaluk were the parts of the atoll that were not clearly something else—that is, not coconut grove, not taro swamp, not household area. The boondocks were not exactly wild, because all sorts of useful things grew there, including planted coconuts and breadfruit trees. They were not exactly cultivated either. Such areas could thus hardly be called "jungle" or "scrub"; and "forest" seemed rather inappropriate. "Boondock" was just the word; though we could perhaps better have used the Ifalukian equivalent, niwel.

The boundary between the coconut grove and the boondocks was sharply defined: weeds and shrubs were kept cleared out of the coconuts only up to this definite line—the boondock line. This again roughly paralleled the lagoon shore, fifty or sixty yards in. We plotted it on our map, later, when the trail mapping seemed fairly well in hand.

The habitations, deep in the coconut grove and near the boondock line, were grouped into "households." The census showed that there were twenty-six such households on the atoll, eleven on the island of Falalap, and fifteen on Falarik. The Falarik households were not scattered evenly along the highway and lagoon, but formed two clusters or villages, one called Ranau, at the south end of the island—the Fan Nap was in the middle of this—and the other called "Falarik" (the address would probably be "Falarik, Falarik") with a gap of about a quarter of a mile along the broad highway between the two.

The whole system of land ownership of the island was built around these households, each of which had a name. Later in the summer we tried to map the holdings of one household, Falepenach. These holdings included not only the immediate vicinity of the living quarters, but also several patches of boondock and coconut grove on Falarik, and patches in the big taro swamp on Falalap. The patch arrangement seemed to provide that each household would "own" its share of each of the different kinds of land.

The households varied greatly in size, from one which included

The households varied greatly in size, from one which included 43
only one old man and one old woman, to another (Falepenach) which 592
had twenty-six persons. The household system was matrilineal, and
when a man married he moved into the household to which his wife [591]
belonged. In the matter of what belonged to which household, a man
generally seemed to know much more about the household of his
mother than about the household of his wife, even though he had been
living in the latter for many years. There was considerable informal
movement among the households—people sometimes eating and sleep-
ing regularly in a household to which they didn't really "belong"—
which introduced a considerable element of confusion into the census
making. This informality plus clan relationships and other family ties
meant that labor was not strictly apportioned by household—the two
old people who officially represented the smallest household were as [888]
well looked after as old people would be in a household with numerous
members. Everyone really "belonged" to the whole island.

This matter of "belonging" had been on my mind ever since reading 858
that thought-provoking short novel by Carson McCullers, *Member of
the Wedding*. The "security" of the children of Ifaluk impressed us
from the very beginning. Every child was a member not only of a family
and a household, but of the whole island society. A child crying would
be comforted by the nearest adult. Curiously, the children, though
"secure", were far from obnoxious—in fact it would be difficult to
imagine a more delightful bunch of kids. The "sibling rivalry" that
seems to plague every American household was conspicuous by its
absence—the mannerly, non-aggressive character of Ifaluk society [181]
extended even to the five-year-olds.

The security of the children of Ifaluk is probably still further in- 597
creased by the widespread system of adoption. Ted found that over a
third of the children of the island had been "adopted" by couples who
were not their biological parents. When a couple for some reason wish
another child, they go to a pregnant woman (who must be of the clan
of either the adopting father or adopting mother) and ask if they may
adopt the child when it is born. The request, it is said, is never refused. 597
The adopting mother goes to the birth house with the real mother—all 844
children are born in a special house, which is taboo to men—and stays [343]
there while the baby is born. The biological mother keeps the baby

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

590 844 until it is able to walk, but the adopting mother shares the care and affections from the beginning; and when the baby is able to walk, it moves officially into the household of the adopting parents.

593 597 The child thus really acquires an extra set of parents, since it continues all through life to have close association with its real parents as well as with its adopting parents. The child acquires extra sets of "brothers" and "sisters" as well. Don found some difficulty with the word "brother" in teaching English since, while the Ifalukians all knew who were blood brothers and who were not, the matter seemed of little importance to them.

Our friend Yani, for instance, and his wife, Letaweriur, had three children. His oldest had been adopted into his mother's household, Soumat, and his next into his father's household (since his father was a re-married widower with no children by the second wife). Only the youngest had he kept to himself. Yet Yani was with all of his children every day. In this case, Yani and his wife, although they officially belonged in her household, Falepenach, spent most of their time in the Soumat household, since it was less crowded. This sort of casualness gave us a great deal of trouble with that census.

126 133 487 But this is straying from the problem of trying to get the Falarik trails down on the base map. With the broad highway and the canoe houses as fixed points of reference, we started to map the principal trails across the island. Falarik was a crescent, following the curve of the circular atoll reef; it was a little over a mile long, with an average width of about 300 yards. There were a dozen or so trails across the island from the inhabited, lagoon side, to the outer, ocean side.

The first of these, taking off from the canoe house beside the Fan Nap, began as a "highway" rather than a "trail." Like the broad highway, it was a wide, straight path, marked on both sides by lines of moss-covered coral rocks. On the left side of this trail was the dense [178] vegetation of Katelu, the sacred site of the ancient Men's House which was in use in the time of Maur, the island's "culture hero." This sacred spot was never entered by anyone except Maroligar, who was its official custodian. As a result, it was a wild tangle of natural vegetation. At one point on the path by Katelu was a large, fresh-water pool in [643] which Fagolier, the paramount chief, sometimes bathed. On the right

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

side of the trail there was an open grove of high breadfruit trees and other plantings of the Falivelu household.

This trail by Katelu we called the "schoolhouse trail"—because it led directly to the schoolhouse. The schoolhouse was a thatched shed built in a large clearing exactly half way across the island. It had been put up in accordance with instructions, either from the Navy or the Trust Territory, and contained a blackboard and a supply of essential equipment like boxing gloves and basket balls. But how would one go about introducing schooling on Ifaluk? Or should one? The answer to this latter, surely, is "yes" because willy-nilly the Ifalukians must learn to deal with the outer world in these days when that world has become a small neighborhood, and even Ifaluk cannot be protected by its remoteness. But the question of how to introduce this schooling is a complex one for which perhaps no one has a clear answer.

At any rate, the schoolhouse was not used for educational purposes during the period of our stay, but it did have uses. The clearing was a handy place to locate the rain gauge, and the schoolhouse itself, with its open sides, seemed a good place for the regular measurements of shade temperature and humidity. So the area became our meteorological station.

On this south end of Falarik the coconut grove of the lagoon shore extended right around the tip of the island to the ocean side, enveloping the schoolhouse yard. The trail was straight and formal, however, only as far as the school; beyond it became a winding footpath leading through the coconuts to the ocean beach.

Except for this southern end and the long stretch of lagoon shore, Falarik was covered with boondocks. Cocosuts grew all through these boondocks, and the principal forest tree was breadfruit. But there were a dozen other kinds of trees, and a thick underbrush of bushes and ferns—ferns everywhere. There were many swampy areas in the center of the island, but the land became slightly higher toward the ocean shore, the surface rough with coral boulders, culminating in a definite "boulder ridge" paralleling the ocean beach.

The beach on the ocean side was narrow, sloping rather steeply from this boulder ridge. Along most of the length of the island the beach, too, was covered with coral rocks, but there were also stretches of coral

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

133 sand. Out from the beach there was a hundred yards or so of coral platform, largely exposed at low tide, then finally the edge of the reef itself against which the great rollers of the Pacific broke their force all the year around.

133 361 The other inhabited island, Falalap, was rather different: a large, rounded blob sticking out into the sea and spoiling the neat circle of the atoll. The habitations were all on the northwest end of the island, across the narrow pass from Falarik. Here, too, there was a maintained park-like area, corresponding to the lagoon-side coconut grove of Falarik: but on Falalap, coconuts and large breadfruit trees were interspersed, giving a different "feel" to the landscape.

133 137 262 The center of Falalap was largely a great swampy area carefully cultivated by the women of both islands. Two kinds of aroids (taro), *Colocasia* and *Cyrtosperma*, were grown there for their edible, starchy roots which, with breadfruit, formed the staple food of the atoll. We did not get around to exploring this region in any detail until late in the summer.

123 226 The mapping operation was kept up fairly steadily for several days, but there were always intermissions. On Friday afternoon—the second day of the mapping—Bakal and Yani had no difficulty in persuading us to knock off mapping and go spear fishing. We all piled into Bronson's skiff and rowed over to the shore of Ella, outside the pass into the lagoon. Don was rather snooty about this skiff, remarking that a Western rowboat looked like a garbage scow beside the trim and speedy Ifalukian canoes. But Yani and Bakal liked it—perhaps partly because it was foreign, but also because it was steady and because it [136] could hold several people easily. Don, maintaining his scorn, called it the BWUP after one of the more ungainly species of trigger-fish.

227 Yani and Bakal each had steel-pointed wooden spears, about fifteen feet long; and short, slender steel spears. The long spears were for poking; the short spears were shot from a sling. The sling looked like a strip of inner-tube; at one end was a string loop, tied on firmly; at the other end the rubber was tied into a loop just large enough to slip over the thumb. With the rubber loop over the right thumb, the string loop was pressed over a slight notch in the butt of the spear, and the spear then simply pulled back with the left hand and let go. It worked like a Hawaiian sling spear, with the hand replacing the hollow bamboo grip.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR2]
Ifaluk

Hawaiian sling spear, with the hand replacing the hollow bamboo grip.

Fish were not too plentiful and all were small. In a short time Bakal got four small surgeon fish of two species and a small bright-colored reef fish. None were over five inches long—which showed that small fish were not scorned as food.

Don had taken his Arbalete spear gun—a complicated and lethal weapon that had as yet hardly been tried. Yani borrowed it, and Don was greatly cheered to see him miss a couple of shots—Don had been feeling sheepish about his own misses. Presently there were loud shouts from Bakal and Yani. Yani, for fun, had shot a big moray eel with the Arbalete gun. (For fun because the Ifalukians do not eat moray eels. Ted explained this as a sort of pact: the Ifalukians did not eat morays or sharks, with the idea that the morays and sharks would reciprocate. The pact was occasionally violated by both the morays and the sharks.)

The spear was deep in the neck of the big eel, but the eel was still lively enough so that we did not dare try to bring it into the boat, and it was impossible to get it off the spear. So we rowed all the way home towing the speared moray behind the boat. After dragging the eel up on the beach, we managed to get the spear out. Don, Bakal and Yani then started out again, swimming, to try for more fish among the coral heads of the lagoon in front of the Fan Nap.

Don got a fine chance at a blue crevelley about a foot long, and hit him right through the middle. Just then, Yani swam up and pointed to a big moray eel completely out of the rocks and swimming rather feebly along the sandy bottom twelve feet below. The eel was partly on its side and seemed to be looking up at them. The thought flashed through Don's mind that some fool had thrown the speared moray back into the lagoon, and there it was, out for revenge.

They had just started to get themselves out of there when a big shark shot by—a huge, grey torpedo. It made a swift circle around Don, Yani and the eel. Yani shouted and thrashed the water with his hands and feet, at the same time making for the nearest coral head, yelling for Don to come. Don was close behind, still with the speared fish. They clambered onto the platform of coral, where they were standing in water about halfway up their thighs, Don holding

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

123 the fish and spear high out of the water, trying to avoid attracting
226 the shark with blood. Once more the shark swept by, this time with a second shark just behind. Bakal swam out to the reef, in response to Yani's yells, carrying one of the big, long spears, while Toroman rowed out with the BWUP to pick them all up.

Yani had fished around the coral heads of the lagoon all of his life, and said he had never before seen sharks come in so close to shore. He had a theory that the noise of the spear gun had attracted them. It seemed more likely to Don that they had followed the nice trail of blood from the speared moray, dragged all of the way across the lagoon from outside the pass (where sharks were common) to the area off the Fan Nap. The speared moray was still lying on the coral sand, so the one they had seen behaving so queerly in the lagoon was another.

[260] The day ended with a fine fish dinner.

Ted turned on the radio that evening to listen to some music and
123 presently accumulated an audience of several Ifalukians who had happened to drift by. The next evening people started accumulating on the temple grass behind the Fan Nap shortly after dinner, and it soon became apparent that they wanted another radio concert. The news, apparently, had spread that this was possible. We were a little appalled at the prospect of having to give a radio concert every evening, none of us being much addicted to radios. We explained that the battery would get tired if it were worked too hard. Then Don happened to think of the phonograph.

The expedition had been equipped with a portable, wind-up phonograph. No one knew whose idea this was—perhaps a hang-over from some previous atoll expedition with a juke-box addict among its members. The accompanying records mostly looked like juke-box material, though of uncertain vintage, along with a few records of Hawaiian music.

We pulled down the box of records, which had been stored away high on a beam in the Fan Nap, and set up the phonograph on the temple grass lawn back of the camp. Tony, eagerly helping, said he knew all about phonographs—that experience with the Coast Guard Station on Ulithi again—so we turned the machine and records over

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

to him. This arrangement worked well, and soon the concert was in full swing. I watched for a while from the side lines, caught by the contrast of the brown, naked bodies sprawled on the smooth lawn, listening to jazz records on a portable phonograph.

Presently another aspect of the contrast was brought to our attention —which served also as an illumination of the pocket problem. Nudity, or the seminudity of a loin-cloth, has one great drawback—there are no pockets. Of course, pockets don't necessarily follow from clothing, as any woman in the modern West well knows. But the absence of clothing does necessarily result in an absence of pockets. The men of Ifaluk and the women of the West, for their different reasons, thus share the problem of how to carry small useful objects of the sort that the Western male so conveniently stuffs in his pockets. The solution, in both cases, has been the purse. The men of Ifaluk always carried their purses with them—capacious, neatly woven affairs, which they put beside them when they sat down and tucked under their arms as they walked. What, we often wondered, were the contents of such a purse?

We got some insight, on this occasion, from Tony. After three or four records, he remarked to me that he thought the needle should be changed. I remembered we had come across needles in our unpacking, but for the life of me I couldn't remember where we had put them.

"Oh, that's all right," said Tony.

And he started to fish around in the depths of his purse. Presently he emerged with a small package and started to peel off the layers of wrappings of dried banana leaf, to disclose, finally, a paper of phonograph needles.

The answer to our question about the contents of the Ifalukian purse was clear—it might contain anything. Which I suppose would also be the answer in the case of the female purse of the West. Only Tony, carting his precious packet of needles from Ulithi to phonographless Ifaluk, seemed to have attained a state of preparedness hardly equalled by the White Knight. And yet, as Tony so triumphantly demonstrated, you never can tell!

I was, then, in no way surprised, a few days later, to have Tony pull

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

a small tube of yellow oxide of mercury out of that same purse, and ask me what it was for. When I explained, he graciously gave the tube to Tom, who had granulated eye-lids.

On Sunday (it was the 5th of July by then) I was just contemplating a siesta after a hard morning of mapping, when the peace of the island was broken by cries of "sail-ho" picked up and relayed from the windward side of Falalap across to Falarik in no time at all. Bakal arrived almost as fast as the cries, all out of breath, with Tony soon after, to report that it was a big Navy ship with the number "59" on the prow. The busy crossroads again.

We got out the walkie-talkies, but all we could hear was the "testing," "testing" of one another. The ship wasn't talking. Maroligar dragged a brand new American flag out of the chest by the Fan Nap altar, passing over two tattered ones that had been lying on top, and with Don's help tried to get it on the flagpole, which had been considerably damaged by the typhoon. They finally achieved a sort of half-mast effect—to the considerable puzzlement of the ship's captain, it turned out later.

Ted decided not to let anything as routine as a Navy visit to Ifaluk interfere with his siesta. Don and I, less blasé, haunted the beach until the grey hulk of a destroyer emerged from behind Falalap to anchor off the pass. A small boat put off immediately. When it beached, it turned out to have several cases of equipment identifiable as belonging to Bob Rofen. The crew said there was more cargo aboard. Don hardly dared believe that this might include his missing equipment. He and I went back to the ship with the boat and there, sure enough, were Don's drums, so carefully and lovingly packed in Pacific Grove months before.

We went into the wardroom and had coffee with the officers and told them all about Ifaluk. We borrowed paper, envelopes and stamps to surprise our wives with letters. When Ted came aboard, bringing money, we bought as many cartons of cigarettes as we could at the ship's stores, but this was the only thing we could think of that might be useful. The Ifalukian consumption of cigarettes was enormous—every adult on the island had the nicotine habit—and we were the

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

only source of supply, since no trade ship had visited the island for some months.

The captain went ashore on the final trip of the ship's launch. Most of the local population was assembled on the temple grass by the Fan Nap, all decked out with garlands in the hair and wreaths over the shoulders. I introduced the captain to Fagolier. It was a pleasure to watch the chief on such an occasion. He didn't need clothing for dignity: composed and calm, he always seemed pleased to meet the visitors, murmuring the correct phrases in Ifalukian, with no hint of the naked savage meeting civilization. Rather, the overdressed foreigners seemed awkward and out of place.

The captain photographed everyone, called in the sailors who had been wandering around, and took off. We all went down to the beach to see them go, but unhaunted by any desire to be going along. Don, of course, was terribly pleased to get his missing equipment: and I should have been pleased too, since I came to depend on that equipment for the rest of the summer.

That evening there was dancing. Ted thought at first that it was the children, but it turned out to be the young men, lined up by a bonfire, practicing for some big event that they planned presently. I popped flashbulbs at the dancers and Don and Ted watched, while the mosquitoes drained their blood away—another flaw in paradise. The scene was wild and lovely, the dark backdrop of the coconut palms fitfully lit up by the fire, the row of naked bodies trimmed with flowers and anklets and bracelets of coconut leaves, the inflected chanting, the stomping, clapping and rhythmic movement. Don learned pretty well to get the nice resonance that they produced by clapping the cupped right hand against the inside of the bent left arm.

Don got sore at me for popping flashbulbs—he said it spoiled the atmosphere, was an insult to the Ifalukians, and so forth. I suppose I felt sheepish about intruding with a camera myself—but I had thought I was doing my duty in getting a photographic record. Anyway, I took off with my camera in a huff and kept a residuum of photographic inhibition all of the rest of the summer. The camera is a curious thing that way—it takes gall or cheek or impertinence to get good pictures

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

and the photographer is apt to be much resented. Yet people like to see the pictures. I never could see that the Ifalukians minded my photographic habits. They tended at first to stop work and pose when they saw me with the camera, but they quickly got the idea that I wanted them to continue working without paying any attention to me. The kids were particularly cooperative since (it was Ted's idea) I always had a pocket full of hard candies for distribution.

The people from Satawal left the next morning, Monday. I forgot to mention that when we arrived on Ifaluk, we found we had been preceded, a few days earlier, by a set of visitors from Satawal, another atoll about 150 miles to the east: three of the big ocean-going canoes, carrying thirty-seven men and boys, two women, two young girls and two babies. They were making a round of visits to the islands of the area in the traditional style, and during their stay on Ifaluk they were guests of the community.

Here in the Western Carolines the knowledge and practice of navigation with ocean-going canoes persists, while it is only a dim memory in most parts of the Pacific. Here too it will surely and perhaps promptly disappear, since it is, by any reckoning, a hazardous affair. The palus, the captain-navigators, of Ifaluk were all old men, and few of the young men seemed to be learning the art. The young men that we questioned had all travelled rather widely among neighboring atolls—but mostly in trade ships, or in the course of being moved about for labor by the Japanese during the war. Yani, for instance, who had travelled a great deal in ships, going to Yap to work on the airstrip, and to Palau for the start of his teacher education, had made only two canoe trips—both to nearby atolls—and he had no interest in further canoe travel.

The navigating methods of the Polynesians and Micronesians are not too well understood, and no European has ever accompanied them on an ocean voyage—or at least no European has ever written an account of such a voyage. Ted, in consequence, wanted very much to go with the Satawal flotilla which was heading next for Elato, some fifty miles to the east. Ted pointed out that while the trip might be hazardous, it was surely no more hazardous than driving on a parkway in the United States on Sunday, which millions of people did with no

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

qualms. He asked Tom if he could not arrange a crew to take his wa terach, sea-going canoe, and go along. Tom said he could, but that he would have to get permission from the chiefs.

When the decision was made to sail that Monday morning, Ted had high hopes that he could go along. He made it seem very simple. I didn't know whether to volunteer to go along or not; I don't know whether he would have taken me anyway, but I was scared at the prospect of having to make some decision. But the decision was taken away from us.

We heard Maroligar blowing on his conch shell down by the beach, to call the chiefs together. Shortly after, the three navigators from Satawal came to pay us a farewell call, along with Fagolier, Maroligar and Tom. Tom announced to Ted the chiefly decision:

"Those chief 'e say 'no'. Suppose too much wind. Suppose typhoon 'e come. That canoe 'e go roll, roll, roll. Bimeby fall down in salt water. You *die*.

"Suppose you want go 'nother island, 'e got steamer. 'E got that Navy boat. You take 'im."

I felt a great sense of relief. Ted took it nobly, though surely his last chance for this great anthropological scoop was going with those canoes. He couldn't question the chiefly decision: but he could at least use the incident to show that chiefly government on Ifaluk was operating, and that the chiefs felt secure enough to deny a request backed by the enormous prestige of an anthropologist representing the occupying American power.

Ted decided he would at least get as thorough a description of the embarkation as he could. He put a case of corned beef in the rowboat and we set out for Falalap, Bakal and a friend at the oars and Don and me armed to the teeth with cameras. We got there just in time to see the last of the three big canoes rolled down into the water, and to follow the provisioning and stowing of the baggage—mostly big wooden chests that looked as though they might be of Japanese manufacture. Finally the passengers started to embark. The few women and children among these crawled into little thatched huts built out over the water on each canoe, on the opposite side from the outriggers. It certainly looked like cramped quarters.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

123 Ted dealt out his forty-eight cans of beef as a going-away present. [622] The chief palu acknowledged this with a short but elegant-sounding speech.

We rowed out to the pass to watch the canoes put up sail when they had passed out of the lagoon—a pretty sight. Three sturdy canoes [502] starting out confidently across the Pacific to hit another tiny atoll—perhaps no staggering distance away, but still something to find without instruments.

CHAPTER IV

FISHING—AND BAKALIZING

TUESDAY morning was started by one of the chiefs blowing a series of resonant blasts, down by the lagoon shore, on a horn made from a large Triton shell. This was the signal for a general assembly. The chiefs had decided that the island needed cleaning up, and word had gone round that the start should be made today. The ground of the coconut grove along the lagoon had been littered with trash ever since the storm, particularly noticeable on the fine lawn of Japanese temple grass around the Fan Nap.

The cleaning was unhurried. The ground was swept with short brooms made from coconut leaves or from old coconut flower stalks with the branches held together by a binding of sennit cord. Much of the sweeping was done from a comfortable sitting or squatting position and the trash was gathered into neat piles to be burned later. The clean-up started at the south end of the island, the people gradually working north. At noon, when about half of the Rauau area was finished, Maroligar again sounded the trumpet and everyone knocked off for the day.

Don and I spent the morning trying to get things more organized around camp. There were Don's drums to be unpacked. He now had a typewriter and a small but very useful reference library and all sorts of goodies like specimen jars, thermometers, hydrometers for measuring salinity, and extra trousers which had been used for packing material. I promptly scrounged a pair of trousers. I had come to the

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

island with two pairs of blue jeans and some T-shirts by way of clothes, and first off had cut the legs of both pairs of blue jeans to convert them into shorts. The trouble was that my legs kept getting scratched in the course of pacing through the underbrush. Then the cuts would get nasty infections. I was ready to abandon my principles and take to long trousers, at least for work in the boondocks.

These infections were another of the flaws in paradise. Staphylococcus would start growing happily in every little skin abrasion, turning it into a nasty sore. The infections yielded fairly readily to antibiotic ointments, but this involved daily sessions of "wound-licking" and an ever-present decoration of band-aids over the scratched skin surfaces. This bothered me particularly because it was a contradiction of my pet theories about the intrinsic healthfulness of the tropical climate.

The whole question of "tropical sores" is a puzzling one. Coral cuts are notoriously troublesome, but on Ifaluk it seemed to make no difference whether the cut was made by coral or by the saw-like margins of the pandanus leaves. It might have been special susceptibility by newcomers to local bacterial strains—but the local people often had similar sores. It might have been some nutritional lack—I had seen similar infections in South America clear up quickly with thiamine injections. Certainly, we, with our canned food, were not living on any ideal diet.

Whatever the cause, the sores were a continuing nuisance, and I was very glad to get Don's extra trousers, much as I hated the idea of trousers—an arctic garment not really adapted to a tropical climate.

While Don was stowing his newly arrived gear, I concentrated on trying to set up a drying cabinet for plant specimens, taking one of the big wooden cases and fixing it so that pressed plants could be stored inside over continuously burning kerosene lanterns, to provide a constant, gentle heat. We would need a record of the plants growing on the island, both wild and cultivated, and there was no use starting plant collections without provisions for drying them.

This drying cabinet was put up in the "laboratory tent," a tarp that was suspended between two coconut palms beside the Fan Nap. A big mosquito net was hung under the tarp and a box to serve as table put inside. We frequently worked there during the day, to get away from

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

the flies, and during the evening, to get away from the mosquitoes. Ted stuck to the Fan Nap for writing up his notes—but carefully protected with long trousers tied around the ankles, and with coils of Japanese "punk" burning to exorcise the mosquitoes. He had great faith in that burning punk.

We decided to start the plant collecting that afternoon, since the drying cabinet was ready. It was quite an expedition—Yani, Tony, Bakal, Don and me. The idea was to try to collect not only the plants, but information about them. Tony, as a Ulithi man, didn't know the local plant lore, but he was a good interpreter. Yani's English was rapidly gaining in fluency, however, and he and Don, particularly, were able to understand one another almost from the beginning without outside help. Yani did know the local plants—their names and their uses—and Don would jot down this information while I fussed with the plant press itself. Bakal, as usual, was general handy man.

The clean-up was continued next morning and pretty well finished by noon, when everyone on Falarik gathered on the lawn outside the Fan Nap for a communal meal. "Feast" is probably too strong a word for the meals that invariably followed any community activity. The food was lavish enough, contributed by all of the participating households, but it did not differ markedly from the everyday diet.

In this instance, Ted decided that the occasion was important enough for him to contribute one of the cases of corned beef that he had brought along for just such purposes. The canned beef was a greatly appreciated delicacy, called "carawao," which would seem to stem from the Spanish word for water-buffalo, carabao. Several Ifalukian words reflected Spain's dominance in the Carolines in the 19th century —the word "cat" for instance, which hardly differed from the Spanish gato.

The opened case of beef was put before Maroligar, the number two chief, but the distribution of the cans was carried out by Toroman, the number three chief, who always seemed to take over when there was anything to be divided among the island households. He called out the names of the households, tossing the cans to representatives of each; some cans were set aside for Falalap (which was having its own clean-up), and there was a small, separate pile for the chiefs.

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

262 The people had brought many pots of breadfruit, cooked in different
264 ways, and there was a large pile of drinking coconuts—also divided
527 by Toroman. The meal lasted about an hour. I spent most of the time prowling around with the cameras while Ted and Don were more directly participating, squatting with the chiefly group. Ted reported that he liked best breadfruit that had been cooked with coconut
[250] cream, resulting in a sort of mashed dough with the white, creamy, semi-sweet sauce.

123 That evening Don had his regular session of English and Ifaluk
648 language exchange under the gasoline lanterns in the back of the Fan Nap. After the lesson Yani and his friend Tachiwelimeng lingered. They asked about the war between the United States and Japan, and got to telling about their own experiences. Tachiwelimeng had been taken by the Japanese to Fais, where there was a radio station. When the first American ship appeared off the island the Japanese got very excited, radioed the news to Yap, and then disappeared into hiding. The bombardment that followed scared everybody on the island. Tachiwelimeng spoke no English, but he was a born clown and gave a hilariously vivid pantomime of how the noise of the first shell tumbled him, how he crept behind a coconut palm and crouched in a ball, how a shell hit the coconut tree about six feet overhead and blew it down. No one was hurt except one of the Japanese, who was hit in the arm, but not seriously.

648 Japanese ships later took their captive labor to Yap, to use in filling holes in the landing strip made by the regular American bombings. Tachiwelimeng gave another graphic pantomime of American planes dodging Japanese ack-ack, bombs exploding all over the place and the like. These people seemed to look back on this as a big sideshow, bearing no resentment for the local people killed by the American bombings of Yap, and little resentment against the Japanese for getting them involved there.

126 The days were beginning to go by with remarkable speed. Ted gravely crossed them off, one by one, on a big calendar posted in the Fan Nap, and there was a check on this in my notebook, where the meteorological observations were entered every morning, first thing

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

after breakfast. All sorts of things went into that notebook (one of those waterproof engineer's books, carried in a case on the belt) and I had a chance to exercise my file-clerk instincts in keeping them straight. Numbers for plant notes had a square pencilled around them, so they caught the eye quickly. Pack and film numbers for photographs taken with the Crown Graphic had a circle around them; numbers for the Leica were double underlined; numbers for the Kodak Reflex were distinguished with a triangle.

The only marks for Thursday, July 9th, the day following the clean-up, were triangles, because the only notes were on photographs taken with the reflex. This was because the day was spent on a fishing expedition and I carried only the reflex. I never had liked that camera much, so I carried it whenever I thought there was danger of damage or loss—in this case, danger of salt-water damage.

Most of the men of Falarik were involved in this fishing expedition. Preparations started early in the morning. Great lengths of rope were hauled out of the canoe houses and wound spirally with strips of palm leaves, one after another, until the effect was that of a huge pile of monstrous green tinsel. The lengths of rope, as soon as they were prepared, were carried down to the lagoon shore and piled into the canoes.

By about ten o'clock everything was ready and the flotilla of canoes pushed off—a couple of dozen of them, the small one-man kind, and the medium-sized kind that carried four or five men. None of the big sea-voyaging canoes were launched. We went, with Bakal and Yani, in Bronson's rowboat, the BWUP, named for the ungainly trigger-fish. We felt awkward and sedate in this tub, but we were afraid of being a nuisance if we asked to go in one of the canoes. Anyway, Yani and Bakal were enamored of the BWUP, and it did make a steady base for observation and photography.

There was a row of about a mile across the still, bright lagoon. We took turns at rowing as a matter of principle, of sharing activities. But I am no athlete under any circumstances, and I was perhaps too obviously glad when I could stop the rowing and stretch out on the prow of the boat with head overside, staring into the mysterious sapphire

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

123 depths. The lagoon deepened rapidly, but there were areas, even in
006 the center, where it was only thirty or forty feet deep, and the shadows
[133] of coral heads below could be made out.

Presently the water began to shoal again, as we approached the
502 reef. For a while the boat could be maneuvered through the sandy
226 channels among the coral heads but all hands had to walk across the reef itself while the boat was pulled through a narrow, shoal, "canoe pass" which, although only a few inches deep, was clear enough of coral to enable the canoes to be floated across the reef.

123 I was wearing alpargates, South American canvas sandals, excellent
133 for rain forest, but no good for coal reefs—this was the last day in the life of those sandals, and I had to use great care to make them last even for the walk across the reef. Yani and Bakal were managing nicely in their bare feet, which showed the incredible toughness that the human hide can reach, but even they were walking carefully.

It was something over a thousand feet across the reef. On the far side, on this still morning, there was only a gentle surf from waves averaging only a foot or so high. This was the lee side of the atoll, in terms of the trade winds, but at this season when the trades were not blowing and when the rain was often from the west, the breakers here could be very high, a pulsating line of white on the horizon from the view point of the Fan Nap.

The BWUP was pushed out beyond the breakers and boarded again.
[136] Here, outside the reef, was the shark zone, but none were seen all day. Yani said one of his relatives had been attacked by a shark in this region, but had saved himself by pulling off his loin-cloth and covering the eyes of the shark as he charged by.

226 The reef shelved off gradually and details of the bottom could be
133 made out clearly in twenty-five or thirty feet of water. The bottom was solidly encrusted with life—corals, coralline algae, sponges and the like—except for the narrow, smooth "surge channels," kept clear by the rush of water along the bottom returning from the surf. They were like ravines along a mountain front.

226 The canoes started playing out the coconut-bedecked rope, finally forming a huge semicircle out from the reef. The rope was weighed down with coral-block anchors and attached to each of the regularly-

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

spaced canoes with a line. A large V-shaped seine was set in the middle of the semicircle, its bottom and sides over one of the ravines. When all was ready, groups of men on the reef at each end of the semicircle started hauling in on the rope, bringing the two ends continually closer together, so that eventually a big circle was formed with the off-shore edge just in back of the apex of the seine.

Everyone was in the water except the men hauling on the ends of the rope, the canoes being pulled along as the circle contracted. Everyone who owned them wore goggles, and with goggles the whole theory of the operation was clear. The frightening line of weaving fronds moved slowly along the bottom, driving hordes of fish of all colors, shapes and sizes before it. The swimmers followed along with the rope, and as the circle got smaller and smaller and the water more and more shallow, the circle of swimming men formed an additional barrier above the palm fronds. The fish, milling frantically inside the barrier, were finally driven into the seine, which was then closed, pulled up between two canoes, and the contents ladled into another canoe with a dip net. When the seine was up, many of the men went in with spears and dug out the fish hiding among the coral boulders.

This process was repeated three times during the day, the canoes and seine being moved each time to a new position along the reef. The total catch for the day was one of the middle-sized canoes about half full of fish. This was not regarded as a really good catch, but everyone seemed reasonably happy, and the fishing expedition, accompanied by a great deal of laughter and horseplay, was a fine combination of business and pleasure.

The BWUP with its passengers was sent in over the reef ahead of the rest, since it was so slow. The whole flotilla had moved around the reef toward the north end of Falarik during the course of the day, and the BWUP, on the way home, pulled in to this part of the island, where Yani and Bakal scouted for drinking coconuts. We all sat, relaxed, on the trunk of a fallen coconut for our drinks, and for the first cigarettes of the day. Because smoking before or during a fishing expedition is taboo.

The canoes came dashing home across the lagoon in fine style and by the time we got to the Fan Nap the canoe-load of fish had been

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

pulled out and dumped, ready for distribution. This, as always, was the special function of Toroman. Five big red fish were put in a pile by themselves, for the chiefs, and there was another pile of special kinds of fish, mostly trigger-fish, set aside by custom for the old men. The remainder of the catch was sorted out roughly by size into piles of large, medium-sized and small fish. In the meanwhile, men representing each of the various households gathered around, smoking and chatting. All had freshly-woven coconut baskets for their share of the catch. These baskets, quickly made from the green palm frond, were the ordinary packaging material of the island.

In the first round, Toroman tossed to each man two of the larger and three of the middle-sized fish. Then each got ten to twenty fish from the middle-sized and small piles, the number depending on the size of the fish and the number of people in the household. Then every family got one more large fish.

Don and Yani weighed a few specimens of the different kinds and sizes of fish, and calculated that the total catch was about 630 pounds. About forty pounds of the smallest fish were thrown out as too small for use, or because they were of kinds considered inedible. The seine catch as distributed, amounted to about two pounds of fish per individual inhabitant.

Everyone had fish that evening, and very good it was. Several of the most prized kinds of fish were given to us. These were expertly fileted by Bakal, and equally expertly fried by Ted in bacon grease after being rolled in corn meal. Ted was a master at this. Jobs around the Fan Nap were generally pretty equally shared, but Don and I always tried to maneuver Ted into the fish frying job—not, for once, out of indolence, but because he really did have a touch. The Ifalukians generally roasted fresh fish like these whole over coals from small coconut-husk fires, and they were awfully good that way, too.

This kind of fishing, with giant rope-and-coconut-leaf tinsel dragged over the coral bottom of the outer reef, was called rop fishing. Whether Ifalukian rop had any connection with English rope was questionable. Ted thought the similarity coincidence, since the rop fishing must have been an ancient practice, long antedating any contact with English.

The Ifalukians, like the people of all of the old Micronesian and

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Polynesian cultures, had almost endless ways of catching fish. Individuals or small groups fished with spears or with hook and line. A method that appealed to me particularly was to attach the hook and line to a kite, which was sailed from a canoe in the lagoon: thus combining the pleasures of fishing with those of kite-flying (one of the numerous instances where I couldn't decide whether a particular operation should be called "work" or "play"). There were also a variety of ways of trapping fish, with traps ranging from the large, permanent stone weirs built along the lagoon shore, down through various types of wattle traps, to improvised affairs of plaited coconut leaf sometimes set by the women in the shallows—the only fishing operation of the women, aside from collecting crabs, shellfish and the like. Women, in fact, were subject to various sorts of taboos in relation to fishing, and sex was strictly suppressed during a prolonged fishing operation.

There were various ways of catching special fish, like tuna, bonito and flying fish, when these appeared, but I didn't get to see any of these operations. Later in the summer, however, Don and I did spend a very active day trying to get a complete photographic record of a lagoon seining operation—the kind of fishing called yating.

The Ifalukians had an immense supply of seines—great piles stored in each of the canoe houses. The accumulation of seines and of rope seemed a direct consequence of the almost compulsive male habit of making sennit twine. Whenever a group of men were sitting around gossiping, or helping us gather information, or quietly watching the horizon, some of them would pull handfuls of fluffy leached and pounded coconut fibers out of their purses, and start twisting them into twine. This process, like knitting with the women of the West, did not interfere with either conversation or thought; and since it went on constantly, the twine output was considerable. The sennit twine had a great many different uses, but much of it ended woven into seines.

In the case of the particular yating operation that we photographed, the morning started with groups of men shouldering lengths of seine and carrying them down from the canoe houses to load them into canoes beached on the lagoon shore. The canoes took off in orderly procession, each dumping its seine in turn and connecting with the next until there must have been nearly a mile of seine forming a great

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

226 semicircle out from the shore and back again. Then men on shore started hauling in the seine, moving slowly along the beach to close the circle, a process that lasted from midmorning to midafternoon. Men in canoes were constantly guiding the movement of the seine and as the circle narrowed in shallow water, men with great dip nets stationed themselves along the seine at regular intervals to catch the fish that were frantically leaping out from the milling horde within. Finally, as with rop fishing, the imprisoned fish were driven into traps which were emptied into canoes, to be taken back to the Fan Nap [592] where Toroman, as always, supervised the division of the catch by households.

But the photographing of the yating fishing took place late in the summer. We had only been on the island a couple of weeks when we took part in the rop fishing expedition off the reef and we were full of wonderment about everything that went on about us.

535 571 The evening after the rop fishing there was dance practice again. It was going on every evening and I began to develop a theory that daily dancing was a basic element giving cohesiveness to the island's social structure. It seemed to combine the functions of amateur dramatics (participating in activities) and going to the movies (spectator entertainment). In this case the same people were at one time participants and at another time spectators. Even the kids formed their [857] dance groups, clapping and stomping and chanting in shrill, enthusiastic voices—usually in the early evening, before the adult sessions started. (My theory was all right, I think, except that dancing was an intermittent rather than a continuing activity, since there were long danceless periods between the proper ceremonial occasions.)

535 292 Even for these practice sessions, the people generally got pretty much dressed up, the men at least wearing garlands of flowers on their heads and coconut-leaf skirts over their loin-cloths. The men of Ifaluk, of course, tended to be the gaudier sex. This may be "natural" not only for man but for animals in general, Western civilization being out of step in this regard. Even in the West it hasn't been so long since the days of bright, embroidered waistcoats, and Hawaiian shirts seem to be spreading now in certain parts of the United States.

000 At any rate, Ted thought it was time for a present when Bakal

At any rate, Ted thought it was time for a present when Bakal 301
turned up at the Fan Nap ready for dancing after the day of fishing, 302
with a garland of flowers in his hair, big lilies in the holes in his ear 123
lobes, and a fresh green coconut skirt over his red loin-cloth. Ted had [292]
noticed the Ifalukian passion for ornament when he was there before, and this time came prepared with appropriate gifts, especially a good supply of ropes of the tinsel used for decorating Christmas trees. He got out a length of this tinsel for Bakal, who was delighted. Bakal ran his big, wooden comb through his hair several times to make it stand out stiffly (it stuck up in a great puff about three inches high anyway) and wound the tinsel around it in a double strand from the top of his head, at a rakish angle that brought it low over the right ear. A very flashy get-up for a young blade.

After two weeks on the island, we had become somewhat relaxed in this matter of male ornamentation. The people from the first would offer us maramars—garlands of flowers—for our hair, and we would accept them politely and appreciatively—and wear them sheepishly. But the sheepishness wore off rapidly. Presently I found myself expressing admiration for the effect of a wreath of velvety yellow four-o'-clocks on Don, and Don would notice the nice touch of bright red [137]
hibiscus on my black hair. Ted's beard was approaching magnificence, even at this early stage and made a fine accompaniment for flower garlands. After a while we reached the point of nailing up a mirror in the Fan Nap, so that we could arrange our garlands tastefully and appropriately before sallying forth in the morning. This process came to be known as "bakalizing" after one of its most devoted practitioners.

It was interesting to watch the process of disintegration of Western 123
male prejudices in ourselves. The necklace given me by Tachi was one step in this process. Tachi, a boy perhaps twelve years old who lived near us, cut his foot very badly one day on a coconut shell. He came to me for help and I dressed the foot regularly every morning until the wounds had healed. Tachi, in gratitude for this doctoring, brought me [301]
a beautiful cowrie-shell necklace.

I put on the necklace doubtfully, expecting jeers from Ted and Don. But instead they both, with obvious envy, said how nice it looked! I wore it for a day and generously offered to lend it to Ted and then to Don. The loan was accepted, and for a long time I could only wear

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

123 my necklace every third day, when it came my turn. Presently they were given necklaces, too, and then we could all be properly ornamented all the time!

123 177 Don kept on with the regular English lessons. He wrote a journal entry about one evening when Yani had brought a simple English reader from the school supplies and wanted to know the meanings of some of the words—believe, would, parade, party (that was easy), Halloween, conversation, as, think, exactly. Don felt he did nicely—all his teaching instincts came to the fore. He consulted me once or twice, but this obviously would lead only to an argument that would leave the English lesson suspended indefinitely—"exactly" was perfect for an Abbott-Bates argument. Its meaning could hardly be touched on without previous exploration of the nature of reality and the perceptions of the observer, and once this was started, "exactly" could never be reached again. So Yani got only the Abbott interpretations of meaning.

181 There seemed to be little trouble about the explanations, and this set Don to thinking about the nature of "savages." According to Ted, these people of Ifaluk had had the least contact with the West of any of the Pacific islanders—only the people of central New Guinea being comparable. Thus, by common Western standards, they would be classed as "savages"—in fact, as "naked savages." Yet, Don argued, these are really highly sophisticated people, so startlingly like Westerners that it was sometimes hard to remember that there were any differences at all. He was particularly impressed by their sense of humor, which [502] seemed to differ not at all from his own. They laughed at his jokes when they understood them, as he did at theirs. Humor that didn't cross the cultural barrier seemed to be associated either with the double meanings of language, or with cultural traits that were not shared. Don wrote these impressions in his journal—from which I am cribbing.

535 533 After the English session, we all went to watch dancing on Falalap. We took the BWUP and rowed over in the dark, settling down under the palms near a fire of dry coconut leaves. The women were sitting in a line, making slow movements of arms, torso and head to the pace of a slow, low-pitched song that mostly hung on one note, but oc-

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

casionally rose or dropped over a scale of about three notes. There, in the light of a fire that flared to brightness and sank down almost to darkness as fuel was added or used up, with a row of bare-breasted women singing the pleasant but monotonous dirge-like song, with slow, almost caressingly sensual movements of the hands and arms, Don was overcome again with a feeling of unreality, of the cultural gulf that separated him from them.

But again he thought, this is trivial. The only real barrier is language, and that can be overcome. It was, in fact, already lessening. Just that day, he had been able to explain to a man who brought a wooden bowl to the Fan Nap that Ted was asleep, to tell the man to come back later in the evening, and to ask him whether he wanted tobacco or money for the bowl, and how much. It was a great triumph in communication.

The gulf between California and Ifaluk could be bridged.

CHAPTER V

MOSTLY ABOUT FOOD

461
517
562 Much time on Ifaluk was spent in sitting—men sitting around the canoe houses, women sitting around the cook houses. I had the impression that the men were more apt to just sit, and the women to sit and chatter; but this impression was probably a carry-over from preconceived ideas about my own culture. Certainly, in fact, the men in the canoe houses often carried on interminable conversations; but certainly also they were frequently silent and contemplative—or drowsy.

This fitted my temperament fine. Since childhood I have been an
643 inveterate sitter (and day dreamer). My most frequent companion in the sitting process on Ifaluk was Fagolier, the paramount chief. From the beginning he fascinated me with his poise and dignity, his character-lined face. I had a curious feeling of rapport sitting with him, sharing a mat or a coconut log, smoking, occasionally exchanging a grin, but feeling no real need of trying to say anything.

He had all of the qualities that should go with the paramount chieftainship—the assurance and humility of security; a calm, reliable decisiveness; an ever-present courtesy and thoughtfulness. I wondered often what he was really like, how much this picture of him was the product of my own imaginings, whether I saw him as he was, or whether I saw only the projection of my own concepts of a chief. Yet I gained confidence in my mental portrait because it always seemed to correspond with my observations. Then I would still wonder whether this was a tribute to Fagolier, or a tribute to the flexibility of my

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

imagination. But his poise, his dignity, seemed to have a very real quality, completely independent of the trappings of position or pretence.

I remember the evening early in our stay when he stopped by the Fan Nap just as we were starting our dinner of spam, canned sweet potatoes and canned string beans. We asked him to join us, which he did with apparent pleasure, even making noises of appreciation over the string beans—the equivalent in my own household, over new food, of "how interesting." When we were finished he went off with his plate, cup and silver and washed it and started to try to wash a pot! It was like the thoughtful guest back home who insists on helping with the dishes; somehow, as real a gesture of courtesy as I have ever seen.

The next day, when I went to photograph progress on the canoe that was being built in the Falepenach canoe house, I found Fagolier working away with an adze on a plank, the efficient artisan. Usually he was right in the middle of any work in progress, carrying his full load.

He was always the thoughtful host. Everyone on the island was always a thoughtful host—but Fagolier, as chief, along with Maroligar, number two chief and proprietor of the particular spot where the Fan Nap stood, were especially attentive. I noted my impression in my diary one morning when Fagolier brought us fresh coconuts. He came with two handsome boys bearing the nuts, for all the world like two pages attending a prince. The pages placed the coconuts as directed by a wave of the hand, and during the ensuing period of polite silence, they sat quietly and respectfully in the background, so that the feeling of court was maintained.

I watched him directing a dance rehearsal one night. Don was involved with Yani's English and Ted with something else, and when Fagolier and Maroligar left the Fan Nap after their usual check on our comfort, they obviously expected me, at loose ends, to come along with them. When we got to the fire, they seemed to expect me to join the line of dancing men. So—away from the eyes of my fellow Westerners—I did.

Certainly I was very awkward and shortly I abandoned the attempt,

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

123 but I was glad I tried because it gave me a direct experience with
535 Fagolier as dance director. He squatted by the fire and the line of
643 men formed opposite him against the dark backdrop of the coconut grove. To get some glimmering of what to do, I had to watch both Fagolier and the men in the line beside me, and I gradually got the feel of the situation. The dance involved a series of gestures with both hands, and of vocal sounds that varied from hums to shouts but that did not seem to form word patterns. Fagolier directed this with a remarkable economy of gesture, the indications of his hands being translated into full scale action by the men opposite. He was acting as leader and coordinator—again quietly, skillfully and economically.

121 These thoughts about Fagolier were precipitated the morning that Don started his food study of the Falepenach household. Don was resolved to be as exact about this as possible. It is very difficult to get precise figures on what people eat under any circumstances (think of the problem of measuring everything scraped off the plate into the garbage can, or of finding out whether Johnny got into the cookie jar this morning, and how many cookies he snitched). But, Don reasoned, the greater effort you made to be precise, the nearer you were likely to come to truth in your measurements. So, with the complete and invaluable assistance of Yani, he started out to measure everything eaten in Yani's household, Falepenach, for a month.

125 It developed at once that I was about as helpful as a sore thumb
[261] in this process. That first morning Don and Yani weighed all of the breadfruit and all of the coconuts brought in for the day's use. Then, to get a measure of the difference between crude and finished product, they waited around while the breadfruit and coconut were being prepared for cooking. Clearly I wasn't needed for either the weighing or waiting processes, so I drifted off to sit down by Fagolier and contemplate the horizon. Don, in the meanwhile, found (among other things) that twenty husked, ripe coconuts, weighing 27 lbs. 5 oz. produced 11 lbs. 13 oz. of copra ready for use in that day's cooking operations in Falepenach.

121 We had been talking about the problems of the food study from the
262 beginning. A careful study of what people ate, how much, how they got it, how it served them nutritionally, was clearly basic to any at-

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

tempt at understanding man's relations with the world around him. With the census finished and the mapping well started, food study had next priority.

Each of us had somewhat different ideas about how to approach this difficult job. In the end, records were kept on four different households for a month each. Two of the studies were made by Ted and two by Don. I am not sure, looking back, why I stayed out of this, because food relations have long been one of my pet interests. I think it was chiefly a matter of economy of effort. Ted and Don had the matter well in hand and each had special advantages: Ted because of his familiarity with local customs and with the language, and Don because of his close association with the invaluable Yani. The daily record taking rapidly became routine, and a pattern formed very early by which each of us established his own special daily routines, thereby avoiding duplication of effort. When to collaborate and when to specialize is a nice problem in the team approach to scientific study. I think we handled the division of labor very well, though not always consciously.

Don and Ted have summarized the results of this food study. The details will be published in scientific papers, but perhaps I can give here a general summary.

The four households included a total of forty people, men, women and children: the average weight per person being 95 lbs. The average daily intake of staple food per person per day was: fresh breadfruit, 175 grams; ripe coconut meat, 130 grams; fish, 105 grams; taro, 70 grams; fermented breadfruit, 60 grams; fresh toddy (sap from coconut flower stalks), 415 cc.; milk from green coconuts, 75 cc.; green coconut meat, perhaps 35 grams.

Calculating food values for these materials is not easy, since most detailed nutritional studies have been made with northern foods. The foods of the tropical Pacific, however, have been studied in Hawaii, and there is a growing literature on nutrition in other parts of the Pacific. From this information, it appears that Ifaluk diet is inadequate in several respects, according to the usual dietary norms. The Ifalukians, however, gave every appearance of having an adequate diet—there were no obvious signs of their being undernourished. I have long

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

146 114 come to view with suspicion these tables giving comparative nutritional values for different parts of the world. Truly, much of the world suffers from malnutrition as compared with the United States or Western Europe; but also, I think, our nutritionists have failed to give adequate attention to possibly varying needs. The food needs of man in Ifaluk and of man in New York are not necessarily the same.

121 262 One problem with diet studies is the difficulty of keeping track of snacks, of occasional foods; yet such occasional or incidental food may be very important in relation to some vitamin or mineral requirement. We were very conscious of this problem, and Ted and Don made every effort to keep track of incidental food as well as of staples. Yani was particularly helpful in this, because he tried to remember and report all of the incidental things that he and his friends ate as they wandered about during the day. On this basis, there was considerable variety in the Ifalukian food. At least thirty kinds of plants were eaten in one way or another (not counting "medicines"). Don got records 267 136 of eighty-eight different kinds of fish that were eaten, and guesses that there must be many more. For animals, there were also sea turtles, chickens and other birds, and occasionally pigs and dogs. Some seventeen kinds of molluscs were eaten, eight kinds of crustaceans, and a few other things like sea anemones and one kind of sea urchin.

137 [136] We arrived at the height of the breadfruit season. Breadfruit trees grew everywhere, producing far more fruit than could be used; and the fallen, rotting fruits were probably the chief breeding places of the flies that so plagued us. As the breadfruit harvest dropped later in the summer, so did the numbers of flies.

137 262 Breadfruit in its season (June through September, with a second, smaller crop in February and March) is the staple food, the chief source of starch, for the people of Ifaluk. It is a staple on most of the islands of the tropical Pacific—the "bread" of Polynesia and Micronesia.

137 245 The big, starchy fruits grow on a handsome tree, probably native to Malaya. It may well be among the most anciently cultivated of plants and the main food varieties are seedless, completely dependent on man for reproduction. It is propagated from shoots which spring up around the base of the trunk, and the colonizers of the Pacific—

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Polynesian and Micronesian—had to carry the precious young plants with them on their long canoe voyages to new islands.

The famous expedition of Captain Bligh with the BOUNTY had the purpose of bringing young breadfruit trees from Tahiti for establishment in the West Indies, where the planters thought it would be an ideal food for their African slaves. This first attempt at importing the tree was frustrated by the mutiny, but plants were successfully brought in on a subsequent voyage. Breadfruit, however, never became a staple in the West Indies. People do not adopt new foods easily (not even slaves), and where new staple foods have been adopted—as in the case of the potato in Ireland—it is generally because of overwhelming advantages. Breadfruit seems not to have demonstrated such advantages to any non-Pacific culture.

We went out one morning with Tom and a young man of his household to gather breadfruit. The man who was going to pick the fruit carried a large coil of rope and a long pole which had a short crosspiece firmly tied near one end. We followed him through a complex maze of boondock paths to a large breadfruit tree. He threw the coil of rope over the lowest branch (about twenty feet up) and pulled it out with his pole, so that the rope was hanging double from the branch.

With the aid of the rope he climbed easily up the trunk to this first branch, whence he could scramble to any part of the top of the tree. We watched him walk upright along one horizontal branch about thirty feet above the ground, using his long pole as a sort of balance after the fashion of acrobats. With the pole he was able to break off fruit easily in any part of the tree, allowing the fruit to fall to the ground. The bruising apparently did not matter, though the fruit to be used for food must be gathered before it is completely ripe, while the pulp is still white and mealy.

The fresh fruit is either baked or boiled, with many minor variations in ways of cooking. I didn't think much of it, no matter how cooked. It seemed no better or no worse than potatoes, palatable enough with meat gravy—but the Ifalukians didn't have meat gravy.

Breadfruit is the only food on Ifaluk that can be stored for any

251 Breadfruit is the only food on Ifaluk that can be stored for any length of time (they sometimes smoke fish, but not to keep it for more than a few months). To preserve the breadfruit, the skin is scraped off and the pulp cut into sections which are put into big, open-meshed rope baskets. These are carried to the lagoon, weighed down with coral blocks, and left to soak overnight. The baskets are then removed from the lagoon, covered with leaves, and left for still another night. The pulp can then be kneaded into a paste, which is wrapped in leaves and buried in the ground. The preserving process is quite comparable with that used for sauerkraut, and the stuff lasts for years. We didn't like the taste of this mar, but apparently it is nutritious enough. Considerable quantities are buried every year, insuring a food [731] supply in case of a disaster like a typhoon.

262 There are seven or eight named varieties of breadfruit, distinguished 137 by the size and appearance of the fruit, shape of the leaves, and the like. In the case of two of the varieties, the fruits have seeds, and in these the roasted seeds are used for food. They have a chestnut-like flavor and quality.

Almost as important as breadfruit were the two taros. This is perhaps doing violence to the word "taro" since it is using it to cover two similar but quite distinct kinds of aroids with edible tubers, one called by the botanists *Colocasia* and the other *Cyrtosperma*. The taro of Polynesia is *Colocasia*, but on Ifaluk both plants were about equally important. These again are anciently cultivated plants, vegetatively propagated, each with endless named varieties. The *Colocasia* on Ifaluk was called wot and the *Cyrtosperma*, pulach (the "ch" is also rendered as an "x" sort of a sound—we argued endlessly about how to spell Ifalukian words).

Both wot and pulach are aroids, that is, they belong to the botanical family that includes the "elephant-ear" plants, the Calla lilies and the Jack-in-the-Pulpit of North America. A third edible aroid, *Alocasia*, called file by the Ifalukians, was grown on the atoll, but it was considered definitely inferior to the other two and little used as food.

244 Wot and pulach were grown in low, swampy ground in the interior of the islets. The central part of Falalap was almost all swamp, and the main gardens were located there. These taro swamps occur all through the Pacific and it is difficult to know now to what extent they

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

are "natural" and to what extent man-made, because they have been subject to careful cultivation for many generations. The care of the gardens is exclusively women's work and they become expert gardeners. The plants are set in neat rows in rectangular patches, each patch belonging to a particular household so that each household on the atoll has its share of the large Falalap gardens. Weeds grow luxuriously in the rich, mucky soil, and weeding is the main gardening chore. The weeds, I was interested to see, are always buried in the muck, so the practice of "green manuring" is an ancient one here. With young plants, coconut leaves were sometimes used as mulch, to cut down the growth of weeds.

I was greatly impressed, watching these women go about their work, at how little a Westerner would be able to tell them about gardening practices, at how well their methods were adapted to the plants and environment of their atoll. Perhaps one could put this another way, and wonder at how little modern "civilized" man with all his science has been able to improve on, or change, the gardening practices developed by peasant cultures through generations living close to the earth. We have made drastic changes in large-scale agriculture, but the gardener, throughout the world, shares a curiously large fund of common lore.

But I had intended to write here about food, not about agricultural methods. Wot and pulach were eaten to some extent, even during the breadfruit season, just as the preserved breadfruit (mar) was eaten to some extent at other times of the year, making some variation in the daily monotony of starch. There were many slightly different ways of cooking these tubers. We liked best a way of preparing wot (*Colocasia*) whereby it was mashed, cooked with coconut cream, moulded into little balls in a pot, and the whole covered with a thick paste of coconut meat. The effect was a little like that of mashed sweet potatoes served with heavy whipped cream.

Coconut, of course, permeated every aspect of Ifalukian cooking—the milk from green nuts and ripe nuts, the flesh from green nuts and ripe nuts, the sap from the cut flower stalks (here called hachi, perhaps best called "toddy" in English). The coconut was more often used as a supplement in cooking breadfruit or taro, as a seasoning, or the

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

milk or toddy as a liquid for cooking, than as a food in itself. But the green nuts everywhere provided a handy source of drink; and the translucent, jelly-like flesh of these green nuts, eaten after the milk has been drunk, was surely a highly nutritious, though perhaps minor, food.

When a coconut sprouts, the hollow of the nut becomes filled with the white spongy tissue of a special absorbing organ (an extension of the cotyledon). This spongy tissue has a pleasant, sweetish taste and the Ifalukians were very fond of it. It often seemed to me that the juice of green coconuts filled the role on Ifaluk of soft drinks or mid-morning coffee in our culture; and that the spongy tissue of these sprouted nuts corresponded to candy bars, a tasty snack always readily available. The Ifalukian product, in both cases, would seem to be more "healthful" than its Western counterpart.

Toddy, or hachi, the sap that oozed from the cut flower stalks of coconuts, was a very important element in the Ifalukian dietary. Many palms have a strong flow of sap into the large, rapidly-growing flower stalks, and people in several parts of the world have learned to use this—most notoriously in a fermented form. The flow of sap was better in some coconut palms than in others, and on Ifaluk the particularly good palms were marked off for this special purpose of supplying toddy. Every morning and every evening all of the young men of the island were off on their rounds of collection, each with his special beat.

The toddy palms all had notches cut in the trunks to facilitate climbing. A man would go to each of his palms in succession, climb up to the crown, pour the sap accumulated in a coconut shell into the bottle he carried, shear off a thin slice from the end of the cut flower stalk to stimulate sap flow, replace the coconut shell to catch the drip, and go on to the next palm. Several quarts of the fresh sap were thus brought into every household each morning and evening.

The rich, sweetish sap was reserved primarily for the women and children—its place in the diet of Ifaluk seemed to correspond to milk in the diet of the West, and the regularity of the young men with their toddy chores reminded me strongly of the regularity of the milking chore in the rural West. It was, in fact, the only regularity we were

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

able to observe on Ifaluk. Meal hours had no fixed time. There was generally only one large meal in a day, but the time of day at which this was eaten seemed to vary with the whim or convenience of each particular household. The time of toddy-collecting, however, was as unvarying as the sunrise and sunset with which it coincided; and every young man dropped whatever else he was doing at those times to carry out his chore.

Officially, the toddy was always used fresh on Ifaluk. As Ted had found during his first visit to the island, the chiefs had decreed prohibition. They had observed the effect of alcohol on the peoples of some of the neighboring and more Westernized atolls, where the people had easily learned how to distill the fermented toddy into really potent stuff, and they had decided that for the peace and security of the island it would be best if even fermentation were not allowed.

But toddy ferments easily and quickly. We noticed at some of the dance rehearsals an occasional older man with a definitely unsteady gait or a tendency to be too loud or too obvious, and concluded that he had allowed some toddy to follow its natural course by leaving it sit for a day. We had no direct evidence of the violation of prohibition, however, until toward the end of the summer when Tom offered us a sip from his bottle.

The stuff tasted very good to me, though perhaps I am no judge since my taste in alcohol is catholic. It had a pleasant, cider-like tang with, I should judge, about the strength of good beer.

Breadfruit, the two kinds of taro, and coconut, then, were the basic vegetables of the atoll. There were also a number of minor crops—especially papayas and several kinds of bananas and plantains. The papayas were fair, the bananas excellent, but they seemed to be little used by the people. We were often brought cooked green papayas, which have a squash-like texture and taste, and this seemed to be the way they were most commonly used. We were kept constantly supplied with bananas—we always had a bunch or two hanging to ripen in the Fan Nap—but the people seemed to consider them to be children's food. They appeared to prize the banana plants more for the fiber they got from the stem than for the fruit.

Fish formed the basic animal food, but the people also had pigs

41: Bates & Abbott N-5 (1953) 1958
OR21 Woleai OR21
Ifaluk

Fish formed the basic animal food, but the people also had pigs
262 and chickens. We included domestic animals in our census of the
731 island, and came out with a total of 280 people, five dogs, nineteen cats,
[161] thirty-three pigs and fifty chickens. The pig total included animals of all sizes, so pork was not a common article of diet. Only two pigs were slaughtered during the summer, not, as far as we could see, in celebra-
[052] tion of any special occasion. The pork was simply boiled instead of being roasted in the traditional Polynesian style.

The fifty chickens were regarded also as a source of occasional meat. We found no instance of the eggs being used for food by the local people. Soon after we set up camp, a young man came around with some eggs which he offered to trade with us for cigarettes. We made a deal and started looking forward to next morning's breakfast. We decided to boil the eggs. It turned out that I liked mine at the three minute stage, the others in a somewhat harder condition. So I dipped my eggs out of the pot at the proper time and started to break one open only to disclose, not the expected runny yolk, but a fully developed chick, ready to hatch! A hasty examination showed all of the eggs to be in the same stage.

I don't know whether this was purposeful or accidental. I wondered whether the people knew of the Phillipine delicacy, balut, and assumed that all outsiders like their eggs in a late stage of development. At any
